## AVAYA

Communication Server Integral 55 / Integral 55 LX

Operating instructions

## Contents

1 About this Manual ..... 14
2 Important notes ..... 15
2.1 Safety Information ..... 15
2.2 Environmental Conditions ..... 16
2.3 Delivery and transportation ..... 16
2.4 Protective earthing ..... 16
2.5 Required Servicing Procedures ..... 17
2.6 Connections to V. 24 Interfaces ..... 18
2.7 EU Declaration of Conformity ..... 19
3 Product overview ..... 20
3.1 Structure ..... 20
3.1.1 Rack ..... 20
3.1.2 Modules ..... 22
3.1.3 Power supply ..... 25
3.1.4 Configurations ..... 26
3.2 Expansion options ..... 26
3.2.1 Standing casing ..... 26
3.2.2 19" cabinets - 19" frames ..... 27
3.3 Technical Data ..... 27
3.3.1 Other weights ..... 29
3.3.2 Reliability ..... 30
3.3.3 traffic capacity ..... 31
4 Modules ..... 32
4.1 Single and twin module ..... 32
4.1.1 Procedure for Installation ..... 32
4.1.2 Board slots ..... 32
4.1.3 General information on boards ..... 33
4.1.4 Access to the system ..... 35
4.1.5 Inserting the Connecting Cables ..... 35
4.1.6 Connectivity ..... 37
4.1.7 Switching on ..... 37
4.1.8 Troubleshooting ..... 40
4.2 ICS (multi-module) ..... 41
4.2.1 Rack and assembly ..... 43
4.2.2 Doubling ..... 44
4.2.3 General information on boards ..... 44
4.2.4 Switching on ..... 45
4.2.5 Troubleshooting ..... 47
4.3 B3 module (multi-module) ..... 48
4.3.1 Board slots ..... 49
4.3.2 General information on boards ..... 50
4.3.3 Connectivity ..... 50
4.3.4 Doubling ..... 53
4.3.5 Switching on ..... 55
4.3.6 Troubleshooting ..... 57
5 19" cabinets and cooling ..... 59
5.1 Standing casing ..... 59
5.1.1 Cable routing ..... 60
5.2 33HU ..... 61
5.342 HU 500 mm ..... 64
5.442 HU 730 mm ..... 65
5.5 42HU-can be disassembled ..... 66
5.6 Overview of components (1) ..... 67
5.7 Overview of components (2) ..... 73
5.8 Selection of cabinets for installation of the Integral 55 ..... 80
5.9 Air conditioning ..... 82
5.9.1 Overview ..... 82
5.9.2 Intrinsic convection, heat transmission through the cabinet surface ..... 83
5.9.3 Intrinsic convection with issue of the hot air from inside ..... 84
5.9.4 Forced convection, direct heat exchange using fans ..... 85
5.9.5 Thermal offtake by cooling device: ..... 87
5.9.6 Forced circulation due to heat exchanger (air/air) ..... 88
5.9.7 Calculation formula for the effective cabinet surface ..... 88
5.9.8 Flow chart: Air conditioning in a 19"cabinet for the installation of I55 ..... 90
5.10 Universal installation aids ..... 91
5.11 Integral- Com- Center- ICC- V 01 ..... 92
5.12 Integral- Com- Center- ICC- V 33 F ..... 92
5.13 Integral- Com- Center- ICC- V 02 ..... 93
6 Power supply ..... 94
6.1 19"rack ..... 94
6.1.1 PS350 Adaption ..... 94
6.1.2 FPE in cabinets ..... 106
6.2 B3 module ..... 116
6.2.1 Fuse Panels ..... 116
6.2.2 FPE in B3 module ..... 120
6.3 PSL55 ..... 122
6.4 PS280A ..... 123
6.5 PS350A ..... 124
6.6 ISPS (IMTU Supplementary Power Supply) ..... 125
6.6.1 Fuses ..... 125
6.7 Uninterrupted Power Supply ..... 126
6.7.1 Online UPS systems ..... 127
6.7.2 Line-Interactive UPS systems ..... 129
6.7.3 Supplementary components ..... 130
6.7.4 Explanations ..... 130
6.7.5 Installation and service concept ..... 133
6.7.6 Earthing measures ..... 134
6.8 Earthing concept ..... 136
6.8.1 General Requirements and Explanations for the Decision-Making Diagram ..... 137
6.8.2 Explanations for the terms SELV, TNV1, TNV2 and TNV3: ..... 137
6.8.3 Annex 1 ..... 138
6.8.4 Annex 2 ..... 138
6.8.5 Annex 3 ..... 139
6.8.6 Annex 4 ..... 140
6.8.7 Annex 5 ..... 140
6.8.8 Annex 6 ..... 141
6.9 Power consumption ..... 142
7 Doubling ..... 143
7.1 Doubling ..... 143
7.2 Single module ..... 143
7.2.1 doubling PS ..... 144
7.2.2 doubling CF* ..... 144
7.2.3 doubling *CB ..... 145
7.3 Twin module ..... 146
7.3.1 doubling PS ..... 146
7.3.2 doubling CF* (within a module) ..... 146
7.3.3 doubling *CB ..... 147
7.4 Multi-module ..... 148
7.4.1 Interconnected systems ..... 148
7.4.2 MLB (Module Link Board) ..... 150
7.4.3 ISMx ..... 151
7.4.4 ICF ..... 151
7.4.5 IVZ on *CB boards ..... 151
7.4.6 IVZ on separate *CB boards ..... 152
7.4.7 Doubling of the PS in the B3 module ..... 153
7.4.8 Complete doubling ..... 153
8 Boards ..... 156
8.1 General Points ..... 156
8.2 Configurations ..... 158
8.3 Block diagram of R1 rack ..... 160
8.4 Control, Central Functions and Transport ..... 161
8.4.1 ACB/ACB1 Advanced Computer Board ..... 162
8.4.2 ASM3 Announcement Module 3 ..... 171
8.4.3 CBI1A3 CBus Interface 1 Adapter Version 3 ..... 172
8.4.4 CF22 Central Functions 22 ..... 173

## 1 About this Manual

This manual contains information for sales personnel, service technicians and installers for the acquisition, installation, service, maintenance and expansion of the Integral 55 Communication Server and Integral 55 Compact.

In this manual, abbreviations of boards and modules marked with an "x" apply to specific variants of boards and/or modules.

A separate manual is available for each individual application.

## 2 Important notes

### 2.1 Safety Information

Prior to completing the connection of the system to the mains power, all cabling of the communication server Integral 55 must be completed and checked.

System service and repairs are the exclusive domain of an authorised specialist!
The telecommunications system must be connected to properly installed, earthed mains socket. The power supply voltage must correspond to the mains voltage. The provided mains cables must be used.

When connecting devices to the V. 24 interfaces, only use the supplied shielded cables.
Each module must be connected to voltage compensation!
The occurrence of strong magnetic fields in the vicinity of the communication server Integral 55 must be prevented!

The communication server Integral 55 must not be exposed to shock, impact or vibrations!
ESD precautions must be followed when working with boards susceptible to electrostatic shock.
For reasons of EMC, vacant slots should be covered with frontplates.
Prior to removing power supply modules, they must be separated from the mains voltage!
Prior to commissioning, pull the protective hoods over the power supply devices on the front side.
Subsequent to system startup, the communication server Integral 55 must be closed (dust covers and rear panels depending on hardware configuration and module types)!

The following regulations or guidelines must be considered during system installation, startup and operation:

- DIN VDE 0100 Setting up heavy current systems
- DIN VDE 0105 Operating heavy current systems
- DIN VDE 0132 Fire countermeasures in electrical systems
- DIN VDE 0298 Use of cables and insulated wiring for heavy current systems
- DIN VDE 0800 Telecommunications engineering
- DIN VDE 0891 Use of cables and insulated wiring for telecommunication and information processing systems
- DIN 4102 Combustive properties of building materials and components
- DIN 5035 Interior lighting with artificial light
- VDI 2054 Air conditioning systems for data processing environments

Additional regulations or guidelines may apply in special or individual circumstances.

### 2.2 Environmental Conditions

The following placement guidelines must be considered in order to ensure trouble free operation of the Communication Server Integral 55:

- The room must be dry and provide options for ventilation.
- Gross weight, fully equipped - seeTechnical data $\rightarrow 27$.
- The floor covering should possess antistatic properties. It should be easy to clean and abrasion resistant.
- If the system is to be installed in tight quarters, sufficient ventilation should be ensured. The Communication Server Integral 55 should not be exposed to radiated heat (e.g. radiator).
- If the PSL55 is doubled, the mains connections should be established using separate circuits (phase and fuse).
- An additional number of earthed mains sockets must be provided for service purposes.

Climatic conditions for operation, storage and transportation - see Technical data $\rightarrow 27$.

Access to the Communication Server Integral 55 (cabinet, standing casing) must be guaranteed from the front and the back.

### 2.3 Delivery and transportation

Only transport the Communication Server Integral 55 in its original packaging.
Check that the system is complete by referring to the delivery note and the accompanying installation documents.

### 2.4 Protective earthing

All modules must generally be earthed via a separately routed protective conductor. Earthing via the protective conductor of the power cord does not suffice.

The protective conductor must have a green-yellow insulating jacket and a minimum cross-section of 2.5 mm 2 if mechanical protection is present, or 4 mm 2 if this is not the case. More detailed information can be found in the chapter Earthing concept $\rightarrow 136$
You will find ready-made solutions in the chapters GRAB="T">19" cabinet $\rightarrow 107$, Standing casing $\rightarrow 110$ and Housing/Cabinet solutions $\rightarrow 112$.

The following must always be taken into account:

- The lockable earth plug with cable (49.9804.5750) is only used in standing casings with one rack.
- The FPE conductors in the cabinet are executed in green-yellow and have a minimum cross-section of $2,5 \mathrm{~mm} 2$. The potential equalisation conductor ( PA ) outside is protected and has a minimum crosssection of 6 mm 2 .
- Two cables have been defined for the fixed connection of the cabinet:
- 49.9906.7592 5 m with CEE plug blue
- 49.9906.7593 10 m with CEE plug blue
- If more devices have been installed it is necessary to check if the leakage current is greater than 3.5 mA . If this is the case these devices, too, have to be connected tightly to the potential equalisation bar.
- If the leakage current is greater than 3.5 mA it is imperative to provide an earthing connection prior to connection to the supply circuit!
- Leakage currents of UPS systems must be taken into account. If the current is $>3.5 \mathrm{~mA}$ the UPS must be provided with a FPE fixed connection.
- If a cabinet is supplied by an external UPS the connection must be made using the cable 49.9906.8660 ( $3 \times 1.5 \mathrm{~mm} 2$ with earthing-pin plug and conductor end sleeves).
- With redundant power supply of the CSI55 ensure that the power supplies are powered by two different supply circuits. (cabinet with two multiple sockets)
- If the CSI55 rack is to be installed in third-party cabinets without a potential equalisation bar make sure that the FPE of the rack is connected to the potential equalisation conductor (PA) via a potential equalisation bar that has to be retro-fitted or that it is connected directly to the potential equalisation conductor.
- If cabinets on rollers are connected this always has to be done using a flexible connecting cable (litz-wire cable).
- If the computer board with V24 interface of the CSI55 is used, preference should be given ot the insulated interface V24I (28.7640.3242) or similar.

In the chapters FPE in cabinets $\rightarrow 106$ andFPE in B3 module $\rightarrow 120$ you will find a description of how to connect the earthing conductor.

19"cabinet $\rightarrow 107$

### 2.5 Required Servicing Procedures

If servicing is required the Helpdesk has been called by:

- the customer,
- the technician/service technician,
- Remote alarm signalling,
- TNS (off hours)

In most cases, the Helpdesk will already have located the fault through the use of remote diagnostics. If this is the case, if necesary, simply replacing the faulty module will suffice. It should be stated, however, that remote diagnostics are not capable of locating every fault.

You must then:

- Condense the available information
- Interpret fault returns/indications or displays
- Locate the fault using the service PC
- Carry out diagnostics with the aid of the Helpdesk.

### 2.6 Connections to V. 24 Interfaces

To prevent the destruction of the V. 24 interface drivers and receiver components when connecting circuits, it is imperative to use cables that are shielded on both ends (e.g. 27.5630.0561, .0562, . 0564, . 0565 or similar).

### 2.7 EU Declaration of Conformity

## C

We Avaya GmbH \& Co. KG declare that the products Integral 55 and Integral 55 Compact (telecommunication systems in various upgrade stages) concur with the basic requirements and other relevant provisions of EU guideline 1999/5/EU concerning on radio equipment and telecommunications terminal equipment and the mutual recognition of their conformity.

The EU Declaration of Conformity is enclosed to the product and can be also requested at the Internet addresses:
http://www.avaya.de/gcm/emea/de/includedcontent/termsofuse.htm
or
http://www.avaya.de/gcm/emea/de/includedcontent/conformity.htm
or you use the search with the headword "conformity" in our Internet.

## 3 Product overview

The boundaries between computers and telephones are becoming increasingly hazy. TC systems that can be installed directly in the data environment represent a further step in this direction. In this context, it is important to find integral solution approaches, which regard EDP, internet and telephone environments as a unit.

CSI55 is a product in 19" technology, which adapts itself with this construction to the IT environment. It is made up of uniform racks, which can be upgraded in any way. Accordingly, the CSI55 can handle port numbers of less than 30 to over 32,000 within a multi-modular configuartion.

In essence, the marketing strategy is based on the sale of solutions. This strategy is already in practice under the term ICC "Integral Communication Center". CSI55's high flexibility enables the satisfaction of any customer wishes.

The merging CSI55 with the application integration of the ICC has created a highly flexible product, which will satisfy any customer. The new system offers a large range of opportunities in order to make use of all aspects of modern telecommunications. These include e.g. voice over IP, call identification, least cost routing and many more.

Integral 55 systems do not require regularly scheduled maintenance procedures.
The technician requires no system specific tools.
Special tools are available for factory trained technicians.

### 3.1 Structure

CSI55 is made up of uniform racks, built in 19-inch technology. They can be installed in standard 19" cabinets or in 19" frames. In addition, the racks can be installed in specially developed, more cost-efficient standing cases (see chapter Standing cases).

Up to four racks can be joined together to form a single module by means of 8-wire CAT6 copper cables with a length of up to 30 m . This means that the racks can be assembled flexibly. For example they can be distributed over several 19 -inch cabinets. The following provides a more detailed explanation of the HW components.

### 3.1.1 Rack

One rack consists of 8 slots for connecting circuit boards (ISUs) and 2 slots for the control boards (HSCB/ACB, CF2E/CF22). In addition, each end (right and left) has a slot for the power supply.

### 3.1.1.1 Rack assembly

Communication Server Integral 55, rack for installation in a 19" cabinet or in a standing casing (max. 256 ports), view from the front.

1. Left side
2. Upper part
3. Backplane
4. Fan (a fan must be fitted to the rack with ACB/HSCB and CF22/CF2E)
5. Right side
6. Board frame for eight connecting circuit boards

Communication Server Integral 55, rack for installation in a 19 " cabinet or in a standing casing (max. 256 ports), view from the rear.

1. Right side
2. Connection boards on the backplane
3. Upper part
4. Board frame
5. Left side
6. Backplane
7. Rear cover
8. Fastening groove
9. Fan (a fan must be fitted to the rack with ACB/HSCB and CF22/CF2E)

Dimensions: $485 \times 400(9 H U) \times 418(W x H x L)$

### 3.1.2 Modules

In the CSI55 one module is made up of up to 4 individual uniform racks. In this way, a single module that is initially made up of one rack can be expanded later on simply by adding further racks. One module of the CSI55 is made up of up a maximum of 4 racks.
Up to 3 expansion racks can be connected to the basic rack using the connecting module "R1 Rack Connector" R1RC.

Depending on the number of racks in use, the configurations are called C 1 to C 4 .

- C1: consists of one rack
- C2: consists of 2 racks
- C3: consists of 3 racks
- C4: consists of 4 racks

The control modules are only used in the basic rack. The expansion racks (racks 2 to 4) are connected with the basic rack via an 8-wire copper cable in a star-shaped pattern and do not require any separate control. The slots for HSCB/ACB and CF2E/CF22 are not used beyond the second rack and are covered by frontplates.

Several modules ( C 1 to C 4 ) can be joined together to form a twin or multi-group system.
For this purpose it is possible to use both, modules of different sizes ( C 1 to C 4 ) in mixed form, and a system network made up of the CSI55 and the predecessor system I33.

### 3.1.2.1 Single module

A single module can be made up of up to 4 racks, thus enabling a maximum of 1,024 ports with only one control. This number of ports is achieved in that each subscriber receives a B-channel for the transmission of speech and a D-channel for signaling. The maximum possible number of ports may be reduced, depending on the number of participants with $2 B+D$ configuration. In extreme cases, in which each subscriber has a $2 B+D$ connection, the maximum number of ports is reduced to 512.

The expansion racks are connected by 8-wire CAT6 copper cable with a length of up to 30 m , which transmits all information (signal pulse, CBus, Highways...). They are a form of separate modules without control, and can be stacked or arranged in star shapes.

| The Single module in tabular form |  |
| :---: | :---: |
| Modules: | One module is made up of $1-4$ racks (R1, R2, R3, R4). The CF22/CF2E is only connected with the R1 in slot 10 . The ACB/HSCB board is only connected with the R1 rack, usually slot 9 (unless there is doubling of CF22/CF2E). |
| Module types: | The following names have been defined for the various module types: |
|  | C1: $\quad$ Module with one rack |
|  | C2: $\quad$ Module with 2 racks |
|  | C3: $\quad$ Module with 3 racks |
|  | C4: $\quad$ Module with 4 racks |
| The racks in the modules receive consecutive numbers. The basic rack is called R1, followed by R2 to R4. |  |
| Rack number: | The following slots and CBI addresses have been defined for the racks R1-R4: |
|  | R1: $\quad$ Slot 1-10/CBI-address $06-0 \mathrm{~F}+40$ |
|  | R2: $\quad$ Slot 11-18/CBI-address 10-19+41 |
|  | R3: $\quad$ Slot 19-26/CBI-address 46-4F +42 |
|  | R4: $\quad$ Slot 29-36/CBI-address 50-59 + 43 |
| Backplane: | The backplane used in racks R1-R4 is always the same. The bus terminal resistances are integrated on the backplane. Additional submodules are not necessary. |
| Power supply: | 2 power supplies can be connected to each rack. The 1st power supply is connected to the right-hand power supply slot. The 2nd power supply can be connected to the left-hand power supply slot for redundant operation or to increase power. <br> Alternatively a PS350A can be installed on the left side of the rack. For this purpose the PS350 Adaption set is available. |

## Restriction on the number of subscribers:

- 960 digital/analogue subscribers (assumption: at least two boards per module are not intended for subscribers)
- 640 analogue subscribers (restriction due to available DSP resources)
- 864 subscribers with Stimulus terminals (restriction due to available processing capacity on the computer board)

### 3.1.2.2 Twin module

Twin module configurations consist of two single modules, coupled with each other. These are connected directly to the CF2E/CF22 board via the EOCSM or EOCMM or EOCPF submodules using fibre-optic cable. The individual modules can be put together and assembled in any way. The maximum number of ports with a twin module configuration is 2,048 (per subscriber 1B+D).

The fibre-optic connection between two modules can have a cable length of up to 15 kilometres. Larger distances can also be covered. In this case the modules can be network connected for example with QSIG. Connections of this kind are installed very often in corporate networks.

1. FOC
2. 8-wire CAT6 copper cable with a length of up to 30 m

### 3.1.2.3 Multi-module

Large systems are built using multi-modules. A multi-module is used to link several individual modules. For up to 16 modules this can be done by means of an Interconnection Server ICS. If more than 16 modules have to be linked, up to 32 single modules (up to 128 racks if only C4 modules are used) can be connected to a B3 module to form one system. Such a system provides 32.768 ports.

Here, too, the connection to the multi-module is done on the system module side via the CF2E/CF22 module with the EOCSM or EOCMM or EOCPF submodules and using fibre-optic cable.

Thanks to fibre-optic links, the individual modules can be installed at a large distance from each other (up to 15 km , larger distances using QSIG). This way, for example individual modules or module systems can be distributed over the company premises. This is possible either across several storeys within one building or even in different buildings.

1. FOC
2. 8-wire CAT6 copper cable with a length of up to 30 m

### 3.1.3 Power supply

The CSI55 is fed from a power supply unit specially designed for this purpose, called PSL55, material number: 49.9902.4943 $\rightarrow 122$.

The system contains two slots to provide the option of doubling the power supply. The mains units can be used for redundant operation and also in order to double capacity. in redundant operation, the second mains unit takes over the functions in the event of the first unit failing. Connect a second mains unit to the left-hand slot in the event of technical reasons (more than 5 DECT boards in one rack!) necessitating an increase in capacity.

Please observe that redundant operation will not be possible in this case!

Alternatively a PS350A can be installed on the left side of the rack. For this purpose the PS350 Adaption $\rightarrow 94$

### 3.1.4 Configurations

Like I33, the CSI55 also realises single, twin and multi-modular configurations. CSI55 offers high flexibility, thus enabling the realisation of systems in a small port range and also up to 32,000 ports as a single system. Unlike I33, CSI55 does not require an exchange of modules for any system expansion! All you need to do is connect a new expansion rack. Even if a customer still owns an I33 system, he or she can expand it using new I 55 racks, thus realising a mixed form of the old and the new integral systems.

CSI55 and I33 systems can be operated together in a system network.

### 3.2 Expansion options

One single rack represents a fully operative Communication Server I55. The rack can be installed in a standard 19" cabinet or in a standing casing.

One rack consists of 8 slots for connecting circuit boards (ICUs) and 2 slots for the control boards (ACB/HSCB, CF22/CF2E). As a result, there are the following expansion options:

- A single 19"-Rack.
- One single rack in a 19 " standing casing.
- A single or multi rack for installation in a 19 " cabinet or 19 " frame existing at the customer's location.
- A single or several racks in a provided 19" cabinet or 19 " frame.
- Up to four racks (standing casing, racks in 19" cabinets, racks in 19" frames or any combination thereof) connected by flexible cables, can form a single module .

### 3.2.1 Standing casing

In this assembly option, a CSI55 rack can be installed in a specially developed standing casing.
The special construction means that there are two height units available for additional components such as a 19" server or UPS systems.
The dimensions of the standings casings are $550 \mathrm{~mm} \times 550$ $\mathrm{mm} \times 11 \mathrm{HU}$; they stand on four lockable wheels. No more than two standing casings may be stacked.

### 3.2.2 19" cabinets - 19" frames

### 3.3 Technical Data

Connecting options, interfaces

| Network interfaces | T0 |  |  |  |  |  |  | T2 |  |  |  |  |  |

| Traffic values | Traffic capacity $\rightarrow 30$ |

## Telephones/terminals

Terminals of the T93 and T1 series and the telephones of the T3 series can be connected as well as various IP phones if our IPV solution is used.

| Environmental conditions/Air conditioning |  |  |  |
| :--- | :--- | :--- | :--- |
|  | DIN ETS | Temperature range | Relative humidity |
| Storage: | $300.019-\mathrm{KI.1.1}$ | $-5^{\circ} \mathrm{C}$ to $+45^{\circ} \mathrm{C}$ |  |
| Transport: | $300.019-\mathrm{KI.2.2}$ | $-25^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |  |
| Operation: | $300.019-\mathrm{KI} .232$ | $-5^{\circ} \mathrm{C}$ to $+45^{\circ} \mathrm{C}$ | 5 to $95 \%$ |
| Air conditioning | Passive ventilation (e.g. an opening for incoming air in the skirting board or <br> door) is sufficient if up to 2 racks are installed. Active ventilation is necessary if <br> more than 2 racks or additional active components are installed. |  |  |

### 3.3.1 Other weights

## Other weights

| two modules R1RG |  |
| :--- | :--- |
| a fan assembly set | 0.278 kg |
| Power Supply PSL55 | 0.338 kg |
| Standard cable 16x2 connecting circuit, length: 5 m | 3.600 kg |
| Mains connection cable, length: 3 m | 0.800 kg |

## The weight of a rack was found using the following equipment

| Rack without cable with: |
| :--- |
| a fan |
| a HSCB board incl. a Calluna disk drive |
| a CF2E board |
| a DT21 board |
| a DUPN boards |
| a DUPN board |
| a ADM board with a submodule ABSM and a submodule STSM |
| two ASC2 boards |
| two ATA boards, each with four SIGA submodules |
| eight cable adapters CA1B |
| a AV24B board |
| a ESB board |
| as well as |
| one power supply PSL 55 |
|  |
| 22.920 kg |

### 3.3.2 Reliability

The reliability values (MTBF, availability, failure time per year) are specified for CSI55. This focuses on different system parameters.

Total system failure is considered. Total failure means that none of the functions in the entire system can be used. This corresponds with a failure of all subscribers.
In all of the values stated herein, the power supply devices were also taken into consideration. However, the failure of power supply devices is less frequent than the failure of mains voltage due to the the power plant. If UPS (uninterrupted power supply) is not used, this will lead to total system failure in both cases. This must be taken into account during the use of the values.

If invitations to tender specify that the system reliability values must be stated without power supply devices, the tables for the system can be applied with the power supply doubled.

## Reliability CSI55

|  |  | MTBF (years) | Availability (\%) | Failure time <br> p.a. |
| :--- | :--- | :--- | :--- | :--- |
| Single module <br> configuration | not redundant | 34 | 99,9993 | 3.5 min. |
|  | Redundant power <br> supply | 59 | 99,9996 | 2 min. |
|  | Redundant power <br> supply and central <br> functions | 147 | 99,9998 | $<1 \mathrm{~min}$. |

|  |  | MTBF (years) | Availability (\%) | Failure time <br> p.a. |
| :--- | :--- | :--- | :--- | :--- |
| Twin module <br> configuration | not redundant | 2548151 | 99,9999 | $<1 \mathrm{~s}$ |
|  | Redundant power <br> supply | 7724300 | 99,9999 | $<1 \mathrm{~s}$ |
|  | Redundant power <br> supply and central <br> functions | 47176407 | 99,9999 | $<1 \mathrm{~s}$ |

|  |  | MTBF (years) | Availability (\%) | Failure time <br> p.a. |
| :--- | :--- | :--- | :--- | :--- |
| Multi-module <br> configuration | not redundant | 2548151 | 99,9999 | $<1 \mathrm{~s}$ |
|  | Redundant power <br> supply | 7724300 | 99,9999 | $<1 \mathrm{~s}$ |
|  | Redundant power <br> supply and central <br> functions | 47176407 | 99,9999 | $<1 \mathrm{~s}$ |

### 3.3.3 traffic capacity

The term traffic capacity can be broken down into dynamic and static traffic capacity.
The dynamic traffic capacity is the capacity provided by the system. It is specified in BHCA (Busy Hour Call Attempts) and measures the number of calls that can be processed in an average busy hour. For ACD systems the unit BHCC is used (Busy Hour Call Completions) and measures the number of calls that are connected in an average busy hour and reach at least a queue with a recorded announcement.

The static traffic capacity describes the capacity of the switching matrix. It is specified in Erlang (Erl).
The basis for the dimensioning of telephone systems the FTZ guideline 12TR2. It specifies a traffic value of 0.3 Erlang for digital subscribers (2B+D) (see German BAPT regulations for traffic values).

The values listed in the tables below apply to the CSI55:

## Traffic capacity up to E070V08:

| Dynamic |  |
| :--- | :--- |
| Single module | 8000 BHCA |
| Twin module | 16000 BHCA |
| Multi-module | 24000 to 350000 BHCA depending on configuration |
| Static |  |
| Single module | Non-blocking (1 Erlang/B channel) |
| Twin module | Non-blocking (1 Erlang/B channel) |
| Multi-module | 0.88 Erlang with digital ports only and with a proportion of 50\% of the <br> traffic inside the module and 50\% between modules. |

## Traffic capacity with IEE2:

| Dynamic |  |
| :--- | :--- |
| Single module | 20000 BHCA |
| Twin module | 40000 BHCA |
| Multi-module | 60000 to 750000 BHCA depending on configuration |
| Static |  |
| Single module | Non-blocking (1 Erlang/B channel) |
| Twin module | Non-blocking (1 Erlang/B channel) |
| Multi-module | 0.88 Erlang with digital ports only and with a proportion of 50\% of the <br> traffic inside the module and 50\% between modules. |

## 4 Modules

A module is a complete unit which is fully operative. The smalles module is an Integral 55 rack. The following table shows a rough overview of the possible modules:

| Module overview |  | Dodule |
| :--- | :--- | :--- |
| Single modules | consists of 1 to 4 racks <br> Connection: 8-wire CAT6 copper cable, length $<30 \mathrm{~m}$ | Racks <br> max. |
| Twin module | Two single modules Connection <br> fibre-optic cable, length $<15 \mathrm{~km}$, or via QSIG for larger <br> distances | 8 |
| Multi-module | 3 to 16 modules with ICS, up to 32 modules with B3 <br> Connection: Fibre-optic cable, length $<15 \mathrm{~km}$. | 64 or 128 |

### 4.1 Single and twin module

One module can be made up of up to four racks.
The following restriction on the number of subscribers per module must be assumed for various reasons:

- 960 digital/analogue subscribers (assumption: at least two boards per module are not intended for subscribers)
- 640 analogue subscribers (restriction due to available DSP resources)
- 864 subscribers with Stimulus terminals (restriction due to available processing capacity on the computer board HSCB)

These restrictions only take effect with the use of the new ratio boards (twice the number of ports).
Twin module configurations consist of two single modules, coupled with each other.

### 4.1.1 Procedure for Installation

Depending on the configuration, the racks are, or must be, installed in standing casings or in 19" cabinets.

### 4.1.2 Board slots

For reasons of electromagnetic compatibility (EMC), board slots which are not occupied must be provided with metal shields.

| Board slot | Material number: | 49.9901 .9774 |
| :--- | :--- | :--- |
| Power supply unit | Material number: | 49.9903 .1809 |

When installing the shields they have to be held parallel to the front side because otherwise there is danger that no contact to the housing will be established.

In the view on the left you can see a C4 module with the board slots, the corresponding
in decimal form and the in hexadecimal form.
The addresses and slot numbers of smaller modules are identical, please ignore other expansion modules in this view (for example, consider only R1 and R2 for C2).

## Please note:

The slots with the CBI addresses 19;4F;59 (slots 20, 28 and 38) are not suitable for the use of a ACB/HSCB because there is no power fail signal on these slots.

### 4.1.3 General information on boards

The boards used in the module are listed hereafter:

## Boards for Connection Technology and Signalling

| AEV24B | Adapter Ethernet V24 B module |
| :--- | :--- |
| AV24B | Adapter V.24 for B Modules |
| ESBx | External Signalling B Module |
| CAxB | Cable Adapter |
| OFA2B | Optical Fibre Adapter 2 B Module |
| OFAS | Optical Fibre Adapter Single mode |
| CARUB | Cable Adapter Russia B Module |
| EESxB | Emergency Extension Switch B Module |

## Boards for Control, Central Functions and Transport

| ACB | Advanced Computer Board |
| :--- | :--- |
| HSCB | High Speed Computer Board |
| DSPF | Digital Signal Processing Function |
| CF22 | Central Function 22 (used in all modules) |
| CF2E | Central Function 2E (used in all modules) |
| R1RC | R1 Rack Connector for I55 |

## Boards for Analog Interfaces

| ASCxx | Analog Subscriber Circuit |
| :--- | :--- |
| ATLC | Analog Tie Line Circuit |
| ATxx | Analog Trunk Interface |
| DDID | Direct Dialling Inward Circuit |
| JPAT | JISCOS Public Analog Trunk |
| ADM | Analogue/Digital Mixboard |

## Boards for Digital Interfaces

| DUP03 | Digital Linecard UPN |
| :--- | :--- |
| DUPN | Digital Linecard UPN |
| DT0 | Digital Linecard TIE/T0 |
| DT21 | Digital Linecard TIE/T2 (S2M) |
| DS02 | Digital Linecard S0 |
| DECT21 | Digital Enhanced Cordless Telecommunication |
| CAS | Channel Associated Signalling |
| IPN | Intelligency Private Network |
| IMUX | Integrated Multiplexer |
| DCON | Digital Protocol Converter |
| MAC | Multi Access Circuit Board |
| HAMUX | Home Agent Multiplexer |
| BVT2 | (part of a PC, Home Agent) |
| MULI | Multi-line |

| UIP | Universal Interface Platform |
| :--- | :--- |
| ADM | Analogue/Digital Mixboard |

## Boards for IP telephony

| IPGW | Internet Protocol Gateway |
| :--- | :--- |
| VoIP | Voice over IP Board |

## Boards for Power Supply

| PSL55 in racks R1 to R4 | Power Supply Low 55 |
| :--- | :--- |
| PS350A in racks R1 to R4 <br> (optional) | Power Supply 350A |

### 4.1.4 Access to the system

The available and familiar service programmes can be accessed in the following ways:

- Via V. 24 with a connected terminal/PC in MML dialogue.
- Using the operator position in MML dialogue.
- Using SO access via protocol stack.

The V. 24 and SOinterfaces can be accessed on the Service Panel.
Although this communication level presupposes the availability of a PC with corresponding software, it corresponds only to a conventional MML dialogue (transparent mode).

## File Transfer

File transfer $\mathrm{PC}<—$ HGS (Background Memory)

## Traffic measurement

The VEME traffic measurement can be activated by one of the aforementioned methods; the resulting data however is output via the file handling system to the V. 24 interfaces.

## Central Call Charge Data Recording (ZGDE)

The ZGDE generally outputs data via the file handling system to the V. 24 interfaces.

## Callback

It is possible to set up an automatic connection to a PC or a service centre.

### 4.1.5 Inserting the Connecting Cables

The connection of the Communication Server Integral 55 with the MDF or NT is implemented using the supplied connecting cables. The connectors for these cables are located on the adapter modules (cable adapters), which can be reached from the rear side of the rack.

## Example: 19" cabinet

Open the 19" cabinet
Mark the cable at both ends (server and MDF) using the supplied labels.

Attach the connecting cable at the main distribution frame first, and then at the PBX.

Feed the ends of the connecting circuit cable into the console and then into the modules. The cable guides are illustrated.

Rear side of cabinet with wiring
Insert the Champ plug of the connecting cable into the plug sockets of the adapter modules according to the configuration. The adapter modules are held in place by set-squares.

Attach the connecting cables to the provided fastening clamps in the racks using cable binders.
Cover the area with the CA cover.

Rack in standing casing, rear side with CA cover.
Each connecting circuit of a connecting circuit board is fitted with an overvoltage protection device to 4 kV on the output side. Make sure that removed boards are placed back into the same slot (various equipment of the connecting circuit boards with submodules).Ç

### 4.1.6 Connectivity

No more than four racks can be connected to form a module during the installation of a 19" cabinet.
Furthermore, an optical waveguide cable can be used to connect two of these modules directly.

- four racks (one module) and four racks (second module).

This presumes that the group is equipped with the CF22/CF2E boards. This board must also be compleeted by the Sub LP EOCSM/MM/PF.Ç

If three or more of these groups are to be connected to form a PBX, they must be connected using a B3 multi-module or ICS.

This is done via the fibre-optic cable on the MLB board of the multi-module. This presumes also that the modules are equipped with the CF22/CF2E boards.

The R1 rack can also be used as part of a network. Coupling is implemented via S2M on the DT21 or S0 submodules of the DT0 or ADM boards.

### 4.1.7 Switching on

## Single module

Check the stable position of the power supply devices and power supply cables.
Cover all slots with the slot covers.
Insert all required covers over the front panels of the ACB or HSCB and CF22 or CF2E boards.

R1 rack in the standing casing

1. Slot cover
2. Covers for ACB or HSCB and CF22 or CF2E
3. Protective bracket for the mains connection cable

Pull the protective hoods over the slots of the mains connection cable on the front of the power supply devices.
Insert the earthed mains plug(s) of the mains connection cable(s) for the racks in their designated earthed mains sockets.

## Startup with the ACB board

The module is now switched on and is loading the programs (loading duration less/equal 15 min ).

If the illustrated green LEDs L1 to L2 of the Advanced Computer Board ACB are illuminated, the module is ready for operation.

## Startup with the HSCB board

The module is now switched on and is loading the programs (loading duration less/equal 10 min ).

If the illustrated yellow LEDs L7 to L10 of the High Speed Computer Board HSCB are off, the module is ready for operation.

## Twin module

Check whether only one ESU is active in the Communication Server Integral 55 (DIL switch to CF22/CF2E).

## Startup with the ACB board

(Information yet to come!)

## Startup with the HSCB board

In twin operation, the S3 switch of the HSCB board without HGS should be placed in the right-hand position.
Switch on both modules of the server.
The loading phases shown in the modules (LEDs of the HSCB boards) may differ from time to time.
Having switched on both modules, first run through loading phases 15 to 6.

From this point, the HSCB board without HGS is held at loading phase 6 while the HSCB with inserted HGS runs through the remaining loading phases 5 and 4 (access to HGS).

The HSCB board without HGS subsequently runs through loading phases 5 and 4.
Finally both HSCB boards run through loading phases 3 to 0 .

## HSCB Loading Phases

| No. | L7 | L8 | L9 | L10 | Phase name |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 15 | 1 | 1 | 1 | 1 | Start reset phase |

| Loading procedure failed during first <br> commissioning (twin module) | In the module with HSCB board and without HDD, check <br> whether LED L8 on the CF22/CF2E board is flashing. <br> If not, check the optical waveguide connections. If there is no <br> connection, establish it. <br> If subsequently necessary for these modules: <br> Small reset (restart) <br> Switch S2 (HSCB board) in left position, switch S1 (HSCB) in <br> left and then back to middle position <br> Large reset <br> Switch S2 in right position, switch S1 in left and then back to <br> middle position, switch S2 to left position after loading has <br> finished (loading phase 0) |

## Further Course of Action

## with ACB

(Information yet to come!)

## with HSCB

First check the displays of the HSCB board with inserted HGS.
Then check the displays of the HSCB board without HGS (Twin Module).
Note down the status of the LEDs on all boards.
Inform your Service Control Centre.

### 4.2 ICS (multi-module)

## Mains voltage

The ICS is operated with the PSL55. Therefore it is suitable for connection to $230 \mathrm{~V} ; \pm 10 \%, 50 \mathrm{~Hz}-6 \%+26 \%$ $(47$ to 63 Hz ). For more details, see PSL55 $\rightarrow 122$.

## Power dissipation

| Max. power dissipation with expansion for an 8-group system <br> (A MLB board fully equipped with 8 EOC) | 95 W |
| :--- | :--- |
| Max. power dissipation with expansion for a 12-group system <br> (two MLBs, one equipped with 8 EOC, the other with 4 EOC) | 115 W |

| Max. power dissipation with expansion for a 16-group system <br> (Full expansion with two MLBs each equipped with 8 EOC) | 130 W |
| :--- | :--- |

## Board slots

The slots in the ICS are arranged as follows:

The slots for the ICF and ISM2 boards have a 27.5 mm spacing. The two slots for the MLB boards have a spacing of 68.75 mm . as the MLBs are equipped with EOC submodules.
The slots for the individual boards have the following C-bus addresses:

### 4.2.1 Rack and assembly

The assembly kit 49.9904.4791 must be ordered for the assembly of the ICS.

## Shielding

Since the front side of the rack is the EMC barrier it is necessary to always create a complete cover. The slots of the ISM, ICF boards and a PSL55 power supply are always occupied, the shielding function is provided by the front panels of the boards.

The slots of the MLB board must be provided with the same shields regardless of whether they are occupied or free. The shields are part of the scope of delivery of the rack.
The table shows the material numbers of the shields for the MLB and power supply slots:

| Slot | Cover material number |
| :--- | :--- |
| MLB free and occupied slots | 49.9906 .2856 |
| Power supply (free slot) | 49.9903 .1809 |

## Installation of optical waveguides

The optical waveguides are led in via an opening in the backplane, which is located behind the MLB slots. They are linked to the EOCXX boards on the front side and these are then fitted to the MLB or MLBIML board (as applicable) and locked in place.

10. locking
11. unlocking

* Component of tool kit for B3 module (OWG/EOCxx)

## Contacting the fans, ESB installation; CA3B

The multipoint connectors for installation of the ESB and CA3B boards are located under the rear cover hood. The slot TP1E is designed for the ESB board and the slot TP1C for the CA3B board. To connect them, the fixing screws on the rear ICS hood are loosened and the hood is removed. The boards are pressed into the slots designed for them.
The connections on the fans are linked to the connections on the ESB board for fans (see also Pin strips on the ESB $\rightarrow 278$ ). The cables for this are laid out so that they go through the cover hood.

Then the hood is replaced and screwed on firmly using the two screws at the lower end.

## Earth connection

The protective earth connection is achieved via the earthing terminal on the rear side of the housing. The ground clamp is mounted between the earthing sign and the ICS type plate.

### 4.2.2 Doubling

To increase the stability of communications in a multigroup system, two ICS can be linked to one another and to the corresponding modules via OWG (twin cable). One ICS performs normal function, and the second moves to the hot standby operating mode. The second ICF takes over the function of the first as soon as it reports a malfunction.
For more details, see also Complete doubling $\rightarrow 153$.

### 4.2.3 General information on boards

The boards used in the B3 module and in the ICS are listed below.

## Service board

## CBT

C-Bus Tester (only B3 module)

## Boards for Connection Technology and Signalling

| CA3B | Cable Adapter 3 B Module |
| :--- | :--- |
| AV24B | Adapter V.24 B Module |
| EDU | Error Display Unit |
| ESB | External Signalling B Module |
| TER | Termination 2 and 3 (only B3 module) |

## Boards for Control, Central Functions and Transport

| ISMx/ISM2x | IMTU Switching Matrix |
| :--- | :--- |
| MLB | Module Link Board |
| ICF | IMTU Central Functions |
| CL2M/CL2ME | Clock 2 Module (if CL2ME is used see also Intermodule-Handover) |

## Boards for Power Supply

| ISPS | IMTU Supplementary Power Supply (only B3 module) |
| :--- | :--- |
| PS | Power Supply (PS280A or PS350A in B3 module, PSL55 and PS350A in racks R1 to <br> R4, PSL55 in ICS) |

Check the correct positioning of TER2 and TER3 before switching on the B3 module! Make sure that any removed boards are reinserted in the same slot!

### 4.2.4 Switching on

Check the stable position of the power supply devices and power supply cables.
Pull the protective hoods over the slots on the front of the power supply devices.
Check whether only one ESU is active in the Communication Server Integral 55 (DIL switch to CF22/CF2E/ ICF).

Insert the grounded plug of the mains connecting cable into the protection unit or earthed mains socket provided.

If necessary, connect the battery connector (e.g. inserting the -48 V fuse in the battery unit, etc).
If required, move the battery switch on all inserted PS350A power supply units to position 1 (front panel).
The 155 server is switched on and loading programs (loading time depends on number of modules).

| Startup with the ACB board |  |

1 = LED on
$0=$ LED off

### 4.2.5 Troubleshooting

## Power supply

| Fault | Action |
| :--- | :--- |
| Yellow LED on the PS350A power |  |
| supply unit does not light up |  | | Check the mains voltage. |
| :--- |
| If mains voltage is present, replace the power supply unit. |
| Green LED on the power supply <br> unit does not light up |
| Check the mains voltage for PS280A only). <br> Check the battery voltage (for PS350A only). Observe battery switch <br> function on PS350A! <br> First check whether the malfunction can be rectified by removing the <br> boards(s). <br> If this is the case, replace with new board(s). <br> If this is not the case, replace the power supply unit. |

## General Points

| Fault | Action |
| :--- | :--- |
| with ACB | (Information yet to come!) |
| Loading procedure failed during first <br> startup |  |
| with HSCB |  |

Loading procedure failed during first commissioning (twin module)

In all modules containing HSCB boards without HGS, check whether the L8 LEDs on the CF2x boards are flashing. If not, check the optical waveguide connections for these modules. Create any missing optical waveguide connections. If subsequently necessary for these modules: Small reset (restart):
Switch S2 of the HSCB board in left-hand position, switch S1 of the HSCB board in left-hand and then back to middle position.
Large reset:
Switch S2 in right position, switch S1 in left and then back to middle position, switch S2 to left position after loading has finished (loading phase 0).

## Further Course of Action

with ACB
(Information yet to come!)

## with HSCB

First check the displays of the HSCB board with inserted HGS.
Then check the displays of the HSCB board without HGS (Twin Module).
Note down the status of the LEDs on all boards.
Inform your Service Control Centre.

### 4.3 B3 module (multi-module)

Communication Server Integral 55-B3 Built-In-Module in the $1 / 2 \mathrm{~K}$ rack

1. Status display and service device connection
2. Console
3. $1 / 2 \mathrm{~K}$ rack
4. B3 Built-In-Module
5. Empty B module

## Procedure for Installation

The B3 Built-In-Module is accommodated in the $1 / 2 \mathrm{~K}$ rack The rack is on rollers.
Remove the covers of the console.

- Release the quick-action closures on the front side and remove the cover
- Press up and remove the remaining covers

The four rollers in the console can be locked into place.

Console, position of rollers

1. Lock the rollers using 13 mm socket wrench
2. Connect the racks with M8 screw (two or more racks)

### 4.3.1 Board slots

Slot

1. Slot
2. External module number, decimal
3. A second PS350A and a ISPS are required if more than 14 groups are installed.

### 4.3.2 General information on boards

The boards used in the B3 module and in the ICS are listed below.

## Service board

| CBT | C-Bus Tester (only B3 module) |
| :--- | :--- |

## Boards for Connection Technology and Signalling

| CA3B | Cable Adapter 3 B Module |
| :--- | :--- |
| AV24B | Adapter V.24 B Module |
| EDU | Error Display Unit |
| ESB | External Signalling B Module |
| TER | Termination 2 and 3 (only B3 module) |

## Boards for Control, Central Functions and Transport

| ISMx/ISM2x | IMTU Switching Matrix |
| :--- | :--- |
| MLB | Module Link Board |
| ICF | IMTU Central Functions |
| CL2M/CL2ME | Clock 2 Module (if CL2ME is used see also Intermodule-Handover) |

## Boards for Power Supply

| ISPS | IMTU Supplementary Power Supply (only B3 module) |
| :--- | :--- |
| PS | Power Supply (PS280A or PS350A in B3 module, PSL55 and PS350A in racks R1 to <br>  R4, PSL55 in ICS) |

Check the correct positioning of TER2 and TER3 before switching on the B3 module! Make sure that any removed boards are reinserted in the same slot!

### 4.3.3 Connectivity

## Inserting the Connecting Cables

The B3 module is connected to the other modules belonging to the Communication Server Integral 55 using optical waveguides (twin cables).

Open the quick-action closures of the cover plates. Remove the cover plates.
Close the rear panel of the communication server Integral 55 using the supplied keys.

- $1 / 2 \mathrm{~K}$ rack: one rear panel without ventilation holes

Lift out the covers

Feed the ends of the LWL twin cable into the console and then into the module (bending radius min. 35 mm !).

Remove the covers of the LWL cable ducts on the rear side of the backplane.

With the I55 system switched on and unprotected coupling, there is a risk of short-circuiting when assembling the LWL twin cable!

For each LWL twin cable, insert the two insulating tubes (auxiliary item, part of the tool kit for the B3 module) through the respective cable duct of the backplane. See also

Insert the optical waveguide cable in the insulating tubes. Pull the insulating tubes containing the optical waveguide twin cable through the cable ducts toward the front.

Insert and secure the connections of the optical waveguide twin cable to the connectors of the EOCx submodule.

Make sure that the transmitting section of the EOCx submodule belonging to the B3 module is connected to the receiving section of the EOCx submodule. Conversely, the receiving section of the EOCx submodule belonging to the B3 module is to be connected to the transmitting section of the EOCx submodule.

## EOCSM/EOCMM

The optical waveguide wire with the red plugs is to be inserted in the transmitting socket of the EOCSM/ EOCMM and in the receiving socket of the B3 module. The opposite applies to the LWL wire with the black plugs.

## EOCPF

The LWL wire with the grey plugs is to be inserted in the grey sockets of both EOCPF submodules. The LWL wire with the blue plugs is to be inserted in the blue sockets.
Insert the EOCx submodules onto the MLB and lock the submodules into place (hook the tool on the locking rail of the EOCx and lock or unlock).

The slot addresses of the MLB/EOCx boards are defined in TIP.
Insert the edge protector into the optical waveguide cable duct and fasten the connecting cable using cable binders on the fastening grooves provided (optical waveguide cable duct and side wall) in the B3 module.

Cable routing of fibre-optic twin cables, view of a $1 / 2 \mathrm{~K}$ rack with a B3 module from the rear side

7. Receiving
8. EOCPF submodule
9. EOCMM/SM submodule
10. locking
11. unlocking

* Component of tool kit for B3 module (OWG/EOCxx)

### 4.3.4 Doubling

To increase the stability of communications in the system, two B3 modules can be linked to one another and to the corresponding modules via OWG (twin cable). This presumes that the B3 modules are equipped with the MLB boards.
Refer to the TIP documents for the required slots and assignment.

Doubling of the B3 module
$\mathrm{AO}=$ connecting circuit
CB $=$ ACB/HSCB
CF* $=$ CF22/CF2E
ICF = IMTU Central Functions
ISM = IMTU Switching Matrix
ISPS = IMTU Supplementary Power Supply
LWL = Optical waveguide (OWG)
MLB $=$ Multi Link Board
PS = only PS350A
PSL55 = Power Supply Low 55
Wall-mounted and built-in modules can also be connected.

### 4.3.5 Switching on

Check the stable position of the power supply devices and power supply cables.
Pull the protective hoods over the slots on the front of the power supply devices.
Check whether only one ESU is active in the Communication Server Integral 55 (DIL switch to CF22/CF2E/ ICF).
Insert the grounded plug of the mains connecting cable into the protection unit or earthed mains socket provided.

If necessary, connect the battery connector (e.g. inserting the -48 V fuse in the battery unit, etc).
If required, move the battery switch on all inserted PS350A power supply units to position 1 (front panel).
The 155 server is switched on and loading programs (loading time depends on number of modules).

## 5 19" cabinets and cooling

1>
The communication server Integral 55 is marketed in a 19 " cabinet or integrated in the existing customer infratsurtcure.

The RJ45 slot connection system is used for the panels.
For the Communication Server Integral 55 there are available different cabinet versions:

### 5.1 Standing casing

## Standing casing S1 (material number: 49.9902.0611)

A rack can be installed in a standing casing S1. It can accommodate no more than one Communication Server Integral 55. In addition, two HU (height units) are available for the server and / or service panel (material number: 49.9904.8477).
The standing casing S1 is fitted with hidden rollers.
The front plate (plastic pane) can be ordered as a spare part.

Standing casing S1

1. Ground clamps (max. 3)
2. The standing casing S 1 is locked using a no. 13 nut key

## Dimensions

- Width $=550 \mathrm{~mm}$
- Length $=550 \mathrm{~mm}$
- Height = 11 HU

Cabinet colour RAL 7035
Two standing casings S1 can be stacked on each other. Three standing casings must not be stacked on each other.

1. Hexagonal screw M6x30
2. Spacer roller
3. Covering plate

The two standing casings are connected using two M6 screws (1.). Spacer rollers (2.) must be fitted in between for each screw.

The two standing casings must be connected to each other using a earthing wire.

### 5.1.1 Cable routing

The Communication Server Integral 55 is placed on the ground in the standing casing S1 and then screwed tight on the guides.

The cable adapters are accessible from the rear. This is where the connecting circuit cables must be connected.

Section standing casing, cable on cable adapter

### 5.2 33HU

## 19-inch cabinet 33HU

Dimensions

- Width (exterior) $=600 \mathrm{~mm}$
- Length (exterior) $=600 \mathrm{~mm}$
- Height (exterior) $=1,650 \mathrm{~mm}$
- Height (interior) $=33 \mathrm{HU}$
- Profile rail = 495 mm

The cabinet colour and the colour of accessory parts is RAL 7035

## Description

The cabinet can accommodate a maximum of 3 communications servers 155 . Additionally, 6 HU are reserved for the application server, which must be separated thermally from the communication server 155.

|  | Features: |
| :--- | :--- |
|  | the cabinet is fitted with hidden rollers. |
|  | vertical profile rail in 2 levels |
|  | front level 120mm separation from the front door in the section where the communication <br> server I55 is located |
|  | no separation in the section where the application server is located |
|  | lockable glass door in the front |
|  | closed locakable door at the rear |
|  | Lockable side panels |
|  | Cable insertion at the rear under the door and/or through the roof |
|  | Strain relief of the cables is installed at the server shield |
|  | 1 multiple socket with 8 sockets |
|  | 1 earthing rail for the connection of earthing cables 2,5-16 mm2 |
|  | Work lead |
|  | Sliding rail for 1 application server |
|  | 50 cage nuts, 50 mounting screws are attached in bulk form |

Delivery will be in pallets, the supplier's packaging will be used for packaging.
There is a documentation pocket in the door at the rear.

## ECONET program options

19-inch cabinet 33 HU

Section of the 19 -inch cabinet 33 HU on the pallet

### 5.3 42HU 500mm

## 19-inch cabinet 42HU

## Dimensions

- Width (exterior) $=800 \mathrm{~mm}$
- Length $($ exterior $)=800 \mathrm{~mm}$
- Height (exterior) $=2,150 \mathrm{~mm}$
- Height (interior) $=42 \mathrm{HU}$
- Profile rail $=500 \mathrm{~mm}$

The cabinet colour and the colour of accessory parts is RAL 7035

## Description

The system can be equipped with several Communication Servers 155 (max. 4) and several application servers.

Depending on the needs it is also possible to install uninterrupted power supplies UPS in the cabinet.
The level difference between the profile rails in the front and the rear is 500 mm .

|  | Features: |
| :--- | :--- |
|  | vertical profile rail at one level, front level 125 mm separation from the front door |
|  | Base 100 mm high with three-part floor panel (removable) |
|  | Adjustable levelling feet for levelling on irregular floors |
|  | ventilated lockable glass door in the front |
|  | closed locakable door at the rear |

|  | Lockable side panels |
| :--- | :--- |
|  | Roof panel for cable insertion at the back |
|  | Ventilation holes and prepared for active ventilation (fan kit can be retrofitted) |
|  | Cable insertion through the floor, base and/or the roof |
|  | Jumpering bracket for cable routing left, right, front and rear |
|  | 2 multiple sockets with 7 sockets each on 2 branching boxes. |
|  | 1 earthing rail horizontal for the connection of earthing cables 2,5-16 mm2 |
|  | Work lead |
|  | 50 cage nuts, 50 mounting screws Torx are attached in bulk form |

Delivery will be in pallets, the supplier's packaging will be used for packaging.
There is a documentation pocket in the door at the rear.

## ECONET program options:

| Fan insert for active <br> ventilation incl. 2 fans 18W <br> $140 \mathrm{m3} / \mathrm{h}$ | 49.9808 .0869 | is required if more than 2 I55 are used |

### 5.4 42HU 730mm

## 19-inch cabinet 42HU

## Dimensions

- Width (exterior) $=800 \mathrm{~mm}$
- Length (exterior) $=800 \mathrm{~mm}$
- Height (exterior) $=2,150 \mathrm{~mm}$
- Height (interior) $=42 \mathrm{HU}$
- Profile rail $=730 \mathrm{~mm}$

The cabinet colour and the colour of accessory parts is RAL 7035

## Description

This cabinet is used when the E200 application server is used. An assembly kit with a telescopic rail and a cable shears is preinstalled in the cabinet.
The system can be equipped with several Communication Servers 155 (max. 4) and several application servers.

Depending on the needs it is also possible to install uninterrupted power supplies UPS in the cabinet.
The level difference between the profile rails in the front and the rear is 730 mm .

|  | Features: |
| :--- | :--- |
|  | vertical profile rail at one level, front level 120 mm separation from the front door |
|  | Base 100 mm high with three-part floor panel (removable) |
|  | Adjustable levelling feet for levelling on irregular floors |
|  | ventilated lockable glass door in the front |
|  | closed locakable door at the rear |
|  | Lockable side panels |
|  | Roof panel for cable insertion at the back |
|  | Ventilation holes and prepared for active ventilation (fan kit can be retrofitted) |
|  | Cable insertion through the floor, base and/or the roof |
|  | Jumpering bracket for cable routing left, right, front and rear |
|  | 2 multiple sockets with 7 sockets each on 2 branching boxes |
|  | 1 earthing rail for the connection of earthing cables 2,5-16 mm2 |
|  | Work lead |
|  | 50 cage nuts, 50 mounting screws Torx are attached in bulk form |

Delivery will be in pallets, the supplier's packaging will be used for packaging.
There is a documentation pocket in the door at the rear.

## ECONET program options:

### 5.8 Selection of cabinets for installation of the Integral 55

The rack is designed in such a way that it can be installed in any standard 19" cabinet, regardless of the other components. In order that components can be inserted in the rack from the front (EOC, cable etc.), there must be a gap of at least 150 mm length between the front of the rack and the cabinet door. Depending on the size of the cabinet, several racks or other 19" components can be installed stacked on top of each other.
The installation of lockable doors can prevent unauthorised access to the modules.

## Selection of cabinets taking into account heat dissipation

How do I select a suitable 19" cabinet or how do I assess the suitability of an existing 19" cabinet for installation of a Integral 55 (1-n racks and/or additional devices), taking into account the thermal requirements?
Why is heat offtake so important?

Temperature is public enemy number one for the sensitive microelectronic components. A rule of thumb suggests that each increase in temperature by $10^{\circ} \mathrm{C}$ (based on the recommended operating temperature) cuts the life-expectancy in half. Accordingly, it is very important that this energy is kept away from the components and is taken off outwards.

## Thermal offtake concept for the 19" cabinet

The following options are available for thermal offtake from the 19 " cabinet:

## Passive ventilation

Passive ventilation of the cabinets is the simplest method. Using incoming air apertures in the base and/or the door and waste air apertures in the roof plate and/or door, the air exchange is managed on the basis of the principle "front bottom for incoming, cool air" and "top back to let the hot air out." Whether or not this variant can be used depends on the power dissipation of the installed components and on the max. inner cabinet temperature (dependent on the equipment in use).

## Active ventilation

Active ventilation (forced ventilation) is another possibility. Using incoming air apertures in the base and/or the door and waste air apertures in the roof plate and/or door, the air exchange is managed on the basis of the principle "suck in incoming, cool air from the front bottom" and "blow out hot air at the top back." The number of fans is dependent on the power dissipation of the installed components and on the max. inner cabinet temperature (dependent on the equipment in use). As a standard, manufacturers offer roofs with 2 fans (air output per fan from $120 \mathrm{~m} 3 / \mathrm{h}$ upwards). In general, additional fans can be retro-fitted. Furthermore, the fans can be controlled and monitored by thermostat or electronic, remote monitoring.

## Solution: I55 in a 19" cabinet:

Conditions for the selection of cabinets for installation of the Integral 55:

| 19" cabinet with |  | I55 in a 19" cabinet without additional active components |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & 1 \text { rack } \\ & \text { (9HU) } \end{aligned}$ | 2 racks <br> (18HU) | 3 racks (27HU) | 4 racks (36HU) |
| Passive ventilation | No fan | X | X | - | - |
| Active ventilation with | at least 2 fans | X | X | X | - |
|  | at least 3 fans | X | X | X | X |
|  | at least 4 fans | X | X | X | X |
|  | at least 5 fans | X | X | X | X |

| 19" cabinet with |  | I55 in a 19" cabinet with additional active components <br> loss Pv |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | up to 500 <br> W | $501 \mathrm{~W}-$ <br> 750 W | $751 \mathrm{~W}-$ <br> 1000 W | $1001 \mathrm{~W}-$ <br> 1250 W | $1251 \mathrm{~W}-$ <br> 1500 W | $>1500$ |  |
| W |  |  |  |  |  |  |  |

|  | at least 4 <br> fans | X | X | X | X | - | - |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | at least 5 <br> fans | X | X | X | X | X | Exact <br> calcula- <br> tion is <br> required. |

## Explanation/help:

- passive ventilation: Incoming air apertures in the base and/or door at the front and waste air apertures in the roof and/or door at the rear
- active ventilation: Forced ventilation using a fan, incoming air apertures in the base and/or door at the front and fans in the roof/side panel
- Power dissipation Pv Rack: 250 W are assumed per rack
- Determine total power loss $=P v(r a c k) x$ number of racks + Pv plus components + Pv plus components + .......
- Volume flow of the fans min. $120 \mathrm{~m} 3 / \mathrm{h}$
- An exact calculation is required if the power dissipation is greater than 1500 W
- The max. ambient temperature for the Integral 55 is $45^{\circ} \mathrm{C}$, i.e. the max. ambient temperature outside of the 19 " cabinet should not exceed $+40^{\circ} \mathrm{C}$.

Option: thermostat for fan control, remote monitoring of the fans

In view of the extremely varied possibilities, manufacturers of 19 " cabinets ensure a flexible design of the cabinet systems, so that the cabinets can be adjusted to suit the thermal requirements retrospectively.

### 5.9 Air conditioning

### 5.9.1 Overview

Taking into consideration the following ambient conditions

- electric power dissipation Pv of the Integral 55 in the cabinet
- electric power dissipation Pv of additional devices in the cabinet
- Ambient temperature Tu (outside of the cabinet)
- Temperature inside the cabinet Ti
- Temperature difference Delta Ti-Tu
- IP protection
- Cooling performance Qk
- Type and location of assembly and cabinet size (height HU, width, length)
the following options are available for the ventilation and cooling of the 19" cabinet:
- Intrinsic convection, heat transmission through the cabinet surface
- Passive ventilation, intrinsic convection with issue of the hot air from inside
- Active ventilation, forced convection, direct heat exchange using fans
- Heat offtake through the cooler (is not taken into consideration)
- Heat offtake through the cooler (is not taken into consideration)

### 5.9.2 Intrinsic convection, heat transmission through the cabinet surface

- Closed design, no apertures for incoming or outgoing air
- Max. feasible power dissipation between 300 and 500 W , depending on cabinet size, form of installation and temperature difference
- The feasible power loss is reduced by approx. $15 \%$ in the event of series assembly
- IP protection max. IP55 possible

Calculation of the power loss that can be taken off
$\mathrm{Po}=\mathrm{k} \times \mathrm{A} \times(\mathrm{Ti}-\mathrm{Tu})[\mathrm{W}]$

| Po | power that can be taken off via the cabinet surface |
| :--- | :--- |
| k | Heat transfer coefficient (steel plate 5 W/m2K) |
| A | Effective cabinet surface, depending on the form of installation, for calculation see <br> "Calculation formula of the effective cabinet surface" |
| Ti | Inner temperature of cabinet |
| Tu | Ambient air temperature |

### 5.9.3 Intrinsic convection with issue of the hot air from inside

- Open design, incoming air apertures on the base or door, waste air apertures in the roof
- Max.feasible power loss between 600 and 700 W , depending on cabinet size, form of installation and temperature difference
- The feasible power loss is reduced by approx. $10 \%$ in the event of series assembly
- IP protection max. IP54 possible

Incoming air in the base, waste air in the roof

Incoming air from the front (side of door), waste air at the rear (aperture in door)

### 5.9.4 Forced convection, direct heat exchange using fans

- Open design
- Max. feasible power loss 1500 W, depending on fans in use (size, number) and temperature difference
- IP protection max. IP54 possible
a) Filter fans

b) Fan operation

c) Roof fans

Calculation of the required volume flow
$\mathrm{V}=4 \mathrm{xPv} /(\mathrm{Ti}-\mathrm{Tu})$ [m3h]

| V | Required volume flow |
| :--- | :--- |
| Pv | dissipation in the cabinet (heat output on the surface of the cabinet has been neglected) |
| Ti | Inner temperature of cabinet |
| Tu | Ambient air temperature |

### 5.9.5 Thermal offtake by cooling device:

- Closed design
- Max. feasible power loss approx. 1000 W , depending on cabinet size, form of installation, air conditioning system and temperature difference
- IP protection max. IP54 possible

Calculation of the required cooling performance
$\mathrm{Po}=\mathrm{k} \times \mathrm{A} \times(\mathrm{Ti}-\mathrm{Tu})[\mathrm{W}]$
$\mathrm{Qk}=\mathrm{Pv}-\mathrm{Po}[\mathrm{W}]$

| Po | Power that can be taken off via the cabinet surface |
| :--- | :--- |
| k | Heat transfer coefficient (steel plate $5 \mathrm{~W} / \mathrm{m} 2 \mathrm{~K}$ ) |
| A | Effective cabinet surface, depending on the form of installation, for calculation see <br> "Calculation formula of the effective cabinet surface" |
| Ti | Inner temperature of cabinet |

| Tu | Ambient air temperature |
| :--- | :--- |
| Qk | Required cooling performance of the cooling device |

### 5.9.6 Forced circulation due to heat exchanger (air/air)

- Closed design
- Max. feasible power loss approx. 1500 W, depending on cabinet size, form of installation and heat exchanger
- IP protection max. IP54 possible

## Calculation of the required cooling performance

$\mathrm{Po}=\mathrm{k} \times \mathrm{A} \times(\mathrm{Ti}-\mathrm{Tu})[\mathrm{W}]$
$\mathrm{Qk}=\mathrm{Pv}-\mathrm{Po}[\mathrm{W}]$

| Po | Power that can be taken off via the cabinet surface |
| :--- | :--- |
| k | Heat transfer coefficient (steel plate $5 \mathrm{~W} / \mathrm{m} 2 \mathrm{~K}$ ) |
| A | Effective cabinet surface, depending on the form of installation, for calculation see <br> "Calculation formula of the effective cabinet surface" |
| Ti | Inner temperature of cabinet |
| Tu | Ambient air temperature |
| Qk | Required cooling performance of the cooling device |

### 5.9.7 Calculation formula for the effective cabinet surface

|  | Individual casing, free-standing on all sides $\mathrm{A}=1.8 \times \mathrm{H} \times(\mathrm{W}+\mathrm{D})+1.4 \times \mathrm{W} \times \mathrm{D}$ |
| :---: | :---: |
|  | Individual casing for wall mounting $A=1.4 \times W \times(H+D)+1.8 \times D \times H$ |

|  | Start-end casing, free-standing $A=1.4 \times D \times(H+W)+1.4 \times W \times H$ |
| :---: | :---: |
|  | Start-end casing for wall mounting $A=1.4 \times H \times(W+D)+1.4 \times W \times D$ |
|  | Central casing, free-standing $\mathrm{A}=1.8 \times \mathrm{W} \times \mathrm{H}+1.4 \times \mathrm{W} \times \mathrm{D}+\mathrm{D} \times \mathrm{H}$ |
|  | Central casing for wall mounting $A=1.4 \times W \times(H+D)+D \times H$ |

W = cabinet with
$\mathrm{H}=$ cabinet height
D = cabinet depth

### 5.9.8 Flow chart: Air conditioning in a 19"cabinet for the installation of I55

Festlegung erfolgte unter Annahme der folgenden Randbedingungen: 155:

$$
\max \cdot T u=+45^{\circ} \mathrm{C}
$$

$\mathrm{Pv}=250 \mathrm{~W}$
Aufstellart: Reihenaufstellung
Wärmeaustausch über Gehäuseoberfläche nicht berücksichtigt max. Tu der zusätzlichen Geräte beachten

Folgende Punkte sind zu klären: wieviel Racks notmendig? wieviel HE noch vorhanden? wieviel Racks ( $1 \times$ Rack=9HE) in 19" Schrank möglich?

| Geräte | PV |
| :--- | :---: |
| 155 Rack | $\sim 250 \mathrm{NO}$ |
| Senver | $?$ |
| HUB | $?$ |
| Bildschirm | $?$ |
| weitere? | $?$ |

$>750 \mathrm{~W}$ bis 1000 W - 3 Lüfter
$>1000 \mathrm{~m}$ bis 1500 m - 4 Lüfter

Flow chart

### 5.10 Universal installation aids

The universal installation aid consists of two round bolts with a groove running around and a M6 thread.

Section of cabinet, round bolts (1) and M6 thread (2)
This pins are screwed by hand into the upper mounting nuts on the left and right of the cabinet. Then grasp the rack by the bracket with one hand and underneath the rack with the other hand and place the cabinet on to the pins.

The mounting screws are screwed into the rack on the left and right sides, but are not tightened.
The round bolts are then crewed out of the upper part; the rack is raised slightly by the bracket in order to facilitate the removal of the bolts. Now screw in the upper screws and tighten, the lower screws are also tightened.

The upper mounting screws are removed and the bolts are fastened in order to remove a rack from the cabinet. The lower screws are then removed and the rack is raised carefully by the bolts.

Take care that the lower section of the rack suspended from the bolts is always pressed with one hand against the cabinet, as the rack is only held by the nut on the bolt when on the pins.

The bolts are not enclosed with the system. They can be ordered separately.
The material number is: 4.999.054.358
The installation aids work in any cabinet in which the installations are attached using cage nuts M6.
There is no counterpressure exerted against the insert screws M6 that run in the tracks (e.g. for Knürr cabinets), so that the screws may fall out.

The bracket used to collect the cable is also used as a grip. It is a standard part of each rack and remains attached.

The bracket used to collect the cable should not be used as a grip for carrying during transport.

## 6 Power supply

## General Points

In principle, all modules can be connected to the mains voltage of

## $230 \mathrm{~V}, 50 \mathrm{~Hz}$ and 60 Hz

The fuse protection for every electric circuit consists of a C Type 16 A slow acting automatic circuit breaker. Doubled PS must be fed by separate circuits (phase and fuse).

4 different power supply modules are available, used according to module or application: The same type of power supply unit is used for the two devices in the 19" rack, the CSI55 and the ICS.
Power supply CSI55 and ICS (19" racks)

- PSL55

For projects an adaption set - see PS350 Adaption $\rightarrow 94$ In the ICS this set cannot be used.
Power supply units for the B3 module

- Direct feed PS280A (only B3 module)
- PS350A for reserve battery operation, doubling (for B3 module)
- Additional ISPS power supply for B3 module with more than 10 connected modules

The power supply boards PS280A and PS350A are connected to the designated slots on the B3 module.

| Redundant doubling of the PS in the B3 module can only be done using the PS350A. |
| :--- | :--- |

In the B3 module, the supplementary ISPS power supply may only be used in the appropriate slot.
The supplementary ISPS power supply module is made up of two similar DC/DC converters. It is supplied with -48 V from two PS350As.

### 6.1 19"rack

## />

The following power supply units are used in the 19 " rack:

- PSL55 $\rightarrow 122$
- PS350A $\rightarrow 124$ combined with PS350 Adaption (not in the ICS)

For the installation of the PS350A the

### 6.1.1 PS350 Adaption

By means of a special adaption set a PS350A can be installed in the Integral 55 rack. The installation is done on the left side (front side). The first connecting circuit slot is lost.

The PS350A can be operated with both 48 V and with $230 \mathrm{~V}, 50 / 60 \mathrm{~Hz}$ or $115 \mathrm{~V}, 60 \mathrm{~Hz}$ mains voltage. The electrical values of the PS350A are shown under PS350A, Technical data $\rightarrow 124$

In combination with the PSL55, ringing voltage frequency 50 Hz , the PS350A can be operated as a redundant power supply.

1. PS350 Adaption

Six assembly kits have been defined:

1. Assembly kit for 48 V power supply with $50 / 25 \mathrm{~Hz}$ AC ringing voltage, material number: 49.9907.8083
2. Assembly kit for $230 \mathrm{~V} / 115 \mathrm{~V}$ AC power supply with $50 / 25 \mathrm{~Hz}$ AC ringing voltage, material number: 49.9907.6490
3. Assembly kit fuse clamp for 19" cabinet, material number: 49.9907.7417
4. Assembly kit fuse clamp for standing casing, material number: 49.9907.7416
5. Assembly kit for expansions (19" cabinets and standing casings), material number: 49.9907.7419
6. Installation kit, material number: 49.9907.4791

The installation procedures during operation vary depending on the different application cases:

| Failure and replacement of the PS350A in the case of redundant power supply or retrofitting of the <br> PS350A |  |

| Install cover assembly kit |  |

## Failure and replacement of the PS350A in the case of redundant power supply or retrofitting of the PS350A

## System with 230V and 48V battery voltage

Here, preference should be given to preloading using the 48 V battery voltage.
The installation/replacement is done with assembly kit 1.

### 6.1.1.1 Installation

## Startup procedure of a PS350A in Integral 55

The startup procedure of a PS350A in I55 is as follows:

1. Simple power supply with PS350A

- Installation of the PS350A
- Connection of 230 V
- Put the switch to off
- Connection of -48 V
- Put the switch to on

2. Redundant power supply with PS350A and PSL55

- Installation of the PS350A
- Connection of 230 V
- Put the switch to off
- Connection of -48 V
- Put the switch to on
- Installation of the PSL55
- Connection of 230 V

3. Failure and replacement of the PS350A in the case of redundant power supply

- Put the switch to off
- Disconnection of -48 V
- Disconnection of 230 V
- Removal of the defective PS350A
- Put the switch of the new PS350A to off
- Connection of -48 V (preloading of the PS350A), hast to be preloaded with -48 V because 230 V must not be used due to the interruption of the protective conductor (PE).
- Installation of the PS350A
- Connection of 230 V

## Installation PS350 Adaption

1. Insert the PS350A into the slot
2. Screw the separators at the top and at the bottom (1.) into the rack.

3. Connect the wire ends for

- 230V (1.)
- -48 V to the PS350A (2.) and
- -48 V to the clamps (3.).

Put the cover onto the rack and screw it at the top and at the bottom (1).

### 6.1.1.2 Switching off the ringing current PSL55

The power supply unit PSL55 can be operated in conjunction with a PS350A Rev 02.
If it is necessary to ring with $72 \mathrm{VAC} / 25 \mathrm{~Hz}$, the ringing current output on the PSL55 must be switched off so that the ringing current generator of the PS350A $72 \mathrm{VAC} / 25 \mathrm{~Hz}$ can be activated, see Ringing current switchover PS350A $\rightarrow 102$.

This is done by means of the switch located on the underside of the PSL55. The switch must be placed in the direction of the multiple socket.

1. Ringer switch

The supplied sticker must be attached to the PSL55.

## Achtung!

Rufwechselspannung
abgeschaltet

### 6.1.1.3 Ringing current switchover PS350A

The power supply unit PS350A Rev 02 can be operated in conjunction with the PSL55.
If it is necessary to ring with $72 \mathrm{VAC} / 25 \mathrm{~Hz}$ the ringing current output on the PS350A must be switched from ringing voltage frequency 50 Hz to 25 Hz , see also Switching off the ringing current PSL55 $\rightarrow 101$.
This is done by means of the switch located on the underside of the PS350A.

PS350A, underside

1. Switch for ringing voltage frequency

The instructions are shown on the side panel of the housing.

PS350A

1. PS350A
2. Instruction plate

### 6.1.1.4 48 V in cabinet

There is a fuse clamp for 19 " cabinet for the connection of the -48 V voltage in the cabinet.

The fuse clamp can be extended by up to four connecting options.
In the standing casing the fuse clamp is mounted as shown in the picture.

### 6.1.1.5 Special aspects

The following points should be noted in the case of redundant power supply with PS350A:

- It is not possible to have redundant 48 V supply in one rack. Only one PS350A can be plugged.
- The switchover time of the ringing voltage generators in the event of failure of a generator is approx. 20 ms from PS350A to PSL55 and approx. 200 ms from PSL55 to PS350A. This might disconnect an analogue connection that is in the calling state at that time.
- A redundant operation mode of the ringing voltage is not possible for the 25 Hz setting (for redundant power supply the ringing voltage must be deactivated on the PSL55).
- Fault signalling is not assigned unequivocally to the power supply unit and is also created twice.
- A special configuration and identification of the first connecting circuit slot is required for the use of the PS350A in CAT and IMS.
- When plugging or unplugging the PS350A a special startup procedure has to be followed.

Please note also the connection of the

### 6.1.2 FPE in cabinets

Connect the copper wire (FPE=green/yellow, greater/equal 2.5 mm 2 ) to the earthing rail in the 19 " cabinet.
There is a clamp on the base of the standing casing for the copper wire.
All racks must be earthed via a separately routed protective conductor. Earthing via the protective conductor of the power cord does not suffice.

The protective conductor has a green-yellow insulating jacket and a minimum cross-section of 2.5 mm 2 .
It is clamped to:

- The earthing rail (19" cabinet) or ground clamp (standing casing).
- The ground clamp on the rear side depicted in the following diagram.

Section of the rear of the rack

1. Ground clamp

### 6.1.2.1 19"cabinet

The general information of the earthing concept must be taken into account. In the following you will see graphic presentations of various configurations and their earthing measures.

## Arrangement in 19" cabinet without UPS or with UPS outside the cabinet

1. Multiple sockets
2. Junction boxes in the cabinet
3. For mains connection:Fixed connection with separation option e.g. cable 49.9906 .7592 with CEE plug

For UPS: Connecting cable UPS system/cabinet 49.9906.8660
4. Potential equalisation conductor $(\mathrm{PA})$ leads to the potential equalisation bar of the electrical installation of the building minimum 6 mm 2
5. Potential equalisation bar cabinet
6. Cabinet housing

## Arrangement in a 19" cabinet with UPS systems in the cabinet

1. Multiple socket of the UPS system
2. UPS system
3. Multiple socket in the cabinet
4. Junction box in the cabinet
5. Fixed connection with separation option, e.g. cable 49.9906 .7592 with CEE plug
6. Potential equalisation conductor (PA) min. 6 mm 2 to potential equalisation bar of electrical installation of the building
7. Potential equalisation bar cabinet
8. Cabinet

CSI55 and other devices such as servers can be connected to the sockets of the upper or lower configuration.

An intermediate cable with material number 29.4752.3540 must be used to connect the PSL55 power supply unit.

The mains cable, e.g. 27.4752 .1003 is then connected to this intermediate cable that only has L and N conductors. The mains cable has $\mathrm{L}, \mathrm{N}$ and PE .

The mains cable can then be connected to the mains connection for example via the multiple socket in the cabinet.

### 6.1.2.2 Standing casing

## Connection of a rack in the standing casing (C1 module)

1. Intermediate cable 29.4752.3540
2. Mains cable, e.g. 27.4752.1003
3. Mains connection circuit or UPS connection
4. Lockable earth plug with cable 49.9804.5750
5. Cabinet

The lockable earth plug with cable 49.9804 .5750 is only used in C 1 modules!

## Connection of two racks in the standing casing (C2 module)

1. Intermediate cable 29.4752 .3540
2. Mains cable, e.g. 27.4752.1003
3. Mains connection circuit or UPS connection
4. FPE conductor min. 2.5 mm 2
5. Potential equalisation bolt on standing casing
6. Potential equalisation conductor (PA) min. 6 mm 2 to potential equalisation bar of electrical installation of the building
7. Cabinet

An intermediate cable with material number 29.4752.3540 must be used to connect the PSL55 power supply unit.

The mains cable, e.g. 27.4752 .1003 is then connected to this intermediate cable that only has L and N conductors. The mains cable has $L, N$ and PE.

The mains cable can then be connected to the mains connection for example via the multiple socket in the cabinet.

### 6.1.2.3 Housing/Cabinet solutions

The general information of the earthing concept must be taken into account. In the following you will see graphic presentations of various configurations and their earthing measures.

## Arrangement in 19" cabinet without UPS or with UPS outside the cabinet

1. Multiple sockets
2. Junction boxes in the cabinet
3. For mains connection:Fixed connection with separation option e.g. cable 49.9906 .7592 with CEE plug

For UPS: Connecting cable UPS system/cabinet 49.9906.8660
4. Potential equalisation conductor (PA) leads to the potential equalisation bar of the electrical installation of the building minimum 6 mm 2
5. Potential equalisation bar cabinet
6. Cabinet housing

## Arrangement in a 19" cabinet with UPS systems in the cabinet

1. Multiple socket of the UPS system
2. UPS system
3. Multiple socket in the cabinet
4. Junction box in the cabinet
5. Fixed connection with separation option, e.g. cable 49.9906 .7592 with CEE plug
6. Potential equalisation conductor (PA) min. 6 mm 2 to potential equalisation bar of electrical installation of the building
7. Potential equalisation bar cabinet
8. Cabinet

An intermediate cable with material number 29.4752.3540 must be used to connect the PSL55 power supply unit.

The mains cable, e.g. 27.4752 .1003 is then connected to this intermediate cable that only has L and N conductors. The mains cable has L, N and PE.

The mains cable can then be connected to the mains connection for example via the multiple socket in the cabinet.

## Connection of a rack in the standing casing (C1 module)

1. Intermediate cable 29.4752 .3540
2. Mains cable, e.g. 27.4752.1003
3. Mains connection circuit or UPS connection
4. Lockable earth plug with cable 49.9804.5750
5. Cabinet

The lockable earth plug with cable 49.9804 .5750 is only used in C 1 modules!

## Connection of two racks in the standing casing (C2 module)

1. Intermediate cable 29.4752 .3540
2. Mains cable, e.g. 27.4752 .1003
3. Mains connection circuit or UPS connection
4. FPE conductor min. 2.5 mm 2
5. Potential equalisation bolt on standing casing
6. Potential equalisation conductor (PA) min. 6 mm 2 to potential equalisation bar of electrical installation of the building
7. Cabinet

### 6.2 B3 module

The following power supply units are used in B3 modules:

- PS280A $\rightarrow 123$
- PS350A $\rightarrow 124$
- ISPS (IMTU Supplementary Power Supply) $\rightarrow 125$

The connection of 230 V and 48 V is made in the

### 6.2.1 Fuse Panels

## Connection to the Supply Circuit

The B3 module is suitable for connection to 230 Volt alternating mains voltage or 48 Volt direct voltage or both. The modules may have more than one connection to the supply circuit.

## Operation with Battery or External 48 Volt Direct Current Voltage

The connecting cables for the battery or the external 48 Volt direct current voltage supply to the $1 / 2 \mathrm{~kg}$ rack must have a minimum cross-section of 6 mm 2 .

Depending on the cable length, higher cable cross-sections may be required to prevent the voltage drop from exceeding the permissible values.

If the system is supplied by an external 48 Volt direct current voltage source, this must be safely isolated from the mains voltage and correspond with the classification for SELV. A suitable, easily accessible disconnecting device which corresponds to the current values above is to be provided in the supply circuit.

## Protective Earthing

All modules must generally be earthed via a separately routed protective conductor. Earthing via the protective conductor of the power cord does not suffice.

The protective conductor must have a green-yellow insulating jacket and a minimum cross-section of 2.5 mm 2 if mechanical protection is present, or 4 mm 2 if this is not the case. More detailed information can be found in the "Earthing concept" section.

### 6.2.1.2 Connecting the Battery

Move the battery switch to position 0 on all inserted PS350 power supply units. The battery switch is located on the front panel of the unit.
Disconnect the battery connection (e.g. remove the -48 V fuse in the battery compartment).
Strip the end of the cable (approx. 15 cm ). Feed the connecting cable from the battery into the console. Strip the ends of both wires.
Clamp the red wire (GND) and the blue wire $(-48 \mathrm{~V})$ to the terminals on the locking plate illustrated.

1. Console, section of the front side

### 6.2.1.3 Cross-section of the cable between the B3 module and the battery

Clamp cross-section: B3 module 16 mm 2
Intermediate distribution will be required for larger supply conductor cross-sections.

Please note also the connection of the

### 6.2.2 FPE in B3 module

The standing casings, 19 " cabinets and possibly also the standing cabinets must be connected to a FPE. The dimensions of the copper wire are dependent on the installations (sum of the amperage of the individual devices). The exact procedure is described in the chapter Earthing concept $\rightarrow 136$.
Feed the copper wire (FPE=green/yellow, greater/equal 2.5 mm 2 ) through one of the cable openings in the console.

Strip the end of the wire.

## Direct Supply

Use a cable lug to clamp the wire to the screw with toothed lock washer illustrated.

Console of the PBX Integral 55, section from the front side
Uninterrupted Power Supply
Clamp the wire on the screw terminal shown into the locking plate.

Check whether the FPE is properly connected to the potential equalisation bar, distribution battery and server!

Clamp the wire on the screw terminal shown into the locking plate.

1. Console, section of the front side

To protect against fire and energy hazards, fuses must only be replaced with fuses of the same type. Fuses F1 to F4 DIAZET Type USED 16, S16 A/500 V, time-lag

### 6.3 PSL55

The power supply module PSL55 has the following performance features:

- Harmonics as per EN 61000 (PFC).
- Noise immunity input 4 kV (1.2/50).
- Delayed disconnection of outputs $-28 \mathrm{~V},-48 \mathrm{~V},-60 \mathrm{~V}$ during overload/short-circuit
- Delayed disconnection of device during overload/short-circuit of +5 V output.
- Board ID data
- I2C bus port

## Technical Data

## Voltages and Frequencies

|  | PSL55, Part number: 49.9902.4943 |
| :--- | :--- |
| Mains voltage | $230 \mathrm{~V} ; \pm 10 \%$ (single phase alternating current) |

\# = total performance max. 140W

### 6.4 PS280A

The power supply module PS280A has the following performance features:

- Harmonics as per EN 61000 (PFC).
- Noise immunity input 4 kV (1.2/50).
- Delayed disconnection of outputs -28 V, -48 V, -60 V during overload/short-circuit
- Delayed disconnection of device during overload/short-circuit of +5 V output.

## Technical Data

## Voltages and Frequencies

|  | PS280A, Part number: 49.9807.6163 |
| :--- | :--- |

| -60 V | 0.8 A |
| 72 V | 0.18 A |

* total performance max. 154 W

### 6.5 PS350A

The power supply module PS350A (Frako) has the following performance features:

- Harmonics as per EN 61000 (PFC).
- Noise immunity input $4 \mathrm{kV}(1.2 / 50)$.
- Power increase of outputs compared to PS280 (see table).
- Delayed disconnection of outputs -28 V, -48 V, -60 V during overload/short-circuit and power increase 28 V/5 A
- Delayed disconnection of device during overload/short-circuit of +5 V output.
- Call generator synchronisation when doubling the power supply (PS350A/PSL55 only in case of 50 Hz ringing voltage frequency)

## Technical Data

## Voltages and Frequencies

|  | PS350A, Part number: 49.9807.6164 |
| :--- | :--- |

### 6.6 ISPS (IMTU Supplementary Power Supply)

The supplementary power supply module ISPS is used for the direct feeding of the boards of the B3 module if more than 10 modules are connected.
The 2 DC/DC converters work parallel to the B3 module's PS350A power pack. They convert the superfluous capacity of the -48 V rail to +5 V .
Maximum capacity 1 ISPS per B3 module
Technical data
Voltages and Frequencies

### 6.6.1 Fuses

To protect against fire and energy hazards, fuses must only be replaced with fuses of the same type.
Remove cooling plate (four screws on conductor side)
fuses F1 and F2 with G fuse link $6.3 \times 32 \mathrm{~mm}, 20 \mathrm{~A}, 250 \mathrm{~V}$, semi-lag fuses F3 and F4 with G fuse link $5 \times 20 \mathrm{~mm}, 4 \mathrm{~A}, 250 \mathrm{~V}$, time-lag

Board ISPS, location of fuses

### 6.7 Uninterrupted Power Supply

Stand-alone and built-in (19" technology) devices are available for the uniterrupted power supply (UPS).
The procedures that are relevant to assembly and commissioning are described in the manufacturer documents. These documents are enclosed with the products.

A distinction is made between online technology and line-interactive technology. The application fields of each type are partly different. While the line-interactive family is able to compensate

- Power failures
- Voltage oscillations
- Voltage peaks
- Undervoltage
- Overvoltage
online USP systems are also capable of compensating
- Voltage surges
- Alternating voltages
- Voltage bursts
- High harmonic oscillations

Online USP systems must always be used for customers with increased safety requirements such as Hospitals, Police, Fire Brigade or energy supply companies. In addition to that, online UPS systems will continue to be used in cases where a poor quality of the mains supply must be expected, for example near railway lines, sawmills etc.

The selection criteria are shown below.

| Disturbances in the mains supply | Time | $\begin{aligned} & \text { EN 50091-3/ } \\ & \text { IEC } 620403 \end{aligned}$ | UPS solution | Discharge solution |
| :---: | :---: | :---: | :---: | :---: |
| 1. Power failures | $>10 \mathrm{~ms}$ | VFD <br> Voltage+ Frequency Dependent | Classification 3 passive standby operation (offline) | -- |
| 2. Voltage oscillations | $<16 \mathrm{~ms}$ |  |  | - |
| 3. Voltage peaks | 4-16 ms |  |  | -- |
| 4. Undervoltage | continuous | VI <br> Voltage+ Interpendent | Classification 2 line interactive operation | - |
| 5. Overvoltage | continuous |  |  | - |
| 6. Lightning strikes | sporadic | VFI <br> Voltage+ Frequency Independent | Classification 1 double conversion operation (online) | Lighting and over voltage protection IEC (60364-5-534) |
| 7. Voltage surges | $<4 \mathrm{~ms}$ |  |  | - |
| 8. Frequency oscillations | sporadic |  |  | - |
| 9. Voltage bursts | periodic |  |  | - |
| 10. High harmonic oscillations | continuous |  |  | - - |

### 6.7.5 Installation and service concept

Installation and service concept for the Uninterrupted Power Supply from MGE, see Installation and service concept Uninterrupted Power Supply from MGE.

### 6.7.6 Earthing measures

### 6.7.6.1 Pulsar Extreme 700C-1500C, standing casing

For Discharge currents $>3.5 \mathrm{~mA}$, see
Annex $5 \rightarrow 140$ you must connect an earthing wire to Pulsar Extreme 700C-1500C, standing casing.
Proceed as follows:

Extract Pulsar Extreme 700C-1500C, standing casing

1. Ground clamp

- Clamp the earthing wire to the ground clamp (1.).

### 6.7.6.2 Pulsar Extreme 700C-1500C, rack version

For Discharge currents $>3.5 \mathrm{~mA}$, see
Annex $5 \rightarrow 140$ you must connect an earthing wire to Pulsar Extreme 700C-1500C, rack version.
Proceed as follows:

Extract Pulsar Extreme 700C-1500C, rack version

1. Ground clamp

- Clamp the earthing wire to the ground clamp (1.).

### 6.7.6.3 Pulsar Extreme 1500-3000

For Discharge currents $>3.5 \mathrm{~mA}$, see
Annex $6 \rightarrow 141$ you must connect an earthing wire to Pulsar Extreme 700C-3000.
Proceed as follows:

Extract Pulsar Extreme 1500-3000

1. Cover
2. Opening for connecting cable
3. Connecting clamps

- Unscrew the cover (1).
- Insert the earthing wire through the designated opening (2.).
- Clamp the earthing wire to the ground clamp (3.).
- Screw the cover back on to the device (1).

### 6.8 Earthing concept

Telecommunications systems generally required protective earthing (E) and often functional earthing (FE).
Both protective earthing (PE) and functional earthing (FE) can be implemented by means of a functional and protective earthing conductor (FPE).

Earthing of telecommunications systems is based on EN 60950 and DIN VDE 0800, Part 2, "Telecommunications Engineering - Earthing and Potential Equalization".

The PE supplied via the earthing-pin plug can then also be used as FE, provided that the operating current flowing via functional earthing from the telecommunications system is no more than 9 mA alternating current and/or more than 100 mA direct current from a direct voltage source with 60 V or more than 50 mA from a direct voltage source with 120 V . If this limit is exceeded, a permanently connected functional earthing conductor, that can also be used as FPE, must be fitted.
The question of when, how and which devices are to be earthed (PE) for reasons of electrical safety, as well as device-specific information, is dealt with in the decision-making diagram in the sections titled "Earthing concept for devices / systems" and "Earthing concept for devices/systems operating via a UPS".
If a device/system has leakage current of greater than 3.5 mA , the protective-conductor terminal must always be permanently connected to earth. The leakage currents exhibited by 155 systems, also in combination with various UPSs, are listed in the tables in Annex 4 to Annex 6.

Housings and cabinet solutions were defined to allow safe and easy handling of the earthing measures.

### 6.8.1 General Requirements and Explanations for the Decision-Making Diagram

- A permanently connected protective earthing (PE) conductor for several devices is to be implemented in such a way that removal of one device does not lead to the PE connection for one or several other devices being interrupted at any point. This can be achieved, for example, by star-shaped routing of the PE connection from a local earth terminal to the individual devices. (DIN VDE 0800 part 2 Section 6.2.2.5.2)
- The protective earthing (PE) conductor is insulated in green/yellow or is bare (DIN VDE 0100, Part 540, Section 5.2).
- The minimum cross-section of the functional earthing (FE) conductor depends on the nominal current strength of the assigned safety device (e.g. automatic circuit breaker), but is at least 2.5 mm 2 . More detailed specifications can be found in Table 1 of DIN VDE 0800, Part 2, Section 6.2.2.5.5 (Annex 1).
- The absolute minimum cross-section of the separate earthing wire is: 2.5 mm 2 if mechanical protection is provided (e.g. conductors sheathed in a cable, cable duct or conduit), 4 mm 2 if this is not the case (see DIN VDE 0100 Part 540 Section 5). It also specifies that the minimum cross-section is proportionate to the operating current of the safety device and its response time as well as to a material coefficient. By way of providing a guideline, the minimum cross-section of the protective conductor must be same as the cross-section of the external conductor (mains supply cable) of the system. If the protective conductor comprises a conductor in a multi-wire cable (see DIN VDE 0100, Part 540, Section 5.2.1), the minimum cross-section is the same as the cross-section of the external conductor (see DIN VDE 0100, Part 540, Section 5.1.2). If the supply cable comprises a cable with flexible conductors, its minimum cross-section is 0.75 mm 2 (depending on the supply current) (see DIN VDE 0100, Part 520, Section 524.3, Table 52 $\mathrm{J})$.
- The minimum cross-section of the functional and protective earthing conductor (FPE) is subjected to the same high requirements as for $F E$ and $E$.

### 6.8.2 Explanations for the terms SELV, TNV1, TNV2 and TNV3:

In an SELV electric circuit, limited voltages only (max. 42.4 V peak value or 60 V direct voltage) may occur (both in standard operation and after a single fault), with the exception of temporary exceptions in the event of faults. SELV voltages are regarded as contact-safe. (refer to EN 60950, Section 2.3 for more detailed specifications).
In a TNV2 electric circuit limited voltages only may occur in standard operation: Uac/70.7+Udc/120 V<1 (except for telephone ringing signals). Temporary exceptions in the event of single faults are permissible within defined boundaries. (refer to EN 60950, Section 6.2 for more detailed specifications).

TNV1 electric circuits are SELV circuits that are subjected to overvoltage surges of the telecommunications network.

TNV3 electric circuits are TNV2 circuits that are subjected to overvoltage surges of the telecommunications network.

### 6.8.3 Annex 1

Minimum cross-sections for sections of the functional earthing conductor (from DIN VDE 0800, Part 2, Section 6.2.2.5.5)

| Nominal current strength of the assigned safety <br> device 1$)$ in A | Minimum cross-section of the copper conductor in <br> mm2 |
| :--- | :--- |
| up to 25 | 2,5 |
| up to 35 | 4 |
| up to 50 | 6 |
| up to 63 | 10 |
| up to 125 | 16 |
| up to 160 | 25 |
| up to 224 | 35 |
| up to 250 | 50 |
| up to 630 | 70 |
| up to 800 | 95 |
| up to 1000 | 95 |

1) The safety device must not be located in the course of the earthing conductor.

### 6.8.4 Annex 2

## Earthing concept for devices/systems of protective class I

| Protective earthing (PE) required due to TNV/SELV \#1 |  |  |  |

| Lockable two-pole earth plug |

## Explanations for the decision-making tables:

\#1
If a device is connected to both TNV2 / TNV3 circuits (e.g. analog a/b connection or Uko interface) and also SELV or TNV1 circuits (e.g. V24, S0, UPo, S2m) (DIN EN 60950, section TNV circuit)

### 6.8.5 Annex 3

Earthing concept for devices/systems in protective class I operating via a UPS system

| Protective earthing (PE) required due to TNV/SELV \#1 |  |  |  |
| :---: | :---: | :---: | :---: |
| yes |  | no |  |
| Discharge current $>3.5 \mathrm{~mA}$ \#2 |  | Discharge current > 3.5 mA \#2 |  |
| yes | no | yes | no |
| Fixed access for all devices and UPS via: Potential equalisation bar in the building or Oven connection socket | Fixed access for all devices and UPS via: <br> Potential equalisation bar in the building or <br> Oven connection socket or Lockable two-pole protection pin plug | Fixed access for all devices and UPS via: Potential equalisation bar in the building or Oven connection socket | E via earthing-pin plug of the UPS and devices |

## Earthing concept for devices/systems in protective class II operating via a UPS system

| Protective earthing (PE) required due to TNV/SELV \#1 |  |
| :---: | :---: |
| yes | no |
| Fixed access for all devices and UPS via: <br> Potential equalisation bar in the building <br> or <br> Oven connection socket <br> or <br> Lockable two-pole earth plug <br> The PE for the UPS can be supplied via its earthing-pin plug if its leakage current is $<3.5 \mathrm{~mA}$. <br> A fixed access is necessary if the discharge current is $>3.5 \mathrm{~mA}$. | PE is not necessary for devices in protective class II. <br> The PE for the UPS can be supplied via its earthing-pin plug if its leakage current is $<3.5$ mA . <br> A fixed access is necessary if the discharge current is $>3.5$ mA . |

## Explanations for the decision-making tables:

\#1
If a device is connected to both TNV2 / TNV3 circuits (e.g. analog a/b connection or Uko interface) and also SELV or TNV1 circuits (e.g. V24, S0, UPo, S2m) (DIN EN 60950, section TNV circuit)
\#2
Sum total of leakage currents from UPS and connected devices

### 6.8.6 Annex 4

## Discharge currents of I55 systems

| Module <br> type | Power supply unit | Leakage <br> current | Input filter leakage <br> current | Total leakage current |
| :--- | :--- | :--- | :--- | :--- |
| C1 (R1) | $1 \times$ PS350 49.9902.4902 | $<0.8 \mathrm{~mA}$ | Not applicable | $<0.8 \mathrm{~mA}$ |
|  | $2 \times$ PS350 49.9902.4902 | $<0.8 \mathrm{~mA}$ |  | $<1.6 \mathrm{~mA}$ |
|  |  |  |  |  |
| C2 (R1-R2) | $2 \times$ PS350 49.9902.4902 | $<0.8 \mathrm{~mA}$ | Not applicable | $<1.6 \mathrm{~mA}$ |
|  | $4 \times$ PS350 49.9902.4902 | $<0.8 \mathrm{~mA}$ |  | $<3.2 \mathrm{~mA}$ |
|  |  |  |  | $<2.4 \mathrm{~mA}$ |
| C3 (R1-R3) | $3 \times$ PS350 49.9902.4902 | $<0.8 \mathrm{~mA}$ | Not applicable | $<4.8 \mathrm{~mA}$ |
|  | $6 \times$ PS350 49.9902.4902 | $<0.8 \mathrm{~mA}$ |  |  |
|  |  |  |  | $<\mathbf{6 . 2} \mathrm{mA}$ |
| C4 (R1-R4) | $4 \times$ PS350 49.9902.4902 | $<0.8 \mathrm{~mA}$ |  |  |
|  | $8 \times$ PS350 49.9902.4902 | $<0.8 \mathrm{~mA}$ |  |  |

A fixed earth connection is certainly necessary for all extensions, as the lockable earth plugs are insufficient in this case to handle the high leakage current ( $>3.5 \mathrm{~mA}$ ).

| Module type | Power supply unit | PS leakage <br> current | Input filter leakage <br> current | Total leakage <br> current |
| :--- | :--- | :--- | :--- | :--- |
| B3 | $1 \times$ PS280A <br> 49.9807 .6163 | $<0.5 \mathrm{~mA}$ | $<0.3 \mathrm{~mA}$ | $<0.8 \mathrm{~mA}$ |
|  | $1 \times$ PS350A <br> 49.9807 .6164 | $<0.7 \mathrm{~mA}$ |  | $<1.0 \mathrm{~mA}$ |
|  | $2 \times$ PS350A <br> 49.9807 .6164 | $<0.7 \mathrm{~mA}$ |  | $<1.7 \mathrm{~mA}$ |

### 6.8.7 Annex 5

Leakage currents of I55 systems with UPS Pulsar Extreme 700C, 1000C, 1500C

| Module <br> type | Power supply unit | Leakage current | UPS Pulsar Extreme <br> $700 \mathrm{C}, 1000 \mathrm{C}, 1500 \mathrm{C}$ | Leakage current <br> total |
| :--- | :--- | :--- | :--- | :--- |
| C1 (R1) | $1 \times$ PS350 <br> 49.9902 .4902 | $<0.8 \mathrm{~mA}$ | $<0.4 \mathrm{~mA}$ | $<1.2 \mathrm{~mA}$ |

|  | $\begin{aligned} & 2 \times \text { PS350 } \\ & 49.9902 .4902 \end{aligned}$ | $<1.6 \mathrm{~mA}$ |  | $<2.0 \mathrm{~mA}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \mathrm{C} 2 \\ & \text { (R1-R2) } \end{aligned}$ | $\begin{aligned} & 2 \times \text { PS350 } \\ & 49.9902 .4902 \end{aligned}$ | $<1.6 \mathrm{~mA}$ | $<0.4 \mathrm{~mA}$ | $<2.0 \mathrm{~mA}$ |
|  | $\begin{aligned} & 4 \times \text { PS350 } \\ & 49.9902 .4902 \end{aligned}$ | $<3.2 \mathrm{~mA}$ |  | $<3.6$ mA |
| $\begin{aligned} & \text { C3 } \\ & \text { (R1-R3) } \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline 3 \times \text { PS350 } \\ & 49.9902 .4902 \\ & \hline \end{aligned}$ | $<0.8 \mathrm{~mA}$ | $<0.4 \mathrm{~mA}$ | $<2.8 \mathrm{~mA}$ |
|  | $\begin{aligned} & \hline 6 \times \text { PS350 } \\ & 49.9902 .4902 \end{aligned}$ | $<4.8$ mA |  | $<5.2 \mathrm{~mA}$ |
| $\begin{aligned} & \mathrm{C} 4 \\ & \text { (R1-R4) } \end{aligned}$ | $\begin{aligned} & 4 \times \text { PS350 } \\ & 49.9902 .4902 \end{aligned}$ | $<3.2 \mathrm{~mA}$ | $<0.4 \mathrm{~mA}$ | $<3.6$ mA |
|  | $\begin{aligned} & 8 \times \text { PS350 } \\ & 49.9902 .4902 \end{aligned}$ | $<6.4$ mA |  | $<6.8$ mA |

A fixed earth connection is certainly necessary for all extensions, as the lockable earth plugs are insufficient in this case to handle the high leakage current ( $>3.5 \mathrm{~mA}$ ).

| Module type | Power supply unit | PS leakage <br> current | Input filter leakage <br> current | Total leakage <br> current |
| :--- | :--- | :--- | :--- | :--- |
| B3 | $1 \times$ PS280A <br> 49.9807 .6163 | $<0.5 \mathrm{~mA}$ | $<0.3 \mathrm{~mA}$ | $<0.8 \mathrm{~mA}$ |
|  | $1 \times$ PS350A <br> 49.9807 .6164 | $<0.7 \mathrm{~mA}$ |  | $<1.0 \mathrm{~mA}$ |
|  | $2 \times$ PS350A <br> 49.9807 .6164 | $<0.7 \mathrm{~mA}$ |  | $<1.7 \mathrm{~mA}$ |

If an I55 is used in connection with a B3 module (IMTU), the values of the "total leakage current" must be added to the values "total leakage current" for the I55.

### 6.8.8 Annex 6

Leakage currents of I55 systems with UPS Pulsar Extreme 1500, 2000, 3000

| Module <br> type | Power supply unit | Leakage current | UPS Pulsar Extreme <br> $1500,2000,3000$ | Total leakage current |
| :--- | :--- | :--- | :--- | :--- |
| C1 (R1) | $1 \times$ PS350 <br> 49.9902 .4902 | $<0.8 \mathrm{~mA}$ | $<2.7 \mathrm{~mA}$ | $<3.5 \mathrm{~mA}$ |
|  | $2 \times$ PS350 <br> 49.9902 .4902 | $<1.6 \mathrm{~mA}$ |  | $<\mathbf{4 . 3 ~ \mathbf { m A }}$ |
|  |  |  |  |  |
| C2 <br> (R1-R2) | $2 \times$ PS350 <br> 49.9902 .4902 | $<1.6 \mathrm{~mA}$ | $<2.7 \mathrm{~mA}$ | $<\mathbf{4 . 3 ~ \mathbf { m A }}$ |

|  | $4 \times$ PS350 <br> 49.9902 .4902 | $<3.2 \mathrm{~mA}$ |  | $<\mathbf{5 . 9} \mathbf{~ m A}$ |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |
| C3 <br> (R1-R3) | $3 \times$ PS350 <br> 49.9902 .4902 | $<2.4 \mathrm{~mA}$ | $<2.7 \mathrm{~mA}$ |  |
|  | $6 \times$ PS350 <br> 49.9902 .4902 | $<\mathbf{4 . 8} \mathbf{~ m A}$ |  | $<\mathbf{5 . 1} \mathbf{~ m A}$ |
|  | $4 \times$ PS350 <br> 49.9902 .4902 | $<3.2 \mathrm{~mA}$ | $<2.7 \mathrm{~mA}$ | $<\mathbf{m A}$ |
| C4 <br> (R1-R4) | $8 \times$ PS350 <br> 49.9902 .4902 | $<\mathbf{6 . 4} \mathbf{~ m A}$ |  | $<\mathbf{5 . 9} \mathbf{~ m A}$ |
|  |  |  | $<\mathbf{9 . 1} \mathbf{~ m A}$ |  |

A fixed earth connection is certainly necessary for all extensions, as the lockable earth plugs are insufficient in this case to handle the high leakage current ( $>3.5 \mathrm{~mA}$ ).

| Module type | Power supply unit | PS leakage <br> current | Input filter leakage <br> current | Total leakage <br> current |
| :--- | :--- | :--- | :--- | :--- |
| B3 | $1 \times$ PS280A <br> 49.9807 .6163 | $<0.5 \mathrm{~mA}$ | $<0.3 \mathrm{~mA}$ | $<0.8 \mathrm{~mA}$ |
|  | $1 \times$ PS350A <br> 49.9807 .6164 | $<0.7 \mathrm{~mA}$ |  | $<1.0 \mathrm{~mA}$ |
|  | $2 \times$ PS350A <br> 49.9807 .6164 | $<0.7 \mathrm{~mA}$ |  | $<1.7 \mathrm{~mA}$ |

If an 155 is used in connection with a B3 module (IMTU), the values of the "total leakage current" must be added to the values "total leakage current" for the I55.

### 6.9 Power consumption

## -48 V Power consumption of the I55 when fully configured

| Module/rack | I (A) |
| :---: | :---: |
| R1 rack | 1.5 A |
| $1 / 2 \mathrm{~K}$ rack (B3) | 14 A |

Power supply parameteres for the connected terminals in the T13 families

| Analogue terminals via ASCEU | $48 \mathrm{~V} / 7 \mathrm{~mA}(350 \mathrm{~mW})$ |
| :--- | :--- |
| Analogue terminals via ASC2 | $28 \mathrm{~V} / 9 \mathrm{~mA}(250 \mathrm{~mW})$ |
| Digital terminals via S0 or UPN | $48 \mathrm{~V} / 7 \mathrm{~mA}(350 \mathrm{~mW})$ |
| DECT per base station Bosch | $48 \mathrm{~V} / 70 \mathrm{~mA}(3.5 \mathrm{~W})$ |

## 7 Doubling

### 7.1 Doubling

There are two reasons for doubling:

- As an option, the central functions of the communication server Integral 55 may be doubled redundantly in order to increase the security against failure.
- In addition to the redundant doubling, it may be necessary within the system to double certain functions in order to enhance the performance (e.g. processor performance or electrical output)

Because these functions have been created with the aid HW units (boards, equipment), this means that if doubling occurs, a unit will be used not once, but several times in the system.

### 7.2 Single module

Up to four racks (standing casing, racks in 19" cabinets, racks in 19 " frames or any combination thereof) can form a single module, spread over any area and connected by flexible cables.

| Module types: | The following names have been defined for the various module types: |  |
| :--- | :--- | :--- |
|  | C1: | Module with one rack (R1) |

|  |  |  |

R4

R1

[^0]
### 7.2.1 doubling PS

Doubling of the PS within one module is possible for each individual rack (R1, R2, etc.)
The PSL55 occupies the right-hand slot in the rack. A PSL55 is also connected to the left-hand side of the rack in the event of PS doubling.

$A O=$ connecting circuit
CB = ACB/HSCB
CF* $=$ CF22/CF2E
C4 Module with PS doubling

The doubling of the PSL55 may be necessary for reasons of:

- Redundancy
- Performance increase

For projects an adaption set - see PS350 Adaption $\rightarrow 94$

### 7.2.2 doubling CF* $^{*}$

Mixed operation CF22/CF2E in one module is not permitted.

CF doubling within one module is only possible in the R1 rack.
An additional CF22/CF2E board, which is normally operated by hot stand-by, can only be inserted there. In the event of trouble on the active CF22/CF2E side, a complete automatic switchover to the previously passive CF22/CF2E takes place. Individual messages may be lost here.
The slot for the second CF22/CF2E board is reserved and must be set up during system configuration.

\section*{R1 <br> 

$A O=$ connecting circuit
$C B=A C B / H S C B$
$\mathrm{CF}^{*}=\mathrm{CF} 22 / \mathrm{CF} 2 \mathrm{E}$
R1 rack ( C 1 module) with CF doubling
The switching matrix facilities of a recently inserted CF22/CF2E are updated automatically by adopting the current information from the active CF22/CF2E, while at the same time entering all connections made since insertion.

CF doubling is possible in the R1 rack.

R4

R3

R2

R1

$A O=$ connecting circuit
$C B=A C B / H S C B$
CF* $=$ CF22/CF2E
C 4 module with CF doubling

### 7.2.3 doubling *CB

Mixed operation ACB/HSCB in one module is not possible (different operating systems).

Although doubling of the ACB/HSCB board is possible, technical reasons dictate that it is not necessary in the single module.

### 7.3 Twin module

An 155 twin module is made up of any two 155 single modules ( $\mathrm{C} 1, \mathrm{C} 2, \mathrm{C} 3$ or C 4 ), which, connected to each other by a transmission channel (optical waveguide), form an I55 system. With regard to the central boards, the facilities of the connected, individual modules is the same as with a single module.
Each module has its own CF22/CF2E and ACB/HSCB.

$\mathrm{AO}=$ connecting circuit
CB = ACB/HSCB
CF* $=$ CF22/CF2E
e.g. a twin module consisting of 2 C 1 modules

### 7.3.1 doubling PS

The power supply (PS) can generally be doubled in any rack of any module that forms a so-called twin module together with an additional module.
The purpose of the PS doubling may be to establish redundancy or to increase performance.

$A O=$ connecting circuit
CB = ACB/HSCB
CF* $=$ CF22/CF2E
e.g. a twin module consisting of 2 C 1 modules

For projects an adaption set - see PS350 Adaption $\rightarrow 94$

### 7.3.2 doubling CF* (within a module)

Mixed operation CF22/CF2E in one module is not permitted. However, the other module (twin) can be equipped with two other CF boards which have to be identical, e.g. two CF2E.

If the central functions of this board are to be doubled redundantly, the CF22/CF2E boards will then be doubled in the R1 racks of the connected, single modules. This also includes an additional transmission link. For a transmission link to be operable however, it must not only have an optical waveguide, but also the CFIML function unit on the CF22/CF2E board.

In principle, the active CF22/CF2E board transmits on both available optical waveguide lines. This means the MTU functions operate respectively on the CF22/CF2E board which is active at that time. This also operates the optical waveguide line of the hot stand-by CF22/CF2E board however. In the event of a failure on the active side, a complete switchover to the hot stand-by CF22/CF2E side will take place.

$A O=$ connecting circuit
$C B=A C B / H S C B$
CF* $=$ CF22/CF2E
A twin module consisting of 2 C1 modules with CF22/CF2E doubling
If failure of a transmission link occurs without redundancy (double fault!), the two modules are separate and no longer form a joint unit, they each remain operable, if only in a limited sense.
The switching matrix facilities of a recently inserted CF22/CF2E are updated automatically by adopting the current information from the active CF22/CF2E, while at the same time entering all connections made since insertion.

### 7.3.3 doubling *CB

| M | Mixed operation ACB/HSCB in one module is not possible (different operating systems). |
| :--- | :--- |

Although doubling of the ACB/HSCB board is possible, technical reasons dictate that it is not necessary. In the event of ACB/HSCB board failure in a twin module, the corresponding module will also fail. The second module will continue to operate without limitation. The second ACB/HSCB board, which is still intact, cannot take on the functions of the failed ACB/HSCB.

$A O=$ connecting circuit
CB $=$ ACB/HSCB
$\mathrm{CF}^{*}=\mathrm{CF} 22 / \mathrm{CF} 2 \mathrm{E}$
Twin module consisting of 2 C 1 modules

### 7.4 Multi-module

### 7.4.1 Interconnected systems

An I55 multi-module system is made up of several, varied I55 and I33 single modules (between 3 and 16 or between 17 and 32, depending on the configuration), which are connected to each other by a multi-module, which can be either an ICS ( 3 to 16 modules) or a B3 module ( 17 to 32 modules). The multi-module is accommodated in a separate module casing. If an ICS is used the casing is a 19" rack and can be installed in the same cabinet as the CSI55 modules. If more than 16 modules have to be interconnected it is necessary to use a B3 module with the IMTU function, which cannot be integrated in the 19" technology of the CSI55.
Multi-module without MTU/IMTU doubling with ICS

$\mathrm{AO}=$ connecting circuit
$\mathrm{CB}=\mathrm{ACB} / \mathrm{HSCB}$
$\mathrm{CF}^{*}=\mathrm{CF} 22 / \mathrm{CF} 2 \mathrm{E}$
Multi-module without MTU/IMTU doubling with B3 module

$A O=$ connecting circuit
$\mathrm{CB}=\mathrm{ACB} / \mathrm{HSCB}$
$\mathrm{CF}^{*}=\mathrm{CF} 22 / \mathrm{CF} 2 \mathrm{E}$
PS = only PS350A
The following boards are used in the multi-module, among others:

- MLB Module Link Board
- ISMx IMTU Switching Matrix
- ICF IMTU Central Functions

The following chapters describe how operation with the multi-module can be carried out in various ways.

### 7.4.2 MLB (Module Link Board)

- Board for optical fibre connection; 8 modules can be connected by one 5ML. Up to 2 MLB boards can be used in one ICS (16 groups).
- Up to four MLB boards can be inserted in one B3 module (17 to 32-group system).
- The optical fibre connectors can be distributed as desired onto the MLB board.
- See also MLB Module Link Board $\rightarrow 209$

## Example:

4 required optical waveguide connections can be installed on one MLB, although they are distributed over 4 MLB boards.

### 7.4.3 ISMx

- Switching matrix with control
- See also ISMx Switching Matrix $x \rightarrow 206$

Four of these boards are present in each multi-module. Should one of these board fail, the remaining connected modules continue working. Connections which have been made via the failed ISMx board will be disconnected.

When doubled, both multi-modules must contain ISMx boards which are the same type.

### 7.4.4 ICF

- Inter module manager, clock generation.
- An optical fibre pair can be connected to form a connection path between the IMTU's during doubling.
- See also ICF IMTU Central Functions $\rightarrow 285$

### 7.4.5 IVZ on *CB boards

The IVZ is always doubled and is placed onto the ACBs/HSCBs of 2 participating modules. This variant is suitable as long as the number of modules is not too high (normal limit is 8 modules).
The 11 package can be configured with a maximum of 20 groups.
IVZ on ACB/HSCB boards

## B3/ ICS

$A O=$ connecting circuit
$C B=A C B / H S C B$
$\mathrm{CF}^{*}=\mathrm{CF} 22 / \mathrm{CF} 2 \mathrm{E}$

1. IVZ

### 7.4.6 IVZ on separate *CB boards

IVZ and RIVZ slots may be allocated as desired.
Installation of a ACB/HCSB (with IVZ function) in a B3/ICS module is generally not possible for software reasons!

The I2. I3 or 14 package can be expanded with a maximum of 32 groups.
Other functional units of the 13 and 14 packages are assigned to separate ACB/HSCB boards.
IVZ on separate ACB/HSCB boards

$A O=$ connecting circuit
$C B=A C B / H S C B$
$\mathrm{CF}^{*}=\mathrm{CF} 22 / \mathrm{CF} 2 \mathrm{E}$

1. IVZ

### 7.4.7 Doubling of the PS in the B3 module

The failure of a non-doubled PS in a B3 module is synonymous with the failure of the entire multi-module. This means that communication between the individual, connected modules is no longer possible. Accordingly, all modules fail completely for communication between modules excepting the two modules with IVZ functions.

This risk can be reduced by doubling the PS (only PS350A) in the multi-module redundantly.

### 7.4.8 Complete doubling

## Doubling of the transmission link

In a multi-module system, only one transmission link per module can ever be connected to a multi-module (ICS or B3 module). Connecting two transmission links for one module to just one multi-module contradicts the redundancy concept and is therefore not technically possible - it would lead to erratic behaviour in the system.
Accordingly, transmission links can only be doubled in a fully doubled multi-module system.

## Fully redundant system

In a complete double system, the CF22/CF2E board is present twice over in the individual connected modules for redundancy purposes, and likewise the multi-module (ICS or B3 module).

Depending on the slots, one of the two CF22/CF2E boards in each module is connected with one of the two multi-modules by transmission link.

In this, each of the two multi-modules forms one half of the system together with the CF22/CF2E boards they are connected to. One of these is the "active" system half, in which all user data is processed, as for a nondoubled system. The other is the "hot stand-by" half, which is activated in different ways in the event of the "active" half failing.

## Modul 1

1. Fibre-optic cable for linking the interconnection servers
2. Fibre-optic link to the "hot standby" half of the system
3. Fibre-optic link to the "active" half of the system
4. CF22/CF2E of the "hot standby" half of the system
5. CF22/CF2E of the "active" half of the system

## Complete IMTU doubling

In the event of one of the functional units on one of the two CF22/CF2E or one optical waveguide connection failing, the missing information is brought over to the module in question from the inactive to the active side, and therefore is replaced. This alternative route will remain in existence for the duration of the failure.
Following repairs, the active CF22/CF2E in the "default" active side should take over the information flow again. This is brought about by a manual service changeover on either one of the two CF22/CF2E boards of the affected module. This also automatically releases the alternative route between the two ICS/B3 modules, making it available for any new occurrence of an error in one of the connected modules.
If another error occurs in a different module on the active side while the first error is still in existence (failure on active CF22/CF2E or its transmission link), the system will react by completely switching over to the other system half, that is to say, all modules in the system switch to their "hot standby" side.

The complete system half will also switch over in the event of failure of functional units within an active IMTU (see above).
If the hot standby side fails, the flow of information is unaffected.
Message loss is to be expected in all cases where a switchover occurs.

## 8 Boards

The board is a physical unit within the CSI55 system. It is made up of a multilayer, a socket connector, electronic components and a front panel with low force on/off connectors.
The board frame in the rack contains slots to accommodate various other boards.
Plug connectors are used to secure the boards to the board frame.

### 8.1 General Points

The boards may be removed and inserted during system operation.
Please note:

- ESD protective measures.
- All existing connections of the board are disconnected if it is removed.

For reasons of EMC, vacant slots should be covered with frontplates.

More information about removing and inserting should be noted for the following boards

- ACB
- HSCB
- CF22
- CF2E
- ICF
- ISM
- CBT (see Measuring and Testing Tools)
- V24IA V24 Interface Adapter (see Measuring and Testing Tools)
. You will find the information in the subchapter "Removing and Inserting Modules" for the boards mentioned above.

## Removing and inserting

Using the latch fasteners on the front panel, boards can be inserted and then interlocked into the board frame, or be detached and removed from it.
1.

Board locking levers

1. Latch fasteners
2. Board

## Bridges and Breakpoints

In some boards, it is possible to make hardware adjustments (e.g. for setting the current strength). This can be done by inserting or removing bridges and breakpoints.
The diagram opposite shows the coordinates which enable bridges and breakpoints to be located.

Board co-ordinates

1. Soldering side

### 8.2 Configurations

Example of a configuration with ICS as multi-module

1. Single module
2. Twin module
3. Multi-module
4. Cable for backplane connection
5. FOC
6. ICS

There is also an adaption module - see PS350 Adaption $\rightarrow 94$

Example of a configuration with B3 module as multi-module

1. Single module
2. Twin module
3. Multi-module
4. Cable for backplane connection
5. FOC
6. B3 module

Mixed operation of ISMx and ISM2x boards is not permissible.

### 8.4.1 ACB/ACB1 Advanced Computer Board

## Short description

The ACB board is the basic equipment in all modules. This computer board must be used to support the software IEEx (Linux operating sistem). As HGS it is used a 2.5" hard disc drive.

The ACB1 board is the follow-up board of the ACB and can be used starting with software version IEE2 (version L021V00 1 1.0). The difference to the ACB is the physical medium of the HGS. In the case of the ACB1, the HGS is a Compact Flash Card with different capacity according to system size, the following sizes are recommended:

|  | Compact Flash Card |
| :--- | :--- |
| for single and Twin system: | with 1 GB |
| for multi-module up to 4000 subscr.: | with 2 GB |
| for multi-module of more than 4000 subscr.: | with 4 GB |

Handling, as well as switch and display functions of both boards are identical:

| Features |  |
| :---: | :---: |
| ETX-PC <br> The ETX-Board is a complet PC-System. All functions the current PCs offer are realized on this Board. Performance same as Pentium III/400MHz or higher. | 512 MByte of main memory, (only one SO DIMM Modul) |
|  | Boot flash PROM with Phoenix Bios |
|  | Voltage generation |
|  | Real-time clock (RTC) |
|  | Hardware watchdog |
| RTC battery (8 years buffer operation) |  |
| Ethernet interface 10/100 Base T |  |
| two V. 24 interfaces (see AEV24B Adapter Ethernet V24 B Modul) |  |
| Interface to the PCM highway (4 independent B channel accesses) |  |
| PCI Bus (5V tolerant) 32Bit/33MHz |  |
| Two CBus interfaces (ISA Bus) on for system control reasons one as SPY-remote Interface (SPY =System Protocoller and Analyser) |  |
| IDE interface for HGS |  |

The hardware prerequisites for remote logging with SPY are contained on the board.

ACB1 board, component side

ACB board, component side

1. Battery
2. ETX-PC
3. V24I/NI
4. Transformer 10/100 Base T
5. Boot Flash (Compact Flash Card)
6. PCM highway controller
7. PCM highway controller
8. CBI1A3 for SPY I55
9. EPLD
10. CBI1A3
11. HDD

The ACB is equipped with one of the following V. 24 submodules:

- V.24I Insulated
- V.24NI Non-Insulated (basic configuration)

The following signals are available for the V.24:

- RXD
- TXD
- DTR
- GND
- DSR
- RTS
- CTS

Other features
Power demand +5 V
3.5A

The V24NI submodule is used as standard when connecting devices to the V. 24 interfaces. If necessary, it is also possible to use the DC isolated V24I.

AEV24B adapter Ethernet / V24 B module $\rightarrow 230$

### 8.4.1.1 LEDs and Switch Functions

## Switch Position in Normal Operation

| S1 | Neutral position |
| :--- | :--- |
| S2 | Left position |
| S3 | Left position |

## Switch Function

| S1 | Reset switch |  |
| :--- | :--- | :--- |
|  | Mean: | Operating status |
|  | links: | Hardware Reset of the board, locking |
|  |  |  |

|  | Right: | ACB is been shut down (by operating system), pushing |
| :---: | :---: | :---: |
| S2 | Hard Disk Change Request (HDCHR) |  |
|  | links: | Operating status: IDE Hard Disk in operation |
|  | Right: | Service position: Pulling out the IDE hard disk and plugging it back in |
| S3 | Service entry |  |
|  | links: | The commissioning (OS, applications and customer's data load) is executed without break |
|  | Right: | Before booting, the switch must be in the righthand position (reboot, power restoration). <br> The boot phase is interrupted at a defined point. At this point an service access via ISM (WebMin) is possible. Changing of parameters as for example IP addresses or GCU slot address can be executed. <br> Then the switch is to be brought in the left position. The service access is closed and a reboot is executed. |

## Meanings of LEDs

| LL | On: | Ethernet connection status is OK |
| :--- | :--- | :--- |
|  | off: | Ethernet connection status is interrupted |
| LD | On: | data transmission via Ethernet |
|  | off: | no data transmission via Ethernet |
| L1 | On: | The Ethernet interface of this module is connected to the network |
|  | off: | The Ethernet interface of this module is not connected to the network |
| L2 | On: | Alle the voltages of the board are present |
| L3 | on or <br> flashing: | Data transfer via the C bus |
| L4 | on or <br> flashing: | Access to the inserted background memory |
| L5 | On: | Indicates that the HGS can be unplugged |
|  | off: | Operating system does not allow pulling out the HGSs |
| L6 | On: | Fault in GCU (collective display) |
|  | off: | Operating status |
| L7 - L10 | These light-emitting diodes show the statuses from reset to operation. After switching on the <br> power a function check is executed (short flashing). |  |

If an error was recognized by SEM (System Error Management) which leads to a recovery (prozess restart or system shut down), the light-emitting diode L6 goes on (shines). The L7 to L10 remain unconsidered. If the recovery is finished, the L 6 (red) is turned on for 5 sec . and afterwards is switched off. The status LEDs L7-L10 show now the actual system status.

The commissioning status is divided into eight groups:

1. Loading ACB from the flash software
2. Loading ACB from HGS at operating system level
3. Loading ACB from HGS at application level
4. Loading ACB in special status (APS change) during operation.

| No. | L7 | L8 | L9 | L10 | Gr. | Status | Phase name |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 15 | 1 | 1 | 1 | 1 | 0 | Commissioning starts | BIOS is running; LED test. |
| 14 | 1 | 1 | 1 | 0 | 0 | operating system takes over the funktion | Linux kernel is loaded. GRUB finished and initialization RAM-Disc started. |
| 13 | 1 | 1 | 0 | 1 | 0 | Load operating system via CBI | ACB board without HGS is loaded as a slave via $C$ bus. <br> Status 11 and 12 are skipped over. |
| 12 | 1 | 1 | 0 | 0 | 0 | Load operating system via Ethernet | ACB board without HGS is loaded as master via Ethernet. <br> Status 11 and skipped over. |
| 11 | 1 | 0 | 1 | 1 | 0 | Load operating system via local bus | ACB board with HGS is loaded as master directly. <br> Statuses 11 to 13 are not processed in the order. |

### 8.4.1.2 Fan replacement

## Replacement of defective fans in 155 systems with ACB

The ACB for standard systems is characterized by its relatively low heat generation. For this reason, even if no fan is used the risk that the processor reaches or exceeds the maximum operating temperature only exists under unfavourable conditions. Unfavourable conditions are a high room temperature (over 35 degrees C ( 95 degrees F)) and permanent high load (over 70 percent).
In the event of failure of one of the two fans we recommend replacing it within one week.
In the event of failure of both fans the CPU temperature and CPU usage (total load) of the ACB in question should be checked first (Webmin: Performance Management). If the CPU temperature is clearly below the limit value of 100 degrees C ( 212 degrees $F$ ) the defective fans should be replaced within the following two days. For safety reasons the CPU temperature should controlled at regular intervals until then. If the CPU temperature is only slightly below or even above the limit value the defective fans must be replaced as soon as possible.

## Projects

Up to four ACBs shall be allowed per module. However, only two per frame to provide sufficient heat dissipation. The software can handle this (a confirmation test will be provided later), four per module were mentioned as the upper limit for systems with HSCB during the workshops with system specialists.

### 8.4.1.3 Removing and Inserting the board

The ACB board may be removed or inserted during system operation, if the S 1 switch handle has been moved to the left.

In single module systems, removing the ACB board during operation will result in a total breakdown.
In multi-module systems, removing the ACB board will result in the failure of this module or of the central functions depending on the BS Confi data packet.

### 8.4.1.4 Operation ACB

Refer to handling specification HSP to ACB, APS IEE2.1

### 8.4.2 ASM3 Announcement Module 3

## Short description

The announcement module ASM3 is a submodule of the DSPF.
The ASM3 variant is used in the CSI55 for recording and playback of ACD spoken announcements and for hotel applications. The corresponding hotel messages are pre-programmed in the hotel application.

| Samples and announcements |  |
| :--- | :--- |
| maximum number of samples recorded | 1000 |
| maximum total time recorded | 32 minutes of announcements (PCM) |
| maximum number of simultaneous announcements | 30 |
|  |  |
| Samples in one announcement | up to 10 |

A sample is a recording with varied contents (music or spoken text).
An announcement can be repeated several times, or even infinitely.
The 30 announcement channels are handled and managed as a digital port with 30 channels.
Each ASM3 also provides two additional channels for the recording of samples for ACD application. These samples are initially available as WAV files, and are loaded to the ASM3 by means of PC application (ACD user interface). The 2 recording channels are handled and managed as a digital port with 2 channels.

## Other features

Power demand +5V
300 mA

Each ASM3 can occupy up to 32 channels.

Location of the ASM3 on the DSPF module

1. ASM3 Module
2. DSPF Module
3. Connecting circuit slot

### 8.4.3 CBI1A3 CBus Interface 1 Adapter Version 3

## Short description

The CBI receives a message (data packet) from the micro processor and stores it internally in a buffer memory. Once the message has been completely entered from the micro processor (cyclic recording), the CBI sends the packet via the C-bus to the specified destination CBI. This CBI stores the packet internally and offers it to its micro processor (typ. per interrupt). The micro processor then receives the packet via cyclic readout from the CBI. The CBIs receiving and transmitting parts work independently of each other.

The CB1A3 is used on the HSCB board. Only one package for transmission and reception can be stored internally at any one time.

CBI1A3 submodule on the BG HSCB

1. BG HSCB module
2. CBI1A3 Module
3. HSCB slot

## LED Denotations

| L1 | on: | High data traffic |
| :--- | :--- | :--- |
|  | flashing: | Data packet being received/sent to/from the micro processor |
| L2 | flashing: | Packet loss in transmission buffer because of transmit time-out or reset, or <br> synchronization fault in the micro processor |
| L3 | flashing: | Packet loss in receiver buffer because of receive time-out or reset |

| L4 | on: | Abnormal operating status e.g.: <br> - CBI cannot be used to transmit and receive <br> - Reset status |
| :--- | :--- | :--- |
|  | flashing <br> weakly: | 1 MBit of data has been transmitted on the C-bus. |

### 8.4.4 CF22 Central Functions 22

## Short description

The central board CF22 is the basic equipment in all modules. It replaces the CF2E board.
It supports:

- the dealer functions
- intermodule handover functions for DECT and
- call number display for incoming calls to analogue terminals ("CLIP" Calling Line Identification Protocol). As opposed to CF2E it only features one DSP system.

| Features | 544 |
| :--- | :--- |
| Ports | 1088 |
| B channels (time slots) | + |
| ILMx | + |
| DECT | 1088 Erl. |
| Internal traffic flow | 225 Erl. |
| External traffic flow |  |

## Features

Clock Supply and Module Synchronization
External synchronization via network nodes (S0, S2M).
Master function in multi-module systems can be set up using software.
Master free-run clock mode (internal clocking)

## Module Switching Matrix

Bit rate 4,096 MBit/s
Module internal non-blocking

11 DTMF receiver sets, 4 DTMF transmitters (only for dialling)

## Call Progress Tones

A maximum of 16 call progress tones can be generated as customer-specific or country-specific and can be cyclically repeated. At the same time unrestricted supply is possible.
In addition, a maximum of 3 tones with burst character can be supplied.

## Short Voice Messages

Up to 8 voice messages or "music on holds" can be used. The total duration of all brief voice messages must be no longer than 64 sec .

## Long Voice Messages

4 voice messages with unspecified time limits and confidata can be set up (connecting message devices via analogue subscriber line circuits). At the same time unrestricted supply is possible.

## Tone Injection in Two-Party Conversations

Up to 3 various cyclic tones can be generated which may be fed into a maximum of 15 two-party conversations (e.g. call waiting tone, rolling tone etc.).

## Conferences

The system software only allows three-party conferences.
Only dealer terminals support conferences with more participants.

| Call number ID |
| :--- |
| 8 DTMF transmitters for CLIP (call nummer indication on analogue terminals for incoming calls) |

| Other features | 1400 mA |
| :--- | :--- |
| Power demand +5 V |  |

A high precision reference clock is required for the intermodule handover functions. This can be carried out through the use of the CL2M submodule on the UIP or ICF. See also Intermodule Handover section.
If fibre-optic links are used, the CF22 board is to be fitted with the submodule CFIML Central Function Inter Module Link.

### 8.4.4.1 Jumper and DIL Switch Functions

Configuration switches are located on the component side of the board. The functions and positions of these switches are described below:

CF22 board, component side

1. DIL switch, 8-part
2. DIL switch, 4-part
3. Fuse F2 for the power supply EOC, 500 mA replaceable
4. LED red:

Loadable hardware of the board out of service
Operation of the board is not possible
5. FPGA Boot/Load PROM
6. Fire protection fuse 7A

If the fire protection fuse is defective (burned out), the board must be replaced by a new one.
7. LED green: R/T active
on: High data traffic
flashing: Data packet being received/sent to/from the micro processor
8. LED yellow: TFAIL
flashing: Packet loss in transmission buffer because of transmit time-out or reset, or synchronization fault in the micro processor
9. LED red: RFAIL
flashing: Packet loss in receiver buffer because of receive time-out or reset
10. CFIML submodule Central Function Inter Module Link

## Functions of the DIL Switches, 8-part

|  | Switch | Switch |

|  | Left: | Reset of the board, locking |
|  | Right: | Reset board, keying |
| S2 | Service Switch |  |
|  | Middle: | Operating status |
|  | Left: | No function, locking |
|  | Right: | With a doubled CF2x: Activate switchover, keying |

## Meanings of LEDs

| L1 | ACTIVE | MSMC active/inactive |
| :--- | :--- | :--- |
|  | on: | MSMC (switching matrix processor unit) resetting/inactive |
|  | flashing: | MSMC downloading or waiting for commissioning |
|  | off: | MSMC active |
| L2 | CLKUA | Clock unit active |
|  | on: | Normal operation: Active module clock unit |
| L3 | IMHOSYNC | Module is synchronised for DECT operation |
|  | flashing: | Resynchronization (flashes for 30 sec.) |
|  | off: | Module is not synchronised for DECT operation |
|  | L! | This operating status may also occur if switch 1 of DIL switch 2 is in <br> the ON position (IMHO active) while LED L4 is on. |
|  | MAFREI | Master free-run clock mode (internal clocking) or external <br> L4 |
|  | on: | synchronization (if L10 is also on) |

|  | flashing: | temporary synchronization fault on a DSP Highway |
| :--- | :--- | :--- |
|  | off: | DSP system in operation |
| L14 | RFAIL |  |
|  | on or flashing: | One or more C-bus receive errors |
|  | off: | C-bus in operation. CFIML submodule not inserted into the CF22. |

### 8.4.4.3 Doubling

It is possible to double the CF22 board in the R1 rack.
SeeDoubling $\rightarrow 143$

### 8.4.4.4 Removing and Inserting the board

ESD-measures must be accomplished when working with boards susceptible to electrostatic shock.
The CF22 board can be removed or inserted during system operation. However, the module will not operate if the CF22 is not doubled.

Removal of the board is followed by a restart without loading customer data.
When doubling, the CF22 board may only be removed when in passive status (LED 2 off). If LED 2 is on, place switch S2 into the right position. LED 2 Off The board can now be removed.

### 8.4.5 CF2E Central Functions 2E

## Short description

The central board CF2E is the basic equipment in all modules.
It supports the dealer and intermodule handover functions for DECT.

| Features |  |
| :--- | :--- |
| Ports | 544 |
| B channels (time slots) | 1088 |
| ILMx | + |
| DECT | + |
| Internal traffic flow | 1088 Erl. |
| External traffic flow | 225 Erl. |

| Features |
| :--- |
| Clock Supply and Module Synchronization |
| External synchronization via network nodes (S0, S2M). |
| Master function in multi-module systems can be set up using software. |
| Master free-run clock mode (internal clocking) |

| Module Switching Matrix |
| :--- |
| Bit rate 4,096 MBit/s |
| Module internal non-blocking |

## 11 DTMF receiver sets, 4 DTMF transmitters

## Call Progress Tones

A maximum of 16 call progress tones can be generated as customer-specific or country-specific and can be cyclically repeated. At the same time unrestricted supply is possible.
In addition, a maximum of 3 tones with burst character can be supplied.

## Short Voice Messages

Up to 8 voice messages or "music on holds" can be used. The total duration of all brief voice messages must be no longer than 64 sec .

## Long Voice Messages

4 voice messages with unspecified time limits and confidata can be set up (connecting message devices via analogue subscriber line circuits). At the same time unrestricted supply is possible.

## Tone Injection in Two-Party Conversations

Up to 3 various cyclic tones can be generated which may be fed into a maximum of 15 two-party conversations (e.g. call waiting tone, rolling tone etc.).

## Conferences

The number of subscribers at a conference is 3 .

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 2200 mA |

The CF2E board is supported from the programme file MSC2P006 onwards.

A high precision reference clock is required for the intermodule handover functions. This can be carried out through the use of the CL2M submodule on the UIP or ICF. See also Intermodule Handover section.

In coupling via LWL, the CF2E module is to be fitted with the submodule CFIML central function inter module Link.

### 8.4.5.1 Jumper and DIL Switch Functions

Configuration switches are located on the component side of the board. The functions and positions of these switches are described below:

CF2E board, component side

1. DIL switch 3
2. DIL switch 2
3. Fuse F1 for the power supply EOC, 500 mA replaceable
4. LED red:

Fault indicator of the central functions
Hardware out of order
5. Fire protection fuse F3, 7 A

If the fire protection fuse is defective (burned out), the board must be replaced by a new one.
6. LED green: R/T active
on: High data traffic
flashing: Data packet being received/sent to/from the micro processor.
7. LED yellow: TFAIL
flashing: Packet loss in transmission buffer because of transmit time-out or reset, or synchronization fault in the micro processor
8. LED red: RFAIL
flashing: Packet loss in receiver buffer because of receive time-out or reset
9. CFIML submodule Central Function Inter Module Link

|  | on: | Normal operation: Active module clock unit |
|  |  | Doubling: active CF2x |
| L3 | IMHOSYNC |  |
|  | on: | Module is synchronised for DECT operation |
|  | flashing: | Resynchronization (flashes for 30 sec .) |
|  | off: | Module is not synchronised for DECT operation |
|  |  | This operating status may also occur if switch 1 of DIL switch 2 is in the ON position (IMHO active) while LED L4 is on. |
| L4 | MAFREI |  |
|  | on: | Master free-run clock mode (internal clocking) or external synchronization (if L10 is also on) |
|  | flashing: | Internal free-run clock mode (internal clocking) after failure of synchronous clock via beam waveguide path |
| L5 | AMEX1S | Alarm message ext. synchr. clock 1 sec. |
|  | on: | Failure of synchronizing clock signal for more than 1 sec . (with master module: clock pulse from local exchange, network node; with slave module: clock pulse via fibre-optic cable) |
| L6 | $\begin{aligned} & \hline \text { DSP } \\ & \text { System } 1 \end{aligned}$ | Status - LED |
|  | on: | Boot phase after board reset or DSP system 1 defective |
|  | off: | DSP system 25.40 mm operation |
| L7 | TFAIL |  |
|  | flashing: | Packet loss in transmission buffer because of transmit time-out or reset, or synchronization fault in the micro processor |
| L8 | MMG | MMG status |
|  | on: | MMG not in operation (no board operation) or defective beam waveguide connection (after CF reset in multi-module system) |
|  | flashing: | MMG in operation, but board logon not yet possible |
|  | off: | MMG in operation |
| L9 | CLKUSYN | Clock unit synchronization |
|  | on: | Module clock system is synchronized |
| L10 | MANK | Master network node |
|  | on: | External synchronous clock switched on for synchronization by the system software |
| L11 | IDR | IDR fault from IMLA (e.g. beam waveguide not in order) |
| L12 | ECLKU | Error clock unit |
|  | on: | Clock system error |
|  | flashing: | After failure of synchronous clock via beam waveguide |

| L13 | DSP <br> System 2 | Status - LED |
| :--- | :--- | :--- |
|  | on: | Boot phase after board reset or DSP system 2 defective |
|  | off: | DSP system 2 in operation |
| L14 | RFAIL | Packet loss in receiver buffer because of receive time-out or <br> reset |
|  | flashing: |  |

### 8.4.5.3 Doubling

It is possible to double the CF2E board in the R1 rack.
SeeDoubling $\rightarrow 143$

### 8.4.5.4 Removing and Inserting the board

ESD-measures must be accomplished when working with boards susceptible to electrostatic shock.
The CF2E board can be removed or inserted during system operation. However, the module will not operate if the CF2E is not doubled.

Removal of the board is followed by a restart without loading customer data.

| $!$ | When doubling, the CF2E board must only be removed when in passive status (LED 2 off). If <br> LED 2 is on, place switch S2 into the right position. LED 2 Off The board can now be <br> removed. |
| :--- | :--- |

### 8.4.6 CFIML Central Functions Inter Module Link

## Short description

The CFIML submodule is inserted in the CF22/CF2E board if this is connected via fibre-optic cable in twin or multi-module operation.

It is connected with the CF22/CF2E via two SMD pin strips.

CFIML board, soldering side

## Meanings of LEDs

| L1 | on: | High data traffic |
| :--- | :--- | :--- |
|  | flashing: | Data packet being received/sent to/from the micro processor |
| L2 | flashing: | Packet loss in transmission buffer during regulatory transmit <br> time-out or reset. |
| L3 | flashing: | Packet loss in receiver buffer during regulatory receive time-out <br> or reset. |
| L4 | on: CBI cannot be used to transmit and receive. |  |
| - Warm start or master reset. |  |  |
| - FIFO is full (100\%) in transmission or receiver direction |  |  |
| L5 | flashing weakly: | Further data has been transmitted with 1 MByte/sec capacity. |
| L6 | on: | IML path is frame synchronous. |
| L7 | on: | IML path is ready to transmit C-bus data. <br> L8 <br> on: <br> direction. is not ready to receive C-bus data in receiving |
| L9 | on: | IML path is not ready to receive C-bus data in transmitting <br> direction. |

### 8.4.7 CL2M Clock 2 Module

## Short description

The submodule CL2M on the UIP or ICF board implements an external clock supply for the PBX or a clock pulse output for external devices.

| Use on |  |
| :--- | :--- |
| UIP | receiver and transmitter 2048 kHz |
| ICF | receiver $2048 / 1544 \mathrm{kHz}$ |

This is necessary if digital dial-up lines or permanent connections are not available as the clock source, or if the customer has made high demands in terms of the reliability of the clock supply.

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 100 mA |

If the CL2M is positioned on slot 1 or 2 of the UIP, the line can be connected via the CA1B board.
With slots 3 or 4 occupied and V24M (slot 1 or 2 ) being used, the line must be connected via the CA3B board.

Location of CL2M on the UIP board

1. Connecting circuit slot
2. UIP module
3. CL2M module

### 8.4.8 CL2ME Clock 2 Module Extended

## Short description

The CL2ME submodule is used to implement an external clock supply by means of a high precision reference clock (TAREF). This is needed if DECT Intermodule Handover is used in twin and multi-module configurations..

| Use on |  |
| :--- | :--- |
| UIP/ICF | Receiver 2048 kHz |

## Other features

Power demand +5V
100 mA

If the CL2ME is positioned on slot 1 of the UIP, the line can be connected via the CA3B/T board.

Location of CL2ME on the UIP board

1. Connecting circuit slot
2. UIP module
3. CL2ME board

### 8.4.9 DSPF Digital Signal Processing Function

## Short description

The DSPF as the basic board accommodates the ASM3 announcement module. The announcement module serves for recording and playback of ACD spoken announcements and for hotel applications. Depending on the application the DSPF can be equipped with up to:

| 4 ASM3 | for access to 128 time slots | in I55 |
| :--- | :--- | :--- |
| 2 ASM3 | for access to 64 time slots | in I55C |

| Other features |  |
| :--- | :--- |
| Country of application | National and international |
| Power demand +5 V | 850 mA |

For more detailed information about configuration with ASM3 please refer to the service manual.

### 8.4.9.1 Inserting the submodule

The used ASM3 modules are inserted in the submodule slots "submodule 1" - "submodule 4" of the DSPF.

DSPF board, component side

1. Submodule 1
2. Submodule 2
3. Submodule 3
4. Submodule 4

The position must correspond to the setting in the confidata. The following allocation must be observed:

| "Submodule number" <br> parameter in the ICU Editor | Labelling | Labelling on the DSPF board |
| :--- | :--- | :--- |
| 0 | Submodule 1 | SUB1 |
| 1 | Submodule 2 | SUB2 |
| 2 | Submodule 3 | SUB3 |
| 3 | Submodule 4 | SUB4 |

### 8.4.9.2 Time slot management

Each ASM3 submodule represents an ICU. This means that one DSPF board can implemented a maximum of 4 ICUs. The ICU of the physical slot of the board logs on with the ICU type DSFM (DSPF Master). The other (up to 3) ICUs are implemented on the same hardware by means of logical address entries in the CBI, and log on with the ICU type DSFS (DSPF Slave).
This means that the DSPF must have access to a total of 128 time slots. Because the slots in the Integral $55 x E$ generally only have 32 time slots, access must be enabled as follows.
The DSPF uses:

| Time slots of the DSPF slot | ICU TYPE DSFM |
| :--- | :--- |
| Time slots of the Auxiliary Highway, Part 1-AUX1 | ICU TYPE DSFS 1) |
| Time slots of the Auxiliary Highway, Part 2-AUX2 | ICU TYPE DSFS 1) |
| Time slots of the slot to the right of the DSPF | ICU TYPE DSFS 2) |

1) Access to AUX1 and AUX2 is possible in each module to the left of the CF board. The time slots of the Auxiliary Highway are available only once per module.
2)In order to gain access to the time slots of the right slot, the DSPF must be configured on an odd slot.

These events provide the following framework conditions:
One DSPF with four submodules

- must use the AUX1 and AUX2
- can be configured only once in each module
- must be set up on an odd slot to the left of the CF circuit board

Every other DSPF (within the same module)

- has access to a maximum of 64 time slots (DSPF slot and slot to the right of the DSPF)
- can consequently supports two modules only
- must be set up on an odd slot (to the right of the CF also possible)

In accordance with the above conditions, each submodule slot and thus an ICU can be assigned an application (ACD or HOTCOM). This means that it is also possible to operate different applications on a DSPF. For example, four submodules could be set up for ACD, three for ACD and one for HOTCOM or two for ACD and two for HOTCOM, as well as any other possible configuration.

Setting up of the DSFM and DSFS ICUs prior to operation of the PBX is implemented using the KAD/CAT application and during operation using the ICU Editor service and management programme.
A connection to the MDF is not implemented at present.

### 8.4.9.3 LEDs and Switch Functions

DSPF board, front panel

## Meaning of the switch on the front panel of the DSPF board

Up to 4 ICUs (1* DSFM and 3 * DSFS) can be implemented on the DSPF board. The common status of the ICUs can be controlled via the S1 front panel switch as follows:

| S1 | Reset and blocking switch |  |
| :--- | :--- | :--- |
|  | Middle position | All ICUs in operating status |
|  | Left position | All ICUs in preparatory disabling |
|  | Right position | All ICUs in reset |
|  | Left position after board <br> reset | Master ICU DSMF (DSPF board) receives a forced ICU <br> download. After commencing the loading process, the <br> switch must be returned to the middle position. |

## Meaning of the LEDs on the front panel of the DSPF board

Up to 4 ICUs (1* DSFM and 3 * DSFS) can be implemented on the DSPF board. The common status of the ICUs is displayed via the two front panel LEDs L1 and L10 according to the following pattern:
The display appears according to priority, i.e., if several functions of the scheme are represented by one LED, the one with the highest priority is implemented. Prio 1 is the highest priority, and prio 5 the lowest. In the cases with priority 1 , the board is still in the reset or download phase, whereby the additional ICUs (DSFS) are not yet active.

| L1 | flashing 5Hz | At least 1 ICU is still in startup, waiting for "Switching On" <br> message | Prio 2 |
| :--- | :--- | :--- | :--- |
|  | flashing 1 <br> Hz | All ICUs are preparatory disabled, the board is removeable | Prio 3 |

### 8.4.10 EOCPF Electrical Optical Converter Plastic Fibre

## Short description

EOCPF is an electrical optical interface for the connection of modules via PF conductors in both transmitting and receiving directions and can be installed onto the CF22, CF2E, MLB and ICF boards.

1.

EOCPF submodule on the CF2E board

1. PF Connector
2. EOCPF Module
3. CF2E module

| Fibre-optic cable length |  |
| :--- | :--- |
| EOCPF | $\operatorname{max.} 40 \mathrm{~m}$ |

| Other features |  |
| :--- | :--- |
| Country of application | National and international |
| Power demand +5 V | 180 mA |
| EOCPF submodule, can be inserted on the front side of the boards mentioned above. |  |
| Max. transmission rate: aprox. $40 \mathrm{MBit} / \mathrm{s}$ |  |

| ! | Observe the color coding when inserting the PF cable into the EOCPF submodule. |
| :--- | :--- |

4.

EOCPF, connectors for LWL

1. blue
2. grey
3. Transmitter
4. Receiver

### 8.4.11 EOCSM/MM Electrical Optical Converter

## Short description

The two boards EOCSM (SM = Single Mode) and EOCMM (MM = multi-mode) are intended as interfaces for use in the twin module and in multi-module systems.

1.

EOCSM/MM module on the CF2E board

1. LWL connector
2. EOCSM or EOCMM Module
3. CF2E module

| Fibre-optic cable length |  |
| :--- | :--- |
| EOCSM | 15 km (single-mode graded-index fibre) |
| EOCMM | 7 km (multi-mode graded-index fibre) |

## Other features

Country of application $\quad$ National and international

| Power demand +5 V | 180 mA |
| :--- | :--- |

When inserting the LWL cable into the EOCSM/MM submodules, it must be remembered that the "transmit" connector of one EOCSM/MM connects to the "receive" connector of another EOCSM/MM and vice versa.
1.

EOCSM/MM, Connectors for the LWL

1. Sending
2. Receiving
3. FOC

### 8.4.12 HSCB High Speed Computer Board

## Short description

HSCB is the basic equipment in all modules. It is a computer board with dynamic RAM.

| Features |
| :--- |
| Optionally with parity |
| 128 kByte ERROR flash-PROM |
| 512 kByte Boot flash-PROM |
| Buffered real time clock |
| Two-level hardware watchdog |
| Hardware status register |
| C-bus interface |
| 4 B channel accesses |
| 2 V.24 interfaces |
| Downloadable |
| 2x PC card/ATA interfaces for 1.8 " PC card driver with ATA mode. Hard disk drives with 260 MB or 1 GB <br> (for large systems) are available for these interfaces. |

| Other features |  | Basic equipment in all modules |
| :--- | :--- | :--- |
| Application | without HGS |  |
| Power demand +5 V | 1900 mA | with 1 HGS (startup current) |
|  | 2400 mA | with 2 HGS (startup current) |
|  | 2900 mA |  |
| The drives can be replaced during operation. | The V24NI submodule is used as standard when connecting circuits to the V.24 interfaces. If necessary, it <br> is also possible to use the DC isolated V24I. |  |
| Additional Memory | If additional memory submodules (PS2) are inserted into the HSCB, it should be <br> taken into account that the first memory slot must always be occupied. The <br> inserted PS2 memory modules must have an access time of 60 ns. |  |
|  |  |  |

HSCB board, component side

1. Memory 4
2. Memory 3
3. Memory 2
4. Memory 1
5. HGS
6. Battery

The HSCB is equipped with one of the following V. 24 submodules:

- V.24I Insulated
- V.24NI Non-Insulated (basic configuration)

The following signals are available for the V.24:

- RXD
- TXD
- DTR
- GND
- DSR
- RTS
- CTS

### 8.4.12.1 LEDs and Switch Functions

HSCB board, front side

## Switch Position in Normal Operation

| S1 | Middle position |
| :--- | :--- |
| S2 | Left position |
| S3 | Left position |
| S4 | Left position |

## Switch Function

| S1 | Reset switch and MI button |  |
| :--- | :--- | :--- |
|  | Middle: | Operating status |
|  | Left: | Reset board, locking (see S2) |
|  | Right: | Monitor interruption (TENOBUG start), keying |
| S2 | Memory test switch |  |
|  | Left: (Standard) | No memory test when resetting/restarting |
|  | Right: | Memory test when reseting/reloading the TC system |
| S3 | Hard Disk Change Request (HDCHR) |  |
|  | Left: | Operating status: PC-CARD-ATA-interfaces in operation |
|  | Right: | Service position: Removing and inserting the HGS(s) |
| S4 | System console connected (SCOCON) |  |
|  | Left: | No device connected (Default), or printer or video terminal <br> connected |
|  | Right: | System terminal connected |

## Meanings of LEDs

| L1 | Fault indication from the control (group statement) |
| :--- | :--- |
| L2 | Indicates module data transfer via the C-bus (e.g. call at subcriber) |
| L3 | Indicates access to the inserted background memory |
| L4 | Indicates that the HGS(s) can be removed |
| L5 | Indicates that the S4 switch is in the "right" position, and that the system terminal can be <br> connected to the first V.24 interface on the AV24B/W (service) |
| L6 | Unused |
| L7- L10 | The LEDs flash to indicate the status from reset to operation. The display remains lit for <br> about 5 seconds if a fault is found in the loading phases 15 to 7 (see following table). If a <br> fatal fault occurs, the reset process is repeated from the beginning (loading phase 15). |

| No. | L7 | L8 | L9 | L10 | Phase name |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 15 | 1 | 1 | 1 | 1 | Start reset phase |
| 14 | 1 | 1 | 1 | 0 | Test flash-PROM |
| 13 | 1 | 1 | 0 | 1 | Test QUICC |
| 12 | 1 | 1 | 0 | 0 | Test real time clock |
| 11 | 1 | 0 | 1 | 1 | Test C-bus interface |

| 10 | 1 | 0 | 1 | 0 | Test DUART (V.24 ports) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 9 | 1 | 0 | 0 | 1 | Test dynamic RAM |
| 8 | 1 | 0 | 0 | 0 | Output hardware image |
| 7 | 0 | 1 | 1 | 1 | End reset phase |
| 6 | 0 | 1 | 1 | 0 | Initial program loading (IPL)/IPL ready flag |
| 5 | 0 | 1 | 0 | 1 | STIN program loader is loaded and started |
| 4 | 0 | 1 | 0 | 0 | Operating system has been loaded and started (restart) |
| 3 | 0 | 0 | 1 | 1 | User programs (have been dispatched) have been loaded |
| 2 | 0 | 0 | 1 | 0 | Start of customer data loading in the user programs |
| 1 | 0 | 0 | 0 | 1 | All customer data loaded Start commissioning of module(s) |
| 0 | 0 | 0 | 0 | 0 | Module(s) in operation |

1 = LED on
$0=$ LED off

### 8.4.12.2 Changing the HGSs

The HGS may be removed or inserted during system operation without the prior removal of the HSCB.
The following procedure must be adhered to:

- Remove static charge from the module frame
- Move S3 switch to the right
- Wait for L4 to light up
- Remove the appropriate HGS

Do not touch the components!

Take hold of the drive from above and below.

- Insert the new HDD
- Move S3 switch to the left
- L4 will go out in a short time

### 8.4.12.3 Removing and Inserting the board

The HSCB board may be removed or inserted during system operation, if the S1 switch handle has been moved to the left.
In single module systems, removing the HSCB board will result in a total breakdown.
In multi-module systems, removing the HSCB board will result in the failure of this module.

### 8.4.13 ICF IMTU Central Functions

## Short description

The central board of the B3 module or ICS is the ICF.
Features

| Clock Supply and <br> Synchronization | Clock frequency precision for DECT. |
| :--- | :--- |
|  | Remote synchronizable by high precision reference clock and master module <br> (with CL2M or CL2ME) |
|  | Master function for multi-module systems, adjustable using software. |

| External interfaces |
| :--- |
| 128 receive/transmit highway |
| Outputs for ext. signalling |
| Remote control for power supply |
| LWL connector |
| Ref. clock supply (CL2M) |
| Clocks |
| Micro processor bus |

| Interface to Other Modules |
| :--- |
| Through MLB, with possible MLBIML |
| Transfer of C-bus data. |
| 256 PCM channels. |

Inter Module Manager (IMMG)

Fault Management using Inter Module Manager

| Other features |  |
| :--- | :--- |
| Application | Basic equipment in B3/ICS |
| Power demand +5 V | 3210 mA |
| Battery status query |  |
| Memory Doubling e.g. for Downloading |  |
| Fire Protection Fuse |  |

Difference between ICF . 1321 and . 1331
In .1331, CBI and IMLA are on the board.
The ICF with material number 49.9905.9146 can be used in the B3 module and in the ICS.

### 8.4.13.1 Jumper and DIL Switch Functions

ICF board, component side

1. DIL switch
2. Jumper
3. Fire Protection Fuse

## Jumper Functions

| Total breakdown (system not in operation) via ESB |  |
| :--- | :--- |
| $1-2$ | Normally closed contact for message |
| $2-3$ | Normally open contact for message |
|  |  |
| Battery status query | Testing of -48 V battery not possible (default) |
| $4-5$ | Testing of -48 V battery active |
| $5-6$ | When using PS350 with connected battery: Switch on the battery voltage monitoring option |

Fire Protection Fuse

| $\mathbf{~}$ | If the fire protection fuse is defective (burned out), the board must be replaced by a new one. |
| :--- | :--- |

## Functions of the DIL Switches

| S1 |  | Error signalling unit |
| :--- | :--- | :--- |

|  | ON: | with ESU |
| :--- | :--- | :--- |
|  | OFF: | without ESU |
|  |  |  |
| S2 |  | System configuration for IMMG |
|  | ON: | IMMG passive |
|  | OFF: | IMMG active |
|  |  |  |
| S3 | S4 | Specification of highest scan address |
| ON | ON | 16 |
| OFF | ON | 32 |
| ON | OFF | 64 |
| OFF | OFF | 128 (default) |
|  |  |  |
| S5 |  | Inter module manager watchdog |
|  | ON: | Watchdog inactive |
|  | OFF: | Watchdog active (default) |
|  |  | CBI master mode switching |
| S6 | ON: | Test mode |
|  | OFF: | CBI master (default) <br> For testing and servicing purposes. Do not change |
|  |  |  |
|  | Non-maskable interruption |  |
| S7 | ON: | Enable NMI |
|  | OFF: | NMI disable (default) <br> For testing and servicing purposes. Do not change |
|  |  |  |
| S8 |  | CBI speed |
|  | ON: | 2 MHz |
|  | OFF: | 4 MHz (default) |

### 8.4.13.2 LEDs and Switch Functions

Switch Functions

| S1 | Reset |  |
| :--- | :--- | :--- |
|  | Left: | No function, locking |
|  | Middle: | Operating status |
|  | Right: | Reset board, keying |
| S2 | Service Switch | No function, locking |
|  | Left: | Operating status |
|  | Middle: | With redundant star coupler: Activate switchover, keying |
|  |  |  |

## Meanings of LEDs

| L1 | No function |  |
| :--- | :--- | :--- |
|  |  |  |
| L2 | Clock unit active |  |
|  | on: | Active module clock unit |
| L3 | When doubling, IMTU status |  |
|  | on: | IMTU active |
|  | off: | IMTU hot stand-by |
|  | flashing quickly: | IMTU active and alternate path switched |
|  | flashing slowly: | IMTU hot-standby and alternate path switched |
|  |  |  |
| L4 | IMMG status |  |

|  | on: | IMMG not in operation (no board operation) |
| :---: | :---: | :---: |
|  | flashing: | IMMG in operation, but board logon not yet possible |
|  |  | With doubled multi-module, also failure of the fibre-optic link ICF $<->$ ICF. |
|  | off: | IMMG in operation |
| L5 | Clock unit synchronization |  |
|  | on: | Module's clock system is synchronized |
| L6 | Master/free-run clock mode |  |
|  | on: | Module prepared by system software for master operation |
|  |  | or |
|  |  | module in master free-run clock mode |

### 8.4.13.3 Removing and Inserting the board

The board may be removed and inserted during system operation.
All existing connections are disconnected if the board is removed. Exception when doubling.

If the active ICF board of a doubled pair is to be removed, the service switch must be used to change it over to the hot stand-by side. After the ICF has been reinserted, the service switch must be switched back again.

### 8.4.13.4 Doubling

Only one ICF board can be inserted for each B3 module.
A doubling of the system can only be implemented by using a second ICS or B3 module.
SeeComplete doubling $\rightarrow 153$

### 8.4.13.5 External clock pulse input

First V. 24 interface of the CA3B (Cable Adapter 3 for B modules)

| PIN 1 | A1 | External clock pulse input 2.048 MHz (high precision reference |
| :--- | :--- | :---: |
| clock / TAREF) |  |  |

### 8.4.14 ISMx Switching Matrix x

## Short description

The board ISMx is used in the basic configuration in the ICS and B3 module. Its task is to switch inter-module connections with a bit rate of $4 \mathrm{MBit} / \mathrm{s}$.

In order to ensure the total availability of the IMTU switching matrix function, 4 ISMx boards of the same variant are required. Mixed operation of ISMx and ISM2x boards is not permissible.

| Variants for the B3 module |  |
| :--- | :--- |
| ISMA | IMTU Switching Matrix variant A, material number: 28.5630 .1512 <br> 4x per B3 module, up to 8 modules in conjunction with one MLB in slot 1 |
| ISMB | IMTU Switching Matrix variant B, material number: 28.5630 .1522 <br> $4 x$ per B3 module, up to 16 modules in conjunction with two MLBs in slots 1 and 2 |
| ISMC | IMTU Switching Matrix variant C, material number: 28.5630 .1532 <br> 4x per B3 module, up to 32 modules in conjunction with three or <br> four MLBs in slots 1, 2 and 8 or 1, 2, 8 and 9 |
| ISM2A | IMTU Switching Matrix variant 2 A, material number: 49.9805.5675 <br> 4x per B3 module, up to 8 modules in conjunction with one MLB in slot 1, <br> supersedes ISMA 28.5630.1512 |
| ISM2B | IMTU Switching Matrix variant 2 B, material number: 49.9805.5676 <br> 4x per B3 module, up to 16 modules in conjunction with two MLBs in slots 1 and 2, <br> supersedes ISMB 28.5630.1522 |
| ISM2C | IMTU Switching Matrix variant 2 C, material number: 49.9805.5677 <br> 4x per B3 module, up to 32 modules in conjunction with three or <br> four MLBs in slots 1, 2 and 8 or 1, 2, 8 and 9, <br> supersedes ISMC 28.5630.1532 |

## Variants for the ICS

| ISM2A | IMTU Switching Matrix variant 2 A, material number: 49.9905.9147 <br> $4 x$ per rack ICS, up to 8 system modules in conjunction with one MLB in slot 1, <br> supersedes ISM2A 49.9805.5675 |
| :--- | :--- |
| ISM2B | IMTU Switching Matrix variant 2 B, material number: 49.9905.9148 <br> $4 x$ per rack ICS, up to 16 modules in conjunction with two MLBs in slots 1 and 2, <br> supersedes ISM2B 49.9805.5676 |

| B3 module slot | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Board | MLB | MLB |  |  | ICF |  |  | MLB | MLB |
| ISMA It No: $28.5630 .1512 ~$ <br> or <br> ISM2A It No: 49.9805 .5675 | x |  | 0 | 0 | + | 0 | 0 |  |  |
| ISMB It No: 28.5630 .1522 <br> or <br> ISM2B It No: 49.9805 .5676 | x | x | 0 | 0 | + | 0 | 0 |  |  |
| ISMC It No: 28.5630 .1532 <br> or <br> ISM2C It No: 49.9805 .5677 | x | x | 0 | 0 | + | 0 | 0 | x | x |

| ICS slot | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Board | MLB | MLB | ISM2 | ISM2 | ICF | ISM2 | ISM2 |
| ISM2A It No: 49.9905.9147 | x |  | 0 | 0 | + | 0 | 0 |

| ISM2B It No: 49.9905.9148 | x | x | o | o <br> $/ \mathrm{td}>$ | + | 0 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

For each switching matrix, four switching matrix modules of the same type must be inserted (e.g. four ISMAs).
With doubled IMTU, all eight switching matrix modules $(2 \times 4)$ must be of the same type.
$0=$ inserted switching matrix module
$\mathrm{x}=$ supported by switching matrix modules
$+=$ fixed assignment

| Other features |  |  |
| :--- | :--- | :--- |
| Power demand +5V | ISMA | 840 mA |
|  | ISMB | 980 mA |
|  | ISMC | 1460 mA |
| Download board software |  |  |
| Board identification using board passport |  |  |
| Maintenance function |  |  |

### 8.4.14.1 LEDs and Switch Functions

## Switch Function

| S1 | Left: | No function, locking |
| :--- | :--- | :--- |
|  | Middle: | Operating status |
|  | Right: | Reset board, keying |

## Meanings of LEDs

| L1 |  | Switching matrix processor unit |
| :--- | :--- | :--- |
|  | on: | Resetting or inactive |
|  | flashing quickly: | Download |
|  | flashing slowly: | Waiting for startup |
|  | off: | active |
| L2 |  | No function |

### 8.4.14.2 Doubling

Redundancy of the boards for the system's switching matrix function is enabled by doubling the multi-module.

The ISMx board variants must be the same for both IMTUs. Mixed operation of ISMx and ISM2x boards is not permissible.

### 8.4.14.3 Removing and Inserting the board

The board may be removed and inserted during system operation.
All existing connections are disconnected if the board is removed.

In doubled systems, a service switchover (service switch S2 on ICF) should be carried out before removing an ISMx from the active multi-module. On completion of repairs, the service switch must be switched back in order to resume operation of the default active side.

### 8.4.15 MLB Module Link Board

## Short description

The board MLB is used to connect modules to the multi-module. It can be equipped with the MLBIML submodule and is designed for a maximum of 8 modules.

In standard configuration, the module is equipped with components for a max. of 3 modules. The MLBIML is used from the fourth module onward.
The module connection is managed using the boards EOCMM, EOCSM or EOCPF.

| Features |
| :--- |
| Adaptation to C-bus and coupler interface. |
| Multiplexes and demultiplexes of the various types of data to be transmitted (C-bus data and Highway). |

| Line coding/decoding. |
| :--- |
| Clock generation. |
| Optical transmitting and receiving. |
| Test and maintenance function. |

The following notes must be observed when using the MLB board:

- IMLE3 submodules with IML software 28.7637 .8533 or IMLASB must be inserted in the connected CFx boards.
- A maximum of 13 modules can be connected (on two MLBs) to the B3 module without the ISPS board. No CBT must be inserted under these circumstances. These may only be inserted if only a single MLB board is fitted.
The ISPS board is generally required from the 14th module on. In this case, the CBT may be inserted without restriction.

| Other features |  |  |
| :--- | :--- | :--- |
| Power demand +5 V | 1830 mA | 3 MLBIML on the board and 330 mA for <br> MLB logic and 0 EOC |

### 8.4.15.1 LEDs and Switch Functions

## Switch Function

MLB board, front side

| S1 $^{*}$ | Middle: | Operating status |
| :--- | :--- | :--- |
|  | Left: | No function |
|  | Right: | Board RESET |

* Depending on the configuration, adjusting the switch can result in a restart of the entire system.

| S2 | Middle: | Operating status, Link 7/8 |
| :--- | :--- | :--- |
|  | Left: | RESET Link 7 |
|  | Right: | RESET Link 8 |
| S3 | Middle: | Operating status, Link 5/6 |
|  | Left: | RESET Link 5 |
|  | Right: | RESET Link 6 |
| S4 | Middle: | Operating status, Link 3/4 |
|  | Left: | RESET Link 3 |
|  | Right: | RESET Link 4 |
| S5 | Middle: | Operating status, Link 1/2 |
|  | Left: | RESET Link 1 |
|  | Right: | RESET Link 2 |

## LED Denotations

MLB board, component side

| L1 | on: | High data traffic |
| :--- | :--- | :--- |
|  | flashing: | Data packet being received/sent to/from the micro processor |
| L2 | flashing: | Packet loss in transmission buffer during regulatory receive <br> time-out or reset, or synchronization fault in the micro <br> processor. |
| L3 | flashing: | Packet loss in receiver buffer during regulatory transmit <br> time-out or reset. |

| L4 | on: | - CBI cannot be used to transmit and receive. <br> - Warm start or master reset. <br> - FIFO is full $(100 \%)$ in transmission or receiver direction |
| :---: | :---: | :---: |
|  | flashing weakly: | Further data has been transmitted with 1 MByte/sec capacity. |
| L5 | on: | IML path is frame synchronous. |
| L6 | on: | IML path is ready to transmit C-bus data. |
| L7 | on: | IML path is not ready to receive C-bus data in receiving direction. |
| L8 | on: | IML path is not ready to receive C-bus data in transmitting direction. |

### 8.4.16 MLBIML Module Link Board, Inter Module Link

## Short description

The board MLBIML a sub-board which is plugged into the MLB board from the fourth module onwards. It can optionally take an EOC.

| Variants |
| :--- |
| EOCMM |
| EOCSM |
| EOCPF |

Other features

| Power demand +5 V | 500 mA |
| :--- | :--- |

### 8.4.16.1 Meanings of LEDs

MLBIML board, component side

| L1 | on: | High data traffic |
| :--- | :--- | :--- |
|  | flashing: | Data packet being received/sent to/from the micro processor |
| L2 | flashing: | Packet loss in transmission buffer during regulatory receive <br> time-out or reset, or synchronization fault in the micro <br> processor. |
| L3 | on: | Packet loss in receiver buffer during regulatory transmit <br> time-out or reset. |
| L4 |  | $\bullet$ CBI cannot be used to transmit and receive. <br> $\bullet$ Warm start or master reset. |
|  | flashing weakly: | Further data has been transmitted with 1 MByte/sec capacity. |
| L5 | on: | IML path is frame synchronous. |
| L6 | on: | IML path is ready to transmit C-bus data. |
| L7 | on: | IML path is not ready to receive C-bus data in receiving <br> direction. |
| L8 | on: | IML path is not ready to receive C-bus data in transmitting <br> direction. |

### 8.4.17 R1RC Rack Connector for I55

## Short description

Up to 3 expansion racks can be connected to the basic rack in a star-shaped pattern, which are then called the C2-C4 modules. You will require an R1RC/R1RC2 adapter for the connection between the backplanes.

| Variants |  |  |
| :--- | :--- | :---: |
| R1RG (part no: 49.9903.5498) / R1RG2(part no: <br> 49.9907.9213) | for use in the basic rack (R1 rack) |  |
| R1RE (part no: 49.9903.5500) / R1RE2 (part no: <br> 49.9907.9214) | for the expansion racks R2, R3 and R4. |  |

The adapters are connected to each other using cables. This connection transmits CBus information, highway information, status signals and I2C bus data, so that the connected modules act as a single module (B2 of the I33).

The adapters R1RG/R1RG2 and R1RE/R1RE2 are attached to the board frame from the rear.

| A. | The R1RG/R1RG2 and R1RE/R1RE2 variants do not have to be identical. Mixed operation <br> of the boards is possible. |
| :--- | :--- |

| Other features |  |
| :--- | :--- |
| Application | for the expansion racks R2, R3 and R4. |
| Power demand +5V | 400 mA |

### 8.4.17.1 Connection of the expansion racks to the basic rack

The connection to the next board frame is made using a double-screened Ethernet cable "category 6" (8-pin). The maximum length is 30 metres. Connection is implemented via a Western socket RJ45 (8-pin). A cable is required between each basic and expansion rack in order to transmit the system data. The connection is made to the Western socket 1 (see under Function of the Switches and LEDs).

The following diagram depicts the principal connections.

1.

Connection of the expansion racks to the basic rack

1. View from the rear
2. Basic rack
3. Expansion rack 1
4. Expansion rack 2
5. Expansion rack 3

### 8.4.17.2 LEDs and Switch Functions

R1RC (R1RG/R1RG2, R1RE/R1RE2) front side with LEDs and switches

1. Fan plug 1
2. Fan plug 2
3. Western socket RJ45 1

| S1 | Switch 1 | Left: | No function |
| :--- | :--- | :--- | :--- |
|  | Middle: | Operating status |  |
|  | Right: | Reset |  |

| LED | Name |  | Description |
| :--- | :--- | :--- | :--- |
| L1 | Status | on: | SMALRES CBI |
| L2 | RTActive | on: | Send and receive active |
| L3 | RFail | on: | Receive error |
| L4 | TFail | on: | Send fault |
| L5 | TMFail | on: | Transmission is not synchronous |
| L6 | IDR | on: | Data transfer possible |
| L7 | TXTC | on: | Greater traffic from the rack |

| L8 | RXTC | on: | Greater traffic into the rack |
| :--- | :--- | :--- | :--- |

## Fault signaling

The following fault monitoring is implemented:

1. There are two equipment variations for the modules, one for the basic rack (R1RG/R1RG2) and one for the expansion rack (R1RE/R1RE2). A check is carried out whether the module is inserted in the correct rack. If this is not the case, the LEDs TMFail, IDR, RXTC and TXTC will blink.
2. The transmitted FP8K is checked on the receiver side. Further, the FP160ms is also checked. The LED TMFail then switches to inactive. If a FP8K or a FP160ms then fails, the LED TMFail switches to active and the checking procedure starts once more.
3. The IDR LED displays that data transfer is possible. In the event of a fault, it remains inactive for at least 127 ms .
4. As soon as the CBI is unable to receive and data from the transmission link (PWR inactive), this is displayed by the RXTC LED.
5. As soon as the CBI is unable to receive and data from the transmission link (PWR inactive), this is displayed by the RXTC LED.
6. The TMFail LED is activated as soon as the reception frequency of 49.152 MHz is no longer correct.

## Western plug

The Western plug RJ45 is used to transmit system data (frame pulse, highway data, CBus data, status lines and I2C bus data) and the transmission pulses.

### 8.4.17.3 C-bus address distribution

### 8.4.17.4 Fuses on the board

Component side of the R1Rc board

1. Fan plug
2. Fan plug
3. Switch
4. Light Emitting Diodes
5. Western plug 1
6. Fuses 48 V ( T SIC, 500 mA )

- R1RG/R1RE: on the rear of the board
- R1RG2/R1RE2: on the component side of the board

7. 5 V fuse soldered in

If the fire 5 V fuse is defective (burned out), the board must be replaced by a new one.

### 8.4.18 V24I/NI Insulated/Non-Insulated

## Short description

Both submodules are inserted on to the ACB/HSCB board and have the following features:

- V24I, is for the DC decoupling of all signals and of the logic ground.
- V24NI,
is for the direct connection of all signals and of the logic ground.

V24I/V24NI modules on the HSCB board

### 8.4.19 V24M Module

## Short description

V24M is a sub-board for the UIP board. It comprises the layer 1 functions for a V. 24 interface.
A maximum of two V24 modules can be inserted on slots 1 and 2 of the UIP board. This requires the connection of the connecting circuit line to be implemented via the CA3B board.

| Other features |  |
| :--- | :--- |
| Application | for further V.24 ports on the system |

### 8.5.1 ACB/ACB1 Advanced Computer Board

## Short description

The ACB board is the basic equipment in all modules. This computer board must be used to support the software IEEx (Linux operating sistem). As HGS it is used a 2.5 " hard disc drive.

The ACB1 board is the follow-up board of the ACB and can be used starting with software version IEE2 (version L021V00 1 1.0). The difference to the ACB is the physical medium of the HGS. In the case of the ACB1, the HGS is a Compact Flash Card with different capacity according to system size, the following sizes are recommended:

|  | Compact Flash Card |
| :--- | :--- |
| for single and Twin system: | with 1 GB |
| for multi-module up to 4000 subscr.: | with 2 GB |
| for multi-module of more than 4000 subscr.: | with 4 GB |

Handling, as well as switch and display functions of both boards are identical:

| Features |  |
| :---: | :---: |
| ETX-PC <br> The ETX-Board is a complet PC-System. All functions the current PCs offer are realized on this Board. Performance same as Pentium III/400MHz or higher. | 512 MByte of main memory, (only one SO DIMM Modul) |
|  | Boot flash PROM with Phoenix Bios |
|  | Voltage generation |
|  | Real-time clock (RTC) |
|  | Hardware watchdog |
| RTC battery (8 years buffer operation) |  |
| Ethernet interface 10/100 Base T |  |
| two V. 24 interfaces (see AEV24B Adapter Ethernet V24 B Modul) |  |
| Interface to the PCM highway (4 independent B channel accesses) |  |
| PCI Bus (5V tolerant) 32Bit/33MHz |  |
| Two CBus interfaces (ISA Bus) on for system control reasons one as SPY-remote Interface (SPY =System Protocoller and Analyser) |  |
| IDE interface for HGS |  |

The hardware prerequisites for remote logging with SPY are contained on the board.

ACB1 board, component side

ACB board, component side

1. Battery
2. ETX-PC
3. V24I/NI
4. Transformer 10/100 Base T
5. Boot Flash (Compact Flash Card)
6. PCM highway controller
7. PCM highway controller
8. CBI1A3 for SPY I55
9. EPLD
10. CBI1A3
11. HDD

The ACB is equipped with one of the following V. 24 submodules:

- V.24I Insulated
- V.24NI Non-Insulated (basic configuration)

The following signals are available for the V.24:

- RXD
- TXD
- DTR
- GND
- DSR
- RTS
- CTS

Other features
Power demand $+5 \mathrm{~V} \quad$ 3.5A
The V24NI submodule is used as standard when connecting devices to the V. 24 interfaces. If necessary, it is also possible to use the DC isolated V24I.

AEV24B adapter Ethernet / V24 B module $\rightarrow 230$

### 8.5.1.1 LEDs and Switch Functions

## Switch Position in Normal Operation

| S1 | Neutral position |
| :--- | :--- |
| S2 | Left position |
| S3 | Left position |

## Switch Function

S1

| Reset switch |  |
| :--- | :--- |
| Mean: | Operating status |
| links: | Hardware Reset of the board, locking |

|  | Right: | ACB is been shut down (by operating system), pushing |
| :--- | :--- | :--- |
| S2 | Hard Disk Change Request (HDCHR) |  |
|  | links: | Operating status: IDE Hard Disk in operation |
|  | Right: | Service position: Pulling out the IDE hard disk and plugging it <br> back in |
|  | Service entry | links: |
|  | Right: | The commissioning (OS, applications and customer's data load) <br> is executed without break |
|  | Before booting, the switch must be in the righthand position <br> (reboot, power restoration). <br> The boot phase is interrupted at a defined point. At this point an <br> service access via ISM (WebMin) is possible. Changing of <br> parameters as for example IP addresses or GCU slot address <br> can be executed. <br> Then the switch is to be brought in the left position. The service <br> access is closed and a reboot is executed. |  |

## Meanings of LEDs

| LL | On: | Ethernet connection status is OK |
| :--- | :--- | :--- |
|  | off: | Ethernet connection status is interrupted |
| LD | On: | data transmission via Ethernet |
|  | off: | no data transmission via Ethernet |
| L1 | On: | The Ethernet interface of this module is connected to the network |
|  | off: | The Ethernet interface of this module is not connected to the network |
| L2 | On: | Alle the voltages of the board are present |
| L3 | on or <br> flashing: | Data transfer via the C bus |
| L4 | on or <br> flashing: | Access to the inserted background memory |
| L5 | On: | Indicates that the HGS can be unplugged |
| L6 | off: | Operating system does not allow pulling out the HGSs |
|  | Onf: | Fault in GCU (collective display) |
| L7 - L10 | These light-emitting diodes show the statuses from reset to operation. After switching on the <br> power a function check is executed (short flashing). |  |

If an error was recognized by SEM (System Error Management) which leads to a recovery (prozess restart or system shut down), the light-emitting diode L6 goes on (shines). The L7 to L10 remain unconsidered. If the recovery is finished, the L 6 (red) is turned on for 5 sec . and afterwards is switched off. The status LEDs L7-L10 show now the actual system status.
The commissioning status is divided into eight groups:

1. Loading ACB from the flash software
2. Loading ACB from HGS at operating system level
3. Loading ACB from HGS at application level
4. Loading ACB in special status (APS change) during operation.

| No. | L7 | L8 | L9 | L10 | Gr. | Status | Phase name |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 15 | 1 | 1 | 1 | 1 | 0 | Commissioning starts | BIOS is running; LED test. |
| 14 | 1 | 1 | 1 | 0 | 0 | operating system takes over the funktion | Linux kernel is loaded. <br> GRUB finished and initialization RAM-Disc started. |
| 13 | 1 | 1 | 0 | 1 | 0 | Load operating system via CBI | ACB board without HGS is loaded as a slave via $C$ bus. <br> Status 11 and 12 are skipped over. |
| 12 | 1 | 1 | 0 | 0 | 0 | Load operating system via Ethernet | ACB board without HGS is loaded as master via Ethernet. <br> Status 11 and skipped over. |
| 11 | 1 | 0 | 1 | 1 | 0 | Load operating system via local bus | ACB board with HGS is loaded as master directly. <br> Statuses 11 to 13 are not processed in the order. |
| 10 | 1 | 0 | 1 | 0 | 0 | Update flash SW | Flashsoftware ACB under development. |
| 9 | 1 | 0 | 0 | 1 | 1 | PAL startet | The pascal server is ready. All known pascal tasken will be started. |
| 8 | 1 | 0 | 0 | 0 | 1 | Download the application | Download Applikationfiles in progress. |
| 7 | 0 | 1 | 1 | 1 | 3 | Start of the platform applications | Start of the platform applications such as PFSP, PAL, L4AD. |
| 6 | 0 | 1 | 1 | 0 | 3 |  |  |
| 5 | 0 | 1 | 0 | 1 | 3 |  |  |
| 4 | 0 | 1 | 0 | 0 | 3 | APS change in progress (indication only at the IVL) | ACB with IVL funktion prepares an APS change. |
| 3 | 0 | 0 | 1 | 1 | 2 | Customer data conversion (display only at the IVL) | Customer data conversion (Started by MML CKDT is not displayed.). |
| 2 | 0 | 0 | 1 | 0 | 2 | Load APS customer data | DMS of the module signalls the phase loading customer data. |
| 1 | 0 | 0 | 0 | 1 | 2 | ICU commissioning | All customer data loaded. <br> Start commissioning of the module(s). |
| 0 | 0 | 0 | 0 | 0 | 2 | Normal operation | Module(s) in operation |

[^2]| 2 x | There are 16 USB devices preconfigurated. Beeing 8 of them designed for only TTY operation. <br> Furthermore 4 are designed for the ACOM protocol and 4 as RAW, they are not used yet. By <br> default all have the Host Index configured as group 1. But this can be changed by means of the <br> Webmin at any moment. <br> The USB devices are not connected normally with logical devices of the pascal applications. <br> This must still be done via the Webmin interface. |
| :--- | :--- |
| As soon as this is done, the pascal application (prolog task) will try to show its prompt ('C) on <br> this new device. This activation can take up to one minute after the change of configuration <br> data done by the Webmin. <br> In the same way all other interfaces can be also configured (commissioning and shut down). |  |

Reference numbers, that are available in the Ebuyer Tool:

| 4.999 .096 .855 | USB Hub |
| :--- | :--- |
| 4.999 .096 .856 | USB/V24 adapter |
| 4.999 .100 .643 | USB/USB Laplink gold cable |

### 8.5.1.2 Fan replacement

## Replacement of defective fans in 155 systems with ACB

The ACB for standard systems is characterized by its relatively low heat generation. For this reason, even if no fan is used the risk that the processor reaches or exceeds the maximum operating temperature only exists under unfavourable conditions. Unfavourable conditions are a high room temperature (over 35 degrees C (95 degrees F)) and permanent high load (over 70 percent).
In the event of failure of one of the two fans we recommend replacing it within one week.
In the event of failure of both fans the CPU temperature and CPU usage (total load) of the ACB in question should be checked first (Webmin: Performance Management). If the CPU temperature is clearly below the limit value of 100 degrees $C$ ( 212 degrees $F$ ) the defective fans should be replaced within the following two days. For safety reasons the CPU temperature should controlled at regular intervals until then. If the CPU temperature is only slightly below or even above the limit value the defective fans must be replaced as soon as possible.

## Projects

Up to four ACBs shall be allowed per module. However, only two per frame to provide sufficient heat dissipation. The software can handle this (a confirmation test will be provided later), four per module were mentioned as the upper limit for systems with HSCB during the workshops with system specialists.

### 8.5.1.3 Removing and Inserting the board

The ACB board may be removed or inserted during system operation, if the S1 switch handle has been moved to the left.

In single module systems, removing the ACB board during operation will result in a total breakdown.
In multi-module systems, removing the ACB board will result in the failure of this module or of the central functions depending on the BS Confi data packet.

### 8.5.1.4 Operation ACB

Refer to handling specification HSP to ACB, APS IEE2.1

### 8.5.2 AEV24B adapter Ethernet / V24 B module

## Short description

The adapter board Ethernet / V24 B module (AEV24B) is fitted in the R1 racks only behind the ACB or VOIP boards.

AVE24B board

1. RJ45 socket (8 pins), 1st V24
2. RJ45 socket (8 pins), 1st V24 (not for VOIP)
3. 15-pin D socket for 6-pair cable to the MDF (not for VOIP)
4. 26-pin connection strip as output for SCA 28.7640.385x using pre-assembled cable (only for use in I33 with the ACB Advanced Computer Board)
5. RJ45 socket for the Ethernet connection for the hub (data network connection, LAN switch)
6. RJ45 socket for the Ethernet connection for a PC (direct connection to PC)
7. Plug for backplane
8. Fixation

It is not permitted for the Ethernet connections for the hub (5) and the PC (6) to be active concurrently.

Applications for V24 ports

| First V24 port | with ACB | Linux system console |
| :--- | :--- | :--- |
|  | with VOIP | System console for the VOIP board |

| second V24 port | with ACB | MML system console |
| :--- | :--- | :--- |
|  | with VOIP | none |

### 8.5.2.1 MDF Connections

The connections described hereafter are only relevant for connection in the I33.
On the MDF the 6-pair (16-pin D plug) cable should be connected as follows.

| MDF | AEV24B |
| :---: | :---: |
| Colours |  |
| RD/BU | A1/B1 (T) S0 connection for service PC (*) |
| WH/YE | C1/D1 (R) S0 connection for service PC (*) |
| WH/GN | A1/B1 (T) S0 test subscriber (*) |
|  | UP0 test subscriber (*) |
|  | a1/b1, analog test participants (*) |
| WH/BN | C1/D1 (R) S0 test subscriber (*) |
| WH/BK | free |
| WH/BU | free/GND (plug screen) |

* Connect the S0-, UP0 and a/b test connections from the MDF to the PBX.

### 8.5.2.2 V. 24 Interfaces

see also interface configuration
PIN assignment of the V24 ports

Assignment of the V. 24 interfaces

The cable connections for the hub are not crossed; those for the PC are crossed.

### 8.5.3 ASCxx Analogue Subscriber Circuit

## Short description

The ASC board is available in the following variants:
ASCEU: Europe with the following characteristics:

| Country-specific <br> variants are <br> configurable using <br> board software for <br> the following <br> countries: | Germany, Spain, Netherlands, Switzerland, Italy, Belgium, Austria, Greece, Mexico <br> and Venezuela |  |
| :--- | :--- | :--- |
| Power demand +5V | 620 mA |  |
| Interfaces | $16 \mathrm{a} / \mathrm{b}$ (connectors for analog terminals in accordance with country-specific <br> guidelines) |  |
| Constant current <br> supply | 24 mA , switchable to 30 mA (mounting of a 0 ohm resistance) |  |
|  | Line resistance | $2 \times 475$ Ohm |
|  | Range | 4 km installation cable J-Y(ST)Y Ø0.4 mm <br> 9 km installation cable J-Y(ST)Y Ø0.6 mm <br> 15 km installation cable J-Y(ST)Y $\varnothing 0.8 \mathrm{~mm}$ <br> Line lengths for Message waiting $\rightarrow 325$ |
| DTMF/pulse dialling, flash and earth button detection, Telecom-specific (dependent on terminals) |  |  |
| Short and long flash time, Telecom-specific (dependent on terminals) |  |  |
| Overvoltage protection up to 4 kV <br> Board software download <br> Board identification using board pass <br> Maintenance function |  |  |

## Polarity reversion for "message waiting" signalling <br> Connection of external announcement devices

ASCF: France with the following characteristics:

| Power demand +5 V | 620 mA |
| :--- | :--- |
| Interfaces | $16 \mathrm{a} / \mathrm{b}$ (connectors for analog terminals in accordance with French guidelines and <br> voice terminals) |
| Resistance feed <br> (const. voltage) | $2 \times 400$ Ohm |
| DTMF/pulse dialling, polarity reversal and button detection |  |
| Overvoltage protection up to 4 kV |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |
| Symmetric call supply |  |
| Polarity reversion for "message waiting" signalling |  |
| Connection of external announcement devices |  |

## ASCGB: Great Britain

| Power demand +5 V | 620 mA |
| :--- | :--- |
| Interfaces | $16 \mathrm{a} / \mathrm{b}$ (connectors for analog terminals in accordance with British guidelines) |
| Constant current <br> supply | 30 mA |
|  | Loop range |
| 900 ohms |  |
| DTMF/pulse dialling, flash and earth button detection |  |
| Overvoltage protection up to 4 kV |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |
| Polarity reversion for "message waiting" signalling |  |

### 8.5.3.1 Line lengths for Message waiting

The range for Message waiting signaling for analogue subscribers of the ASCEU board with the ICU programme ASCEU018.ICP in connection with the various apparatus types and seizure (pick up on call) and outgoing seizure (pick up) with the installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,4 \mathrm{~mm}$ is:

|  | Outgoing seizure (pick up) |  | Incoming seizure (pick up in call) |  |
| :--- | :--- | :--- | :--- | :--- |
| Apparatus types | Line length [m] | Line length [W ] | Line length [m] | Line length [W ] |
| Tel. T40 | 1400 | 379 | 1400 | 379 |
| Tel. TE51 | 1000 | 272 | 1000 | 272 |
| Tel. TE91 | 1000 | 272 | 1000 | 272 |

| Tel. TC91 | 1100 | 298 | 1100 | 298 |
| :--- | :--- | :--- | :--- | :--- |
| Tel. TB510LED <br> DE | 1100 | 298 | 600 | 163 |
| Tel. TB519D | 900 | 245 | 900 | 245 |
| Tel. TK40-20-2 | 300 | 83 | 300 | 83 |

## Recommendation

The line length with which the performance feature Message waiting is to be operated with conventional signaling (permanently illuminated LED signal), should not exceed

| 600 m | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0.4 \mathrm{~mm}$ ) |
| :--- | :--- |
| 1.3 km | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0.6 \mathrm{~mm}$ ) |
| 2.4 km | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,8 \mathrm{~mm}$ ) |

Malfunctions may occur when establishing a connection if the lines are any longer.
The tel. TK40-20-2 should only be operated with a 300 m (83W) line length.
Deviations from the recommended line length are possible.
If the lines are any longer, a different Message waiting signal (signal LED blinks) should be selected. Signalling is implemented in the ICU programme ASCEU019.ICP for the ASCEU board.

### 8.5.3.2 LEDs and Switch Functions

ASCxx board, front side

1. LED red
2. LED green

## Switch Position in Normal Operation

| S1 | Middle position |
| :--- | :--- |

## Switch Function

| S1 | Left: | Preparatory disabling (of all connecting circuits) |
| :--- | :--- | :--- |
|  | Middle: | Neutral/release/ operating status |
|  | Right: | Reset board |
|  | Right, then left: | Forced board download |

## Meanings of LEDs

| L1 | on: | Board is busy with switching functions |
| :--- | :--- | :--- |
|  | flashing: | Module can be removed after preparatory disabling (VSP) or <br> blocked in terms of software |
|  | off: | Board is not busy |
| L2 | on: | Board reset in progress |
|  | flashing: | Download in progress |
|  | off: | Board in operation |

### 8.5.3.3 Bridge positions

The power supply can be increased from 24 mA (standard) to 30 mA per line in this board: The increase in the supply current is implemented by inserted 0 Ohm resistors or bridges at the following coordinate points:

| AO1 | 197077 |
| :--- | :--- |
| AO2 | 199128 |
| AO3 | 173069 |
| AO4 | 179116 |
| AO5 | 155077 |
| AO6 | 157128 |
| AO7 | 131069 |
| AO8 | 137116 |
| AO9 | 113077 |
| AO10 | 115128 |
| AO11 | 089069 |
| AO12 | 095116 |
| AO13 | 071077 |
| AO14 | 073128 |
| AO15 | 047069 |

| AO16 | 053116 |
| :--- | :--- |

### 8.5.3.4 MDF Connections

| MDF |  | Cable Adapter CA1B/CARUB from ASCxx |

| WH/BU | WE 16 | a16/b16 |

### 8.5.4 AV24B Adapter V24 B Module

## Short description

The adapter board V24 / B module (AV24B) is fitted in the R1 racks only behind the HSCB board or with the CBT service board.

AV24 B board

1. BG AV24B, soldering side
2. 26-pin strip connector to the SCA $28.7640 .385 x$ board (only for use in I33)
3. 15-pin D plug for the six-pair cable to the HVT for a tester, service PC or DuWa test jack (only for use in 133)
4. 9-pin D plug, 2nd V24
5. 9-pin D plug, 1st V24
6. HSCB slot
7. BG HSCB module

| First V24 port | Used to connect the PC for CBT applications, such as logging etc. |
| :--- | :--- |
| second V24 port | can be configured in the IVL (HSCB with HGS) as a connecting interface of the <br> DCF77 receiver. |

### 8.5.4.1 MDF Connections

The connections described hereafter are only relevant for connection in the I33.

| MDF | AV24B |
| :---: | :---: |
| Colours |  |
| RD/BU | A1/B1 (T) S0 connection for service PC (*) |
| WH/YE | C1/D1 (R) S0 connection for service PC (*) |

| WH/GN | A1/B1 (T) S0 test subscriber (*) |
| :---: | :---: |
|  | UP0 test subscriber (*) |
|  | a1/b1, analog test participants (*) |
| WH/BN | C1/D1 (R) S0 test subscriber (*) |
| WHBK | a11/b11 (DID test device) $\left(^{*}\right)$ |
| WH/BU | a12/b12 (DID test device) (*) |

* Connect the S0-, UPO and a/b test connections from the MDF to the PBX.

### 8.5.4.2 V.24 Interfaces

seeInterface Configuration $\rightarrow 525$
PIN assignment of the V24 ports

Assignment of the V. 24 interfaces

| PIN1=free; |
| :--- |
| PIN2=RXD; |
| PIN3=TXD; |
| PIN4=DTR (only supported for HSCB); |
| PIN5=GND; |
| PIN6=DSR (only supported for HSCB); |
| PIN7=RTS (only supported for HSCB); |
| PIN8=CTS (only supported for HSCB); |
| PIN9=free |

## Connections from the first V24 port of the CA3B in the B3 module

| PIN1/PIN6 | A1/B1 (R, external clock 2048/1544 kHz) |
| :--- | :--- |

### 8.5.5 CA Cable Adapter

## Short description

The CA Cable Adapters are fitted in the rack (only I55) and allow connecting circuit board connections to be switched through to the MDF.

### 8.5.5.1 CA Assignment

Cable Adapters for Digital connecting device boards

| Board | Cable adapter |
| :--- | :--- |
| CAS | CA1B |
|  | CA4B |
|  | CA1B |
|  | CA4B |
| DS02 | CA1B |
| DT0 | CA2B |
| DT21 | CA1B |
|  | CA1B |

| DUP03 | OFA2B |
| DUPN | CA1B |
| IMUX | CA2B |
| MAC | CA5B |
| HAMUX | CA6B |
| MULI | CA6B |
| ADM | CA1B |
| UIP without V.24M | CA2B |
| UIP with V.24M | CA1B |

Cable Adapters for Analog connecting device boards

| Board | Cable adapter |
| :--- | :--- |
| ASC2. | CA2B |
|  | CARUB |
| ASC . . | CA1B |
|  | CARUB |
| ATA/B/C | CA1B |
| ATLC | CA2B |
|  | CARUB |
| DDID | CA1B |
| JPAT | CA2B |
|  | CARUB |

Cable adapters for IP telephoning Gateways

| Board | Cable adapter |
| :--- | :--- |
| IPGW | CAIB |
| VoIP | AEV24B |

## Cable Adapters for Other Connectors

| CF22/CF2E | ESBx |
| :--- | :--- |
| ACB | AEV24B |
| HSCB | AV24B |
| ICF + CL2M | CA3B (B3 module and ICS) |

### 8.5.6 CA1B cable adapter 1 for $B$ modules

## Short description

Cable adapter for 16, 4 or 2-pair analog or digital connecting circuit line for boards ASCEU, ASCF, ASCGB, ATAx, ATB, ATC, DDID, DUP03, DT0, DT21, CAS, DCON, UIP without V24M, MULI and DECT21 with

- 50-pin CHAMP plug as an output to the MDF
- Overcurrent breakpoint (230 V contact)

1. 16, 4 or 2-pair to the MDF/NT

2. Release the lock by pressing the bracket
3. Do not turn the screw!

### 8.5.7 CA2B cable adapter 2 for $B$ modules

## Short description

Cable adapter for 2 to 8 -wire analog or 4 -wire digital connection device line for the ASC2, ASC21, ATLC, DS02, DUPN, JPAT and ADM boards with

- 50-pin CHAMP plug as an output to the MDF
- Overcurrent breakpoint (230 V contact)

1. Cable $1(16 \times 2)$ to the MDF
2. Cable $2(16 \times 2)$ to the MDF

### 8.5.8 CA3B cable adapter 3 for $B$ modules

## Short description

Cable adapter for the UIP board, provided that the V24M submodules are also inserted here. The board is also required for external synchronization when using the CL2M/CL2MEM on ICF (B3 module or ICS).

- 50-pin CHAMP plug as an output to the MDF
- 2x 9-pin D plugs for V24 interfaces or connection of high precision reference clock
- Overcurrent breakpoint (230 V contact)

If the first slot of a UIP board is equipped with a CL2ME for the clock supply of TAREF it is necessary to use the CA3B/T cable adapter.

1. Cable 16X2 to MDF

2. Cable for connecting an external clock source plugged on the first V .24

### 8.5.9 CA3B/T cable adapter 3 for B modules TAREF

## Short description

Cable adapter for UIP board if the clock supply from TAREF is implemented via the CL2ME inserted on the first slot of the UIP.

The V24M submodules can also be inserted here.

1. Cable for connecting the TAREF (material number: 27.5630 .0531 ) inserted in the first V. 24

### 8.5.10 CA4B cable adapter 4 for $B$ modules

## Short description

Cable adapter for the connection of coax lines when using boards DT21, CAS and DCON, provided that these modules are set on unsymmetrical interfaces.

- 2 BNC Coax sockets as output to NT or MUX.

1. Coax cable to NT or MUX

### 8.5.11 CA5B cable adapter 5 for B modules

## Short description

Cable adapters for the connection of V. 24 and X. 21 connectors to the IMUX board.

- Cable to the TA of the network operator or MDF (X1 and X5)
- 1x 15-pin Sub-D female Connector for X. 21 data terminals (X4)
- 1x 25-pin Sub-D female Connector for V. 24 data terminals (X3)
- Overcurrent breakpoint (230 V contact)
- Ground breakpoints (see IMUX board)

1. Cable Adapter 5B, rear component side, breakpoints

### 8.5.12 CA6B cable adapter 6 for $B$ modules

## Short description

Cable adapter for connecting UP0 and S2M connections to MAC and HAMUX boards.

- 50-pin CHAMP plug as an output to the MDF
- 8-pin WE plugs

1. Cable 16X2 to MDF
2. 8-pin WE plugs

### 8.5.13 CAIB Cable Adapter I for B Modules

## Short description

Cable adapters for the connection of the connections to the IPGW board.

CAIB cable adapter

1. Connection cable CAIB - MDF

Cable adapter CAIB, component side

1. Cable $6 \times 2$ to the main distribution frame
2. RJ45 socket for the Ethernet connection
3. V. 24 connection
4. Plug for backplane
5. Fixation

### 8.5.14 CARUB Cable Adapter Russia B modules

## Short description

The cable adaptor CARUB are used in Russia and the USA for the connection of ASCEU, ASC2, ASC21, JPAT and ATLC boards.

- 50-pin CHAMP plug as an output to the MDF
- Overcurrent breakpoint (230 V contact)
- Protective elements for contact with outside voltage

1. Cable 1 (16x2) to the MDF
2. Cable 2 ( $16 \times 2$ ) to the MDF

### 8.5.15 CF22 Central Functions 22

## Short description

The central board CF22 is the basic equipment in all modules. It replaces the CF2E board.
It supports:

- the dealer functions
- intermodule handover functions for DECT and
- call number display for incoming calls to analogue terminals ("CLIP" Calling Line Identification Protocol). As opposed to CF2E it only features one DSP system.

| Features |  |
| :--- | :--- |
| Ports | 544 |
| B channels (time slots) | 1088 |
| ILMx | + |
| DECT | + |
| Internal traffic flow | 1088 Erl. |
| External traffic flow | 225 Erl. |

## Features

Clock Supply and Module Synchronization
External synchronization via network nodes (S0, S2M).
Master function in multi-module systems can be set up using software.
Master free-run clock mode (internal clocking)

## Module Switching Matrix

Bit rate $4,096 \mathrm{MBit} / \mathrm{s}$
Module internal non-blocking

## 11 DTMF receiver sets, 4 DTMF transmitters (only for dialling)

## Call Progress Tones

A maximum of 16 call progress tones can be generated as customer-specific or country-specific and can be cyclically repeated. At the same time unrestricted supply is possible.
In addition, a maximum of 3 tones with burst character can be supplied.

## Short Voice Messages

Up to 8 voice messages or "music on holds" can be used. The total duration of all brief voice messages must be no longer than 64 sec .

## Long Voice Messages

4 voice messages with unspecified time limits and confidata can be set up (connecting message devices via analogue subscriber line circuits). At the same time unrestricted supply is possible.

## Tone Injection in Two-Party Conversations

Up to 3 various cyclic tones can be generated which may be fed into a maximum of 15 two-party conversations (e.g. call waiting tone, rolling tone etc.).

## Conferences

The system software only allows three-party conferences.
Only dealer terminals support conferences with more participants.

```
Call number ID
8 DTMF transmitters for CLIP (call nummer indication on analogue terminals for incoming calls)
```

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 1400 mA |

A high precision reference clock is required for the intermodule handover functions. This can be carried out through the use of the CL2M submodule on the UIP or ICF. See also Intermodule Handover section.

If fibre-optic links are used, the CF22 board is to be fitted with the submodule CFIML Central Function Inter Module Link.

### 8.5.15.1 Jumper and DIL Switch Functions

Configuration switches are located on the component side of the board. The functions and positions of these switches are described below:

CF22 board, component side

1. DIL switch, 8-part
2. DIL switch, 4-part
3. Fuse F2 for the power supply EOC, 500 mA replaceable
4. LED red:

Loadable hardware of the board out of service
Operation of the board is not possible
5. FPGA Boot/Load PROM
6. Fire protection fuse 7A

If the fire protection fuse is defective (burned out), the board must be replaced by a new one.
7. LED green: R/T active
on: High data traffic
flashing: Data packet being received/sent to/from the micro processor
8. LED yellow: TFAIL
flashing: Packet loss in transmission buffer because of transmit time-out or reset, or synchronization fault in the micro processor
9. LED red: RFAIL
flashing: Packet loss in receiver buffer because of receive time-out or reset
10. CFIML submodule Central Function Inter Module Link

## Functions of the DIL Switches, 8-part

|  | Switch | Switch |
| :--- | :--- | :--- |
| System configuration for MMG | 1 | 3 |
| Single module system | ON | ON |
| Two module system, first module | ON | OFF |
| Two module system, second module | OFF | ON |
| Two module system, systems with more than two modules | OFF | OFF |
|  |  |  |
| Specification of highest scan address | 2 | 4 |

| 55 | ON | OFF |
| 87 | OFF | ON |
| 126 (Default) | OFF | OFF |
|  |  |  |
| Battery status query (AIC) |  | 5 |
| Testing of -48 V battery is not possible |  | ON |
| (Default) |  | OFF |
| Testing of -48 V battery active |  | ON |
| When using PS350 with a connected battery (only Integral 33): Switching on the battery voltage <br> monitoring | OFF <br> Error signalling unit <br> with ESU <br> without ESU |  |

In order to get the correct signalling direction ATA with EE8B in a communication server Integral 55 with ESBA instead of ESB, switch 6 must be placed to ON (with ESU).

|  | Switch |
| :--- | :--- |
| Download | 7 |
| Download inactive | ON |
| Download possible (default) | OFF |
|  |  |
| Module Manager Watchdog | 8 |

| Watchdog inactive | ON |
| :--- | :--- |
| Watchdog active (default) | OFF |

Functions of the DIL Switches, 4-part

|  | Switch |
| :--- | :--- |
| Intermodule handover | 1 |
| for twin and multi-module configuration: Intermodule handover active between <br> modules | ON |
| for twin and B3 configuration: Intermodule handover not active between modules | OFF |
|  | 2 |
| Optical waveguide length compensation (only with doubled CF2E) | ON |
| Activation of the length compensation function for the default passive CF slot | OFF |
| Deactivation of the length compensation function for the default passive CF slot |  |
|  | 3 |
| Switch still without function | 4 |
|  |  |
| Switch still without function |  |

### 8.5.15.2 LEDs and Switch Functions

CF22 board, front side

## Switch Position in Normal Operation

| S1 | Middle position |
| :--- | :--- |
| S2 | Middle position |

## Switch Function

| S1 | Reset switch |  |
| :--- | :--- | :--- |
|  | Middle: | Operating status |
|  | Left: | Reset of the board, locking |
|  | Right: | Reset board, keying |
| S2 | Service Switch |  |
|  | Middle: | Operating status |
|  | Left: | No function, locking |
|  | Right: | With a doubled CF2x: Activate switchover, keying |

## Meanings of LEDs

| L1 | ACTIVE | MSMC active/inactive |
| :--- | :--- | :--- |
|  | on: | MSMC (switching matrix processor unit) resetting/inactive |
|  | flashing: | MSMC downloading or waiting for commissioning |
|  | off: | MSMC active |
| L2 | CLKUA | Clock unit active |
|  | on: | Normal operation: Active module clock unit |
| L3 | IMHOSYNC | Module is synchronised for DECT operation |
|  | flashing: | Resynchronization (flashes for 30 sec.) |
|  | off: | Module is not synchronised for DECT operation |
|  | L! | This operating status may also occur if switch 1 of DIL switch 2 is in <br> the ON position (IMHO active) while LED L4 is on. |
|  | MAFREI | Master free-run clock mode (internal clocking) or external <br> L4 |
|  | on: | synchronization (if L10 is also on) |

|  | flashing: | temporary synchronization fault on a DSP Highway |
| :--- | :--- | :--- |
|  | off: | DSP system in operation |
| L14 | RFAIL |  |
|  | on or flashing: | One or more C-bus receive errors |
|  | off: | C-bus in operation. CFIML submodule not inserted into the CF22. |

### 8.5.15.3 Doubling

It is possible to double the CF22 board in the R1 rack.
SeeDoubling $\rightarrow 143$

### 8.5.15.4 Removing and Inserting the board

ESD-measures must be accomplished when working with boards susceptible to electrostatic shock.
The CF22 board can be removed or inserted during system operation. However, the module will not operate if the CF22 is not doubled.

Removal of the board is followed by a restart without loading customer data.
When doubling, the CF22 board may only be removed when in passive status (LED 2 off). If LED 2 is on, place switch S2 into the right position. LED 2 Off The board can now be removed.

### 8.5.16 CF2E Central Functions 2E

## Short description

The central board CF2E is the basic equipment in all modules.
It supports the dealer and intermodule handover functions for DECT.

| Features |  |
| :--- | :--- |
| Ports | 544 |
| B channels (time slots) | 1088 |
| ILMx | + |
| DECT | + |
| Internal traffic flow | 1088 Erl. |
| External traffic flow | 225 Erl. |

| Features |
| :--- |
| Clock Supply and Module Synchronization |
| External synchronization via network nodes (S0, S2M). |
| Master function in multi-module systems can be set up using software. |
| Master free-run clock mode (internal clocking) |

| Module Switching Matrix |
| :--- |
| Bit rate 4,096 MBit/s |
| Module internal non-blocking |

## 11 DTMF receiver sets, 4 DTMF transmitters

## Call Progress Tones

A maximum of 16 call progress tones can be generated as customer-specific or country-specific and can be cyclically repeated. At the same time unrestricted supply is possible.
In addition, a maximum of 3 tones with burst character can be supplied.

## Short Voice Messages

Up to 8 voice messages or "music on holds" can be used. The total duration of all brief voice messages must be no longer than 64 sec .

## Long Voice Messages

4 voice messages with unspecified time limits and confidata can be set up (connecting message devices via analogue subscriber line circuits). At the same time unrestricted supply is possible.

## Tone Injection in Two-Party Conversations

Up to 3 various cyclic tones can be generated which may be fed into a maximum of 15 two-party conversations (e.g. call waiting tone, rolling tone etc.).

## Conferences

The number of subscribers at a conference is 3 .

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 2200 mA |

The CF2E board is supported from the programme file MSC2P006 onwards.

A high precision reference clock is required for the intermodule handover functions. This can be carried out through the use of the CL2M submodule on the UIP or ICF. See also Intermodule Handover section.

In coupling via LWL, the CF2E module is to be fitted with the submodule CFIML central function inter module Link.

### 8.5.16.1 Jumper and DIL Switch Functions

Configuration switches are located on the component side of the board. The functions and positions of these switches are described below:

CF2E board, component side

1. DIL switch 3
2. DIL switch 2
3. Fuse F1 for the power supply EOC, 500 mA replaceable
4. LED red:

Fault indicator of the central functions
Hardware out of order
5. Fire protection fuse F3, 7 A

If the fire protection fuse is defective (burned out), the board must be replaced by a new one.
6. LED green: R/T active
on: High data traffic
flashing: Data packet being received/sent to/from the micro processor.
7. LED yellow: TFAIL
flashing: Packet loss in transmission buffer because of transmit time-out or reset, or synchronization fault in the micro processor
8. LED red: RFAIL
flashing: Packet loss in receiver buffer because of receive time-out or reset
9. CFIML submodule Central Function Inter Module Link

|  | flashing: | Resynchronization (flashes for 30 sec .) |
|  | off: | Module is not synchronised for DECT operation |
|  |  | This operating status may also occur if switch 1 of DIL switch 2 is in the ON position (IMHO active) while LED L4 is on. |
| L4 | MAFREI |  |
|  | on: | Master free-run clock mode (internal clocking) or external synchronization (if L10 is also on) |
|  | flashing: | Internal free-run clock mode (internal clocking) after failure of synchronous clock via beam waveguide path |
| L5 | AMEX1S | Alarm message ext. synchr. clock 1 sec. |
|  | on: | Failure of synchronizing clock signal for more than 1 sec . (with master module: clock pulse from local exchange, network node; with slave module: clock pulse via fibre-optic cable) |
| L6 | $\begin{aligned} & \hline \text { DSP } \\ & \text { System } 1 \end{aligned}$ | Status - LED |
|  | on: | Boot phase after board reset or DSP system 1 defective |
|  | off: | DSP system 25.40 mm operation |
| L7 | TFAIL |  |
|  | flashing: | Packet loss in transmission buffer because of transmit time-out or reset, or synchronization fault in the micro processor |
| L8 | MMG | MMG status |
|  | on: | MMG not in operation (no board operation) or defective beam waveguide connection (after CF reset in multi-module system) |
|  | flashing: | MMG in operation, but board logon not yet possible |
|  | off: | MMG in operation |
| L9 | CLKUSYN | Clock unit synchronization |
|  | on: | Module clock system is synchronized |
| L10 | MANK | Master network node |
|  | on: | External synchronous clock switched on for synchronization by the system software |
| L11 | IDR | IDR fault from IMLA (e.g. beam waveguide not in order) |
| L12 | ECLKU | Error clock unit |
|  | on: | Clock system error |
|  | flashing: | After failure of synchronous clock via beam waveguide |

| L13 | DSP <br> System 2 | Status - LED |
| :--- | :--- | :--- |
|  | on: | Boot phase after board reset or DSP system 2 defective |
|  | off: | DSP system 2 in operation |
| L14 | RFAIL | Packet loss in receiver buffer because of receive time-out or <br> reset |
|  | flashing: |  |

### 8.5.16.3 Doubling

It is possible to double the CF2E board in the R1 rack.
SeeDoubling $\rightarrow 143$

### 8.5.16.4 Removing and Inserting the board

ESD-measures must be accomplished when working with boards susceptible to electrostatic shock.
The CF2E board can be removed or inserted during system operation. However, the module will not operate if the CF2E is not doubled.

Removal of the board is followed by a restart without loading customer data.

| $!$ | When doubling, the CF2E board must only be removed when in passive status (LED 2 off). If <br> LED 2 is on, place switch S2 into the right position. LED 2 Off The board can now be <br> removed. |
| :--- | :--- |

### 8.5.17 EDU Error Display Unit

## Short description

The EDU boards are used either optionally in the service panel or in the multi-module ( $1 / 2 \mathrm{k}$ rack) as fault displays.

| Features |
| :--- |
| 18 red LEDs for indicating fault statuses. |
| 1 green LED for display of operational readiness |
| $26-$ pin pin strip for control cable connection |

EDU board on the ESB board

1. BG ICF (only in the B3 module)
2. Ribbon cable
3. Board ESB
4. 26-pin plug
5. $10 \times 2$ LEDs
6. EDU board (located on the service panel or on the front of the $1 / 2 \mathrm{~K}$ racks)

| L12 | (redver) | Loss of redundancy | $\begin{aligned} & 227,228,361, \\ & 362,363,364, \\ & 401 \end{aligned}$ | Switch off using MML after fault elimination. |
| L13 | (synausf) | Synchronization failure | 649 | 650 |
| L14 | (ausfext) | External facility failure | $\begin{aligned} & 530,615,617, \\ & 619,621,694, \\ & 696 \end{aligned}$ | Switch off using MML after fault elimination. |
| L15 | (imtustoe) | IMTU malfunction | 643, 644 | 645 |

* LED2 is activated via the HGS driver.

A LED stays activated until the required switch off text code is output or until it is switched off by means of the SSUP MML program (submenu MANI; command FSSM).

It is not possible to freely configure the LEDs that are not occupied. The assignment of LED and S01 text code is a fixed part of the S01 program.

The S01 does not distinguish between the different system types; this has to be done by the user of the S01 task.

For a description of the S01 texts for the E070V06 version, see E070V06 S01

### 8.5.18 EESOB Emergency Extension Switch SO B Module

## Short description

For special services, such as the police force, fire brigade or Red Cross, whose answering facilities must always be available, the Emergency Extension Switch S0 for CSI55 is available. In the event of a power failure or other malfunctions, this modules enables a switchover from the connecting line coming from the ISDN network to sets that are powered by the ISDN network.
3.

EESOB board

1. Cable $1+2$, each 24 -pair to external MDF
2. Champ plug
3. EESOB
4. Pl. 1
5. PI. 2

## Instructions

Connection to a DT0, i.e. 2 DAs are to be switched per port.
Switchover is implemented to a set that is only used when the switchover is active.
For this purpose, a switchover with 1 WP each for the analog voice documentation.
Two 50-pin plugs are available as external connectors.

| Switch-over criteria |
| :--- |
| General power failure |
| PC Board DT0 removed |
| Manual actuation of an external potential-free switch |

The number of ports is determined by the limited number of plug positions.
The port $1 . .6$ contains the switchover option. Port 7 and 8 are directly switched through.
The switchover is implemented with 4 wires.
For each port, an additional 2 switchover contacts are brought out, via which, for example, lines to voice recording devices are switched.

The power supply to the board is implemented with GND from the DT0. -48 V is fed via the connecting cable. One wire is fed for the forced switchover via the connecting cable.

Connection cables required: 2 cables $24 \times 2$ I55-HVT (MDF) 29.9030.56xx (xx = cable length)

1. ISDN line
2. Answering with emergency set
3. Answering without emergency set
4. Answering
5. Emergency set
6. ZN
7. manual emergency switching
8. Documentation

### 8.5.18.1 Further Information

An NTBA with emergency supply is used as the NT, and the exchange dialling can be loaded with up to 380 mW in this case.

In normal operation, the emergency set has no function and therefore nothing appears in the display.
Facilities of this type are normally only to be handled by trained personnel. It can then be assumed that no unqualified actions shall be initiated by the users.

Each cable adapter is provided with 125 mA semi-lag fuse protection.

### 8.5.19 EESSO Emergency Extension Switch S0

## Short description

For special services, such as the police force, fire brigade or Red Cross, whose answering facilities must always be available, the adapter board Emergency Extension Switch S0 for CSI55 is available. In the event of a power failure or other malfunctions, this modules enables a switchover from the connecting line coming from the ISDN network to S0 sets that are powered by the ISDN network.
3.

EESSO board

1. Cable $1+2$, each 24 -pair to external MDF
2. Champ plug
3. EESSO
4. PI. 1
5. PI. 2

## Instructions

Connection to a DT0 or ADM, i.e. 2 wire paris are to be switched per port.
Switchover is implemented to a set that is only used when the switchover is active.
For this purpose, a switchover with 1 WP each for the analog voice documentation.
Two 50-pin plugs are available as external connectors.

| Switch-over criteria |
| :--- |
| General power failure |
| DTO/ADM board removed |
| Manual actuation of an external potential-free switch |

## Other features

Power demand $-48 \mathrm{~V}=108 \mathrm{~mA}$
The number of ports is determined by the limited number of plug positions.
The port $1 . .6$ contains the switchover option. Port 7 and 8 are directly switched through. Ports 9 to 16 cannot be used (only applies to ADM).
The switchover is implemented with 4 wires.
For each port, an additional 2 switchover contacts are brought out, via which, for example, lines to voice recording devices are switched.
The detection "Board removed" is implemented with GND from the DT0 or ADM.
-48 V is fed via the connecting cable.
One wire is fed for the forced switchover via the connecting cable.
Connection cables required: 2 cables $24 x 2$ I55-HVT (MDF) 29.9030.56xx (xx = cable length)

The X8 connector of the ADM board requires the EEADM submodule.

The EESSO board differs from the EESOB board only in as far as in the EESS0 it is possible to prevent emergency switching of individual ports by means of jumpers.

## Block Diagram

Emergency switchover facility for S0 lines

1. ISDN line
2. Answering station
3. Manual emergency switching
4. Documentation
5. Emergency answer

### 8.5.19.1 Additional measures with ADM

I!If the ADM board is used with emergency switching (EESSO cable adapter) submodule 3 is not required. On the X8 connector (normally for submodule 4) you must insert the EEADM submodule instead of submodule 4.

ADM board, location of EEADM on X8
If the EEADM board is inserted in the wrong place on the ADM board this will cause a defect in the ADM board.

### 8.5.19.2 Jumper

The EESS0 features switching contacts with jumpers to prevent emergency switching of individual ports.

EESSO cable adapter, component side
Upon first delivery emergency switching is active for ports 0 to 5 , i.e. the jumpers are on 2-3 and 5-6. For special applications it is possible to exclude individual ports from emergency switching.
4. 5.6 .

1. 2.3 .

|  | Jumpers 4-5 | Emergency switching for <br> port 1 inactive |
|  | Jumpers 5-6 | Emergency switching for <br> port 1 active |
|  | Jumpers 1-2 |  |
|  | Jumpers 2-3 | Emergency switching for <br> port 2 inactive |
|  | Jumpers 4-5 | Emergency switching for <br> port 2 active |
|  | Jumpers 5-6 | Emergency switching for <br> port 3 inactive |
| Connector X9 | Jumpers 1-2 | Emergency switching for <br> port 3 active |
|  | Jumpers 2-3 | Emergency switching for <br> port 4 inactive |
|  | Emergency switching for <br> port 4 active |  |
|  | Jumpers 4-5 | Emergency switching for <br> port 5 inactive |
|  | Jumpers 5-6 | Emergency switching for <br> port 5 active |

### 8.5.19.3 Further Information

The feedlines of the -48 V should not be connected to the same fuse as those of the PBX because of the current difference between them.

The failure criteria such as fuse failure, board removed or manual switchover trigger a message on the system console so that monitoring from there is guaranteed.

An NTBA with emergency supply is used as the NT, and the exchange dialling can be loaded with up to 380 mW in this case.

In normal operation, the emergency set has no function and therefore nothing appears in the display.
Facilities of this type are normally only to be handled by trained personnel. It can then be assumed that no unqualified actions shall be initiated by the users.

### 8.5.20 EESxB emergency extension switch $B$ module

## Short description

The board EESxB is used to connect the $a / b$ interfaces of the ATA, ATB, ATC and ATA2 modules to the lines leading to the MDF.

The board EES1B serves the direct connection of an analog exchange line to a terminal in the event of a network failure. It provides connections for one analog exchange line, one line with analog terminal and one subscriber line circuit.

The EES8B enables an emergency switchover of eight analog subscriber sets to the network. The board also contains an overvoltage breakpoint ( 230 V contact).

EESxB Adapter module with connection

1. 50-pin Champ plug
2. Cable, 16 or 24 -pair to external MDF
3. EESxB Adapter module

### 8.5.21 ESBx External Signalling B Module

## Short description

The ESBx board is an adapter board which is inserted behind the CF2E, CF22 or ICF board.

| Features |
| :--- |
| 50 -pin CHAMP plug as an output to the MDF. |
| 18 relays for fault indication, one changeover contact per relay. |
| 26 -pin pin strip for connection of the EDU board |
| Total breakdown indication for single or doubled control (adjustable using jumper). |
| 4 inputs used for external status queries, DC decoupled via optocoupler. <br> These may be messages from a UPS for example, that are signalled via the PBX and activate a validation <br> call. |
| 4 fused -48 V electric circuits for the operator sets or NT |
| 4 potential connections for fans with failure supervision. |

| Other features |  |
| :--- | :--- |
| Power demand +5 V | $20-400 \mathrm{~mA}$ (depending on the number of relays to be activated) |

Apart from the fully equipped variant of the ESB there are two variants with reduced equipment:

```
variant
```

| ESBA | without external fault signalling, only power supplies for fan, VA and NT, with no <br> EDU |
| :--- | :--- |
| ESBB | without external fault signalling, only power supplies for fan, VA and NT, with no <br> EDU, all optocouplers equipped. |

The characteristics of the boards can be found in the following table:

| Characteristics of the ESBx board family |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Feature | ESB | ESBA | ESBB | Notes |
| Champ plug | 1 | 1 | 1 | to MDF |
| Relays for fault signalling | 18 | 0 | 0 | one changeover contact per relay |
| Champ plug | 1 | 0 | 0 | Fault signalling by the relay contacts |
| 48V power supply circuit <br> assured | 4 | 4 | 4 | Operator set or NT |
| Optocoupler inputs for <br> interrogating external <br> conditions | 4 | 0 | 4 | e.g messages from a UPS for <br> example, that are signalled via the <br> PBX and activate a validation call. |
| Connection facilities for a <br> fan | 4 | 4 | 4 | with drop-out monitoring |
| 26-pin connector | 1 | 0 | 0 | for EDU connection via ribbon cable |

### 8.5.21.1 Pin strip on the ESBx

- If overload current points of division on the ESBx board are burnt out, the board must be replaced with a new one.
- Never attempt to repair the breakpoints!
- The system may carry out a reset when the board is inserted!

## Assignment of pins to Pin strips on ESB and ESBB boards

|  | Optoc. | Bridge | Optoc. | Bridge |
| :--- | :--- | :--- | :--- | :--- |
| S1/1 | 1 inactive | $1-2$ | 1 active | $2-3$ |
| S1/2 | 2 inactive | $4-5$ | 2 active | $5-6$ |
| S2/1 | 3 inactive | $1-2$ | 3 active | $2-3$ |
| S2/2 | 4 inactive | $4-5$ | 4 active | $5-6$ |
| S3/1 | Module with 1 CFx | $1-2$ | Module with 2 <br> CFx's | $2-3$ |
| S3/2 | Default setting | $4-5$ | Parking position | $5-6$ |

## For use in B3 module (IMTU)

| S3/1 | Module with 1 ICF | $1-2$ | not permissible | $2-3$ |
| :--- | :--- | :--- | :--- | :--- |

Insert the jumpers as required.
To protect against fire and energy hazards, fuses must only be replaced with fuses of the same type. Fuses S1 to S5 Wickmann type TR5-630 mA, 250 V time-lag.

### 8.5.22 HSCB High Speed Computer Board

## Short description

HSCB is the basic equipment in all modules. It is a computer board with dynamic RAM.

| Features |
| :--- |
| Optionally with parity |
| 128 kByte ERROR flash-PROM |
| 512 kByte Boot flash-PROM |
| Buffered real time clock |
| Two-level hardware watchdog |
| Hardware status register |
| C-bus interface |
| 4 B channel accesses |
| 2 V.24 interfaces |
| Downloadable |
| $2 x$ PC card/ATA interfaces for 1.8" PC card driver with ATA mode. Hard disk drives with 260 MB or 1 GB <br> (for large systems) are available for these interfaces. |

| Other features |  |  |
| :--- | :--- | :--- |
| Application | Basic equipment in all modules | without HGS |
| Power demand $+5 \mathrm{~V}$ | 1900 mA | with 1 HGS (startup current) |
|  | 2400 mA | with 2 HGS (startup current) |
|  | 2900 mA |  |
| The drives can be replaced during operation. |  |  |
| The V24NI submodule is used as standard when connecting circuits to the V.24 interfaces. If necessary, it <br> is also possible to use the DC isolated V24I. |  |  |

| Additional Memory | If additional memory submodules (PS2) are inserted into the HSCB, it should be <br> taken into account that the first memory slot must always be occupied. The <br> inserted PS2 memory modules must have an access time of 60 ns. |
| :--- | :--- |

HSCB board, component side

1. Memory 4
2. Memory 3
3. Memory 2
4. Memory 1
5. HGS
6. Battery

The HSCB is equipped with one of the following V. 24 submodules:

- V. 24 I Insulated
- V.24NI Non-Insulated (basic configuration)

The following signals are available for the V.24:

- RXD
- TXD
- DTR
- GND
- DSR
- RTS
- CTS

### 8.5.22.1 LEDs and Switch Functions

HSCB board, front side
Switch Position in Normal Operation

| S1 | Middle position |
| :--- | :--- |
| S2 | Left position |
| S3 | Left position |
| S4 | Left position |

## Switch Function

| S1 | Reset switch and MI button |  |
| :--- | :--- | :--- |
|  | Middle: | Operating status |
|  | Left: | Reset board, locking (see S2) |
|  | Right: | Monitor interruption (TENOBUG start), keying |
| S2 | Memory test switch |  |
|  | Left: (Standard) | No memory test when resetting/restarting |
|  | Right: | Memory test when reseting/reloading the TC system |
|  | Hard Disk Change Request (HDCHR) |  |
|  | Left: | Operating status: PC-CARD-ATA-interfaces in operation |
|  | Right: | Service position: Removing and inserting the HGS(s) |
| S4 | System console connected (SCOCON) |  |
|  | Left: | No device connected (Default), or printer or video terminal <br> connected |
|  | Right: | System terminal connected |

## Meanings of LEDs

| L1 | Fault indication from the control (group statement) |
| :--- | :--- |
| L2 | Indicates module data transfer via the C-bus (e.g. call at subcriber) |
| L3 | Indicates access to the inserted background memory |
| L4 | Indicates that the HGS(s) can be removed |
| L5 | Indicates that the S4 switch is in the "right" position, and that the system terminal can be <br> connected to the first V.24 interface on the AV24B/W (service) |
| L6 | Unused |
| L7- L10 | The LEDs flash to indicate the status from reset to operation. The display remains lit for <br> about 5 seconds if a fault is found in the loading phases 15 to 7 (see following table). If a <br> fatal fault occurs, the reset process is repeated from the beginning (loading phase 15). |

| No. | L7 | L8 | L9 | L10 | Phase name |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 15 | 1 | 1 | 1 | 1 | Start reset phase |
| 14 | 1 | 1 | 1 | 0 | Test flash-PROM |
| 13 | 1 | 1 | 0 | 1 | Test QUICC |
| 12 | 1 | 1 | 0 | 0 | Test real time clock |
| 11 | 1 | 0 | 1 | 1 | Test C-bus interface |
| 10 | 1 | 0 | 1 | 0 | Test DUART (V.24 ports) |
| 9 | 1 | 0 | 0 | 1 | Test dynamic RAM |
| 8 | 1 | 0 | 0 | 0 | Output hardware image |
| 7 | 0 | 1 | 1 | 1 | End reset phase |
| 6 | 0 | 1 | 1 | 0 | Initial program loading (IPL)/IPL ready flag |
| 5 | 0 | 1 | 0 | 1 | STIN program loader is loaded and started |
| 4 | 0 | 1 | 0 | 0 | Operating system has been loaded and started (restart) |
| 3 | 0 | 0 | 1 | 1 | User programs (have been dispatched) have been loaded |
| 2 | 0 | 0 | 1 | 0 | Start of customer data loading in the user programs |

| 1 | 0 | 0 | 0 | 1 | All customer data loaded Start commissioning of module(s) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | 0 | Module(s) in operation |

1 = LED on
$0=$ LED off

### 8.5.22.2 Changing the HGSs

The HGS may be removed or inserted during system operation without the prior removal of the HSCB.
The following procedure must be adhered to:

- Remove static charge from the module frame
- Move S3 switch to the right
- Wait for L4 to light up
- Remove the appropriate HGS

Do not touch the components!

Take hold of the drive from above and below.

- Insert the new HDD
- Move S3 switch to the left
- L4 will go out in a short time

### 8.5.22.3 Removing and Inserting the board

The HSCB board may be removed or inserted during system operation, if the S1 switch handle has been moved to the left.

In single module systems, removing the HSCB board will result in a total breakdown.
In multi-module systems, removing the HSCB board will result in the failure of this module.

### 8.5.23 ICF IMTU Central Functions

## Short description

The central board of the B3 module or ICS is the ICF.

| Features |  |
| :--- | :--- |
| Clock Supply and <br> Synchronization | Clock frequency precision for DECT. |
|  |  |

|  | Remote synchronizable by high precision reference clock and master module <br> (with CL2M or CL2ME) |
| :--- | :--- |
|  | Master function for multi-module systems, adjustable using software. |

| External interfaces |
| :--- |
| 128 receive/transmit highway |
| Outputs for ext. signalling |
| Remote control for power supply |
| LWL connector |
| Ref. clock supply (CL2M) |
| Clocks |
| Micro processor bus |

| Interface to Other Modules |
| :--- |
| Through MLB, with possible MLBIML |
| Transfer of C-bus data. |
| 256 PCM channels. |

Inter Module Manager (IMMG)

Fault Management using Inter Module Manager

| Other features |  |
| :--- | :--- |
| Application | Basic equipment in B3/ICS |
| Power demand +5 V | 3210 mA |
| Battery status query |  |
| Memory Doubling e.g. for Downloading |  |
| Fire Protection Fuse |  |

Difference between ICF . 1321 and . 1331
In .1331, CBI and IMLA are on the board.
The ICF with material number 49.9905 .9146 can be used in the B3 module and in the ICS.

### 8.5.23.1 Jumper and DIL Switch Functions

ICF board, component side

1. DIL switch
2. Jumper
3. Fire Protection Fuse

## Jumper Functions

| Total breakdown (system not in operation) via ESB |  |
| :--- | :--- |
| $1-2$ | Normally closed contact for message |
| $2-3$ | Normally open contact for message |
|  |  |
| Battery status query | Testing of -48 V battery not possible (default) |
| $4-5$ | Testing of -48 V battery active |
| $5-6$ | When using PS350 with connected battery: Switch on the battery voltage monitoring option |

Fire Protection Fuse

| $\mathbf{~}$ | If the fire protection fuse is defective (burned out), the board must be replaced by a new one. |
| :--- | :--- |

## Functions of the DIL Switches

| S1 |  | Error signalling unit |
| :--- | :--- | :--- |

|  | ON: | with ESU |
| :--- | :--- | :--- |
|  | OFF: | without ESU |
|  |  |  |
| S2 |  | System configuration for IMMG |
|  | ON: | IMMG passive |
|  | OFF: | IMMG active |
|  |  |  |
| S3 | S4 | Specification of highest scan address |
| ON | ON | 16 |
| OFF | ON | 32 |
| ON | OFF | 64 |
| OFF | OFF | 128 (default) |
|  |  |  |
| S5 |  | Inter module manager watchdog |
|  | ON: | Watchdog inactive |
|  | OFF: | Watchdog active (default) |
|  |  | CBI master mode switching |
| S6 | ON: | Test mode |
|  | OFF: | CBI master (default) <br> For testing and servicing purposes. Do not change |
|  |  |  |
|  | Non-maskable interruption |  |
| S7 | ON: | Enable NMI |
|  | OFF: | NMI disable (default) <br> For testing and servicing purposes. Do not change |
|  |  |  |
| S8 |  | CBI speed |
|  | ON: | 2 MHz |
|  | OFF: | 4 MHz (default) |

### 8.5.23.2 LEDs and Switch Functions

Switch Functions

| S1 | Reset |  |
| :--- | :--- | :--- |
|  | Left: | No function, locking |
|  | Middle: | Operating status |
|  | Right: | Reset board, keying |
| S2 | Service Switch | No function, locking |
|  | Left: | Operating status |
|  | Middle: | With redundant star coupler: Activate switchover, keying |
|  |  |  |

## Meanings of LEDs

| L1 | No function |  |
| :--- | :--- | :--- |
|  |  |  |
| L2 | Clock unit active |  |
|  | on: | Active module clock unit |
| L3 | When doubling, IMTU status |  |
|  | on: | IMTU active |
|  | off: | IMTU hot stand-by |
|  | flashing quickly: | IMTU active and alternate path switched |
|  | flashing slowly: | IMTU hot-standby and alternate path switched |
|  |  |  |
| L4 | IMMG status |  |

|  | on: | IMMG not in operation (no board operation) |
| :---: | :---: | :---: |
|  | flashing: | IMMG in operation, but board logon not yet possible |
|  |  | With doubled multi-module, also failure of the fibre-optic link ICF $<->$ ICF. |
|  | off: | IMMG in operation |
| L5 | Clock unit synchronization |  |
|  | on: | Module's clock system is synchronized |
| L6 | Master/free-run clock mode |  |
|  | on: | Module prepared by system software for master operation |
|  |  | or |
|  |  | module in master free-run clock mode |

### 8.5.23.3 Removing and Inserting the board

The board may be removed and inserted during system operation.
All existing connections are disconnected if the board is removed. Exception when doubling.

If the active ICF board of a doubled pair is to be removed, the service switch must be used to change it over to the hot stand-by side. After the ICF has been reinserted, the service switch must be switched back again.

### 8.5.23.4 Doubling

Only one ICF board can be inserted for each B3 module.
A doubling of the system can only be implemented by using a second ICS or B3 module.
SeeComplete doubling $\rightarrow 153$

### 8.5.23.5 External clock pulse input

First V. 24 interface of the CA3B (Cable Adapter 3 for B modules)

| PIN 1 | A1 | External clock pulse input 2.048 MHz (high precision reference |
| :--- | :--- | :---: |
| PIN6 | B1 |  |

### 8.5.24 OFA2B/OFAS Optical Fibre Adapter

## Short description

The OFA2B Optical Fibre Adapter 2 B modules and OFAS Optical Fibre Adapter single mode are for connecting the optical waveguides when DT21 boards are used and the optical interfaces are employed.

The boards are used for various optical fibre types:

| OFA2B |  | OFAS |  |
| :--- | :--- | :--- | :--- |
| Graded-index fibres | Mono-mode fibres |  |  |
| Ready-made cable types | CoreØ $\mu \mathrm{m}$ | Ready-made cable types | Core $\varnothing \mu \mathrm{m}$ |
| $29.9030 .6101-6199^{*}$ | 62,5 | $29.9030 .6201-6299^{*}$ | 9,5 |

*The last two characters of the material number indicate the length of the pre-prepared cable in metres.
Cable lengths $>99 \mathrm{~m}$ are handled by the project division.

## Common data for OFA2B and OFAS boards

| Interfaces | Number and form | Wavelength |
| :--- | :--- | :--- |
| Optical transmitters | 1 SC socket | 1300 nm |
| Optical receivers | 1 SC socket | 1300 nm |

| electrical values | 5 V |  |
| :--- | :--- | :--- |
| Supply voltage | 250 mA | typical |
| Supply current | 1.25 W |  |
| Power consumption |  |  |

Depending on the optical fibre used and cross-section area of the optical cable, different maximum cable lengths can be achieved:

| Maximum distances |  |  |  |
| :---: | :---: | :---: | :---: |
| Type of fibre | Optical fibre core $\varnothing \mu \mathrm{m}$ | maximum length km |  |
| Graded-index | 62,5 | 10 |  |
| fibre | 50 | 6,2 |  |
| Mono mode | 9,5 | 15 |  |

## Basic construction of OFA2B and OFAS

OFA2B and OFAS boards are designed for connecting to SC plugs. Neither board is thus compatible with the previous OFA1B board type, which was designed for mono-mode fibre and ST connectors.

### 8.5.25 TER Termination

## Short description

The TER boards are used for line terminations (terminating resistor) of the backplane. Depending on the application, the following TER boards are available:

| Submodules |  |  |
| :--- | :--- | :--- |
| TER2 | Power demand +5V | 110 mA |
| TER3 | Power demand +5V | 90 mA |

When using TER boards, check that they are properly connected.
1.

1. TER slot on the B3 backplane

### 8.6 Analog interfaces

### 8.6.1 ABSM Analog Subscriber Submodule

## Short description

The ABSM submodule is plugged into the ADM board. It makes available four a/b connection for analog end devices, according to country specific requirements with the following features:

| Country-specific <br> variants are <br> configurable using <br> board software for <br> the following <br> countries: | Germany, Austria, Switzerland, Netherlands, Great Britain, Italy, Spain, Belgium, <br> Venezuela, Hungary, Czech Republic, Slovakian Republic, Mexico, Hong Kong, <br> USA, Russia and France |
| :--- | :--- |
| Power demand +5V | 70 mA |
| Interfaces | $4 \times \mathrm{a} / \mathrm{b}$ |
| Constant current <br> supply | 24 mA convertible to 30 mA |
|  | Line resistance |

The connection on the MDF is carried out via the CA2B or CARUB boards.

## Changing the Supply Current

The power supply per connecting circuit can be increased from 24 mA (standard) to 30 mA in this board. The following actions are to be carried out per connecting circuit:

- Equip with 0 Ohm resistance (see illustration)

ABSM board, component side

1. Connecting circuit 1
2. Connecting circuit 2
3. Connecting circuit 3
4. Connecting circuit 4
5. Plug connector to the ADM (internal ADM interface)
6. Plug connector to the ADM (line interface)

### 8.6.2 ABSM1 Analog Subscriber Submodule 1

## Short description

The ABSM1 submodule is plugged into the ADM board. It replaces the ABSM submodule and provides four a/ b connections for analogue terminals, according to country-specific requirements, with the following features:

The connection on the MDF is carried out via the CA2B or CARUB boards.

## Setting of the supply current 30 mA per port

The ABSM1 board implements a subscriber interface with continuous current supply. This means that the switching regulator of each port component provides the supply voltage to the terminal (analogue telephone) in order for the supply current to flow (within the limits of the supply range). A continuous current of 24 mA is adjusted by default.
The supply current can be increased to 30 mA by inserting bridges or 0 ohm resistances. Each of the 4 ports can be adapted individually. A maximum of 4 ports must be changed individually.

Only one of the following setting options should be used for the ABSM1 submodule. Mixing the variants does not make sense!

## Increase of the supply current to 30 mA by inserting bridges on the component side

The following picture shows the component side of the ABSM1. The positions of the soldering spots for the resistances (or bridges) are highlighted and shown in detail next to the board.

Simple wire bridges must be soldered on the component side. Short-circuits as a result of contact with neighbouring components and signalling lines at all costs must be avoided!

ABSM1 submodule, component side
Increase of the supply current to 30 mA by inserting bridges on the solder side
Since the components are in close proximity to each other and since it is not possible to immediately find the modified current setting of an ABSM1 plugged onto the ADM, there is another possibility of setting the current. By soldering wire bridge onto the solder side of the ABSM1 it is possible to obtain the same effect as by soldering bridges onto the component side. The soldering points located between the *1 marks (very small) must be connected by means of a wire bridge. The following figure shows the soldering side of the ABSM1. The port-specific areas are outlined and shown in detail.

ABSM1 submodule, conductor side

There are no components on the soldering side. This simplifies the soldering process and the optical recognition of a chosen current increase. A very exact orientation must be ensured with this variant! We recommend the use of a magnifying glass to make sure that the correct soldering points are connected to each other.

### 8.6.3 ACSM Alternating Current Signalling Submodule

## Short description

The Alternating Current Signalling submodule (ACSM) performs the signal exchange with the remote connecting circuit by transmitting 50 Hz AC impulses back and forwards on the speech lines.

| Other features |  |
| :--- | :--- |
| Country of application | National and international |
| Power demand +5 V | 5 mA |
| Interface to the remote connecting circuit | an a/b (two-core line) <br> The signalling current must be measured. |
| Combinations with other submodules on an ATLC board are possible. |  |

### 8.6.3.1 Setting up the ACSM

In exceptional application cases, a separate alternating current signal for signalling to the remote connecting circuit can be supplied instead of the alternating current from the power supply of the I55. At the MDF, the supply is implemented via the (in this case unused) wires of the incoming $\mathrm{Ka} / \mathrm{Kb}$ speech path. To switch the alternating current signal, two bridges must be disconnected and two bridges inserted on the ACSM submodule.
1.

Section of the soldering side on the ACSM submodule

1. Disconnect two bridges here
2. Insert two bridges here

## Note

The supply must be implemented separately for each port via the associated $\mathrm{Ka} / \mathrm{Kb}$ wires.

### 8.6.3.2 Calibrating the Signalling Current

The signal current comprises the base for signalling between the ACSM and the remote connecting circuit. Because the strength of the current depends on the connecting line between ACSM and the remote connecting
circuit, commissioning or alteration of the connecting line must be followed by individual adjustment of the signal current to and from the remote side.

If the signalling current is too weak, the individual criteria may not be identified. If the current is too strong, this may lead to signal distortion, and subsequent misrepresentation of the individual criteria.
The ACSM submodule is equipped with two potentiometers for adjustment of the signal current to the remote connecting circuit and two measuring points for identification of the signal current from the remote connecting circuit.

For the calibrating procedure, the ATLC board and the corresponding ACSM sub-board should be inserted into the TC system via the Board Adapter (BA) module, material number: 28.5630.590x. This provides access to the potentiometers and measuring points.

| The a.c signalling voltage is located on the sleeve strip lines to the ATLC basic board. |
| :--- | :--- |
| Contact with these parts as well as the component connections is to be avoided. |

Soldering side of the ACSM submodule

1. Potentiometers

### 8.6.3.3 Measuring the Transmitted Alternating Current from the remote connecting circuit

In order to do this, the remote connecting circuit must transmit a continuous alternating current. The intensity of the current is measured by a voltmeter, which is to be set as follows:
Measurement range: 1V-2V, DC
The required measuring points, PP1 (-) and PP2 (+), are illustrated.

Soldering side of the ACSM submodule

1. Potentiometers

The signalling current must be adjusted at the remote connecting circuit until the test points read 0.7 V DC voltage.

Once this process has been completed, the continuous alternating current from the remote connecting circuit is switched off.

### 8.6.3.4 Setting the Transmission Current to the remote connecting circuit

In order to carry out this process, the ACSM must send a continuous alternating current to the remote connecting circuit. To do this, the appropriate testing and blocking switches on the ATLC board must be switched into the right position. The associated LED will flicker slowly, the connecting circuit is now blocked and will transmit continuous alternating current to the remote connecting circuit.

The alternating current transmitted by the ACSM is now measured at the remote connecting circuit, and, by turning the potentiometers alternately, the ACSM adjusts the current to correspond with the remote connecting circuit's requirements. Turning the meters clockwise results in an increase of the transmission current. Turning anti-clockwise results in a decrease of the transmission current.
Subsequently, the testing and blocking switches on the corresponding port of the ATLC must be brought back into the middle (resting) position. The continuous alternating current is switched off, the accompanying LED goes out, and the connecting circuit is ready for operation.
The calibrating procedure is completed.
The ATLC board can now be removed from the BA module and inserted in its place in the PBX.
The corresponding adjustments must be made in the configuration data.

### 8.6.3.5 Adjusting the Configuration Data

- Physical line interface

Set to "AC signalling active".

- Signalling plan

Set the signalling plan so that is identical to that of (coordinated with) the remote connecting circuit.

- Speech path design and relative level

Set one of the following combinations according to the requirement of the interface to the remote connecting circuit.
If your country of application is not listed, select the required level setting for D. Your application then corresponds to German transmission technology.

| Speech path design | Relative level <br> $(\operatorname{PrE} / \mathrm{PrA})$ | Application in countries |
| :--- | :--- | :--- |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{A}, \mathrm{D}, \mathrm{E}, \mathrm{GR}$ |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{B}, \mathrm{L}$ |
| 2-wire | $0 /-7 \mathrm{dBr}$ | F |
| 2-wire | $0 /-7 \mathrm{dBr}$ | NL |
| 2-wire | $0 /-7 \mathrm{dBr}$ | I |
| 2-wire | $-3 /-4 \mathrm{dBr}$ | $\mathrm{D}, \mathrm{GR}$ (default setting) |
| 2-wire | $-3 /-4 \mathrm{dBr}$ | F |
| 2-wire | $-4 /-3 \mathrm{dBr}$ | B, L |

| 2-wire | $-4 /-3 \mathrm{dBr}$ | NL |
| :--- | :--- | :--- |
| 2-wire | $-5 /-2 \mathrm{dBr}$ | D |
| 2-wire | $-6 /-1 \mathrm{dBr}$ | A |
| 2-wire | $-6 /-1 \mathrm{dBr}$ | F |

- Modifications of the signal times may only be made in exceptional circumstances on site.
- Some signalling plans require adjustments to be made to the "digits". The permissible settings can be found in the respective signalling plan.
- Settings for the connecting circuit type must not be changed.

### 8.6.4 ADM Analog Digital Mixboard

## Short description

The ADM board is a basic board which accomodates up to five submodules. The following submodules are available:

| Submodule | Features |
| :--- | :--- |
| STSM | four S0/T0 interfaces as exchange, permanent connection or subscriber <br> connection |
| UPSM | four UPN interfaces as subscriber connections or permanent connections |
| ABSM | four analogue subscriber ports (a/b) |
| UKSM | twoi UK0 master interfaces |
| EEADM | for use of the ADM with S0 emergency sets via cable adapter EESS0 |

ADM board, component side

| $!$ Observe numbering of the submodules |
| :--- | :--- |

| 1 | AO 1-4 |
| :---: | :---: |
| 3 | AO 9-12 |
| 2 | AO 5-8 |
| 4 | AO 13-16 |

If the ADM board is used with emergency switching (EESSO cable adapter) submodule 3 is not required. On the X8 connector (normally for submodule 4) you must insert the EEADM submodule instead of submodule 4.

If the EEADM board is inserted in the wrong place on the ADM board this will cause a defect in the ADM board.

For the ADM board the "Call Reference Length - (CRL)" can be set to a length of one or two bytes for the whole board by means of the ICU editor. The call reference length of 2 bytes is required for QSIG network connection with some third-party PBX. If this setting is used all ports have CRL=2 bytes no matter which protocol is selected. For this reason it was not possible to connect any system terminals with TN1R6 protocol to this ADM board.
As of software version ADM0900.ICL / ADM00009.ICP of the ICU, the behaviour of the ADM board and of the Integral 55 Compact-ADM port has changed. The CRL setting is only adopted for the ports of the board which use the "QSIG" protocol. For all other protocolos the call reference length will always be $C R L=1$. This makes it possible to configure QSIG ports with CRL=2 for networks with third-party systems while it is possible to use system terminals and permanent circuit lines with CRL=1 for other ports with TN1R6 protocol.

| Other features |  |
| :--- | :--- |
| Countries of application | Application in all countries |
| Power demand +5 V | 230 mA |
| Interfaces | 16 times 2/4-wire |
| Overvoltage protection up to 4 kV | Download board software |
| Board identification using board passport |  |
| Maintenance function |  |
| In conjunction with V24IA module debugging interface on the board front |  |

### 8.6.5 ALSM Active Loop Submodule

## Short description

The ALSM module is a submodule for the ATLC. It provides an extension to the signalling variants via a two-wire speech path ( $\mathrm{a} / \mathrm{b}$ line). The ALSM submodule is an interface featuring:

| Options for use | National and international |
| :--- | :--- |
| Power demand +5 V | 30 mA |
| interface | $\mathrm{a} / \mathrm{b}$ |
| Supply/loop recognition (subscriber line circuit) |  |
| Ringing current signalling |  |
| Flash key recognition |  |
| Pulse and DTMF dial recognition |  |
| Possible combination with other submodules in an ATLC board |  |

### 8.6.5.1 Setting up the ALSM

The Active Loop Submodule (ALSM) implements signal exchange with the remote connecting circuit by means of active loop signals (supply and ringing current) on the speech wires.
The ALSM submodule is used for the connection of special facilities (e.g. speech memory). It is also possible to connect analog CB sets or connecting lines which require this type of signalling.

Connection is implemented via a 2 -wire line $(a / b)$.
With the ALSM submodule, the supply current on the a/b line comprises 24 mA (standard). Current changeover to supply current of 30 mA is achieved by disconnecting one conductor path and inserting one bridge (see following illustration).
1.

Section of the soldering side on the ALSM submodule

1. Material number: 28.7640 .6961 or .6962
2. Insert bridge here
3. Disconnect bridge here

The corresponding adjustments must be made in the configuration data.

- Physical line interface

Set to "loop signalling active".

- Signalling plan

Set the signalling plan so that is identical to that of (coordinated with) the remote connecting circuit.

- Speech path design and relative level

Set one of the following combinations according to the requirement of the interface to the remote connecting circuit.

| Speech path design | Relative level (PrE/PrA) | Application in countries |
| :--- | :--- | :--- |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{A}, \mathrm{D}, \mathrm{E}, \mathrm{GR}$ (def.) |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{B}, \mathrm{L}$ |
| 2-wire | $0 /-7 \mathrm{dBr}$ | F (with ALSMF) |
| 2-wire | $0 /-7 \mathrm{dBr}$ | NL |
| 2-wire | $0 /-7 \mathrm{dBr}$ | I |
| 2-wire | $0 /-6.5 \mathrm{dBr}$ | CH |
| 2-wire | $+3 /-5 \mathrm{dBr}$ | UK |
| 2-wire | Special application 1 |  |

If your country of application is not listed, select the required level setting for D. Your application then corresponds to German transmission technology.
In the case of ALSM submodules with material number: 28.7640 .6961 which do not show any wire changes, only a setting of " 2 -wire, special application 1 " is permissible.

In the case of ALSM submodules with material number: 28.7640 .6962 and ASLM submodules with reference no. 28.7640 .6961 which were changed by inserting wire bridges, all settings except " 2 -wire, special application 1" are permissible.

- Adjustments to times must not be made.
- Adjustments to the digits may be made if required.

These settings depend on the application case and the selected signalling plan. The required setting measures are found in the respective signalling plan.

- Settings for the connecting circuit type

The only other permissible setting in addition to connecting circuit type "QUe" is "TS". This setting is used if the ATLC port is to be operated as a "normal" subscriber line circuit. More detailed information can be found in the respective signal plan.

### 8.6.6 ALSMF Active Loop Submodule France

## Short description

The ALSMF board is a submodule for the ATLC and is used in France. It provides an extension to the signalling variants via a two-wire speech path ( $a / b$ line). The ALSMF submodule is an interface featuring:

| Options for use | National and international |
| :--- | :--- |
| Power demand +5 V | 30 mA |
| interface | $\mathrm{a} / \mathrm{b}$ |
| Supply/loop recognition (subscriber line circuit) |  |
| Ringing current signalling |  |
| Flash key recognition |  |
| Pulse and DTMF dial recognition |  |
| Possible combination with other submodules in an ATLC board |  |

### 8.6.6.1 Setting up the ALSMF

The Active Loop Submodule France (ALSMF) implements signal exchange with the remote connecting circuit by means of active loop signals (supply and ringing current) on the speech wires.

In terms of its functions, the ALSMF is identical to the ALSM submodule. However, additional components mean that it is coordinated especially for French transmission technology.
Connection is implemented via a 2 -wire line ( $\mathrm{a} / \mathrm{b}$ ).
A switchover via a point of division is not possible with the ALSMF submodule.
The corresponding adjustments must be made in the configuration data.

- Physical line interface

Set to "loop signalling active".

- Signal code

Set the signalling plan so that is identical to that of (coordinated with) the remote connecting circuit.

- Speech path design and relative level

Set one of the following combinations according to the requirement of the interface to the remote connecting circuit.
If your country of application is not listed, select the required level setting for D. Your application then corresponds to German transmission technology.

| Speech path design | Relative level (PrE/PrA) | Application in countries |
| :--- | :--- | :--- |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{A}, \mathrm{D}, \mathrm{E}, \mathrm{GR}$ (def.) |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{B}, \mathrm{L}$ |
| 2-wire | $0 /-7 \mathrm{dBr}$ | F (with ALSMF) |
| 2-wire | $0 /-7 \mathrm{dBr}$ | NL |
| 2-wire | $0 /-7 \mathrm{dBr}$ | I |
| 2-wire | $0 /-6.5 \mathrm{dBr}$ | CH |
| 2-wire | $+3 /-5 \mathrm{dBr}$ | UK |
| 2-wire | Special application 1 |  |

- Adjustments to times must not be made.
- Adjustments to the digits may be made if required.

These settings depend on the application case and the selected signalling plan. The required setting measures are found in the respective signalling plan.

- Settings for the connecting circuit type

The only other permissible setting in addition to connecting circuit type "QUe" is "TS". This setting is used if the ATLC port is to be operated as a "normal" subscriber line circuit. More detailed information can be found in the respective signal plan.

### 8.6.7 ALSMH Active Loop Submodule Hong Kong

## Short description

The ALSMH module is a submodule of the ATLC and is used for direct inward dialling in Hong Kong.

Once the ALSMH has been installed, it must be set up by the ICU editor in terms of software for Hong Kong (deviating loadlist (.ICL) / Program (.ICP)).
Connection is implemented via a 2 -wire line (a/b).

## Setting up the ALSMH

Refer to the descriptions in the following documents:

- Setting up features
- ICU Editor User Manual

Other features:

| Options for use | National and international |
| :--- | :--- |
| Power demand +5 V | 30 mA |

### 8.6.8 ASC2 Analog Subscriber Circuit 2

## Short description

The ASC2 board makes available $32 \mathrm{a} / \mathrm{b}$ connections for analog end devices, according to country specific requirements with the following features:

| Country-specific <br> variants are <br> configurable using <br> board software for <br> the following <br> countries: | Germany, Austria, Switzerland, Netherlands, Great Britain, Italy, Spain, Belgium, <br> Venezuela, Hungary, Czech Republic, Slovakian Republic, Mexico, Hong Kong, <br> USA, Russia and France |  |  |
| :--- | :--- | :---: | :---: |
| Power demand +5V | 700 mA |  |  |
| Interfaces | $32 \times$ a/b |  |  |
| Constant current <br> supply | 22 mA convertible to 30 mA |  |  |
|  |  |  |  |
|  | Line resistance |  |  |

## In conjunction with V24IA board debugging interface on board front

Debugger = program that helps to track down errors

The connection on the MDF is carried out via the CA2B or CARUB boards.

### 8.6.8.1 Changing the Supply Current

The power supply per connecting circuit can be increased from 22 mA (standard) to 30 mA in this board.
The following steps must be taken:

- Each connecting circuit is fitted with its number on the conductor side or component side of the board.
- The code digit *3 is found in this connecting circuit area.
- Four soldering points are arranged at the position labelled *3. The two soldering points in the middle are connected by a conductor path.
- Connect the right and left soldering point with the two soldering points in the middle. A supply current setting of 30 mA is thereby achieved.

ASC2 board

1. Connecting circuit e.g. 31
2. common for four connecting circuits

### 8.6.9 ASC21 Analog Subscriber Circuit 21

## Short description

The ASC21 board provides $32 \mathrm{a} / \mathrm{b}$ connections for analog terminals, according to country-specific requirements with the following features:

| Country-specific <br> variants are <br> configurable using <br> board software for <br> the following <br> countries: | Germany, Austria, Switzerland, Netherlands, Great Britain, Italy, Spain, Belgium, <br> Venezuela, Hungary, Czech Republic, Slovakian Republic, Mexico, Hong Kong, <br> USA, Russia and France |
| :--- | :--- |
| Power demand +5V | 600 mA |
| Interfaces | $32 \times \mathrm{a} / \mathrm{b}$ |
| Constant current <br> supply | 22 mA convertible to 30 mA |

|  | Line resistance | $2 \times 235$ Ohm |
| :--- | :--- | :--- |
|  | range: | 1.7 km installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,4 \mathrm{~mm}$ |
|  |  | 4.0 km installation cable J-Y(ST)Y $\varnothing 0,6 \mathrm{~mm}$ |
|  | 7.5 km installation cable J-Y(ST)Y $\varnothing 0,8 \mathrm{~mm}$ |  |
| DTMF/pulse dialling |  |  |
| $25 / 50 \mathrm{~Hz}$ ringing current (convertible) |  |  |
| Short and long flash time (end device dependent) |  |  |
| Overvoltage protection up to 4 kV |  |  |
| Board software download |  |  |
| Board identification using board pass |  |  |
| Maintenance function |  |  |
| Polarity reversion for "message waiting" signalling |  |  |
| Connection of external announcement devices |  |  |

The connection on the MDF is carried out via the CA2B or CARUB boards.

### 8.6.9.1 Changing the Supply Current until F Revision

The supply current on the board can be set between 22 mA (standard) and 30 mA per connecting circuit.
Until the F Revision of the ASC21 (shown on the front panel: 49.9906.7719 F) the ASC21 is manufactured with power supply components in a 28 -lead SO ( $\mathrm{SO}=$ Small Outline Package). The housing can be distinguished by the plug-in connections (14) on each of the two longer sides.
The following steps must be taken:
The number of the AO for which the current changeover can be made is stated on the conductor path side and on the component side.

## Example:

The power supply component for AO 01 is located on the component side. The soldering points for setting the higher loop current are located on the conductor path side. For this reason the 01 marking is also located on the conductor path side.

The marking *3 is to be found in each AO area, close to which are four mounting spots for two not equipped resistors (0 ohm).
These mounting spots must be connected in pairs by wire jumpers. It is important to solder two wire jumpers per AO.

ASC21 board

1. Power supply component per $A O$
2. jointly for four AOs
3. Connector to backplane of I55

For better orientation, please turn the board so that the connector (3) is facing you and the numbers of the AOs are legible.

The following is a section from the component side on which you can see the position of the mounting spots to be bridged.

1 on component or soldering side, depending on port
The mounting spots must be vertically connected to each other.
The marking *3 relates to the mounting spots marked with an arrow.
The current increase can be set on the component side for the following AOs:

| Number for xx | Number for yy |
| :---: | :---: |
| 02 | 04 |
| 05 | 07 |
| 10 | 12 |
| 13 | 15 |
| 18 | 20 |
| 21 | 23 |
| 26 | 28 |
| 29 | 31 |

The components are arranged in the same way in all AOs marked with xx or yy .
The following is an section from the conductor side on which you can see the position of the mounting spots to be bridged.
A different arrangement applies to AO 01 and the remaining AOs. First of all, the component arrangement for AOs 01 and 03:

1 on component or soldering side, depending on port
In AO 01 the two bridges to be vertically soldered lie side by side.
The marking *3 relates to the mounting spots marked with an arrow.
The components arrangement is the same for the remaining AOs on which the current increase can be set on the conductor side:

1 on component or soldering side, depending on port
The marking *3 relates to the mounting spots marked with an arrow.
The current increase can be set on the conductor side for the following AOs:

| AO number |  |
| :--- | :--- |
| Number for xx | Number for yy |

| $01 \# 1$ | 03 |
| :---: | :---: |
| 06 | 08 |
| 09 | 11 |
| 14 | 16 |
| 17 | 19 |
| 22 | 24 |
| 25 | 27 |
| 30 | 32 |

\#1 The component arrangement is different on AO 01.
The components are arranged in the same way in all AOs marked with $x x$ or $y y$.

Please connect (vertically) only the mounting spots which are marked accordingly! Bridges which are soldered differently may result in serious malfunctioning.

### 8.6.9.2 Conversion of supply current from G revision onwards

The supply current on the board can be set between 22 mA (standard) and 30 mA per connecting circuit.
From the G revision onwards (designation on front panel: 49.9906 .7719 G ) the ASC21 will be manufactured with power supply components in a 32-pole PLCC housing (PLCC = plastic leaded chip carrier) by modifying the shape of the housing. The housing can be distinguished by the plug-in connections distributed over all four sides.

The following steps must be taken:

- The number of the AO for which the current changeover can be carried out is stated on the conductor path and on the component side.
Example:
The power supply component for AO 01 is located on the component side. The soldering points for setting the higher loop current are located on the conductor path side. For this reason the 01 marking is also located on the conductor path side.
- The marking *3 is to be found in each AO area, close to which are four mounting spots for two not equipped resistors (0 ohm).
- These mounting spots must be connected in pairs by wire jumpers. It is important to solder two wire jumpers per AO.

For better orientation, please turn the board so that the connector (3) to the backplane is facing you and the numbers of the AOs are legible.

Since the component arrangement for the board from $G$ revision onwards differs slightly from its predecessor, a section from the component side is shown, on which you will see the location of the mounting spots to be bridged.

The mounting spots must be vertically connected to each other.

The marking *3 relates to the mounting spots in the yellow (grey) highlighted area.
The current increase can be set on the component side for the following AOs:

| AO number |  |
| :--- | :--- |
| Number for $x x$ | Number for yy |
| 02 | 04 |
| 05 | 07 |
| 10 | 12 |
| 13 | 15 |
| 18 | 20 |
| 21 | 23 |
| 26 | 28 |
| 29 | 31 |

The components are arranged in the same way in all AOs marked with $x x$ or $y y$.
The mounting spots to be connected are now always located side by side. A short-circuit between the two bridges to be inserted does not create a problem, provided the four points are connected to each other. A contact to adjoining components must be avoided.
Please connect (vertically) only the mounting spots which are marked accordingly!

## Bridges soldered at other points may result in serious malfunctioning.

The following is an section from the conductor side from the board from $G$ revision onwards, on which you can see the position of the mounting spots to be bridged.
Here the pattern for all affected ports is the same. Ports 01 and 03 are not shown separately.

The marking *3 relates to the mounting spots in the yellow (grey) highlighted area.
The current increase can be set on the conductor side for the following AOs:

| AO number |  |
| :--- | :--- |
| Number for $x x$ | Number for yy |
| 01 | 03 |
| 06 | 08 |
| 09 | 11 |
| 14 | 16 |
| 17 | 19 |
| 22 | 24 |
| 25 | 27 |
| 30 | 32 |

The components are arranged in the same way in all AOs marked with $x x$ or $y y$.
The mounting spots to be connected are now always located side by side. A short-circuit between the two bridges to be inserted does not create a problem, provided the four points are connected to each other. A contact to adjoining components must be avoided.

Please connect (vertically) only the mounting spots which are marked accordingly!

Bridges soldered at other points may result in serious malfunctioning.

### 8.6.9.3 LEDs and Switch Functions

ASC21 board, front side

| WH/BN | WE 14 | $a 14 / b 14$ | $a 30 / b 30$ |
| WH/BK | WE 15 | $a 15 / b 15$ | $a 31 / b 31$ |
| WH/BU | WE 16 | $a 16 / b 16$ | $a 32 / b 32$ |

### 8.6.10 ASCxx Analogue Subscriber Circuit

## Short description

The ASC board is available in the following variants:
ASCEU: Europe with the following characteristics:

| Country-specific <br> variants are <br> configurable using <br> board software for <br> the following <br> countries: | Germany, Spain, Netherlands, Switzerland, Italy, Belgium, Austria, Greece, Mexico <br> and Venezuela |
| :--- | :--- |
| Power demand +5V | 620 mA |
| Interfaces | 16 a/b (connectors for analog terminals in accordance with country-specific <br> guidelines) |
| Constant current <br> supply | 24 mA, switchable to 30 mA (mounting of a 0 ohm resistance) |
|  | Line resistance |

|  | Range | 4 km installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0.4 \mathrm{~mm}$ <br> 9 km installation cable J-Y(ST)Y $\varnothing 0.6 \mathrm{~mm}$ <br> 15 km installation cable J-Y(ST)Y $\varnothing 0.8 \mathrm{~mm}$ <br> Line lengths for Message waiting $\rightarrow 325$ |
| :--- | :--- | :--- |
| DTMF/pulse dialling, flash and earth button detection, Telecom-specific (dependent on terminals) |  |  |
| Short and long flash time, Telecom-specific (dependent on terminals) |  |  |
| Overvoltage protection up to 4 kV |  |  |
| Board software download |  |  |
| Board identification using board pass |  |  |
| Maintenance function |  |  |
| Polarity reversion for "message waiting" signalling |  |  |
| Connection of external announcement devices |  |  |

ASCF: France with the following characteristics:

| Power demand +5 V | 620 mA |
| :--- | :--- |
| Interfaces | 16 a/b (connectors for analog terminals in accordance with French guidelines and <br> voice terminals) |
| Resistance feed <br> (const. voltage) | $2 \times 400$ Ohm |
| DTMF/pulse dialling, polarity reversal and button detection |  |
| Overvoltage protection up to 4 kV |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |
| Symmetric call supply |  |
| Polarity reversion for "message waiting" signalling |  |
| Connection of external announcement devices |  |

## ASCGB: Great Britain

| Power demand +5 V | 620 mA |  |
| :--- | :--- | :---: |
| Interfaces | $16 \mathrm{a} / \mathrm{b}$ (connectors for analog terminals in accordance with British guidelines) |  |
| Constant current <br> supply | 30 mA |  |
|  | Loop range |  |
| DTMF/pulse dialling, flash and earth button detection |  |  |
| Overvoltage protection up to 4 kV |  |  |
| Board software download |  |  |
| Board identification using board pass |  |  |
| Maintenance function |  |  |
| Polarity reversion for "message waiting" signalling |  |  |

### 8.6.10.1 Line lengths for Message waiting

The range for Message waiting signaling for analogue subscribers of the ASCEU board with the ICU programme ASCEU018.ICP in connection with the various apparatus types and seizure (pick up on call) and outgoing seizure (pick up) with the installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,4 \mathrm{~mm}$ is:

|  | Outgoing seizure (pick up) |  | Incoming seizure (pick up in call) |  |
| :--- | :--- | :--- | :--- | :--- |
| Apparatus types | Line length [m] | Line length [W ] | Line length [m] | Line length [W ] |
| Tel. T40 | 1400 | 379 | 1400 | 379 |
| Tel. TE51 | 1000 | 272 | 1000 | 272 |
| Tel. TE91 | 1000 | 272 | 1000 | 272 |
| Tel. TC91 | 1100 | 298 | 1100 | 298 |
| Tel. TB510LED <br> DE | 1100 | 298 | 600 | 163 |
| Tel. TB519D | 900 | 245 | 900 | 245 |
| Tel. TK40-20-2 | 300 | 83 | 300 | 83 |

## Recommendation

The line length with which the performance feature Message waiting is to be operated with conventional signaling (permanently illuminated LED signal), should not exceed

| 600 m | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0.4 \mathrm{~mm}$ ) |
| :--- | :--- |
| 1.3 km | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0.6 \mathrm{~mm}$ ) |
| 2.4 km | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,8 \mathrm{~mm}$ ) |

Malfunctions may occur when establishing a connection if the lines are any longer.
The tel. TK40-20-2 should only be operated with a 300 m (83W) line length.
Deviations from the recommended line length are possible.
If the lines are any longer, a different Message waiting signal (signal LED blinks) should be selected. Signalling is implemented in the ICU programme ASCEU019.ICP for the ASCEU board.

### 8.6.10.2 LEDs and Switch Functions

ASCxx board, front side

1. LED red
2. LED green

## Switch Position in Normal Operation

| S1 | Middle position |
| :--- | :--- |

## Switch Function

| :--- | :--- | :--- |
|  | Middle: | Neutral/release/ operating status |
|  | Right: | Reset board |
|  | Right, then left: | Forced board download |

## Meanings of LEDs

| L1 | on: | Board is busy with switching functions |
| :--- | :--- | :--- |
|  | flashing: | Module can be removed after preparatory disabling (VSP) or <br> blocked in terms of software |
|  | off: | Board is not busy |
| L2 | on: | Board reset in progress |
|  | flashing: | Download in progress |

|  | off: | Board in operation |
| :--- | :--- | :--- |

### 8.6.10.3 Bridge positions

The power supply can be increased from 24 mA (standard) to 30 mA per line in this board: The increase in the supply current is implemented by inserted 0 Ohm resistors or bridges at the following coordinate points:

| AO1 | 197077 |
| :--- | :--- |
| AO2 | 199128 |
| AO3 | 173069 |
| AO4 | 179116 |
| AO5 | 155077 |
| AO6 | 157128 |
| AO7 | 131069 |
| AO8 | 137116 |
| AO9 | 113077 |
| AO10 | 115128 |
| AO11 | 089069 |
| AO12 | 095116 |
| AO13 | 071077 |
| AO14 | 073128 |
| AO15 | 047069 |
| AO16 | 053116 |

### 8.6.10.4 MDF Connections

| MDF |  | Cable Adapter <br> CA1B/CARUB <br> from ASCxx |

| WH/BU | WE 16 | $\mathrm{a} 16 / \mathrm{b} 16$ |

### 8.6.11 ATA Analog Trunk Interface A

## Short description

The ATA board provides the interface for up to 8 analog exchange accesses (PSTN) in accordance with country-specific guidelines. It is a universal Euro-based trunk module and can be adapted to individual countries by means of the corresponding submodule and software (level, impedances etc.).

| Submodule | Countries of application |
| :--- | :--- |
| SIGA Signalling Unit A | Germany, Russia |
| SIGB Signalling Unit B | Switzerland |
| SIGC Signalling Unit C | Luxemburg |
| SIGD Signalling Unit D: | Austria |
| SIGE Signalling Unit E | Austria |
| SIGF Signalling Unit F | Belgium |
| SIGG Signalling Unit G | Hungary |

A mixed combination of ATA boards and submodules is not possible.
The board can accommodate a maximum of 4 two-part submodules.

ATA board, slots

| Other features |  |
| :--- | :--- |
| Power demand $+5 \mathrm{~V} ~$ | 530 mA with eight occupied connecting circuits |
| Interfaces | $8 \times \mathrm{a} / \mathrm{b}$ |
| DTMF/pulse dialling |  |
| Overvoltage protection up to 4 kV |  |
| Dial tone identification, charge count |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |

In the Integral55, an emergency operation switchover can be set up by inserting an EES1B (EES8B) board behind the ATA board; this is not possible in the Integral55 Compact.

### 8.6.12 ATA2 Analog Trunk Interface A2

## Short description

The ATA2 board provides the interface for up to 8 analog exchange accesses (PSTN). It is a universal basic exchange line board for Europe. By

| Submodule | Countries of application |
| :--- | :--- |
| SIGH Signalling Unit H | Czech/Slovak Republic |

and software (level, impedance, etc.) it is adapted to the specific requirements of each country. The difference between this module and the ATA board is the lower DC loop resistance.
A mixed combination of ATA2 modules and submodules is not possible.
The board can accommodate a maximum of 4 two-part submodules.

ATA2 board, slots

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 530 mA with eight occupied connecting circuits |
| Interfaces | $8 \times \mathrm{a} / \mathrm{b}$ |

### 8.6.14 ATC Analog Trunk Interface C

## Short description

The ATC board provides the interfaces for up to 8 analog network accesses (PSTN) in accordance with country-specific guidelines. It is a universal basic exchange line board for Europe and can be adapted by

| Submodule | Countries of application |
| :--- | :--- |
| SSBA Signalling Sub Board Type A | France |
| SSBB Signalling Sub Board Type B | Spain |
| SSBC Signalling Sub Board Type C | Italy |
| SSBD Signalling Sub Board Type D | Netherlands |

and software (level, impedance, etc.) to meet the specific requirements of each country.
The board can accommodate a maximum of 4 two-part submodules.

## ATC board, slots

A mixed combination of ATC modules and submodules is not possible.

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 530 mA with eight occupied connecting circuits |
| Interfaces | $8 \times \mathrm{a} / \mathrm{b}$ |
| DTMF/pulse dialling |  |
| Overvoltage protection up to 4 kV |  |
| Dial tone identification, charge count |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |
| Direct current loop control |  |

An emergency operation switchover can be set up by inserting an EES1B (EES8B) module behind the ATC board.

### 8.6.15 ATLC Analog TIE Line Circuit

## Short description

The Analog TIE Line Circuit board (ATLC) is used for

- Networking of the CSI55 with identical or different telecommunication systems via analogue connecting lines,
- connection of special facilities (e.g. speech memory, door handsfree device).

The module can be used inland or abroad, e.g. in special police networks, power supply companies, etc.
The ATLC board contains 8 connecting circuits. These connecting circuits do not have submodules in their basic configuration. The exchange of signals with the remote connecting circuit can take place via separate signal wires depending on the signalling plan (San (in)/Sab (out) forr connection setup and realease and additionally S3an (in)/S3ab (out) for monitoring functions). The speech path can be executed as a two or four-wire path.

Speech wire designation:

- $a / b$ two-wire speech path or outgoing speech path of the four-wire speech path,
- $\mathrm{Ka} / \mathrm{Kb}$ incoming speech path of the four-wire speech path

The following signalling procedures can be used with these designs:

- Static signals on the $\operatorname{Sin}(\mathrm{E})$ and Sout (M) signal wires
- Time-assessed signals on the $\operatorname{Sin}(E)$ and Sout (M) signal wires
- Time-assessed signals on the signal wires San (in) (E) and Sab (out)(M) and monitoring functions via the signal wires S3an and S3ab.

Dialling information signalling, which controls the connection setup, may appear as:

- Pulses on signal wires San (E) and Sab(M)
- DTMF signals via the speech wires
- Pulse signalling procedure using speech wires (simultaneous transmission). Alternating current transmission

The individual connecting circuits can also be equipped with submodules according to application. One terminating set is occupied in each submodule.

The following submodules are available:

- Alternating Current Signalling Submodule (ACSM), alternating current transmission
- Simplex Signalling Submodule (SSSM), simultaneous transmission
- Active Loop Submodule (ALSM/ALSMF/ALSMH), subscriber
- Passive Loop Submodule (PLSM), loop transmission

Signal exchange for these applications takes place via the speech path. An exception to this rule is the PLSM submodule in certain applications.

The function of the ATLC board is assigned by means of the configuration data at the corresponding slot in the CSI55. The configuration data can be entered or changed using the ICU editor.
The following adaptations and adjustments must be made to the ATLC boards's configuration data for each connecting circuit:

- Physical interface condition must be adapted
- Signal exchange and speech path version must be adjusted
- Signalling function

The signalling function for the ATLC and it's submodules is documented in signalling plans. These indicate the physical version (direct current, alternating current, etc.) and also the nature and duration of individual signals (seizure, selection, etc.) corresponding to the exchange connection status.

- Changing the connecting circuit type.

This function type is used to log on the port of the ATLC to the CSI55's control. This connecting circuit type must coincide with the customer data set up in the CSI55! The basic setting of the connecting circuit type for all applications is "QUE". Exceptions to this are stated in the respective signalling plan.

The appropriate interface for the remote connecting circuit with regard to:

- physical realization and
- signal exchange
can be identified with the aid of the ATLC signalling plans:
Numbering scheme
Alternating current signalling, ACSM
Simplex signalling a/b earth, SSSM
No submodule, 2 signal lines
No submodule, 4 signal lines
Passive loop signal, PLSM
Active loop signal, ALSM
Special applications
Examples for the connection of door handsfree devices
A signalling plan is set up for each signalling process.

| Other features |  |
| :--- | :--- |
| Country of <br> application | National and international |
| Power demand +5 V | 480 mA |
| Interfaces | 8 times $2 / 4$-wire speech path with $2 / 4$ signal wires each |
| Overvoltage protection up to 4 kV |  |
| Board software download |  |
| Download of configuration data |  |
| Board identification using board pass |  |
| Maintenance function |  |

### 8.6.15.1 ATLC board Without Submodule

Each connecting circuit of the ATLC board that is being operated without a submodule can exchange signals with the remote connecting circuit using:

- static signals on the signal wires $\operatorname{Sin}(E)$ and Sout (M)
- time-assessed signals on the signal wires $\operatorname{Sin}(E)$ and Sout (M)
- time-assessed signals on the signal wires $\operatorname{San}(E)$ und $\operatorname{Sab}(M)$ and monitoring functions via the signal wires S3an und S3ab

Signalling of the dialling information in order to control the connection setup can be implemented using:

- Pulses on signal wires $\operatorname{San}(E)$ and $\operatorname{Sab}(M)$
or
- DTMF signals via the speech wires

The corresponding adjustments must be made in the configuration data.
Signalling on the outgoing signal wires Sab (out)(M) and S3ab (out)is performed applying a OV potential during the active signal. When resting or pausing from signalling, the signal wires are unconnected.

The signal wire Sab (out) ( M ) can be changed to signalling with a negative potential ( -48 V ) for ATLC boards as of material number: 28.5630.4003. These different signalling methods are internationally designated as type 1 and type 4.

1. 2. 

3.

RS 464
Typ 1

Signalling on signal wires Sout and Sin

1. ATLC (first delivery)
2. User
3. ATLC (altered)

The outgoing signal wire S3ab is not switchable.
In order to change the signal potential of the Sout signal wire, a breakpoint must be opened for each port and a wire bridge must be soldered in. The following illustration shows the location of the breakpoints and the bridging points.

The ATLC board is a multilayer circuit board. The connector must be removed at a flat angle, so that the conductor tracks located below are not damaged.

Soldering side of the ATLC board. Example of switching the signal potential on port 1 (port 0)

1. Disconnect
2. Connect

With an active Sout ( M ) line, the minimum current is monitored in static signalling. This recognizes the "presence" of the connected remote side. In order to ensure the error-free operation of the board, the following conditions for the signal wires must be observed.

## Input conditions:

1. 

Principle of the San signal wire

| IOUT C max: | 100 mA | Continuous load |
| RON typ: | 14 Ohm | IOUT $=10 \mathrm{~mA}$ |

## Adjusting the Configuration Data

- Physical line interface

Make a selected setting according to the requirement of the interface to the remote connecting circuit:

```
"No submodule, 2 signal lines" (default setting)
"No submodule, 4 signal lines"
```

- Signalling plan

Set the signalling plan so that is identical to that of (coordinated with) the remote connecting circuit.

- Speech path design and relative level
- Set one of the following combinations according to the requirement of the interface to the remote connecting circuit. If your country of application is not listed, select the required level setting for D. Your application then corresponds to German transmission technology.

| Speech path design | Relative level (PrE/PrA) | Application in countries |
| :--- | :--- | :--- |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{A}, \mathrm{D}, \mathrm{E}, \mathrm{GR}$ |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{B}, \mathrm{L}$ |
| 2-wire | $0 /-7 \mathrm{dBr}$ | F |
| 2-wire | $0 /-7 \mathrm{dBr}$ | NL |
| 2-wire | $0 /-7 \mathrm{dBr}$ | I |
| 2-wire | $-3 /-4 \mathrm{dBr}$ | $\mathrm{D}, \mathrm{GR}$ |
| 2-wire | $-3 /-4 \mathrm{dBr}$ | F |
| 2-wire | $-4 /-3 \mathrm{dBr}$ | $\mathrm{B}, \mathrm{L}$ |
| 2-wire | $-4 /-3 \mathrm{dBr}$ | NL |
| 2-wire | $-5 /-2 \mathrm{dBr}$ | D |
| 2-wire | $-6 /-1 \mathrm{dBr}$ | A |
| 2-wire | $-6 /-1 \mathrm{dBr}$ | F |
| 4-wire | $0 / 0 \mathrm{dBr}$ |  |
| 4-wire | $-2.5 /-4.5 \mathrm{dBr}$ | (default setting) |
| 4-wire | $-3.5 /-3.5 \mathrm{dBr}$ |  |
| 4-wire | $+4 /-14 \mathrm{dBr}$ |  |
| 4-wire | $+9 /-17 \mathrm{dBr}$ |  |

- Modifications of the signal times may only be made in exceptional circumstances on site.
- Some signalling plans require adjustments to be made to the "digits". The permissible settings can be found in the respective signalling plan.
- The only other permissible setting in addition to connecting circuit type "QUe" is "DUe". This connecting circuit type is to be set if special facilities for line adaptation are to be connected to the ATLC board.

### 8.6.15.2 Inserting the Submodules

ATLC board, component side

1. Connecting circuit 1
2. Connecting circuit 2
3. Connecting circuit 3
4. Connecting circuit 4
5. Connecting circuit 5
6. Connecting circuit 6
7. Connecting circuit 7
8. Connecting circuit 8

Remove the ATLC board from the I55 slot.

The board may be removed and inserted during system operation. The switch functions and LED displays on the front panel must be taken into consideration however.

Remove the strapping plug of the corresponding connecting circuit (1-8) from the three pin strips. Insert the submodule into the prepared location.

Insert the ATLC board into the 155 slot.
Once a submodule has been installed, the configuration data must be set up or changed in the 155 (line interface, signalling plan and speech path version/level). This is necessary for the ATLC board to work properly with the submodule.

### 8.6.15.3 Removing the Submodules

When removing a submodule, reinsert the bridge plug. Make sure it is in the correct position.

Installation which does not correspond with the diagram can lead to malfunctions in the whole board or Communication Server Integral 55.

### 8.6.15.4 Connection to the MDF

The connectors of the ATLC board are picked up by two 16-pair cables on the CA2B adapter modules, and fed to the MD.
Insert the CA2B adapter module in the respective alignment section.
Insert the Champ plug of the connecting cable into the plug socket of the adapter module.
Attach the connecting cable to the designated fastening grooves.

CA2B adapter module with ATLC board

1. 50 -pin Champ plug
2. Cable 1, 16 -pair to MDF
3. 50-pin Champ plug
4. Cable 2, 16-pair to MDF

### 8.6.15.5 LEDs and Switch Functions

### 8.6.15.6 MDF Connections

## Main distributor

If necessary, connect the sheath wires of the connecting cable (open end and WP plug) with the ground clamps.

Connect the connectors of the connecting cable from the 155 with the line network (wiring blocks).
Mark the cable at both ends using the supplied labels.

## Connections from the ATLC

### 8.6.16 DDID Direct Dialling Inward Circuit

## Short description

The DDID board is the interface for 8 analogue network accesses for direct dial in accordance with countryspecific guidelines.

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 450 mA |
| Interfaces | $8 \times \mathrm{a} / \mathrm{b}$ |
| 16 kHz meter pulse count |  |
| Overvoltage protection up to 4 kV |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |

### 8.6.16.1 LEDs and Switch Functions

DDID board, front side

## Switch Position in Normal Operation

| S1 | Middle position |
| :--- | :--- |
| S2-S9 | Middle position |

## Switch Function

| S1 | Left: | Preparatory disabling (VSP) |
| :--- | :--- | :--- |
|  | Middle: | Neutral/release |
|  | Right: | Reset board |
|  | Right, then left: | Forced board download |
| S2 | Left: | DID 1 preparatory disabling |
|  | Middle: | DID 1 release |
| S3-S8 | Left: | DID x preparatory disabling |
|  | Middle: | DID x release |
| S9 | Left: | DID 8 preparatory disabling |
|  | Middle: | DID 8 release |

## Meanings of LEDs

| L1 | on: | Board is busy with switching functions |
| :--- | :--- | :--- |
|  | flashing: | Board removable after preparatory disabling |
|  | off: | Board is not busy |
| L6 | on: | Board reset in progress |
|  | flashing: | Download in progress |
|  | off: | Board in operation |
| L2 | on: | DID 1 is busy |
| L3, L4, L5, <br> L7, L8, L9 | on: | DID $x$ is busy |
| L10 | on: | DID 8 is busy |

### 8.6.17 JPAT JISCOS Public Analog Trunk

## Short description

The board JPAT board provides a maximum of eight 3-wire, analogue connectors for the connection of exchange lines to the CSI55 in the public network.
In order to operate the JPAT module, it must be equipped with a least one of the following submodules:

| Submodule | Country of application |
| :--- | :--- |
| SUTC Signaling Unit Trunk C | Russia |
| SUTD Signaling Unit Trunk D | Russia |

Mixed combination with both submodules on the JPAT is possible.

JPAT board, component side

| Other features |  |
| :--- | :--- |
| Interfaces | 8 times 3-wire (2-wire speech path which is also used for signalling together with <br> the c-wire) |
| Pulse dialling (DEC) | MF-PS register signalling <br> Transmission and receipt of ANI |

The JPAT is connected using the CARUB cable adapter.

### 8.6.17.1 LEDs and Switch Functions

| S1 | Reset switch |  |  |
| :--- | :--- | :--- | :---: |
|  | Middle: | Operating status |  |
|  | Left: | Preparatory disabling of board (VSP of all connecting circuits) |  |
|  | Right: | Reset board |  |
| S2-S9 | AO1-AO8 |  |  |
|  | Left: | AO1-AO8 Normal status (operating status) |  |
|  | Right: | AO1-AO8 preparatory disabling (VSP) |  |
| S10 * | RS2323 Interface |  |  |
|  | Left: | On |  |
|  | Right: | Off |  |

## Meanings of LEDs

| L1 | on: | Board is busy in terms of exchange functions |
| :--- | :--- | :--- |
|  | flashing: | Board removable <br> (all connecting circuits blocked or defective) |
|  | off: | Board not busy |
| L2 | on: | Board reset in progress. Programming break in download |
|  | flashing: | Download in progress |
|  | off: | Board in operation |

### 8.6.18 PLSM Passive Loop Sub Modul

## Short description

The submodule Passive Loop Sub Module (PLSM) performs the signal exchange with the remote connecting circuit by means of passive loop signals on the speech wires.

The PLSM submodule is used for the connection of special facilities, e.g.:

| Door handsfree facilities |
| :--- |
| Paging systems |
| Dictation facilities |

For certain special facilities (e.g. door opener), further signals can be fed via additional speech wires.

| Other features |  |
| :--- | :--- |
| Options for use | National and international |
| Power demand +5 V | 5 mA |
| interface | six wires $(\mathrm{a} / \mathrm{b} / \mathrm{c} / \mathrm{d} / \mathrm{e} / \mathrm{f})$ |

### 8.6.18.1 Functions of the Wires

## a/b wire

The seizure of special facilities is implemented by the closing of the a/b loop. The loop current must be supplied from the special facility (remote side). If the remote side cannot provide this supply, the "ATLC without submodule" version is to be applied.

## c wire

The c wire serves to check the operational readiness of the special facility. Here, a -48 V voltage is offered by the PLSM via a resistor. The operational readiness is signalled by the OV potential from the special facility.

## d wire

The $d$ wire serves to switch on the special facility. The PLSM switches 0 V potential onto the line.

## e wire

The e wire is used to implement, for example, the door opening function via the transmitted 0 V potential.

## f wire

The $f$ wire serves to block the respective connecting circuit from the paging system so as to prevent an outgoing seizure by the subscriber ( 0 V potential). When connecting to a door handsfree facility, the f wire can be connected to the door bell.

The functions of the e and $f$ wires described above can be changed to the following functions in some signalling plans:

Loop monitoring in place of the f wire
Earth button function in place of the e wire
To do this, conductor paths must be disconnected and bridges inserted on the PLSM submodule.
The corresponding adjustments must be made in the configuration data.
28.7640 .6951

3.
28.7640 .6953

3.

Section of the soldering side on the PLSM submodule

1. For the evaluation of loop current monitoring in place of the $f$ wire disconnect the bridge here
2. For the evaluation of loop current monitoring in place of the $f$ wire insert the bridge here
3. Insert bridge here for the earth button function in place of the e wire

### 8.6.18.2 Adjusting the Configuration Data

- Physical line interface Set to "loop signalling passive".
- Signalling plan

Set the signalling plan so that is identical to that of (coordinated with) the remote connecting circuit.

- Speech path design and relative level

Set one of the following combinations according to the requirement of the interface to the remote connecting circuit.

| Speech path design | Relative level (PrE/PrA) | Application in countries |
| :--- | :--- | :--- |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{A}, \mathrm{D}, \mathrm{E}, \mathrm{GR}$ (default setting) |
| 2-wire | $-7 / 0 \mathrm{dBr}$ | D |

- Changes to the signal times must not be made.
- Adjustments to digits are to be made according to the application of the PLSM (door handsfree facility, paging system, etc.), for example, to provide a code to activate the door opening function. The code can be set once the number of digits in the code has been specified. The functions of the codes depend on the set signalling plan. They are explained in the respective signalling plan.
- Settings for the connecting circuit type must not be changed.

### 8.6.19 SIGA Signalling Unit A

## Short description

The submodule SIGA contains the functions for 2 connecting circuits and is inserted on the ATA board. A maximum of 4 submodules can be used as analog trunk module (non direct inward).
2.

1.

Location of the SIGA on the ATA module

1. ATA module
2. Submodule SIGA
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Germany, Russia |
| Call recognition $(25 / 50 \mathrm{~Hz})$ |  |
| Charge recognition $(16 \mathrm{kHz})$ |  |

### 8.6.20 SIGB Signalling Unit B

## Short description

The submodule SIGB contains the functions for 2 connecting circuits and is inserted on the ATA board. A maximum of 4 submodules can be used as analog trunk modules without direct inward dialling.

1.

Location of the SIGB on the ATA module

1. ATA module
2. Submodule SIGB
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Switzerland |
| Call recognition $(20 / 55 \mathrm{~Hz})$ |  |
| Charge recognition $(12 \mathrm{kHz})$ |  |

### 8.6.21 SIGC Signalling Unit C

## Short description

The submodule SIGC contains the functions for 2 connecting circuits and is inserted on the ATA board. A maximum of 4 submodules can be connected as trunk modules.
2.

1.

Location of the SIGC on the ATA module

1. ATA module
2. Submodule SIGC
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Luxemburg |
| Call recognition ( 25 Hz ) |  |
| Charge recognition (16 kHz or 50 Hz earth symmetric). |  |
| The switchover is made using the ATA board software. |  |

### 8.6.22 SIGD Signalling Unit D

## Short description

The submodule SIGD contains the functions for 2 connecting circuits and is inserted on the ATA board. A maximum of 4 submodules can be used for the direct inward dialling circuits with monitoring frequency.
2.

1.

Location of the SIGD on the ATA module

1. ATA module
2. Submodule SIGD
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Austria |
| 12 kHz identifier for supervisory frequency and charges |  |

### 8.6.23 SIGE Signalling Unit E

## Short description

The submodule SIGE contains the functions for 2 connecting circuits and is inserted on the ATA board. A maximum of 4 submodules can be used for DC direct inward dialling (GSD).
2.

Location of the SIGE on the ATA module

1. ATA module
2. Submodule SIGE
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Austria |
| Charge identifier $(12 \mathrm{kHz})$ |  |
| Call identifier $(40-60 \mathrm{~Hz})$ |  |
| Potential switch and direct current identifier for GSD signalling process. |  |

### 8.6.24 SIGF Signalling Unit F

## Short description

The submodule SIGF contains the functions for 2 connecting circuits and is inserted on the ATA board. A maximum of 4 submodules can be connected as trunk modules.
2.

1.

Location of the SIGF on the ATA module

1. ATA module
2. Submodule SIGF
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Belgium |
| Charge identifier $(16 \mathrm{kHz})$ |  |
| Call identifier $(25 \mathrm{~Hz})$ |  |
| Dial tone identifier $(\mathrm{f} 1=420-460 \mathrm{~Hz}, \mathrm{f} 2=1140 \mathrm{~Hz})$ |  |

### 8.6.25 SIGG Signalling Unit G

## Short description

The submodule SIGG contains the functions for 2 connecting circuits and is inserted on the ATA board. A maximum of 4 submodules can be used as analog trunk modules without direct inward dialling.

Location of the SIGG on the ATA module

1. ATA module
2. Submodule SIGG
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Hungary |
| Charge identifier $(12 \mathrm{kHz})$ |  |
| Call identifier $(20-50 \mathrm{~Hz})$ |  |

### 8.6.26 SIGH Signalling Unit H

## Short description

The submodule SIGH contains the functions for 2 connecting circuits and is inserted on the ATA2 board. A maximum of 4 submodules can be used as analog trunk modules without direct inward dialling.

Location of the SIGH on the ATA module

1. ATA module
2. Submodule SIGH
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Countries of application | Czech/Slovak Republic |
| Charge identifier $(16 \mathrm{kHz})$ |  |
| Call identifier $(25-50 \mathrm{~Hz})$ |  |

### 8.6.27 SSBA Signalling Sub Board A

## Short description

The submodule SSBA contains the functions for 2 connecting circuits and is inserted on the ATC board. A maximum of 4 submodules can be connected.
2.

1.

Location of the SSBA on the ATC module

1. ATC module
2. Submodule SSBA
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | France |
| Call recognition $(50 \mathrm{~Hz})$ |  |
| Charge identifier $(12 \mathrm{kHz})$ |  |
| Direct loop current limit: 60 mA |  |
| Polarity reversal detection |  |

### 8.6.28 SSBB Signalling Sub Board B

## Short description

The submodule SSBB contains the functions for 2 connecting circuits and is inserted on the ATC board. A maximum of 4 submodules can be connected.
2.

1.

Location of the SSBB on the ATC module

1. ATC module
2. Submodule SSBB
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Spain |
| Call recognition $(20-30 \mathrm{~Hz})$ |  |
| Charge identifier $(50 \mathrm{~Hz}$ and 12 kHz$)$ |  |

### 8.6.29 SSBC Signalling Sub Board C

## Short description

The submodule SSBC contains the functions for 2 connecting circuits and is inserted on the ATC board. A maximum of 4 submodules can be connected.
2.

1.

Location of the SSBC on the ATC module

1. ATC module
2. Submodule SSBC
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Italy |
| Call recognition $(25-50 \mathrm{~Hz})$ | Charge identifier $(12 \mathrm{kHz})$ |
| Blocking of incoming seizure in case of malfunctions or during shutdown |  |
| Polarity reversal detection |  |
| Switchable loop impedance (high, low) |  |

### 8.6.30 SSBD Signalling Sub Board D

## Short description

The submodule SSBD contains the functions for 2 connecting circuits and is inserted on the ATC board. A maximum of 4 submodules can be connected.

Location of the SSBD on the ATC module

1. ATC module
2. Submodule SSBD
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Netherlands |
| Call recognition $(50 \mathrm{~Hz})$ |  |
| Charge identifier $(50 \mathrm{~Hz})$ |  |
| Polarity reversal detection |  |
| Switchable loop impendance |  |

### 8.6.31 SSSM Simplex Signaling Sub Modul

## Short description

The submodule Simplex Signalling Sub Module (SSSM) performs the signal exchange with the remote connecting circuit by means of continuous current signals on the speech wires.

| Other features |  |
| :--- | :--- |
| Country of application | National and international |
| Power demand +5 V | 45 mA |
| Interface to the remote connecting circuit | a/b earth signalling method (two-wire <br> line) <br> No calibrations are required for the signal <br> exchange with the remote connecting <br> circuit. |
| Combinations with other submodules on an ATLC board are possible. |  |

The corresponding adjustments must be made in the configuration data.

### 8.6.31.1 Adjusting the Configuration Data

- Physical line interface

Set "Simplex signalling a/b earth".

- Signalling plan

Set the signalling plan so that is identical to that of (coordinated with) the remote connecting circuit.

- Speech path design and relative level

Set one of the following combinations according to the requirement of the interface to the remote connecting circuit.

| Speech path design | Relative level (PrE/PrA) | Application in countries |
| :--- | :--- | :--- |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{A}, \mathrm{D}, \mathrm{E}, \mathrm{GR}$ |
| 2-wire | $0 /-7 \mathrm{dBr}$ | $\mathrm{B}, \mathrm{L}$ |
| 2-wire | $0 /-7 \mathrm{dBr}$ | NL |
| 2-wire | $-3 /-4 \mathrm{dBr}$ | $\mathrm{D}, \mathrm{GR}$ (default setting) |
| 2-wire | $-4 /-3 \mathrm{dBr}$ | $\mathrm{B}, \mathrm{L}$ |
| 2-wire | $-4 /-3 \mathrm{dBr}$ | NL |
| 2-wire | $-5 /-2 \mathrm{dBr}$ | D |
| 2-wire | $-6 /-1 \mathrm{dBr}$ | A |

If your country of application is not listed, select the required level setting for D. Your application then corresponds to German transmission technology.

- Adjustments to times must not be made.
- Adjustments to digits must not be made.
- Settings for the connecting circuit type must not be changed.

### 8.6.32 SUPA Supplement A

## Short description

The submodule SUPA contains the functions for 2 connecting circuits and is inserted on the ATB board. A maximum of 4 submodules can be connected.

Location of the SUPA on the ATB module

1. ATB module
2. Submodule SUPA
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Countries of application | Great Britain/Hong Kong |
| Call recognition/charge detector (14-26 Hz/50 Hz) |  |
| Switch to turn on earth calling signalling systems (ECS) |  |
| Highly resistant tape loop for loop calling guarded clearing (LGC) |  |
| Auxiliary voltage switch for testing PSTN off-line condition in ECS. |  |

### 8.6.33 SUPB Supplement B

## Short description

The submodule SUPB contains the functions for 2 connecting circuits and is inserted on the ATB board. A maximum of 4 submodules can be connected.

Location of the SUPB on the ATB module

1. ATB module
2. Submodule SUPB
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Countries of application | USA |
| Call recognition $(14-26 \mathrm{~Hz} / 50 \mathrm{~Hz})$ | Ground Start |
| Loop Start |  |
| Auxiliary voltage switch for testing PSTN off-line condition in ECS. |  |

### 8.6.34 SUTC Signaling Unit Trunk C

## Short description

The SUTC is a submodule of the JPAT. It is used for analog exchange lines (direct inward dialling) with 3-wire signalling.

Location of the SUTC on the JPAT module

1. JPAT module
2. Submodule SUTC
3. Connecting circuit slot

| Other features | Russia |
| :--- | :--- |
| Country of application | Incoming traffic, local |
| Variants | Incoming traffic, long-distance |

Two ports are implemented on each submodule. Using the ICU Editor, the two ports can be configured for incoming local, incoming long-distance or mixed traffic.

The transmission of signals is implemented in decimal dialling (DEC) via DC signalling only and using various resistance values. Only the transmission of ANI is implemented in the voiceband by means of frequency signalling.

The following tables indicate the correlation between the signal, transmission direction and associated resistance value.

### 8.6.34.1 Incoming Traffic, Local

| Signal | Direction / wire | Incoming end of connection |  |  |  | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 8.6.35 SUTD Signalling Unit Trunk D

## Short description

The SUTD is a submodule of the JPAT. It is used for analog exchange lines with 3-wire signalling (direct inward dialling).

Location of the SUTD on the JPAT module

1. JPAT module
2. Submodule SUTD
3. Connecting circuit slot

| Other features |  |
| :--- | :--- |
| Country of application | Russia |
| variant | Outgoing local and long-distance traffic |

The transmission of signals is implemented in decimal dialling (DEC) via DC signalling only and using various resistance values. Only the transmission of ANI is implemented in the voiceband by means of frequency signalling. The following tables indicate the correlation between the signal, transmission direction and associated resistance value.

Two ports are implemented on each submodule.

### 8.6.35.1 Outgoing traffic, local and long-distance

| Signal | Direction | Outgoing end of connection |  | Notes |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | / wire | a | b | c |  |

| Idle condition control | c | - | + | + | Ringing current monitoring (l 2 mA ) to see if the central office $(\mathrm{CO})$ is ready to be seized. |

### 8.7.1 ADM Analog Digital Mixboard

## Short description

The ADM board is a basic board which accomodates up to five submodules. The following submodules are available:

| Submodule | Features |
| :--- | :--- |
| STSM | four S0/T0 interfaces as exchange, permanent connection or subscriber <br> connection |

| UPSM | four UPN interfaces as subscriber connections or permanent connections |
| :--- | :--- |
| ABSM | four analogue subscriber ports $(\mathrm{a} / \mathrm{b})$ |
| UKSM | twoi UK0 master interfaces |
| EEADM | for use of the ADM with S0 emergency sets via cable adapter EESS0 |

ADM board, component side

| $!$ Observe numbering of the submodules |
| :--- | :--- |

| 1 | AO 1-4 |
| :---: | :---: |
| 3 | AO 9-12 |
| 2 | AO 5-8 |
| 4 | AO 13-16 |

If the ADM board is used with emergency switching (EESSO cable adapter) submodule 3 is not required. On the X8 connector (normally for submodule 4) you must insert the EEADM submodule instead of submodule 4.

If the EEADM board is inserted in the wrong place on the ADM board this will cause a defect in the ADM board.

For the ADM board the "Call Reference Length - (CRL)" can be set to a length of one or two bytes for the whole board by means of the ICU editor. The call reference length of 2 bytes is required for QSIG network connection with some third-party PBX. If this setting is used all ports have CRL=2 bytes no matter which protocol is selected. For this reason it was not possible to connect any system terminals with TN1R6 protocol to this ADM board. As of software version ADM0900.ICL / ADM00009.ICP of the ICU, the behaviour of the ADM board and of the Integral 55 Compact-ADM port has changed. The CRL setting is only adopted for the ports of the board which use the "QSIG" protocol. For all other protocolos the call reference length will always be CRL=1. This makes it possible to configure QSIG ports with CRL=2 for networks with third-party systems while it is possible to use system terminals and permanent circuit lines with CRL=1 for other ports with TN1R6 protocol.

| Other features |  |
| :--- | :--- |
| Countries of application | Application in all countries |
| Power demand +5 V | 230 mA |
| Interfaces | 16 times $2 / 4$-wire |
| Overvoltage protection up to 4 kV | Download board software |
| Board identification using board passport |  |
| Maintenance function | In conjunction with V24IA module debugging interface on the board front |

## Debugger

### 8.7.1.1 LEDs and Switch Functions

DECT board, front side

1. RJ45 connector with PIN assignment

### 8.7.2 BVT2 Motherboard, Voice Transmitting Module 2

## Short description

The board BVT2 is used to provide access to an I55 for PC supported applications. A UPOconnector on the BVT2 module connects the PC to the I55.

BVT2 board with CC telephone

1. PC
2. HAB with BVT2
3. CC telephone
4. Cable with UPO connection
5. for I55

| Application options |  |
| :--- | :--- |
| ACD-UI application. | ACD system with CSI55. |
| CC telephone <br> aplication. | Can only be used in conjunction with a call centre and the CSI55. Up to 15 IPN <br> connections are possible per board. |

### 8.7.2.1 BVT2 Module

BVT2 board
The BVT2 board features the following connector options:

1. UPO connection
2. AEl interface
3. Loudspeaker and microphone connector
4. Handset and headset connector
5. Hook switch connector

### 8.7.2.2 Pin Assignment

Assignment of the WE sockets

1. Hook switch
2. Handset
3. Loudspeaker and microphone
4. AEI
5. UPO

## Hook switch

The pin configuration of GND and GU allows a hook switch function to be assigned. The make contact 1 is intended for the application of a tape recorder controller, and make contact 2 for the application of a door opener, for example.

| Connector | Hook switch |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Pin | 1 | 2 | 3 | 4 | 5 | 6 |  |
| Seizure | GND | GU | K1 | K1 | K2 | $>$ K2 |  |

| GND | $=$ | Ground |
| :--- | :--- | :--- |
| GU | $=$ | Hook switch |
| K1, K2 | $=$ | Make contact 1,2 |

## Handset or headset

Either a T1 handset or a headset can be connected to the 4-pin WE socket. Connecting a switchover module enables switchover between the handset and headset.

| Connector | Handset or headset |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Pin | 1 | 2 | 3 | 4 |
| Seizure | SK- | HK + | HK- | SK + |

| SC | $=$ | Transmitter inset (microphone) |
| :--- | :--- | :--- |
| HK | $=$ | Receiver inset |

## Loudspeaker and microphone

A loudspeaker and a microphone can be connected to this interface for handsfree operation or open listening.

| Connector | Loudspeaker and microphone |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Pin | 1 | 2 | 3 | 4 |
| Seizure | MIC- | MIC + | LS- | LS+ |

| LS | $=$ | Loudspeaker |
| :--- | :--- | :--- |
| MIC | $=$ | Microphone |

## AEl interface

The AEI (Additional Equipment Interface) pursuant to ETSI features an analog X port and digital Y port. A tape recorder or headset can be connected to the AEI interface.

Connection is implemented via a 6-pin WE socket.

A connection cable must not exceed the total length of 6 m .

| Connector | AEI interface |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Pin | 1 | 2 | 3 | 4 | 5 | 6 |
| Seizure | XTE | XTE | GND | YTE | GND | YTE |
|  | OUT | IN | A | IN | D | OUT |

## UPO Interface

The UPO interface is in two-wire design. Both wires transmit the user data and signalling data between the PC and the 155 using the time separation technique, also known as the ping-pong technique.

| Connector | UP0 Interface |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: |
| Pin | 1 | 2 | 3 | 4 | 5 | 6 |  |  |
| Seizure | free | free | A | B | free | free |  |  |

## UPO Interface Range

When planning the cable network, it is necessary to take into account that the range of the UPO interface concerning the cables used is different:

- 0.6 mm diameter for 3.5 km outdoor cable; 1.7 km for installation cable
- 0.4 mm diameter for 2.1 km outdoor cable

The use of different cable types and the number of distributors in the network reduces the range of the UPO interface.

When connecting the line network, the following instructions must be adhered to:

- The lines for the UPO interface must be installed as a twisted wire pair.
- The shields of the cables must be connected to the earth potential on both sides.

The supply of the UPO interface to a terminal is implemented via so-called Universal Connector Units (UAEs).

### 8.7.2.3 Tape recorder

## Connector

A tape recorder can be connected to the AEI interface. The input line of the tape recorder must be DC isolated and highly resistant ( $>10 \mathrm{kOhm}$ ).

The tape recorder is controlled via make contacts 1 . See "AEI interface" table for pin assignment.

## Control

The diagram illustrates the control connections on a tape recorder.

3.

Tape recorder connection

1. AEI interface
2. Tape recorder NF input
3. BVT2
4. Relay contact
5. Interface for hook switch

|  | AC | DC | Unit |
| :--- | :--- | :--- | :--- |
| I max | 2 | 2 | A |
| Umax | 250 | 220 | V |
| P max | 62,5 | 30 | W |

### 8.7.3 CA1B cable adapter 1 for $B$ modules

## Short description

Cable adapter for 16, 4 or 2-pair analog or digital connecting circuit line for boards ASCEU, ASCF, ASCGB, ATAx, ATB, ATC, DDID, DUP03, DT0, DT21, CAS, DCON, UIP without V24M, MULI and DECT21 with

- 50-pin CHAMP plug as an output to the MDF
- Overcurrent breakpoint ( 230 V contact)

1. 16, 4 or 2-pair to the MDF/NT

2. Release the lock by pressing the bracket
3. Do not turn the screw!

### 8.7.4 CA2B cable adapter 2 for $B$ modules

## Short description

Cable adapter for 2 to 8-wire analog or 4 -wire digital connection device line for the ASC2, ASC21, ATLC, DS02, DUPN, JPAT and ADM boards with

- 50-pin CHAMP plug as an output to the MDF
- Overcurrent breakpoint (230 V contact)

1. Cable 1 (16x2) to the MDF
2. Cable $2(16 \times 2)$ to the MDF

### 8.7.5 CA3B cable adapter 3 for $B$ modules

## Short description

Cable adapter for the UIP board, provided that the V24M submodules are also inserted here. The board is also required for external synchronization when using the CL2M/CL2MEM on ICF (B3 module or ICS).

- 50-pin CHAMP plug as an output to the MDF
- 2x 9-pin D plugs for V24 interfaces or connection of high precision reference clock
- Overcurrent breakpoint (230 V contact)

If the first slot of a UIP board is equipped with a CL2ME for the clock supply of TAREF it is necessary to use the CA3B/T cable adapter.

1. Cable 16 X 2 to MDF

2. Cable for connecting an external clock source plugged on the first V .24

### 8.7.6 CA3B/T cable adapter 3 for $B$ modules TAREF

## Short description

Cable adapter for UIP board if the clock supply from TAREF is implemented via the CL2ME inserted on the first slot of the UIP.
The V24M submodules can also be inserted here.

1. Cable for connecting the TAREF (material number: 27.5630 .0531 ) inserted in the first V. 24

### 8.7.7 CA4B cable adapter 4 for $B$ modules

## Short description

Cable adapter for the connection of coax lines when using boards DT21, CAS and DCON, provided that these modules are set on unsymmetrical interfaces.

- 2 BNC Coax sockets as output to NT or MUX.

1. Coax cable to NT or MUX

### 8.7.8 CA5B cable adapter 5 for $B$ modules

## Short description

Cable adapters for the connection of V. 24 and X. 21 connectors to the IMUX board.

- Cable to the TA of the network operator or MDF (X1 and X5)
- 1x 15-pin Sub-D female Connector for X. 21 data terminals (X4)
- 1x 25-pin Sub-D female Connector for V. 24 data terminals (X3)
- Overcurrent breakpoint (230 V contact)
- Ground breakpoints (see IMUX board)

1. Cable Adapter 5B, rear component side, breakpoints

### 8.7.9 CA6B cable adapter 6 for $B$ modules

## Short description

Cable adapter for connecting UP0 and S2M connections to MAC and HAMUX boards.

- 50-pin CHAMP plug as an output to the MDF
- 8-pin WE plugs

1. Cable 16X2 to MDF
2. 8-pin WE plugs

### 8.7.10 CAS Channel Associated Signalling

## Short description

The CAS board is a PCM30 interface for up to 30 B channels in accordance with CCITT. The board contains the following features:

| Other features |  |
| :--- | :--- |
| Country of <br> application | National and international |
| Power demand $+5 \mathrm{~V} ~$ | 930 mA |
| Line signalling in channel 16 (CAS) in accordance with CCITT or country/customer specifications. |  |
| Register signalling in 30 B channels (inband) in accordance with CCITT or country/customer <br> specifications. |  |
| Can be used as an exchange interface, connection line or special interface. |  |
| Incoming, outgoing and bothway traffic direction, can also be mixed as required |  |
| Overvoltage protection up to 4 kV |  |
| Board software download. |  |
| PCM30 interface configuration via board software. |  |
| Board identification using board pass |  |
| Maintenance functions |  |

### 8.7.10.1 CAS-TIELINE User Program

## Introduction

The CAS-TIELINE user program was developed for the 155 system on the CAS hardware platform, and is a tie-line transmission program. The 16 different tie-line transmission variants are designated E1 to E10/2.
The user data is adapted to individual requirements by means of the ICU mask.

## Hardware

The CAS board (channel associated signalling) is used here. Depending on the application, the $2 \mathrm{MBit} / \mathrm{s}$ interface can be configured using the confidata (see Section "ICU mask and confidata") with impedance of 75 W (unsymmetrical) or 120 W (symmetrical).
Depending on that, for the line connection one of the following adapter boards (only Integral 55) is then required:

- CA1B for 75 W
- CA4B for 120 W

Further general information about the CAS board, in particular about the controls and denotations of the front panel, can be gathered from the appropriate paragraphs.

## SoftWare

The CAS board is set up with KAD (customer specific user data) for TIELINE application. This requires the corresponding load list name for the accompanying slot address to be entered.

The necessary parameters (confidata) are then set up using the ICU editor. The corresponding ICP files and the confidata subsequently end up on the CAS board by means of a download.

## Short description of Applications

The TIELINE user program supports inband signalling (DTMF dial codes, call progress tones) and line signalling (signalling channel bit a). The following applies to line bits $b, c$ and $d$ : $b c d=101$. Only changes to bit 'a' will be processed by the user program. Changes to the bcd bits will be ignored.
16 different signalling plans are produced from the available signal stock. These plans can be selected using the confidata and always apply to all 30 connecting circuits (AO).

In principle all the AOs are set up for both-way throughput.
Line signalling will not be carried out if all the signals appear as pulsed signals.
DTMF (dual tone multi-frequency dialling) and pulse dialling are suitable dialling systems.
The suffix dialling facility is guaranteed for the entire duration of an outgoing call, and for a predefined period of an incoming call.

If the criterion "message" is identified, an active call will be cancelled and the digits memory will be deleted.
The elegibility or inelegibility of a line can be set up by the confidata seperately for incoming and outgoing AOs.

In the same way, a 425 Hz continuous tone can be connected to the switching matrix as a proceed-to-select signal for outgoing traffic, or a 425 Hz busy tone to the line for incoming traffic according to configuration.
Up to 10 digits can be programmed for a destination number in outgoing traffic. The destination number will be chosen automatically according to the preset timeout when "elegible" or "inelegible" in the absence of the "dialling" message.

If "elegible"; incoming "dialling" messages are ignored once the timeout has ended. If "inelegible"; they will always be ignored. The suffix dialling facility is also guaranteed for the previous destination number when in call status.
Outgoing DTMF signals which are "called through" will be identified, and incoming "dialling" messages are subsequently ignored.

An area code may be programmed, which will be relayed to the GCU global control unit during incoming seizure once the proceed-to-select criterion (signal, time) has been met.
Where "dial" or "message" information is absent, the release which has been initialized by the user program's watchdog exists neither for incoming nor for outgoing traffic.

If a fault occurs, trouble signalling to the opposite side can be activated using confidata.
In the same way, an unblocking function can be set up for each connecting circuit: When active (blocking-n = on), and with the front panel switches TBS (total blocking switch) and TBS-N (total blocking switch minus n) switched on, the corresponding connecting circuit will not be blocked.

## Specification of Inband Signals

The available DTMF transmitters and receivers are set out in accordance with CEPT recommendation T/CS 46-02.

The tone identifier will certainly operate in the range of 350 to 500 Hz with -30 dBm .
The tone generator supplies a 425 Hz frequency with a transmission level of -3 dBm 0 . In outgoing traffic, it can be sent to the switching matrix as a proceed-to-select signal (continuous tone). In incoming traffic, it can be connected to the line as a busy tone (German rhythm).

## Synchronization

The CAS board can generally be used as the synchronous clock supplier for synchronization purposes. In the TIELINE application, however, this is only meaningful if no digital exchange interfaces or tie lines are present. . This is the reason for the default setting of "No synchronous clock". This setting can be changed via the configuration data.

### 8.7.10.2 Identifying the Operation Phase

As described above, the boot software controls

- initialization,
- test and download procedures after a reset and
- indicates various statuses and possible faults by means of the LED's on the front panel.

If no faults are found and all GCU messages (test messages, "startup ready" etc) have been received, L1 will flash eleven times and L9, L7, L8, L15 and L16 will go out, indicating that the operation phase has been reached.

### 8.7.10.3 LED and Switch Functions

The functions of the switches and LED's on the front panel differ in boot phase from those in operation phase.
Following a reset, the boot software carries out initialization, test and download procedures, and indicates various statuses as well as possible faults via the LEDs on the front panel.

If no faults are found and all necessary GCU messages (test messages, "ready for startup" etc.) have been received, the CAS board will reach the operation phase, where user software is put into effect.

## Switch Position in Normal Operation

| S1 | Middle position |
| :--- | :--- |
| S2 | Middle position |
| S3 | Middle position |

## Switch Function

| S1 | Left: | Preparatory disabling (TBS) * |
| :--- | :--- | :--- |
|  | Middle: | Neutral/release |
|  | Right: | Reset board |
|  | Right, <br> then left: | Forced board download |
| S2 | Left: | Preparatory disabling (TBS-N) ${ }^{*}$ |
|  | Middle: | Neutral |
|  | Right: | No function |
| S3 | Left: | No function |
|  | Middle: | No function |
|  | Right: | No function |

* $\quad$ With S1 (TBS) in the left position and S2 (TBS-N) in the middle position, all 30 ports will be blocked. With S1 (TBS) and S2 (TBS-N) in the left position, all ports outlined in the configuration data will not be blocked.
If S1 (TBS) is in the middle position, all 30 ports will not be blocked, irrespective of the position of S2 (TBS-N).

## Meanings of LEDs

| L1 | TSL | Total status LED |
| :--- | :--- | :--- |
| L2 | ESY | External synchronization |
| L3 | LOS | No signal |
| L4 | LOF | Frame failure |
| L5 | CRC | CRC4 test fault |
| L6 | RFR | Frame failure at remote side |
| L7 | ISU1 | ** |
| L8 | ISU3 | ** |
| L9 | RDL | LED reset/download |
| L10 | MSG | C-bus message |
| L11 | AIS | Alarm identification signal |
| L12 | LMF | Superframe failure |
| L13 | BIT | Increased bit error ratio |
| L14 | RMF | Superframe failure at remote side |
| L15 | ISU2 | $* *$ |
| L16 | ISU4 | ** |

### 8.7.10.4 MDF Connections

MDF Connection via CA1B from the CAS Module

| Cable end | CA1B |
| :--- | :--- |
| Colours | CAS |
| BK/BN | A1/B1 $(\mathrm{T})$ |
| BK/RD | C1/D1 (R) |

MDF Connection via CA4B from the CAS Module

| Coax | 1 | A1/B1 | Transmit |
| :--- | :--- | :--- | :--- |
| Coax | 2 | C1/D1 | Receive |

### 8.7.11 CL2M Clock 2 Module

## Short description

The submodule CL2M on the UIP or ICF board implements an external clock supply for the PBX or a clock pulse output for external devices.

| Use on |  |
| :--- | :--- |
| UIP | receiver and transmitter 2048 kHz |
| ICF | receiver $2048 / 1544 \mathrm{kHz}$ |

This is necessary if digital dial-up lines or permanent connections are not available as the clock source, or if the customer has made high demands in terms of the reliability of the clock supply.

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 100 mA |

If the CL2M is positioned on slot 1 or 2 of the UIP, the line can be connected via the CA1B board.
With slots 3 or 4 occupied and V24M (slot 1 or 2) being used, the line must be connected via the CA3B board.

Location of CL2M on the UIP board

1. Connecting circuit slot
2. UIP module
3. CL2M module

### 8.7.12 CL2ME Clock 2 Module Extended

## Short description

The CL2ME submodule is used to implement an external clock supply by means of a high precision reference clock (TAREF). This is needed if DECT Intermodule Handover is used in twin and multi-module configurations..

| Use on | Receiver 2048 kHz |
| :--- | :--- |
| UIP/ICF |  |

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 100 mA |

If the CL2ME is positioned on slot 1 of the UIP, the line can be connected via the CA3B/T board.

Location of CL2ME on the UIP board

1. Connecting circuit slot
2. UIP module
3. CL2ME board

### 8.7.13 DCON Digital Protocol Converter

## Short description

The DCON board network connects the systems from various manufacturers, in which signalling between the systems takes place via the DPNSS protocol.

It provides this protocol by converting the TNet Bosch Network Protocol.

| Other features |  |
| :--- | :--- |
| Country of application | National and international |
| Power demand +5 V | 800 mA |
| Interfaces | A module contains one port (30B+D or <br> $23 \mathrm{~B}+\mathrm{D})$. |
| Overvoltage protection up to 4 kV |  |
| Download board software |  |
| Board identification using board passport |  |
| Maintenance functions |  |

The CS155 SW and tools will treat the DCON like a DT2 with TNET protocol.
The board should generally be set up as a SLAVE type via the ICU data.

### 8.7.13.1 LEDs and Switch Functions

## Switch Position in Normal Operation

| S1 | Middle position |
| :--- | :--- |
| S2 | Middle position |
| S3 | Middle position |
| S4 | Middle position |

## Switch Function

| S1 | Left: | Preparatory disabling |
| :--- | :--- | :--- |
|  | Middle: | Operating status/release |
|  | Right: | Reset DT2 part |
|  | Right, then left: | Forced board download |
| S2 | Left: | No function |
|  | Middle: | Normal mode |
|  | Right: | Report (fault statistic message to the system console) The <br> switch must be moved back to the middle position after use. |
| S3 | Left: | Trace mode |
|  | Middle: | Normal mode |
|  | Right: | Reset converter part |
| S4 | Left: | No function |
|  | Middle: | Normal mode |
|  | Right: | Non-maskable interruption request |

## Meanings of LEDs

| L1 | on: | Module is busy in terms of exchange functions (active layer 3 connection) |
| :---: | :---: | :---: |
|  | flashing: | Board removable after preparatory disabling |
|  | off: | Board is not busy |
| L2 | on: | Module is clock supplier |
| L3 | on: | Unused |
| L4 | on: | Remote Alarm Indication RAI (remote side reporting fault status) |
| L5 | on: | Alarm Indication Signal AIS (remote side reporting Out of Order) |
| L6 | on: | Loss of Signal LOS (no receiving signal) |
| L7 | on: | RES1 (reserve) |
| L8 | on: | Trace mode (Test operation for fault tracking) |
| L9 | on: | TNET LOS (loss of signal in TNET) |
| L10 | on: | TNET L1 alarm (layer 1 failure in TNET) |
| L11 | on: | TNET L2 alarm (layer 2 failure in TNET) |
| L12 | on: | TNET in operation |
| L13 | on: | Board reset in progress |
|  | flashing: | Download in progress |
|  | off: | Board in operation |
| L14 | on: | Normal operation (layer 1 active, no alarm) |
| L15 |  | Unused |
| L16 | on: | Fault count $>$ E-6 (bit error rate $>10-6$ ) |
| L17 | on: | Fault count $>$ E-3 (bit error rate $>10-3$ ) |
| L18 | on: | Loss of Frame LOF (loss of frame synchronization) |
| L19 | on: | RES2 (not busy at present) |
| L20 | on: | Reset of converter part in progress |
|  | off: | Converter part in operation |
| L21 | on: | DPNSS LOS (loss of signal in DPNSS network) |
| L22 | on: | DPNSS L1 alarm (layer 1 failure in DPNSS network) |
| L23 | on: | DPNSS L2 alarm (layer 2 failure in DPNSS network) |
| L24 | on: | DPNSS network in operation (layer 2 is o.k.) |

### 8.7.13.2 Jumper Position

DCON board, component side

## X32-X36 Line Impedance Selection

The line impedance is set using five-fold jumpers.

| Connection | Impedance |
| :--- | :--- |
| X32-X33 | 75 Ohm |
| X33-X34 | 100 Ohm |
| X34-X35 | 100 Ohm |
| X35-X36 | 120 Ohm |

## X31

not equipped

### 8.7.13.3 DIL Switch Position

## S4 Pulse Shape Selection

The shape of the transmission pulse can be adapted for 1.544 MHz applications using S4. For E1, the switch position is ignored and the pulse shape is set according to the specified line impedance. For DSX-1 applications, the pulse shape can be set according to the line length. S4/4 is not used.

| S4/1 | S4/2 | S4/3 | Application |
| :--- | :--- | :--- | :--- |
| OFF | OFF | OFF | DSX-1 $(163-200 \mathrm{~m})$ |
| ON | OFF | OFF | DSX-1 $(122-163 \mathrm{~m})$ |

| OFF | ON | OFF | DSX-1 $(81-122 \mathrm{~m})$ |
| :--- | :--- | :--- | :--- |
| ON | ON | OFF | DSX-1 $(41-81 \mathrm{~m})$ |
| OFF | OFF | ON | DSX-1 $(0-41 \mathrm{~m})$ |
| OFF | OFF | ON | CSU ECSA T1 C1.2 |
| ON | OFF | ON | CSU FCC Part 68A |
| $X$ | ON | ON | CSU FCC Part 68A |

## S5

This is used by the ZAP monitor (interactive module control). S5/6 and S5/7 determine the baud rate for the serial ZAP RS232 port.

| S5/7 | S5/6 | Baud rate |
| :--- | :--- | :--- |
| Off | Off | 38400 |
| Off | On | 19200 |
| On | X | 9600 |

$X=$ Insignificant position
S5/1 is used to select the "DT2 Transparent Mode" (ON position) The DCON acts as a normal DT2 in this mode. The board transfers all D channel messages transparently.
In the OFF position, the user program is booted and the board starts to operate automatically.
S5/2 determines whether the user program or the ZAP monitor program is loaded. In the ON position, the board will boot the ZAP monitor program, and is then ready for testing and debugging.

## S6

Only $\mathrm{S} 6 / 6$ is used at present. This selects the clock source for the transmission port.
In the OFF position, the system's internal clock is used.
In the ON position, the clock is derived from the receiver port.

### 8.7.13.4 DCON Configuration

## General Points

This chapter describes the user interface and the configuration parameters which are required for the TNet/ DPNSS board.

Each paragraph consists of a configuration menu, which appears to the user, and a description of the available options.

The user interface consists of a list of menus. Each menu option is selected by entering the number to the left of the option.

In order to commence a user interface session, the user must press any button within the first five seconds of system initialization. The user then selects the required option by entering the number to the left of the option.

## Connecting the Terminal

The socket on the front side of the board is 9-pin (D Sub). 3 connectors are needed to connect the terminal. The connected terminal can be 9-pin or 25-pin.
A VT 100 compatible terminal or a VT 100 emulation on a PC can be used.

| 9-pin to 9-pin connection |  |  |
| :--- | :--- | :--- |
|  |  | Terminal |
| RXD 2 | - | 3 TXD |
| TXD 3 | - | 2 RXD |
| GND 5 | - | 5 GND |

| 9-pin to 25-pin connection |  |  |
| :--- | :--- | :--- |
|  |  | Terminal |
| RXD 2 | - | 3 TXD |
| TXD 3 | - | 2 RXD |
| GND 5 | - | 7 GND |

## System Initialization

The following text will appear on the screen during initialization:

## BOSCH TELECOM TNet/DPNSS Conversation

Version x.xx
DCON Initialising
Press Any Key for MMI: 3
In order to commence configuration, the user must press any key within the first five seconds of initialization. If no button is pressed during this time, the configuration menu will only become available again after a reset.

The following text will appear on the screen after initialization:

## BOSCH TELECOM TNet/DPNSS Conversation

## Version $\mathrm{x} . \mathrm{xx}$

Initialisation Complete
Reset DCON for MMI

## Main menu

The configuration main menu is displayed.

## BOSCH TELECOM TNet/DPNSS Conversation

Version x.xx

1. TNET Configuration
2. DPNS Configuration
3. System Clock Source
4. Software Download
5. Exit

Enter Option [1..5]:
The user selects an option by entering a number (1..5) and pressing the return button.
The following paragraphs describe the available options.

## TNet Configuration

The TNet configuration main menu is displayed.
TNet Configuration

1. Orignation Adress
2. Timeslots
3. Timers
4. Write Settings
5. Exit

Enter Option [1..5]:
The following options are available:

| 1. | Default origination address (during call setup) in the TNet, if no line identity is supported by DPNSS. |
| :--- | :--- |
| 2. | Incoming time slots can be configured individually. |
| 3. | Signal timer configuration |
| 4. | New settings are written in the flash-PROM, and the board is reset. |
| 5. | Return to main menu. |

## Origination Address

The following options are available:
TNet Origination Adress

1. Default Origination Adress: 0525371393
2. Write Settings
3. Exit

Enter Option [1..3]:

| 1. | The user will be prompted to enter a new default origination address. Only digits between 0 and 9 <br> are accepted. A maximum of 30 digits can be entered. Pressing the return button without entering <br> any digits will result in the default origination address being erased. |
| :--- | :--- |
| 2. | New settings are written in the flash-PROM, and the board is reset. |
| 3. | Return to previous menu. |

## Time slots

The following options are available:
TNet Timeslot Configuration
[01] D [17] B
[02] D [18] B
[03] D [19] B
[04] D [20] B
[05] D [21] B
[06] D [22] B
[07] D [23] B
[08] D [24] B
[09] D [25] B
[10] D [26] B
[11] D [27] B
[12] D [28] B
[13] D [29] B
[14] D [30] B
[15] D [31] B

1. Edit
2. Exit
3. Edit time slot configuration (as shown in next diagram).

## 2. $\quad$ Return to previous menu.

All time slots are bidirectional in terms of default.
The time slots are selected using the numeric keypad. The user can select the following options:
TNet Timeslot Configuration
[01] D [17] B Use Numeric
[02] D [18] B keypad to
[03] D [19] B select timeslot -
8:up
2:down
4:left
6:right
[04] D [20] B
[05] D [21] B
[06] D [22] B
[07] D [23] B
[08] D [24] B Timeslot Settings:

[12] D [28] B O:Outgoing
[13] D [29] B D:Disabled
[14] D [30] B
[15] D [31] B
W. Write Settings
E. Exit

Enter Option [B,I,O,D,W,E]:

| B | Configure bidirectional time slot. |
| :--- | :--- |
| I | Configure incoming time slot. |
| O | Configure outgoing time slot. |
| D | Disable time slot for incoming and outgoing conversations. |
| W | Write new settings in the flash-PROM and reset the board |
| E | Return to previous menu. |

## Timer Configuration

The given values are default settings.
TNet Timer Configuration
Time (Seconds)

1. T302 15
2. T303 4
3. T304 60
4. T305 30
5. T308 3
6. T310 60
7. T313 30
8. TЗAA 120
9. Edit
10. Exit

Enter Option [1..10]:
This menu allows the user to configure the TNet signalling software timer.
List of configurable timers:

|  | Timer | Start condition | Stop condition |  |
| :--- | :--- | :--- | :--- | :--- |
| 1 | T302 | Send SETUP ACK, restart <br> if INFO received | Receive ALERT, CONN, <br> CALL, SENT | Release with DISC |
| 2 | T303 | Send SETUP | Receive ALERT, CONN, <br> CALL, SENT | Release with DISC |
| 3 | T304 | Receive SETUP ACK, <br> restart when INFO sent | Receive CALL SENT, <br> ALERT, CONN or INFO | Release with DISC |
| 4 | T305 | Send DISC | Receive REL | Release with REL |
| 5 | T308 | Send REL | Receive REL ACK | Repeat REL and restart <br> from T308 |
| 6 | T310 | CALL SENT, receive INFO | Receive ALERT, CONN | Release with DISC |
| 7 | T313 | Send CONN | Receive CONN ACK | Release with DISC |
| 8 | T3AA | Send ALERT | Send CONN | Release with DISC |

All timers can be configured from 0 to 255 seconds. Other available options:

| 9 | Write new settings in the flash-PROM and reset the board. Return to previous menu. |
| :--- | :--- |
| 10 | Return to previous menu. |

## DPNSS Configuration

The following options are available:
DPNSS Configuration

1. Timeslots
2. Timers
3. Layer 2/layer 3 Configuration
4. Layer 1 Stats
5. Write Settings
6. Exit

Enter Option [1..6]:

[15] B [31] B [47] B [63] B

1. Edit
2. Exit

Enter Option [1..2]:
All time slots are bidirectional set in terms of default.
Channels 1 to 31 are real channels. They are used as speech channels.
Channels 33 to 63 are virtual channels. They are required for features which do not need a speech channel (e.g. callback at a free subscriber).

The time slots are selected using the numeric keypad. The user can select the following options:
DPNSS Timeslot Configuration
[01] B [17] B [33] B [49] B Use Numeric
[02] B [18] B [34] B [50] B keypad to
[03] B [19] B [35] B [51] B select
[04] B [20] B [36] B [52] B timeslot-8:up
[05] B [21] B [37] B [53] B 2:down
[06] B [22] B [38] B [54] B 4:left
[07] B [23] B [39] B [55] B 6:right
[08] B [24] B [40] B [56] B
[09] B [25] B [41] B [57] B Timeslot Settings:
[10] B [26] B [42] B [58] B
[11] B [27] B [43] B [59] B B:Bidirectional
[12] B [28] B [44] B [60] B I:Incoming
[13] B [29] B [45] B [61] B O:Outgoing
[14] B [30] B [46] B [62] B D:Disabled
[15] B [31] B [47] B [63] B
W. Write Setting
E. Exit

Enter Option [B,I,O,D,W.E]:
B $\quad$ Configure bidirectional time slot.

| I | Configure incoming time slot. |
| :--- | :--- |
| O | Configure outgoing time slot. |
| D | Disable time slot for incoming and outgoing conversations. |
| W | Write new settings in the flash-PROM and reset the board. |
| E | Return to previous menu. |

## Timer Configuration

The following options are available:
DPNSS Timer Configuration
Time (Seconds)

1. ISRM/SSRM Timer 60
2. CRM Timer 10
3. Write Settings
4. Exit

Enter Option [1..4]:

| 1. | Configure ISRM/SSRM timer (0 to 255 seconds) |
| :--- | :--- |
| 2. | Configure CRM timer (0 to 255 seconds) |
| 3. | Write new settings in the flash-PROM and reset the board. |
| 4. | Return to previous menu. |

The above values are default settings.

## Layer 2/Layer 3 Configuration

The following options are available:
DPNSS Timer Layer2/Layer3 Configuration
Config.

1. L2 Config A
2. L3 Config $X$
3. Write Settings
4. Exit

Enter Option [1..4]:

| 1. | Configure layer $2 \mathrm{~A} / \mathrm{B}$ end |
| :--- | :--- |
| 2. | Configure layer $3 \mathrm{X} / \mathrm{Y}$ end |
| 3. | Write new settings in the flash-PROM and reset the board. |
| 4. | Return to previous menu. |

$\triangle$
Configuration of layer $3 X / Y$ is necessary to eliminate call collisions. If a call collision occurs, the " $Y$ " conversation is reset and the " $X$ " conversation continues.
Configuration of layer $2 A / B$ is necessary for layer 2 signalling. One end of the DPNSS connection must be
specified as the $\mathbf{A}$ end and the other as the $\mathbf{B}$ end. If $A / B$ end configuration is implemented incorrectly, layer 2 will not be initialized.

## Layer 1 Statistics

DPNSS Layer 1 Stats. Configuration

## Time (Seconds)

1. Layer 1 Stats: Interval 120
2. Write Settings
3. Exit

Enter Option [1..4]:
The following options are available:

| 1. | Time interval between DPNSS layer 1 statistic reports, which are sent via the V.24 interface (0 to <br> 255 seconds). The layer 1 statistic reports are disabled, if the time interval is set to 0. |
| :--- | :--- |
| 2. | Write new settings in the flash-PROM and reset the board. |
| 3. | Return to previous menu. |

## Clock Source

The clock source is given as DPNSS or TNET. This parameter cannot be configured by the user interface.
Conversion System Clock
System Clock Source: DPNSS
Press Any Key To Continue:

## software download

This option is used to download the board.
The user will be asked to connect a PC to the board. This connection is made using the same interface which is being used for the user interface. If a PC with VT 100 emulation is already connected, this emulation can be ended in order to arrive at MS-DOS.

The user can leave this status by resetting the board.
The following paragraph describes the software download.

## Software Download

Connect PC and run download utility.

## Software Download Program

The download program is used to load a new software version for the board. It will operate on every PC (IBM compatible). It can use either the COM1 or COM2 interface. Connection is made as already described for the user interface.

The download program is called up by the DOWNLOAD instruction. The program requires a default from COM1. If the COM2 is also required, the DOWNLOAD COM2 instruction is entered. The baud rate is set to 19200.

The following display will appear when the program is called up:

- BOSCH Telecom TNet/DPNSS Conversation Down-
load Utility Vx.xx
- Opening COMx: at 19k2 baud

The following display will appear if the board is detected:

- DCON Card Detected

If the board is not detected, an error message will appear and the program is ended:

## - DCON COM PORT NOT DETECTED

The flash-PROM will be erased once the board has been detected. The following display will appear:

- Erasing Flash PROM
- Erase Complete

The user can choose whether to preserve the existing parameter:

- Preserve existing configuration? $(\mathrm{Y} / \mathrm{N})$ :

The user must enter $\mathbf{Y}$ or $\mathbf{N}$. No other keys will be accepted.
The filename is then entered:

- Enter filename ()...

The following display will appear if the file is not found:

- Cannot open file, retry, or $<$ ret $>$ to quit
- Enter filename ()...

The following display will appear when download commences:

- Download started

The following display will appear after a download:

- Download complete

The program returns to MS-DOS.

### 8.7.14 DECT21 ICU for DECT-Applications 21

## Short description

The DECT21 board is used to connect the Radio Base Station RM 588, material number 4.998.001.296, to the CSI55.

It carries out an automatic run time measurement. The manual measurement of the individual routes up to 1 km is not applicable as long as no repeater is connected between.

### 8.7.17 DTO Digital Linecard TO

## Short description

This component is no longer manufactured (February 2002). It has been replaced by the ADM Analog Digital Mixboard module. Please only use the ADM with the CS155.

The DTO board provides 8-digit connections.

| Other features |  |  |
| :--- | :--- | :---: |
| Country of <br> application | National and international |  |
| Power demand +5 V | 610 mA |  |
| Interfaces | 8 digital T0 interfaces (exchange line ports) |  |
|  | 8 digital S0 interfaces (locally-fed terminals, e.g. VA93D, PC) |  |
|  | 8 digital S0FV interfaces for permanent circuits (clock master or clock slave) in <br> private connections |  |
|  |  |  |
| Overvoltage protection up to 4 kV |  |  |
| Board software download |  |  |
| Board identification using board pass |  |  |
| Maintenance function |  |  |

The board contains the following additional features:

### 8.7.21 EEADM Emergency Extension Analog Digital Mixboard

## Short description

On the ADM board the EEADM subboard is plugged on the X8 connector together with the STSM subboard, if it is used with emergency switching (cable adapter EESSO). It serves to detect if the ADM is present

Insert the EEADM subboard if required, see the following figure,

onto the X8 connector of the ADM board.

ADM board, component side
In this case slot 3 (X5/X6) remains free.

### 8.7.22 EESOB Emergency Extension Switch SO B Module

## Short description

For special services, such as the police force, fire brigade or Red Cross, whose answering facilities must always be available, the Emergency Extension Switch S0 for CSI55 is available. In the event of a power failure or other malfunctions, this modules enables a switchover from the connecting line coming from the ISDN network to sets that are powered by the ISDN network.
3.

EESOB board

1. Cable $1+2$, each 24 -pair to external MDF
2. Champ plug
3. EESOB
4. Pl. 1
5. PI. 2

## Instructions

Connection to a DT0, i.e. 2 DAs are to be switched per port.
Switchover is implemented to a set that is only used when the switchover is active.
For this purpose, a switchover with 1 WP each for the analog voice documentation.
Two 50-pin plugs are available as external connectors.

| Switch-over criteria |
| :--- |
| General power failure |
| PC Board DT0 removed |
| Manual actuation of an external potential-free switch |

The number of ports is determined by the limited number of plug positions.
The port $1 . .6$ contains the switchover option. Port 7 and 8 are directly switched through.
The switchover is implemented with 4 wires.
For each port, an additional 2 switchover contacts are brought out, via which, for example, lines to voice recording devices are switched.
The power supply to the board is implemented with GND from the DTO. - 48 V is fed via the connecting cable. One wire is fed for the forced switchover via the connecting cable.

Connection cables required: 2 cables 24x2 I55-HVT (MDF) 29.9030.56xx (xx = cable length)
Block Diagram

1. ISDN line
2. Answering with emergency set
3. Answering without emergency set
4. Answering
5. Emergency set
6. ZN
7. manual emergency switching
8. Documentation

### 8.7.22.1 Further Information

An NTBA with emergency supply is used as the NT, and the exchange dialling can be loaded with up to 380 mW in this case.

In normal operation, the emergency set has no function and therefore nothing appears in the display.
Facilities of this type are normally only to be handled by trained personnel. It can then be assumed that no unqualified actions shall be initiated by the users.
Each cable adapter is provided with 125 mA semi-lag fuse protection.

### 8.7.22.2 MDF Connections

### 8.7.23 EESSO Emergency Extension Switch S0

## Short description

For special services, such as the police force, fire brigade or Red Cross, whose answering facilities must always be available, the adapter board Emergency Extension Switch S0 for CSI55 is available. In the event of a power failure or other malfunctions, this modules enables a switchover from the connecting line coming from the ISDN network to S0 sets that are powered by the ISDN network.
3.

EESSO board

1. Cable $1+2$, each 24 -pair to external MDF
2. Champ plug
3. EESSO
4. Pl. 1
5. PI. 2

## Instructions

Connection to a DT0 or ADM, i.e. 2 wire paris are to be switched per port.
Switchover is implemented to a set that is only used when the switchover is active.
For this purpose, a switchover with 1 WP each for the analog voice documentation.
Two 50-pin plugs are available as external connectors.

| Switch-over criteria |
| :--- |
| General power failure |
| DT0/ADM board removed |
| Manual actuation of an external potential-free switch |

## Other features

Power demand $-48 \mathrm{~V}=108 \mathrm{~mA}$
The number of ports is determined by the limited number of plug positions.
The port $1 . .6$ contains the switchover option. Port 7 and 8 are directly switched through. Ports 9 to 16 cannot be used (only applies to ADM).
The switchover is implemented with 4 wires.
For each port, an additional 2 switchover contacts are brought out, via which, for example, lines to voice recording devices are switched.
The detection "Board removed" is implemented with GND from the DT0 or ADM.
-48 V is fed via the connecting cable.
One wire is fed for the forced switchover via the connecting cable.
Connection cables required: 2 cables $24 x 2$ I55-HVT (MDF) 29.9030.56xx (xx = cable length)

The X8 connector of the ADM board requires the EEADM submodule.

The EESSO board differs from the EESOB board only in as far as in the EESSO it is possible to prevent emergency switching of individual ports by means of jumpers.

## Block Diagram

Emergency switchover facility for S0 lines

1. ISDN line
2. Answering station
3. Manual emergency switching
4. Documentation
5. Emergency answer

### 8.7.23.1 Additional measures with ADM

If the ADM board is used with emergency switching (EESSO cable adapter) submodule 3 is not required. On the X8 connector (normally for submodule 4) you must insert the EEADM submodule instead of submodule 4.

ADM board, location of EEADM on X8

If the EEADM board is inserted in the wrong place on the ADM board this will cause a defect in the ADM board.

### 8.7.23.2 Jumper

The EESSO features switching contacts with jumpers to prevent emergency switching of individual ports.

EESSO cable adapter, component side
Upon first delivery emergency switching is active for ports 0 to 5 , i.e. the jumpers are on 2-3 and 5-6. For special applications it is possible to exclude individual ports from emergency switching.
4. 5.6 .

1. 2.3 .

| Connector X7 | Jumpers 1-2 | Emergency switching for <br> port 0 inactive |
| :--- | :--- | :--- |

|  | Jumpers 2-3 | Emergency switching for <br> port 0 active |
| :--- | :--- | :--- |
|  | Jumpers 4-5 | Emergency switching for <br> port 1 inactive |
|  | Jumpers 5-6 | Emergency switching for <br> port 1 active |
|  | Jumpers 1-2 |  |
|  | Jumpers 2-3 | Emergency switching for <br> port 2 inactive |
|  | Jumpers 4-5 | Emergency switching for <br> port 2 active |
|  | Jumpers 5-6 | Emergency switching for <br> port 3 inactive |
| Connector X9 | Jumpers 1-2 | Emergency switching for <br> port 3 active |
|  | Jumpers 2-3 | Emergency switching for <br> port 4 inactive |
|  | Emergency switching for <br> port 4 active |  |
|  | Jumpers 4-5 | Emergency switching for <br> port 5 inactive |
|  | Jumpers 5-6 | Emergency switching for <br> port 5 active |

### 8.7.23.3 Further Information

The feedlines of the -48 V should not be connected to the same fuse as those of the PBX because of the current difference between them.

The failure criteria such as fuse failure, board removed or manual switchover trigger a message on the system console so that monitoring from there is guaranteed.

An NTBA with emergency supply is used as the NT, and the exchange dialling can be loaded with up to 380 mW in this case.

In normal operation, the emergency set has no function and therefore nothing appears in the display.
Facilities of this type are normally only to be handled by trained personnel. It can then be assumed that no unqualified actions shall be initiated by the users.

### 8.7.24 EMAC Extended Multi Access Circuit Board

## Short description

The board EMAC module is a submodule of the MAC and is used for the extension of $2 \times 2$ MBit interfaces.

EMAC board, component side

### 8.7.25 HAMUX Home Agent Multiplexer

## Short description

The following description provides a basic outline of the board HAMUX More detailed information about module features, installation and configuration can be found in a separate manual entitled HAMUX Home Agent Multiplexer.

The HAMUX board with the associated SPCU submodules is used for the integration of up to 8 "Home Agents" in the Call Center and operates with software versions from E04.1 on.
It is a central board with line interfaces, but with a virtual short-circuit between the two connecting circuits, and enables the simultaneous transmission of compressed speech, data and signalling to a home agent via a $B$ channel.

Included in shipment
ISDN exchange access (to home agent) via CS155 standard boards
Purchasable passive ISDN card for S0 bus interface with D-channel protocols

Cable adapter with $2 \times 2$ MBit interfaces
ISDN dial-up connection via SOinterface with a B-channel and D-channel
Multiplexing of the B channel
Communication protocol of the data application/transmission
Speech compression
Within the CSI55xE connection of the HAMUX to the DP world is implemented via a 2 Mbit/s multiport server

Principal overview of a Call Center with home agent

4. ISDN
5. Home agent PC board
6. Digital or analog connector board
7. Database
8. Agent/Supervisor
9. PC Agent/Supervisor
10. BCC Server
11. Router
12. LAN

## 13. HOST

In order to implement the 8 home agents, the board must be logged in with 16 connecting circuits. Connecting circuits AO0-AO7 are responsible for the setup of the carrier connections to the home agents.

Connecting circuits AO8-AO15 are subjected to tunnelled transmission and represent the actual agent connecting circuits.

Data transmission is implemented to a router via a $2 \mathrm{MBit} / \mathrm{s}$ data interface independently of startup and switching software. To enable better exploitation of the router capacity, it is possible to operate the data interfaces of the HAMUX board in cascades.

HAMUX board

### 8.7.25.2 Interfacing

Upgrading of the HAMUX module

1. to Router/Server
2. Cable
3. CA6B Cable Adapter
4. 50-pin Champ

The HAMUX board is connected to the 155 via cable adapter CA6B. At the same time, the interface to the router/server is implemented via WE socket 1 of the cable adapter.

In the event that several HAMUX boards are to be integrated into the system, a cascading of the modules is implemented via WE socket 2 of the respective cable adapter.

| PIN assignment, socket 1 |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| PIN | 3 | 6 | 4 | 5 |
| Function | $1 \mathrm{a}(R x)$ | $1 \mathrm{~b}(R x)$ | $2 \mathrm{a}(T x)$ | $2 \mathrm{~b}(T x)$ |

| PIN assignment, socket 2 |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| PIN | 3 | 6 | 4 | 5 |
| Function | $2 \mathrm{a}(T x)$ | $2 \mathrm{~b}(\mathrm{Tx})$ | $1 \mathrm{a}(R x)$ | $1 \mathrm{~b}(R x)$ |

### 8.7.25.3 Configuration of the Connecting Circuits

## Carrier Connections AOO-A07

Connecting circuits $0-7$ are responsible for the setup and release of the carrier connections to the home agents. They each provide a transparent B channel between the HAMUX board and a home agent.
On the HAMUX board, this is implemented by the simulation of a digital subscriber.
The connecting circuit is designated the digital subscriber type. The second B channel is blocked and assigned to the Data service function only.

A carrier connection connecting circuit is not able to setup a connection itself, but simply to seize the connection.

## Agents AO8-AO15

Connecting circuits $8-15$ are set up as agents in the Call Center. They are designated the digital position type. The second B channel is blocked.
The telephony service function only is set up for the agent connecting circuit.

## Virtual short-circuit

On the HAMUX board, a virtual short-circuit is created by each carrier connection connecting circuit and an agent connecting circuit. The D channel of the agent connecting circuit is packed.
The status of a carrier connection connecting circuit (carrier connection present/not present) corresponds to the status of the agent connecting circuit (active/deactive).

## Configuration Overview

| AO | AO-type | Log file | Service | B Channel No. | B Channel Status |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 00 | Digital subscriber | EDSS1 (EST1 Version 0) | Data only | 1 | free |
|  |  |  |  | 2 | Barred |

### 8.7.26 IMUX Integrated Multiplexer

## Short description

IMUX board is used to link CSI55 systems via permanent connections (FV).

| Type |
| :--- | :--- |
| D64S (S interface with $1 \times 64 \mathrm{KBit} / \mathrm{s} \mathrm{B} \mathrm{channel)}$ |
| DS01/DTS01 (S interface with $1 \times 64 \mathrm{KBit} / \mathrm{s}$ B channel and $1 \times 16 \mathrm{KBit} / \mathrm{s} \mathrm{D}$ channel) |
| DS02/DTS02 (S interface with $2 \times 64 \mathrm{KBit} / \mathrm{s}$ B channel and $1 \times 16 \mathrm{KBit} / \mathrm{D}$ D channel) |
| International leased line as per X.21 (X.21 interface with a transmission rate of $64 \mathrm{KBit} / \mathrm{s})$ |

I55 with the IMUX board
Functions of the IMUX board:

- The IMUX board permits the transmission of several compressed speech channels in one B channel of the permanent circuit. In the process, the band width per speech channel is reduced/compressed to 16 Kbit/s in accordance with G. 728 LD-CELP. This process ensures very high speech quality despite the compression of $4: 1$, and is better than ADPCM coding with the same band width, for example. They are better, for example, than a ADPCM coding with the same band width.

4. 

Speech compression in the IMUX board

1. $I 55$ with IMUX
2. Line
3. IMUX
4. Bandwidth

- Every speech channel is provided with identification and processing functions for fax group 3. Identification of a group 3 fax is necessary, as fax connections must not be subjected to the speech compression. The transmission is implemented at max. 9.6 KBit/s.
- The line may also be used for data transmission via the direct data interface as per V.24/X.21. The data is multiplexed from the direct data interface on the line separately from the speech channels, demultiplexed at the remote side on the second IMUX of the line, and fed to the direct data interface. This means that the data is fed neither via the decompression/compression units of the IMUX boards nor via the switching matrixes of the systems.
- The data service is not supported by the IMUX, as data transport is not possible via compressed channels of IMUX. The Integral 55 uses the service identification function to automatically check whether it is dealing with the service type (DAT). If this is the case, the connection is not fed via the IMUX board, but by means of alternate routing to another bundle. If the alternate routing is not activated, "occupied" is signaled. This procedure functions for a 3 call number plan types: common, hidden, open.
- Transit functions: If a connection is fed via several I55 systems, compression is performed in the originating node and decompression in the destination node. This ensures that repeated compression/ decompression is avoided.
The prerequisite for this is that all routes between the participating nodes are equipped with IMUX boards and that the connection is fed via IMUX routes without exception.
The transit functions also apply when two compressed connections arriving at a transit node from a system need to be routed in different directions.

1. 

Transit functions of the IMUX board

1. I55 with IMUX
2. Line
3. IMUX
4. Bandwidth

Data connections via the direct data interface cannot be set up via several transit nodes, but only as point-to-point connections between 2 systems.

| Other features |  |
| :--- | :--- |
| Country of <br> application | National and international |
| Power demand +5 V | 650 mA |
| Overvoltage protection up to 4 kV |  |
| Board software download. |  |

## Board identification using board pass <br> Maintenance function

## Hardware Requirements

- The number of IMUX boards used per module is not limited. Each IMUX board occupies one connecting circuit slot.

## Restrictions

- If a permanent circuit with 8 speech channels (DS02/DTS02) or two permanent circuits each with 4 speech channels (DS01/DTS01) is set up, the application of four SPCU speech compression units is required. IMUX boards that are equipped in this way must not be installed in directly neighbouring slots. In this case, one slot must remain free or be occupied by a board with low dissipated power (ASCEU, DS0, DT0, DT2....).

## Software Requirements

Software from E03.2 is required for operation of the IMUX boards.

### 8.7.26.1 Components and Cables

## Components of the IMUX board:

The IMUX board is made up of one basic board and submodules:

| ComponentFunction | Material <br> number |  |
| :--- | :--- | :--- |
| IMUX | This board is the basic board and requires a connecting circuit slot. | 28.5630 .318 x |
| SPCU | Submodule of the IMUX for speech compression. Each SPCU can <br> process two (speech) channels. A maximum of 4 SPCUs can be inserted <br> onto the basic board. | 28.7640 .517 x |
| S64LI | Submodule of the IMUX for the implementation of the D64S (1xB), <br> DS01/DTS01 (1xB+D) and DS02/DTS02 (2xB+D) line interfaces. One <br> submodule is required for each of the mentioned interfaces. | 28.7640 .516 x |
| X64LI | Submodule of the IMUX, implements the line interface: International <br> leased line X.21 with a transmission rate of 64Kbit/s. One line interface is <br> implemented per submodule. <br> Max. 2 S64LI, 2 X64LI, or 1 S64LI and 1 X64LI can be inserted on the <br> basic board at any one time. | 28.7640 .515 x |
| CA5B | Adapter module for B modules | 28.7640 .366 x |

## Cable:

- $6 x 2$ Sub-D/open ext. Connection cable TC-MDF (material number 29.9030.5101 for 1 m up to 29.9030 .5199 for 99 m ).
- 1x15-pin D-sub (male)/D-sub (female) for X64LI (material numbers 27.5630 .0541 to .0543 ) in lengths of 5,20 and 50 m . This cable can also be used for connection between the direct X. 21 data interface and a data terminal.

For the direct V. 24 async./sync. interface, a conventional 25-pin D-sub (male)/D-sub (female) cable can be used. The number of wires depends on the data terminal (HW handshake). For sync. transmission, the clock lines must always be switched.

- The following line interfaces can be served:

| Line interface type | Structure | maximum number of <br> speech channels |
| :--- | :--- | :--- |
| D64S | $1 \times \mathrm{B}$ | 3 |
| DS01/DTS01 | $1 \times \mathrm{B}+\mathrm{D}$ | 4 |
| DS02/DTS02 | $2 \times \mathrm{B}+\mathrm{D}$ | 8 |
| International leased line as per X.21 | $64 \mathrm{KBit} / \mathrm{s}$ | 3 |

$\triangle$
The data transmission as per X. 21 allows a point-to-point data transmission only. Each line interface requires its own D channel (one D channel for two identical line interfaces is not possible. The number 3 for lines without dedicated $D$ channel ensues due to the fact that $D$ channel signalling also needs to be transmitted inband within the B channel. This is why not the entire band width is available for user data.

### 8.7.26.2 Inserting the Submodules

Remove the IMUX board from the I55 slot.

## Note

The board may be removed and inserted during system operation.
Insert the S64LI and/or X64LI submodule onto Line-Interface A and/or Line-Interface B. One or more speech compression units (SPCUs) can be inserted at random on one or more free SPCU1-SPCU4 slots.

## IMUX board, component side

1. SPCU Speech Compression Unit 2*G728/G. 711 Speech Compression/Decompression
2. Line-Interface A Either: S64LI (Structured 64 KBit/s Line Interface) or X64LI (X. 2164 KBit/s Line Interface)
3. Line-Interface B Either: S64LI (Structured 64 KBit/s Line Interface) or X64LI (X. 2164 KBit/s Line Interface)

In order to guarantee the error-free operation of the board, the type and number (max. 2) of inserted line interfaces (S64LI and/or X64LI), as well as the number of speech compression units (2 speech compression units per SPCU board $->$ max. 8 speech compression units), must be adapted to the customer application. The configuration data must always be entered accordingly using the ICU Editor.

Insert the IMUX board into the I55 slot.
$\triangle$
An installation that does not correspond to the diagram can lead to malfunctions in the board. For better orientation, the material number (*) must be located on the left side of the SPCUs to ensure that they are installed the right way around.

### 8.7.26.3 Synchronization

When networking I55 systems via the IMUX, it is unavoidable that the systems run synchronously, because:

- The speech compression algorithm reacts very sensitively to transmission faults through transmutation processes.
- Error-free operation cannot be guaranteed for the data interface without synchronization.

When networking systems via the permanent circuit of the public network, the IMUX line interfaces are configured as the "slave" on both sides of the permanent circuit (normal case). With direct connection, one side is set as the "master" and the other side as the "slave". This means that the same rules must be followed as, for example, with a permanent circuit operated with the DTO board.

For synchronization purposes, I55 systems exchange information via the networking permanent circuit. This is carried out via the signalling channels of the logical ports. This means that synchronization can only be present via IMUX lines to which ports are assigned (i.e. that are set up for transportation of one or more B channels).
The IMUX board software will reject a configuration (configuration error) that results in a port number $=0$ for the entire board.

However, a port number $=0$ (entire band width for data transmission) is possible for one of the individual IMUX lines (A, B). These represent special cases that are to be observed with regard to synchronization.
Special case 1: 2155 systems network connected via two permanent circuits (FV) operated with IMUX

Special case 1 for synchronization

1. FV1: only data
2. FV2: only B channels

Because no ports (no B channels) are configured for permanent circuit FV1, synchronization of the two I55xE systems is only possible via FV2 (or via further permanent circuit lines that can be operated with IMUX or other boards such as DT0 or DT2, for example).

## Note:

With the appropriate configuration of the line interfaces, the permanent circuit (FV) lines in the above example can also be connected to the line interfaces of the IMUX in a "crossed" pattern.
Special case 2: 3 I55 systems network connected via two permanent circuits (FV) operated with IMUX

Special case 2 for synchronization

1. FV1: only data
2. FV2: only B channels
3. FV3
4. FV4
5. FV5
6. FV6
7. Access to public network

The I55-1 and I55-2 cannot be synchronized via FV1 (no ports)! However, because synchronization must be ensured (data transmission), it is necessary to provide further synchronization paths:

- Via further permanent circuits between I55-1 and I55-2 and operated with IMUX, e.g. FV3.
- Via further permanent circuits (operated with IMUX, DT0, DT2...) e.g. FV5.
- Via permanent circuits between I55-2 and I55-3, e.g. FV6.
- Via access of systems to the public network.

### 8.7.26.4 Configuration

## ICU Editor

The module possesses 2 physical ports, the line interfaces A (upper line submodule) and B (lower line submodule).
The ICU Editor is used to select the interface type and a band width distribution for each line interface (A, $B$ ). The distribution is made up of a $B$ channel number (compressed speech channels of $16 \mathrm{KBit} / \mathrm{s}$ each) and band width reservation for the transmission of data (see table below). The number of B channels provides the quantity, numbering and type of logical ports (connecting circuits). This means that with the IMUX, the number of logical ports represented for the switching software (MSU1 task) depends entirely on the configuration.

1. Example: Line A 3B chanels, slave (e.g. DS01)

Line B 5B channels, master (DS02)
results:

| Port (AO) no. | Port type | Transmitted on physical line |
| :--- | :--- | :--- |
| 0 | BAVLN-2B-Slave | A |
| 1 | BAVLN-1B-Slave | A |
| 2 | BAVLN-2B-Master | B |
| 3 | BAVLN-2B-Master | B |
| 4 | BAVLN-1B-Master | B |

## 2. Example: Line A not installed

Line B 4B channels, slave results:

| Port (AO) no. | Port type | Transmitted on physical line |
| :--- | :--- | :--- |
| 0 | BAVLN-2B-Slave | B |
| 1 | BAVLN-2B-Slave | B |

The ICU Editor checks whether the number of $B$ channels on an IMUX board is greater/equal 8 and, if required, returns an error message. If this does not occur, the ICU Editor provides information about the number of speech compression units to be inserted (half the number = number of SPCUs).
When the IMUX module is started, the available band width of a physical line (e.g. $64 \mathrm{Kbit} / \mathrm{s}$ with type D64S) is divided into subwidths by means of a "Mapping" algorithm. The input information for this process is as follows:

- The number of required $B$ channels (ICU Editor).
- The reserved band width for transmission of the data channel (ICU Editor), see data interfaces.
- In some cases, the required band width for the D signalling channel (permanently set, [ $8 \mathrm{KBit} / \mathrm{s}$ ] e.g. with D64S) if the inteface type does not provide a separate D channel.

It must be ensured that the 'Mapping' algorithm provides the same results on both sides of a permanent circuit operated with IMUX (this means that the subbands have the same position throughout the entire band)! To this end, the line interfaces on both sides of the FV must on all accounts have the same configuration concerning B-channel numbers and reserved capacity for the data channel.

This requirement must be met for each line interface. This means, for example, that if line A of an IMUX in an 155 system 1 is connected with line $B$ of an IMUX in system 2 via a permanent circuit, the two line interfaces $A$ (system 1 ) and $B$ (system 2) must be configured in the same way.

## Configuration checks

The ICU Editor carries out configuration checks for the IMUX board. This virtually rules out incorrect settings being made:

- Check of whether the total number of B channels is 8 (max. possible number of speech compression units).
- Check of whether the reserved band width on the line selected for transmission of the data channel is sufficient for the current configuration of the 'direct data interface'.
- In addition, the number of required speech compression units is output (half the number = number of SPCU submodules).

The above points are checked by the ICU software of the board. The hardware configuration data is also checked. In the event of inconsistencies in the configuration, the IMUX will not be started and indicates a configuration data error. This indication involves the top two LEDs flashing red and green on the front panel and a message to MCOM.

An error occurs if:

- The configuration data structure is unknown. (Always switch off the "Type name from ICU.TAB" option in the ICU Editor.)
- The total number of $B$ channels is greater than 8 .
- The reserved capacity for transmitting the data channel is insufficient.
- One or both inserted line submodules is not compatible with the type of the selected line interface.
- No B channel has been configured for the entire module (port number $=0$ ).

If an insufficient number of SPCU submodules is inserted, some ports on the IMUX will not start up (traffic restriction!). This status is indicated by a continuously flashing LED (see "LEDs and Switches").

## Customer data

When setting up the customer data, it must be ensured that enough ports of the BAV type are set up with port addresses 0, 1, 2...

Because one speech compression unit must be present on the board for each B channel, and the maximum number of speech compression units that can be inserted is 8 ( 2 per SPCU submodule), the maximum number of ports is 5 . This means that when setting up customer data for 5 ports of the BAV type with the addresses 0 to 4 on the IMUX slot, all configuration cases of the board are covered.

## Networking via the TNET protocol

The switching control regards the channels of the IMUX board as channels to "link line networks" (basic access $v / n$ ) using the TNET protocol. The IMX feature must be enabled in order to implement switching of the connecting circuits of the IMUX board, which are also set up with a "basic access vln" connecting circuit type. All other customer data is subjected to the known regulations for basic access vin (TNET).

## Prevention of 'non speech connections'

In 'non-speech connections', e.g. in the data service, the switching controller recognizes, with the aid of the customer data, during the connection setup that the desired service is not set up. The response to this is either disconnection or alternate routing. In networks with open numbering plans (exchange line code for each node), it is possible via the customer data to set up the exchange line code for IMUX connections only in dial groups for the speech service.

### 8.7.26.5 LEDs and Switch Functions

IMUX board, front side
Switch Function

| S1 | Right: | Reset board |
| :--- | :--- | :--- |
|  | Middle: | Normal position |
|  | Left: | Service disabling (preparatory) for all log. ports (AO) of the <br> board |
| S2 | Left: | Normal position |
|  | Right: | Service disabling (preparatory) for line A |
| S3 | Left: | Normal position |
|  | Right: | Service disabling (preparatory) for line B |
| S4 |  | No function |

## Meanings of LEDs

| L1 | Summation display via all ports |  |
| :--- | :--- | :--- |
|  | off: | No active layer 3 connections, all ports free |
|  | on: | At least 1 layer 3 connection |
|  | flashing: | All available ports have 'blocked' status |
| L2 | off: | Normal |
|  | on: | Board reset status |
|  | flashing: | Startup or download in progress |
| L3 | off: | Layer 1 on line A active |
|  | on: | Layer 1 on line A inactive (alarm) |

| L4 | off: | Layer 1 on line B active |
| :---: | :---: | :---: |
|  | on: | Layer 1 on line B inactive (alarm) |
| L5 | Summation display via all ports allocated to line A |  |
|  | off: | No active layer 3 connections on line A, all allocated ports free |
| L6 | Summation display via all ports allocated to line B |  |
|  | off: | No active layer 3 connections on line B, all allocated ports free |
|  | on: | At least 1 layer 3 connection on line B |
|  | flashing: | All ports allocated to the line have 'blocked' status |
|  | on: | At least 1 layer 3 connection on line A |
|  | flashing: | All ports allocated to the line have 'blocked' status |
| L7 | off: | Board is not supplying synchronous clock to I55xE central clock supply |
|  | on: | Board supplying synchronous clock |
| L8 | Only valid if SYN LED (L7) is "on"! |  |
|  | off: | Synchronous clock is being fed from line B |
|  | on: | Synchronous clock is being fed from line A |
| L9 | off: | Normal |
|  | flashing: | Insufficient number of compression units (too few SPCU's) |
| L10 |  | No function |
| L11 | The LED lights up briefly when C-bus messages are received |  |
| L12 | One-off fault states (IMUX internal buffer overflows) when transmitting data from the "direct data interface" result in the LED lighting up for 30 seconds. Such faults may occur if, <br> - The network connected I 33 systems are not in sync with each other or with the public network. <br> - Asynchronous data interfaces transmit data from the IMUX and the data terminal at adversely differing rates. (IMUX corrects this fault automatically by slightly increasing the data output rate to the data interface.) |  |

During startup, the LEDs indicate various board statuses. The phase is indicated by LED 12 being continuously ON. When LED 12 has been switched off once, the LEDs resume their normal functions. The simultaneous flashing of LEDs 1 and 7 indicates a configuration fault (board will not operate).

### 8.7.26.6 Data Interfaces

Onedata interface exists for each IMUX which can be configured as an asynchronous type (V.24/V.28) or synchronous type (V.24/V. 28 or X.21/V.11) with various data rates.

These data connections are fed directly to the board via the switching matrix.
The data connections cannot be set up via transit nodes. The respective plug is on the cable adapter CA5B that belongs to the board.

I55 with the IMUX board
The data is transported via one (configurable) of the permanent circuit (FV) lines. For this purpose, sufficient capacity for the data channel must be reserved on the selected line.

The ICU Editor checks whether the reserved band width on the selected transmission line is sufficient for the desired transmission rate. All data rates which fall below the reserved capacity are permissible but not necessarily sensible, as band width may be left unused.

Example:
Data interface 1200 baud asynchronous, transmission on line A, $32 \mathrm{KBit} / \mathrm{s}$ reserved on line A . Because band width can be reserved in increments of $8 \mathrm{KBit} / \mathrm{s}$ a capacity of $24 \mathrm{KBit} / \mathrm{s}$ remains unused, meaning that at least 1 other B channel could be set up.

| Transmission rate (Bit/s) |  | Line bandwidth to be reserved (KBit/s) |
| :--- | :--- | :--- |
| asynch. | synch. |  |
| $<9600$ | $<8000$ | 8 |
| 19200 | 16000 | 16 |
| - | 24000 | 24 |
| 38400 | 32000 | 32 |
| - | 48000 | 48 |
| - | 64000 | 64 |

As only one data channel can be transmitted, band width also only needs to be provided on one permanent circuit line. Any additional capacity reserved on the second line would remain unused.
The data interfaces operate protocol-transparent in all operating modes.
An end-to-end data backup should generally be implemented through the connected data terminals.

For all synchronous operating modes, the data interface is the clock master for the data terminal.
The V. 24 data interface involves unsymmetrical dual power lines that perform the following tasks:

|  |  |
| :--- | :--- |

| TxD (CT103): | Transmit data | DEE | $->$ | DÜE (IMUX) |
| :--- | :--- | :--- | :--- | :--- |
| RxD (CT104): | Receive data |  | $<-$ |  |
| CTS (CT106): | Transmit stand-by |  | $<-$ |  |
| DSR (CT107): | Operational readiness |  | $<-$ |  |
| GND (CT102): | Operational earth |  |  |  |
| DCD (CT109): | Receive signal level |  | $<-$ |  |

In a synchronous transmission, the two lines below supply the DEE with pulse timing information (no function in asynchronous transmission):

| TxC2 (CT114): | Transmitting pulse |  | $<-$ |  |
| :--- | :--- | :--- | :--- | :--- |
| RxC2 (CT115): | Receiving pulse |  | $<-$ |  |

Subsequent to the activation of the interface, the CTS, DSR and DCD lines are permanently set to "ON" and remain at this signal until the board is reset (the data interface of the IMUX signals permanent stand-by).

| Signal on the lines | V1 $<-3$ Volt | V1 $>+3$ Volt |
| :--- | :--- | :--- |
| Data lines | Binary 1 | Binary 0 |
| Control and clock lines | OFF | ON |

The X. 21 data interface involves symmetrical dual power lines that perform the following tasks:

|  |  | Direction | DÜE (IMUX) |  |
| :--- | :--- | :--- | :--- | :--- |
| T: | Sending | DEE | $->$ |  |
| R: | Receiving |  | $<-$ |  |
| C: | Control |  | $->$ |  |
| I: | Report |  | $<-$ |  |
| S: | Clock pulse |  | $<-$ |  |
| G: | Earth or return conductor |  |  |  |

Subsequent to the activation of the interface, the I line is permanently set to "ON" and remains at this signal until the board is reset (the data interface of the IMUX signals permanent stand-by). Line C is not evaluated.

The 'Gnd1' line can be set to ground irrespective of the country of application. The CA5B cable adapters feature a breakpoint which can be used to disconnect this line from ground.

Breakpoints on the cable adapter

1. Breakpoints

| Signal on the lines | VA...VB | VA...VB |
| :--- | :--- | :--- |

|  | $<-0.3$ Volt | $>+0.3$ Volt |
| :--- | :--- | :--- |
| Data lines | Binary 1 | Binary 0 |
| Control and clock lines | OFF | ON |

The following bit rates are supported which can be configured using ISM or the ICU Editor:

| V.24 synch. | V.24 asynch. (1 start bit, 1 stop bit, parity bit <br> is possible) | X.21 synch. |
| :--- | :--- | :--- |
| $1000 \mathrm{Bit} / \mathrm{s}$ | $300 \mathrm{Bit} / \mathrm{s}$ | $1000 \mathrm{Bit} / \mathrm{s}$ |
| $2000 \mathrm{Bit} / \mathrm{s}$ | $600 \mathrm{Bit} / \mathrm{s}$ | $2000 \mathrm{Bit} / \mathrm{s}$ |
| $4000 \mathrm{Bit} / \mathrm{s}$ | $1200 \mathrm{Bit} / \mathrm{s}$ | $4000 \mathrm{Bit} / \mathrm{s}$ |
| $8000 \mathrm{Bit} / \mathrm{s}$ | $2400 \mathrm{Bit} / \mathrm{s}$ | $8000 \mathrm{Bit} / \mathrm{s}$ |
| $16000 \mathrm{Bit} / \mathrm{s}$ | $4800 \mathrm{Bit} / \mathrm{s}$ | $16000 \mathrm{Bit} / \mathrm{s}$ |
| $24000 \mathrm{Bit} / \mathrm{s}$ | $9600 \mathrm{Bit} / \mathrm{s}$ | $24000 \mathrm{Bit} / \mathrm{s}$ |
| $32000 \mathrm{Bit} / \mathrm{s}$ | $19200 \mathrm{Bit} / \mathrm{s}$ | $32000 \mathrm{Bit} / \mathrm{s}$ |
|  | $38400 \mathrm{Bit} / \mathrm{s}$ | $48000 \mathrm{Bit} / \mathrm{s}$ |
|  |  | $64000 \mathrm{Bit} / \mathrm{s}$ |

3.

Assignment of the X3 plug

1. Assignment for V. 24
2. Signal names on the backplane
3. female 25-pin Sub-D (ISO 2110)

4. 

Assignment of the X 4 plug

1. Assignment for $X .21$
2. Signal names on the backplane
3. female 15-pin Sub-D (ISO 4903)
4. 0 Ohm

### 8.7.26.7 MDF Connections

The connectors of the IMUX board are picked off with the corresponding cables on the adapter modules CA5B and fed to the MDF, terminal adapter or data terminal.

When using S64LI as the line interface, the cable with material number 29.9030.51xx is used, whereby xx represents the length of the cable in m (1 to 99).
The 15-pin Sub-D plug is connected to the X1 plug (line interface A) or X5 plug (line interface B) of the CA5B. The open end of this cable is connected with 4 lines in the MDF ( 2 twisted pairs plus earth wire to ground).

Lines used:

| Colours | Pin on the <br> Sub-D | Name | Function |
| :--- | :--- | :--- | :--- |
| YE/WH | $4 / 3$ | $\mathrm{TDa} / \mathrm{TDb}$ | Transmit Data |
| GN/WH | $6 / 5$ | $\mathrm{RDa} / \mathrm{RDb}$ | Receive Data |

When using X64LI as the line interface, the cable with material number 27.5630.054x is used, whereby $x$ represents the length of the cable in m : $(x=1$ for $5 \mathrm{~m}, \mathrm{x}=2$ for $20 \mathrm{~m}, \mathrm{x}=3$ for 50 m$)$. This cable is connected directly to a TA of the network operator.

Pinning of the X 1 and X 5 plugs (Sub-D 15 male)

| Pin | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Name | Gndb | Ta | Ca | Ra | Ia | Sa | Xa | Gnda | Tb | Cb |
| Pin | 11 | 12 | 13 | 14 | 15 |  |  |  |  |  |
| Name | Rb | Ib | Sb | Xb | NC |  |  |  |  |  |

The X3 plug comprises a 25-pin Sub-D female plug that serves the connection of an external data terminal with V. 24 (synchronous/asynchronous) interface.

Pinning of the X3 plug

| Pin | 2 | 3 | 5 | 6 | 7 | 8 | 15 | 17 | Rest |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Name | TxD | RxD | CTS | DSR | GND | DCD | TxC2 | RxC2 | NC |

The X 4 plug comprises a 15-pin Sub-D female plug that serves the connection of an external data terminal with X. 21 (synchronous) interface.

Pinning of the X 4 plug

| Pin | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

### 8.7.27 IPN Intelligent Private Network

## Short description

The board IPN module enables the operation of intelligent private networks between systems (CSI55, I33) by means of data transmission in the speech channel of a digital dial-up line.

| Other features |
| :--- | :--- |
| Power demand $+5 \mathrm{~V} \quad 710 \mathrm{~mA}$ |
| Up to 15 IPN connections are possible per board. |
| Board software download. |
| Board identification using board pass |
| Maintenance function |

The board must operate in conjunction with an ISDN exchange board.

### 8.7.27.1 Function of Switches and LEDs

IPN board, front side

## Switch Position

| S1 | Left: | Preparatory disabling |
| :--- | :--- | :--- |

|  | off: | Operating status |
| L7 | on: | Logging switched on |
| L8 | flashing: | See L3 function |
|  | off: | Operating status |
| L9 |  | No function |
|  | 12x | Main program runtime $>125 \mu$ s |
| L10 | on: | At least one channel blocked |
|  | flashing: | At least one channel defective |
|  | off: | Operating status |

### 8.7.28 MAC Multi Access Circuit Board

## Short description

The MAC board is required for the application of the 155 system as a dealer, special network, railway or master terminal system. It is the connecting circuit module for the digital terminals (e.g. TH93M) and peripheral devices (e.g. speech recording unit). It is also provides switching matrix and mixer functions for the application of special dealer functions.

Overview

1. 2 MB Interface
2. 2 MB Module Loop
3. Databus
4. Power supply
5. UPO Interface
6. MAC module with submodule EMAC

The board is always required if multi connections (monitoring, OLD, extra handset, speech recording) are to be used in conjunction with the dealer terminals. Without these multi connections, a dealer terminal may also be connected to the UIP or DUP0 board.

## Features

8 UP0 interfaces for the connection of TH93x terminals.
$2 \times 2$ MBit interfaces for the connection TH93Zx modules or speech recording devices.
Expansion of the module by means of the EMAC submodule provides an additional two 2 MBit interfaces for the connection of TH93Z modules and speech recording devices.

The 2 MBit interface of a MAC can only be assigned to the terminals and $Z$ modules that are located on the same MAC.

| Other features |  |
| :--- | :--- |
| Country of <br> application | National and international |
| Power demand +5 V | 1500 mA |
| Overvoltage protection up to 4 kV |  |
| Board software download. |  |
| Board identification using board pass |  |
| Maintenance function |  |

## System requirements

The MAC board can only be used in the R1 rack in each module. It can be connected with any of the eight slots.

### 8.7.28.1 System Requirements

The MAC board can only be used in the R1 rack in each module. It can be connected with any of the eight slots.

### 8.7.28.2 CA6B for mains connection

Cable adapter for connecting UPO and S2M connections to the MAC board.

- 50-pin CHAMP plug as an output to the MDF
- 8-pin WE plugs

CA6B with connections

1. 16-paired cable to external MDF, AO 1-8
2. 8-pin WE plug for the 2 MBit interfaces

## Ranges

## UPO Interface

The interface ranges are comparable to those of other UPO interfaces within the CSI55:

| Line length |  |
| :--- | :--- |
| 3.5 km | Earth cable $\varnothing 0.6 \mathrm{~mm}$ |
| 2.1 km | Earth cable $\varnothing 0.4 \mathrm{~mm}$ |
| 1.8 km | Installation cable $\varnothing 0.6 \mathrm{~mm}$ |

## 2 MBit Interface

The interface range varies according to the cable attenuation.
When at 1 MHz , the wave attenuation must be no more than 6 dB .

## Example 1:

The J-2Y (SST)Y $2 x 2 x 0.6$ III Bd (28.9802.0151) installation cable has wave attenuation of $28 \mathrm{~dB} / 1 \mathrm{~km}(2,8$ $\mathrm{dB} / 100 \mathrm{~m}$ ) when at 1 MHz , resulting in a maximum range of $6 \mathrm{~dB}: 2,8 \mathrm{~dB}=214 \mathrm{~m}$.

## Example 2:

The ECONET cable (category 5) has wave attenuation of $16 \mathrm{~dB} / 1 \mathrm{~km}(1,6 \mathrm{~dB} / 100 \mathrm{~m})$ when at 1 MHz , resulting from a maximum range of $6 \mathrm{~dB}: 1,6 \mathrm{~dB}=375 \mathrm{~m}$.

### 8.7.28.3 Connections

Connection of the $\mathbf{2}$ MBit Interface

Connection of 2 MBit interface using WE6-WE4 module connecting cord

1. Patch cable:
0.8 m 27.9798.0231
2.0 m 27.9798 .0232
3.0 m 27.9798 .0233
to
10 m 27.9798.0230
2. ECONET Cable $4 \times 2$ 27.9798.0016
3. 4-wire connecting cord WE4/WE6 (junction box 17.8761.1598)
4. MDF cable:

1m 29.9030.5301
2m 29.9030.5302
to
99m 29.9030.5399
5. Junction boxes
6. Z modules
7. Patch panel:

16-part 27.9798.2353
24-part 27.9798.2354
48-part 27.9798.2357

Connection of 2 MBit Interface, ECONET Standard

Connection of 2 MBit interface using WE8-WE4 module connecting cord in accordance with ECONET standard

1. Patch cable:
$0.8 \mathrm{~m} \mathrm{27.9798.0231}$
2.0 m 27.9798 .0232
3.0 m 27.9798 .0233
to
10 m 27.9798.0230
2. ECONET Cable $4 \times 2$ 27.9798.0016
3. 4-wire connecting cord WE4/WE8 (junction box 17.8761.1598)
4. MDF cable:

1 m 29.9030 .5301
2m 29.9030.5302
to
99m 29.9030.5399
5. Junction boxes
6. Z modules
7. Patch panel:

16-part 27.9798.2353
24-part 27.9798.2354
48-part 27.9798.2357

To be able to meet the requirements of the ECONET cabling standard (featuring standardized configuration of connections), the extension modules now come supplied with a different connecting cord. Further information about cabling can be found in the Installation Manual of the respective extension modules.

Connector Configuration

1. Old Connecting Cord (17.8761.1589)
2. New Connecting Cord (17.XXXX.XXXX)
3. Offering side
4. Z module side

This connecting cord is identifiable via the plug design (WE8 on the offering side).

### 8.7.28.4 Board

MAC board, component side

### 8.7.28.5 LEDs and Switch Functions

MAC board, front side

| L20 |  | CBI LED RXTX active |
| L21 |  | CBI LED FAIL or PCANCEL |
| L22 |  |  |

### 8.7.28.6 Commissioning

When starting up the MAC, the individual stages of the initialization are indicated by means of the LEDs on the front panel. LEDs $1-16$ provide the following signalling:

| 1. | RESET of module On | $\rightarrow$ | LED 5-12 On |
| :---: | :--- | :--- | :--- |
| 2. | pre init interrupt adresses | $\rightarrow$ | LED 5 Off |
| 3. | Init. of hardware register, end of module <br> RESET | $\rightarrow$ | LED 6 Off |
| 4. | Initialization Interrupt Disable counter | $\rightarrow$ | UP0 7 LED Off LED 13-16 On |
| 5. | Network initialization |  |  |

| a. | Initialization of switching modules (mtsl init) | $\rightarrow$ | LED 13 Off |
| :--- | :--- | :--- | :--- |
| b. | Initialization of mixer module (musac init) | $\rightarrow$ | LED 14 Off |
| c. | Initialization of mixer with level setting <br> (musac a init) | $\rightarrow$ | LED 15 Off |
| d. | S2M Initialization (falc init) | $\rightarrow$ | LED 16 Off |
| e. | Initialization of switching components <br> between UP0 and highways (epic init) | $\rightarrow$ | LED 8 Off |
| 6. | init interrupt addresses | $\rightarrow$ | LED 9 Off |
| 7. | initialize heap | $\rightarrow$ | LED 10 Off |
| 8. | Initialization of layer 2 timer | $\rightarrow$ | LED 11 Off |
| 9. | V24 Initialization | $\rightarrow$ | All LEDs Off |

The initialization of the MAC board is now complete.

## Setting up the board using the ICU Configuration Editor

MAC board

| Card |  | Field designation | active | Effect or function |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Gen. | S2M | UP0 |  |  |  | Selection of country |
| X |  |  |  | Country setting |  | EMAC expansion level inserted, <br> yes/no |
| X |  |  |  | EMAC present | DSM expansion level inserted, <br> yes/no |  |
| X |  |  |  | DSP present |  | Specification of which protocol <br> the terminal is using |
|  |  | X |  | Protocol version |  |  |

1
The installation of the MAC board requires the presence of CF2x modules and W1D, W2D or B1D modules. Setting up the MAC also requires a MACS to be set up on slots 90 and 91 .

## Correlations

When using the DSPF board, the AUX-HYs can no longer be used. This means that the DSPF board can now only be used for a maximum of 60 announcement channels and for this purpose uses only the bus bar which is available for the module slot itself and the free slot located below.

MACS board

| Card |  | Field designation | active | Effect or function |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

### 8.7.29 MULI Multi-line

## Short description

$\triangle$
The following description provides a basic outline of the board MULI. More detailed information about module features, installation and configuration can be found in a separate manual entitled MULI Multi-Line.

The MULI board is used for digital subscribers who have convenience features and who work together in a team or department.
The principle of the multi-line function is a pool containing call numbers that are assigned to the multi-line board. Each connected terminal is assigned call numbers which correspond to a B channel from this pool.

## Features

Each subscriber has access to each line.
Access is gained directly via the keys of the terminal.

Holding calls (for consultation).
Each subscriber may retrieve a call in hold status at his terminal and continue conversation.
Definition of individual multi-line group per subscriber.

```
Line display to the terminal
Own call number (Primary Directory Number -> PDN)
Call number of other subscribers (Secondary Directory Number -> SDN)
Virtual call number (Phantom Directory Number -> PhDN)
```

| Other features |  |
| :--- | :--- |
| Country of <br> application | National and international |
| Overvoltage protection up to 4 kV |  |
| Board software download. |  |
| Board identification using board pass |  |
| Maintenance function |  |

### 8.7.29.1 Functionality

## MULI board

The MULI board serves to provide the multi-line functions.
There exist three different configuration options:

- Single multi-line:

## Board with 16 HWAs.

16 ports, each port with a maximum of two call numbers.
Multi-line pool with a maximum of 32 call numbers.

- Single multi-line:

Boards with 32 HWAs with a neighbouring slot for a replacement board.
16 ports, each port with a maximum of two call numbers.
Multi-line pool with a maximum of 64 call numbers.

- Twin multi-line: (for step 2)

Boards, each with 16 HWA
32 ports, each port with a maximum of two call numbers.
Multi-line pool with a maximum of 64 call numbers.

The entire process of signalling and message exchange is implemented by the MULI board.

### 8.7.30 OFA2B/OFAS Optical Fibre Adapter

## Short description

The OFA2B Optical Fibre Adapter 2 B modules and OFAS Optical Fibre Adapter single mode are for connecting the optical waveguides when DT21 boards are used and the optical interfaces are employed.

The boards are used for various optical fibre types:

| OFA2B |  | OFAS |  |
| :--- | :--- | :--- | :--- |
| Graded-index fibres |  |  | Mono-mode fibres |
| Ready-made cable types | CoreØ $\mu \mathrm{m}$ | Ready-made cable types | CoreØ $\mu \mathrm{m}$ |
| $29.9030 .6101-6199^{*}$ | 62,5 | $29.9030 .6201-6299^{*}$ | 9,5 |

*The last two characters of the material number indicate the length of the pre-prepared cable in metres.
Cable lengths $>99 \mathrm{~m}$ are handled by the project division.

## Common data for OFA2B and OFAS boards

| Interfaces | Number and form | Wavelength |
| :--- | :--- | :--- |
| Optical transmitters | 1 SC socket | 1300 nm |
| Optical receivers | 1 SC socket | 1300 nm |

| electrical values | 5 V |  |
| :--- | :--- | :--- |
| Supply voltage |  |  |

| Supply current | 250 mA | typical |
| :--- | :--- | :--- |
| Power consumption | 1.25 W |  |

Depending on the optical fibre used and cross-section area of the optical cable, different maximum cable lengths can be achieved:

| Maximum distances |  |  |  |
| :--- | :--- | :--- | :--- |
| Type of fibre | Optical fibre <br> core $\varnothing \mu \mathrm{m}$ | maximum <br> length km |  |
| Graded-index <br> fibre | 62,5 | 10 |  |
|  | 50 | 6,2 |  |

## Basic construction of OFA2B and OFAS

OFA2B and OFAS boards are designed for connecting to SC plugs. Neither board is thus compatible with the previous OFA1B board type, which was designed for mono-mode fibre and ST connectors.

### 8.7.31 S64LI Structured 64 KBit Line Interface

## Short description

The S64LI is a submodule of the IMUX for connection to digital permanent connections. The maximum transmission rate is $64 \mathrm{kBit} / \mathrm{s}$.

S64LI submodule on the IMUX board

1. S 64 LI submodule
2. Connecting circuit slot
3. IMUX board

| Other features |  |
| :--- | :--- |
| Country of <br> application | National and international |
| Power demand +5 V | 40 mA |
| Configurable for standard digital permanent connections. |  |
| PCM coupling and layer 1 function |  |
| Can be combined with the X64LI submodule on the IMUX board |  |

### 8.7.32 SPCU Speech Compression Unit

## Short description

SPCU is an submodule of the IMUX which aids compression of the bit rate from $64 \mathrm{kBit} / \mathrm{s}$ to $16 \mathrm{kBit} / \mathrm{s}$ on rapid signal processors with digital speech signals.
Implementation occurs here of the

SPCU submodule on the IMUX board

1. SPCU Submodule
2. Connecting circuit slot
3. IMUX board

| Other features |  |
| :--- | :--- |
| Country of <br> application | National and international |
| Power demand +5 V | 300 mA |
| Transmission of FAX signals with $9,6 \mathrm{kBit} / \mathrm{s}$ |  |

### 8.7.33 STSM S0/T0 Submodule

## Short description

The submodule STSM is plugged into the ADM board. It provides four S0- or TOinterface. It contains layer 1 and layer 2 HW ports.

```
Configurable interfaces
Subscriber connection (S0 powered); Layer 1 master (standard)
or
layer 1 slave (outlying extension)
```

Exchange line (T0, unpowered)
Exchange line simulation (T0, unpowered)
Permanent connection (T0, unpowered, master clock or clock slave, layer 2 master or slave)

STSM submodule, component side

1. Plug connector to the ADM (internal ADM interface)
2. Plug connector to the ADM (line interface)

| Other features |  |
| :---: | :---: |
| Country of application | Application in all countries |
| Power demand +5V | 10 mA |
| Selection free configuration of each individual connection |  |
| Overvoltage protection up to 4 kV |  |
| Download board software |  |
| Board identification using board pass |  |
| Maintenance function |  |

### 8.7.34 UIP Universal Interface Platform

## Short description

The UIP board is a basic board which accomodates up to 4 submodules.

## Submodules

V24M with a V. 24 interface.
CL2M for the reception and transmission of external synchronous clock signals.
CL2ME for receiving an external high-precision reference clock by means of a clock normal (TAREF).

UIP board, component side

1. Slot 1
2. Slot 2
3. Slot 3
4. Slot 4

The following signals are available for the V.24:

| RXD |  |
| :--- | :--- |
| TXD |  |
| DTR | (unsupported) |
| GND |  |
| DSR | (unsupported) |
| RTS | (unsupported) |
| CTS | (unsupported) |

The V24M submodule may only be inserted in the first two (upper) slots. The others are freely configurable.

When using the CL2ME in the first slot the cable adapter CA3B/T must be used for connecting the TAREF.

| Other features |  |
| :--- | :--- |
| Country of application | Application in all countries |

| Power demand +5 V | 500 mA |
| :--- | :--- |
| Overvoltage protection up to 4 kV |  |
| Download board software |  |
| Board identification using board pass |  |
| Maintenance function |  |

### 8.7.34. LEDs and Switch Functions

## MDF Connection via CA3B from UIP

The V24M submodules used on slots 1 and 2 can be connected directly to the Sub-D plug of the cable adapter. In the case of mixed combination, slots 1 and 2 with CL2M, CL2ME and V24M, see table above.

### 8.7.35 UKSM UKO Submodule

## Short description

The UKSM submodule is inserted on the ADM board. It provides two UKOmaster interfaces. It contains layer 1 and layer 2 HW ports.

UKSM submodule, component side

1. Plug connector to the ADM (internal ADM interface)
2. Plug connector to the ADM (line interface)

| Other features |  |
| :--- | :--- |
| Country of <br> application | Application in all countries |
| Power demand +5 V | 400 mA |
| Interface description | UKOinterface; two-wire; transmission rate: $384 \mathrm{kbit} / \mathrm{s}$ |
|  | Coding 2B1Q |
| Line lengths | $4,5 \mathrm{~km}$ installation cable $(\mathrm{I}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0.6 \mathrm{~mm}$ |
|  | 8 km outdoor cable $\mathrm{A}-2 \mathrm{YF}(\mathrm{L}) 2 \mathrm{Y} \varnothing 0.6 \mathrm{~mm}$ |
| Overvoltage protection up to 4 kV |  |
| Download board software |  |
| Board identification using board pass |  |
| Maintenance function |  |

### 8.7.36 UPSM UPN submodule

## Short description

The UPSM submodule is inserted on the ADM board. It provides four UPNinterfaces for digital terminals or permanent connection.

UPSM submodule, component side

1. Plug connector to the ADM (internal ADM interface)
2. Plug connector to the ADM (line interface)

| Other features |  |
| :--- | :--- |
| Country of <br> application | Application in all countries |
| Power demand +5 V | 35 mA |
| Interface description | four UPN interfaces; two-wire |
|  | Transmission rate: $384 \mathrm{kbit} / \mathrm{s}$ |
|  | 16 dB attenuation range |
| -48 V/max. 60 mA short-circuit-proof supply for increased power consumption, e.g. T3 terminals |  |
| Line lengths | 1 km installation cable (I-Y(ST)Y Ø0.6 mm |
|  | 2.8 km outdoor cable A-2YF(L)2Y $\varnothing 0.6 \mathrm{~mm}$ |
| Overvoltage protection up to 4 kV |  |
| Download board software |  |

| Board identification using board pass |
| :--- |
| Maintenance function |

Using a UPN-Repeater the range of the UPNinterface can be extended.

### 8.7.37 V24M Module

## Short description

V24M is a sub-board for the UIP board. It comprises the layer 1 functions for a V. 24 interface.
A maximum of two V24 modules can be inserted on slots 1 and 2 of the UIP board. This requires the connection of the connecting circuit line to be implemented via the CA3B board.

| Other features |  |
| :--- | :--- |
| Application | for further V.24 ports on the system |
| Power demand +5 V | 100 mA |

### 8.7.38 X64LI kBit Line Interface

## Short description

The S64LI is a submodule of the IMUX for connection to international digital leased lines.

X64LI submodule on the IMUX board

1. X64LI submodule
2. Connecting circuit slot
3. IMUX board

## Other features

| Country of <br> application | Application in all countries |
| :--- | :--- |
| Power demand +5 V | 220 mA |
| Maximum <br> transmission rate | $64 \mathrm{kBit} / \mathrm{s}$ |
| Use only as permanent connection or leased line |  |
| PCM coupling and layer 1 function |  |
| Can be combined with the S64LI submodule on the IMUX board. |  |

### 8.8 IP Telephoning Gateways

|  | Board |  | Submodule |  | Connection <br> board |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |
| Board/ <br> Rack/ <br> Backplane $\rightarrow-$ | IPGW $\rightarrow 502$ | $\rightarrow$ | DSP $\rightarrow 506$ | $\rightarrow$ | CAIB $\rightarrow 247$ |  |

### 8.8.1 IPGW Internet Protocol Gateway

This board is no longer available. It has been replaced by VOIP board, see VoIP Voice over IP Board $\rightarrow 513$

## Short description

Besides excellent conformance to the relevant standards, the IPGW board offers a variety of new features.

| Features |
| :--- |
| High voice quality |
| Up to 30 parallel calls per device |
| All relevant speech codings (G.711, G.723.1, G.726, G.729A) |
| Full telephone convenience with single-digit and block dialling, local and remote dialling tone, local noise <br> generation in call intervals. |
| Flexible voice routing options IP-IP, ISDN-ISDN and IP-ISDN (any to any dialling) |
| Flexible configuration options, connection as a subscriber or exchange to the PABX, ISDN network or by <br> looping into the existing exchange line. |
| Remote maintenance capability |
| Preconfiguration option |
| Built-in gatekeeper |
| Interoperability with other VoIP products |

It consists of a gateway with integrated gatekeeper and two S2M interfaces (QSIG or DSS1 protocol) for connection to the CSI55.

The gateway can be coupled with the CSI55 and an existing S2M exchange line via the two S2M interfaces. An additional DT2 board is not required for the purpose. Calls from the public port are then transferred transparently through the gateway. Connection to the IP network is via an Ethernet interface.

The IP interface offers the H. 323 Media Stream protocol for speech and enables IP telephony on up to 30 channels (equippment option: 10, 20, 30 channels). Either H. 323 terminals or other gateways for IP networking of PABXs can be connected.

Support with tools (KAD, CAT, ISM) is not currently possible.
Until our own IP phone is available, the IP phone manufactured by Tiptel will be used as a terminal for direct connection to the IP world.

H. 323 environment

1. IP network (IP Network H. 323 LM)
2. IP phone (NTP IP phone; H.323)
3. H. 323 terminal

### 8.8.1.1 Configurations

Exchange line
Own DT2 board for each IPGW

Exchange line IPGW looped in

1. Public network

Permanent connection
Own DT2 board for each IPGW

Permanent connection
IPGW looped in

Example of a connection

1. Public network
2. MDF

### 8.8.1.2 Submodules on IPGW

The IPGW board is equipped with a SOsubmodule and a Digital Signal Processor (DSP) submodule. Depending on the configuration of IP channels on the IPGW, the board is additionaly equipped with a maximum of two additional DSP submodules.

Component side of the IPGW board

1. Slot for submodule S0
2. submodule slot for submodule DSP for the following equipment option: 10 channels (IP network connections)
3. submodule slot for submodule DSP for the following equipment option: 20 channels
4. submodule slot for submodule DSP for the following equipment option: 30 channels
5. free (currently not used)
6. LEDs and switches
7. PRI1
8. PRI2
9. SO
10. 10/100 Base T
11. V. 24 interface
12. V. 24

### 8.8.1.3 LEDs and Switch Functions

IPGW board, front side

## Switch Position in Normal Operation

## Switch Function

| S1 | Left: | No function |
| :--- | :--- | :--- |
|  | Middle: | Operating status/release |
|  | Right: | Reset board * |
| * Reset duration |  |  |

* Reset duration

| greater <br> $5 s$ | Standard configuration and special reset mode |
| :--- | :--- |
| smaller <br> $5 s$ | Normal operating status with activated DHCP (Dynamic Host Configuration Protocol) server <br> mode |

| S2 | Left: | Prepare the board for the connection to a hub |
| :--- | :--- | :--- |
|  | Middle: | Configure the board for the connection to a PC |

## Meanings of LEDs

| L1 | 5V | on: | 5V present/available |
| :---: | :---: | :---: | :---: |
|  |  | off: | 5 V not present/available |
| L2 | PRI1 <br> TE | on: | Layer 1 of transmission path is established |
| L3 | S/T | on: | Layer 1 of transmission path is established |
| L4 | ACT | on: | Ethernet receives or sends data |
|  |  | off: | Idle state |
| L5 | Ready | on: | Board in operation, configuration in order |
|  |  | Flashing 1 time, then 1s pause. The process starts once more from the beginning. | DSP error |
|  |  | Flashing 2 times, aprox. 0.5 s pauses, then 1s pause. The process starts once more from the beginning. | S0 error |
|  |  | Flashing 4 times, aprox. 0.5 s pauses, then 1s pause. The process starts once more from the beginning | S2M error |
|  |  | Flashing 6 times, aprox. 0.5 s pauses, then 1s pause. The process starts once more from the beginning | Enet error (Enet = Ethernet) |
|  |  | Flashing 7 times, aprox. 0.5 s pauses, then 1s pause. The process starts once more from the beginning | Uart error (Uart = V.24) |
|  |  | off: | Board not ready |
| L6 | $\begin{aligned} & \text { PRI2 } \\ & \text { NT } \end{aligned}$ | on: | Layer 1 of transmission path is established |
| L7 | LINK | on: | Ethernet connection is running |
|  |  | off: | Ethernet connection is not running |
| L8 | Speed | on: | 100 Mbps |
|  |  | off: | 10 Mbps |

Assignment of the V. 24 interface (male DSub 9) on the front panel

| Signal name | Description | DSub 9 pin |
| :--- | :--- | :--- |

| TXD | Transmit Data (send data) | 3 |
| :--- | :--- | :--- |
| RXD | Receive Data (reception data) | 2 |
| RTS | Request To Send (switch on the transmitter) | 7 |
| CTS | Clear To Send (readiness for sending) | 8 |
| DTR | Data Terminal Ready (terminal ready for operation) | 4 |
| DSR | Data Set Ready (operational readiness) | 6 |
| GND |  | 5 |
| DCD | Data Carrier Detect (receive signal level) | NC |

The V. 24 interface (console port) can be used for the first configuration of the IPGW.
Set the RS232 interface of your PC as follows:

| Adjustments of the console port |  |
| :--- | :--- |
| Bits per second | 9600 |
| Data bits | 8 |
| Parity | None |
| Stop bits | 1 |
| Protocol / flow control | None |

### 8.8.1.4 MDF Connections

The CAIB cable adapter serves for the connection of the cable network.

CAIB cable adapter

1. Connection cable CAIB - MDF

Cable adapter CAIB, component side

1. Cable $6 \times 2$ to the main distribution frame
2. RJ45 socket for the Ethernet connection
3. V. 24 connection (free)
4. Plug for backplane
5. Fixation

Two cables are available for the connection to the main distributor:

- ext. connection cable IPGW, 10m: 49.9903.4483
- ext. connection cable IPGW, 40m: 49.9903.4485

Through these cables the:

- Exchange line or permanent connections (S2M)
- Service, synchronization (S0)
are connected.

| MDF | Cable Adapter CAIB |  |
| :---: | :---: | :---: |
| Colours 6x2 | IPWG |  |
| WH (white) / BN (brown) | PRI1 | A1/B1 (TX+/TX-) |
| GN (green) / YE (yellow) |  | A2/B2 (RX+/RX-) |
| GY (grey) / PK (pink) | PRI2 | A1/B1 (TX +/TX-) |
| BU (blue) / RD (red) |  | A2/B2 (RX+/RX-) |
| BK (black) / VT (violet) | BRI | A1/B1 (TX+/TX-) |
| GY PK (grey/pink) / RD BU (red/blue) |  | A2/B2 (RX+/RX-) |

PRI=Primary Rate Interface (S2M)
BRI=Basic Rate Interface (S0/TO)
PRI1=TE
PRI2=NT
BRI=S0 (service, synchronization input)

### 8.8.1.5 Connection of the Ethernet Interface

The Ethernet connection located on thecable adapter is connected to the Ethernet 10/100 base T-connection using a CAt5 structure cable with RJ45 plug.

The total length of the connection to the switch must not exceed 100 m .
Seizure of the Ethernet connection (RJ45)

| Signal name | Description | RJ45 pin |
| :--- | :--- | :--- |
| TX + | Transmit | 1 |
| TX- | Transmit | 2 |
| RX + | Receive | 3 |
|  |  | 4 |
|  |  | 5 |
| RX- | Receive | 6 |
|  |  | 7 |
|  |  | 8 |

### 8.8.1.6 Administration

The board mentioned above cannot be managed in CSI55 and in the tools. In order to avoid mistakes when altering or retrofitting communication servers Integral 55 in the field due to the lack of tool administration to the greatest possible extent, please proceed as follows:

1.     - In the event of supply via KSPA, set up a "T1CCS" as a pseudo-module (digital AO, country selection USA) in the KAD/CAT on the IPGW slot. The corresponding lines belonging to the DT2 board are to be labelled Fxx01 - Fxx30 and named VoIP line

- When retrofitting in the field, set up a "T1CCS" as a pseudo-module (digital AO, country selection USA) in the KAD/CAT on the IPGW slot. The corresponding lines belonging to the DT2 board are to be labelled Fxx01 - Fxx30 and named VoIP line

2. The register the system with ZOLS or change with the "Comment": Please register in the customer data: Attention! IPGW board on the T1CSS slot (pseudo-board)

\subsection*{8.8.1.8 Description of software functions}

The enclosed descriptionHBIP400 refers to IP400. All procedures correspond with those of the IPGW board.

\subsection*{8.8.2 VOIP Voice over IP Board}

\section*{Short description}

For the VOIP board and all additional information for setup, dimensioning etc. you can find a detailed description under Notes concerning VoIP.

It is shown once again in the figure below.

VOIP board, component side
1. Speech compression / packetizing
2. Echo cancellation

The basic board VOIP (material number: 49.9903.7976) has 6 slots for SOM-2 submodules, with two DSP chips each(Digital Signal Processing Small Outline Module 2, material number: 49.9903.7980) in order to increase the number of DSP chips used in the system. These DSP chips have two functions:
- Voice compression, in order to pack voice information from the highway into data packets and thus to compress the speech data when desired (from G. 71164 kbit/s to G.729A 8kbit/s)
- Echo cancellation for the voice connection from the IP terminal to the ISDN/analog terminals

The upper three slots (in the centre of the board) are used for voice compression and packetizing, while the lower three slots are used for echo cancellation.

Due to the very high cost of DSP chips, the number of SOM-2 submodules must be selected in accordance with the customer configuration (see calculation of the number of SOM-2 submodules).

In addition, 4 DSP chips are soldered on the VoIP board. These are responsible for central functions such as announcements, mixers, and tone input, and support a fixed number of channels for voice compression and echo cancellation.
The VOIP board connection to the peripherals is done via the AEV24B cable adapter.

\section*{9 BS Confidata:}

\section*{Operating System - Configuration Data from E050}

The distribution of software components and / or tasks in the 9030 system among the single GCU controls is determined by the operating system configuration data. Like the 8030 system, each customer system is not separately configured, instead certain configurations are specified by means of package-formation, which each cover an area of the system. The slot allocation of the GCU is an exception, this occurs in the 9030 individually as per customer data.

From version E06 onwards, the OMSF task in the packages S2, I1...I4 is doubled (no primary function).

\subsection*{9.1 Packages}

A configuration data package determines the operating system configuration data for a specific system extension. The packages are produced in the operating system development.

For the 9030 there are currently six packages.
- Package S1 for a single module
- package S2 for a twin-module and
- Packages I1,I2,I3 and I4 for various multi-module configurations.

\subsection*{9.2 GCU configuration}

Each package defines the minimum and maximum number of GCUs in a system. The minimum number is dependent on the imperative functions (e.g. central switching functions), the maximum number is dependent on the GCUs defined in the package. The package defines which software (operating system/tasks) are loaded on each GCU.
Each GCU is assigned to a logical group number (LGN - logical group number) The LGN must be defined for a physical slot address on the module by TIP/PC-KAD. The LGNs, a function name (abbreviation of the control function, e.g. CSF) and a "mandatory/optional" code are supplied into TIP/PC-KAD/CAT in a data file.

\subsection*{9.2.1 Package S1}

For single modules
\begin{tabular}{|c|c|}
\hline LGN & 1 \\
\hline \begin{tabular}{c} 
mandatory/ \\

\hline
\end{tabular}

\section*{Remark:}

If central functions are made available on separate GCU controls, it is possible to distribute these controls freely in the system 1 (slots are alloted by TIP or KAD/CAT), but no slots are possible in the IMTU module.
\begin{tabular}{|l|l|l|}
\hline 1 & & \begin{tabular}{l} 
GCU slots must be situated under a fan within the framework of the slots defined by the \\
GCU control.
\end{tabular} \\
\hline
\end{tabular}

\subsection*{9.3 Interface Configuration}

Each package also determines, among other things, the number and designation of hard disks and V. 24 interfaces in the system. In this context, a distinction should be made between V. 24 interfaces on GCU and V. 24 interfaces on UIP.

Each GCU is equipped with two V. 24 interfaces, which are configured in the configuration data of the operating system. The interfaces are addressed via the device name. The device names are allocated to a certain interface by the physical device numbers (PDN = physical device number). The device names, PDN, the interface type (console, ACOM) and the physical parameters can be changed within the system by operating system configuration task.

Two V. 24 interfaces can be connected to one UIP board. Configuration data and device names are preconfigured in each package for V. 24 interfaces on UIP. The allocation between an interface and a device name is once more managed by PDN. The PDN must be allocated to an interface by ICU configuration data.

In each package there are currently 2 possible UIPs with V. 24 in the system, each of which is partly operated by the LCF.
Each configuration package contains
- a default configuration for the devices on GCU (online devices)
- an alternative configuration for the devices on GCU (offline devices)
- a predefined configuration for the devices on UIP

The main console (CO-01) is normally not connected to the system. The main console and console 2 (CO-02) are configured on the same interface; when necessary, the main console is activated by a switch (only applies to LCFs).
The following must be taken into account concerning the use of the consoles by the text output task S01:
In view of the fact that the S 01 issues an extremely sizeable volume of reports on the console, a LCF console should always be used for output. This means it is not necessary for these reports to be rerouted from the S01 to the LCF via the CBus system, thus generating a longer processing time.
The following interfaces are currently defined in the operating system configuration data:

For consoles (CO-xx), three devices have been mapped onto each interface:
- CO-xx-1 Fault output level
- CO-xx-2 Control level (for prologue)
- CO-xx-3 Input/Output level (for dialogue)

\section*{10 Cable network}

\subsection*{10.1 Connections from CSI}

The connections of the connecting circuit boards and test connections are conducted through prefabricated cables in
- Main distributor
- Network Termination
- Service panel

\subsection*{10.1.1 Main Distribution Frame or Network Termination}

The cables running from the cable adapters to the main distributor can be supplied in two variants:
- Open end on the main distributor frame
- With champ connector for the patch panel

\section*{Cable with open end}

Connect the sheath wires of the connecting cables with the open end to the ground clamps.

\section*{Cable for patch panels}

The following patch panel variants can be mounted in the cabinets:
\begin{tabular}{|l|l|l|}
\hline & \begin{tabular}{l} 
Patch panel 24 part (3x8 WE, \\
4 -wire)
\end{tabular} & Material number: 4.999.046.814 \\
\hline
\end{tabular}

\begin{tabular}{|l|l|l|l|l|l|l|l|l|}

16
\end{tabular}\(]\)
1. Champ 1
2. Champ 2
3. Champ 3
4. WE1
5. WE2

This patch panel is designed for the two-wire connection. These may be the connections for the following boards:
\begin{tabular}{|l|l|l|}
\hline ADM \(\rightarrow 551\) & ATB \(\rightarrow 557\) & DUP03 \(\rightarrow 548\) \\
\hline ASC2 \(\rightarrow 554\) & ATC \(\rightarrow 557\) & DUPN \(\rightarrow 548\) \\
\hline ASC2 \(\rightarrow 550\) & ATLC \(\rightarrow 558\) & MAC \(\rightarrow 549\) \\
\hline ASCEU \(\rightarrow 555\) & DDID \(\rightarrow 561\) & MULI \(\rightarrow 549\) \\
\hline ATA \(\rightarrow 556\) & JPAT \(\rightarrow 560\) & UIP \(\rightarrow 554\) \\
\hline ATA2 \(\rightarrow 556\) & & \\
\hline
\end{tabular}

Take note that if appropriate you may have to use two cables for each connecting circuit board.

For the service the
\begin{tabular}{|l|l|l|}
\hline & Service patch panel \(\rightarrow 562\) & Material number: 49.9904 .8477 \\
\hline
\end{tabular}
is available.

\subsection*{10.1.1.17 MDF connections from ATLC}

\section*{Main distributor}

If necessary, connect the sheath wires of the connecting cable (open end and WP plug) with the ground clamps.
Connect the connectors of the connecting cable from the 555 with the line network (wiring blocks).
Mark the cable at both ends using the supplied labels.
Connections from the ATLC
\begin{tabular}{|c|c|c|c|}
\hline Variants & Port & Interfaces/procedures & Connections \\

\subsection*{10.1.2 Service panel}

\subsection*{10.1.2.1 General Points}

The service panel provides all connections required for service purposes. It must be installed above or below the rack with the boards ACB/HSCB and CF22/CF2E.

The service panel requires a height unit.
As a standard, the two V. 24 interface connections on the AEV24B/AV24B are offered for the first two RJ45 couplings, viewed from the left side. The last (tenth) RJ45 coupling is reserved for the S0 connection for the service PC (variant main distributor with patch cable).

There are eight RJ45 located in the middle of the panel, which are fitted at the rear with 8 LSA Plus connections each on a circuit board. This means that project-specific connections can be brought to the panel from the main distributor frame. This may also be the S0 connection for the service PC (main distributor frame for cable with open end).

There is an opening on the right hand side to install the error display unit (EDU). This installation is optional.

Service panel I55
1. 10 RJ 45 couplings
2. 8 RJ45 with LSA Plus connections (freely wirable)
3. Opening for EDU board

\subsection*{10.1.2.2 V. 24 Interfaces}

The connections of the V. 24 interfaces (GCU Generic Control Unit, ACB/HSCB) are adapted on the adapter module AEV24B/AV24B with the adapters V.24/RJ45 (connect adapter V.24/RJ45 to 9-pin D-sub-connector). Then connect the adapter RJ45 with the service panel RJ45 using coupling 1 or 2 to 8 -wire panel cables.

V. 24 Interfaces to the service panel
1. Adapter module AEV24B/AV24B
2. Adapter V. 24 RJ45
3. Service panel

\subsection*{10.1.2.3 SO connection}

There are two possibilities, depending on the type of main distributor frame:
- Connection via patch cable

In this variant, you must make a connection between the patch panel on the main distributor frame and the service panel
(right RJ45 coupling).
- Connection with installation cable via the LSA Plus connections

This is where the appropriate jumpering must be carried out on the main distributor frame.

\subsection*{10.1.2.4 Installing the EDU}

Optionally, the service panel can be retro-fitted with the submodule EDU.
A ribbon cable us used to connect the EDU.

3.

Connect the EDU to the EDB
1. ESB Adapter
2. Ribbon cable ESB-EDU
3. Sub-module EDU

The EDU is fastened to the service panel using two screws.

\subsection*{10.2 Line lengths}

When planning the network, it is necessary to take into account the fact that the Ranges of the interfaces (S0, UPOetc.) are different.

When connecting the line network, the following instructions must be adhered to:
- The two transmission and receiving line pairs (SO) and the double wire for UPO, UPN and UK0 must be executed as a twisted wire pair.
- When dealing with cables with four twisted wires, use a four for the joint transmission and reception line of a S0 interface.
- The naked wires of the cable used must be connected to ground potential

The following diagrams explain the correlations of:
- Ranges
- Interfaces
- Cable types
\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|}

\end{tabular}

TX = Transmitting direction
\(R X=\) Receiving direction
Adaptation = device specific in dependence of jumpering distributor components

\subsection*{10.5 LWL-specifications}

The characteristics of the LWL cable are available from the relevant documents.
LWL twin cable SC 29.9030.6100-6199
LWL twin cable SC 29.9030.6200-6299
LWL plastic cable 49.9801.3759-3764

\section*{11 Note on DECT:}

\subsection*{11.1 Intermodule Handover}

The new capacity feature Intermodule Handover (IMHO) for the CS155 denotes the consideration of a sequence of important things for the installation and operation. These are to be found in the hardware side as well as the software side. The following instructions contain component and software requirements, the observation of which will ensure the orderly operation of the IMHO. Applies to single, twin or multi-module in principle:
- IMHO is supported first from E06 system software.
- For the central function a CF22 (ref. no: 49.9906.5748) or CF2E (ref. no.: 49.9903.4968) should be used.
- Use DECT or DECT21 boards as connecting circuit board instead of DECT2.
- IMHO and doubling of CF22/CF2E boards are generally only possible with T1 devices. The use of TC93 devices is not possible.
- For the intermodule central function (only for multi-group) aICF with the ref. no.: 28.5630.1321 or . 1331 or 49.9905 .9146 is required. In doing so, make sure that the software on the ICF is doubling-compatible.
- For this ICF, the CL2ME (material number: 49.9904.2214) should be used.

It is important to take note when planning the radio hops that the base stations of a module represent a cohesive radio hop. The radio hops formed by various modules should meet as infrequently as possible. This will prevent unnecessary handovers between the modules. These would only generate superfluous load for the system switching matrix.

\subsection*{11.1.1 Application in the Multi-Module}

\section*{The hardware side}

An external high precision reference clock is to be connected. See: Connection of the external high precision reference clock to the CSI55. This connection is to be connected to the ICF board in the multi-module via the function unit CL2ME. In multi-module with doubling, both ICF boards under application of the CL2ME are to be connected to the high precision reference clock.
The other modules in the multi-group system are supplied with clocks in the usual manner via the LWL paths. The individual modules may be connected to the multi-module via differing length LWL paths. This length difference results in that the 160 ms frame signal arrives in the individual modules asynchronous. This asynchronous condition is balanced out in that, in the RBS stations, correction values have been entered. These correction values arrive at the radio base stations (RBS) by means of customer data via the DECT boards. The length input of the LWL path in meters is carried out by means of the aid CAT (Customer Administration Tool SW E06 and up). The equalization of the phase positions of the 160 ms frame signal is achieved with the aid of the RBS.
In order to measure the optical waveguide length, refer to the regional network service as it has the necessary know-how.
In the event of doubling the multi-module, ensure that the two optical waveguides that lead to the same module also have the same length. This also applies even if the optical waveguides have different line routes. If this is not the case, handover will not be possible following a switchover.
On the boards CF22/CF2E, only switch 1 of the 4 dip switches is to be set to ON, all others remain at OFF. When the CF22/CF2E become synchronous with the incoming 160 ms clock, LED 3 in the front panel lights up.

\section*{The software side}

Upon startup, the software sets the clock source of the ICF in the multi-module with the address 7D (Hex) as highest priority. In doubling, the ICF in the module with the address 7E (Hex) follows with the same priority level. After startup the clock sources at 7D and 7E are switched on as clock master.
In the event of failure of the input clock on the ICF in the multi-module 7D, the ICF in multi-module 7E will be switched on as clock master. This then leads the clock supply of the ICF in the module 7D via the LWL path of the alternate route. The clock supply is implemented via the active paths which are connected on the module's 7D for all connected modules.
During this switchover, however, each of the multi-modules resynchronises to the new clock source. This may lead to a separation of calls in DECT connections.
After an alternative route switchover, a module is no longer IMHO-compatible after the switchover, as it is the only module to be supplied with clock information from another multi-module as a single module. A system half switchover will take place if the module then receives another switchover request. After this, all modules will receive clock information from one B3 module, and IMHO-compatibility is restored.

Multi-module
1. GPS receiver (GPS = Global Positioning System)
2. Clock master in the CL2M mode

Production of the frame and DECT pulse
3. Master clock from doubling clock master after clock switchover
4. Production of the frame and DECT pulse clock slave B3 in the IML mode

\subsection*{11.1.2 Application in the Twin module}

\section*{The hardware side}

An external high precision reference clock is to be connected. See: Connection of the external high precision reference clock to the CSI55.
In module no. 1, this connection is to be brought about via the CL2ME function unit on the UIP board. If greater safety is desired, a second connection is to be brought about via a CL2ME and another UIP in module no. 1
The module no: 2 remains the clock slave The intermodule handover function is no longer relevant in the event of failure of one of the twin modules.
On the boards CF22/CF2E, only switch 1 of the 4 dip switches is to be set to ON, all others remain at OFF. When the CF22/CF2E become synchronous with the incoming 160 ms clock, LED 3 in the front panel lights up.

\section*{The software side}

Upon startup, the software sets a UIP module in module no. 1 as clock source with the highest priority. In doubling and failure of one UIP, the other UIP follows in module no.:. 1 as a clock source.
Here also applies that module no. 2, connected via a LWL path, receives a delayed frame signal in relation to module no. 1. This asynchronicity is balanced out in that, in the RBS stations, correction values have been entered. These correction values arrive at the radio base stations (RBS) by means of customer data via the DECT boards. The length input of the LWL path to the module no." 2 , in meters, occurs with the CAT auxiliary item.

The same here applies with regard to the measurement and length of the optical waveguide, see Application in Multi-Module - The Hardware Side

Twin module
1. GPS receiver (GPS = Global Positioning System)
2. Clock master in the CL2M mode Production of the frame and DECT pulse

\subsection*{11.1.3 Configurations not allowed}

Comments on the inadmissible connection or operation forms and their reasons by which no orderly operation of the Intermodule Handover are ensured.

\section*{Application in the Multi-Module}
- The hardware side:

Connection via CL2ME and UIP in another module than B3 module.
- The software side:

After startup, this module with its clock source is selected as clock master and drives all other modules via the B3 module.

The module specific delay times may no longer be active in the clock derived module because it would result in a displacement of the edges of the 160 ms frame signal.
In the other modules, the delay for the path from the clock derived module to the B3 module would have to be added to their own delay times. This would all have to occur therewith all modules work with equal phase positions of the frame signal and is not carried out in the software.
Calls will be separated in the event of switchovers, active/passive switch of the CF22/CF2E. The IMHO function is enabled once more once the switchover has taken place.
Application in the Twin Module
- The hardware side:

Connection of another CL2ME via UIP in the module no.: 2.
- The software side:

Up commissioning, a module UIP from the software in module no.: 1 should be used a clock source with the highest priority. In the event of doubling and failure of one UIP, there is a switch-over to the other UIP in the module no.:. 2 as a clock source.
It also applies here that the module no. 2 receives a delayed frame signal in relation to module 1. This asynchronicity is balanced out in that, in the RBS stations, correction values have been entered. These correction values arrive at the radio base stations (RBS) by means of customer data via the DECT boards.

Now model no.: 2 clock master receives module no.: 1 receives a delayed frame signal in relation to module no. 1. Now the RBS stations in module no.: 2 does not require input of the correction value but that in module no.: 1. The would be treated by software and it is not implemented in the SW.
Calls will be separated in the event of switchovers, active/passive switch of the CF22/CF2E. The IMHO function is enabled once more once the switchover has taken place.

It is important to emphasise once more that the system can be switched to an offered exchange line clock with the aid of synchro management in the event of a total failure of the TAREF or upon separation of the connection to the CL2ME: Due to the "quality" of the exchange line clock, it is not possible to guarantee that continued operations will be absolutely smooth. However, should a longer period of "only exchange line clock" operation be unavoidable, the switch 1 of the 4 Dip switches must be set to OFF on all boards of the type CF22/CF2E.

\section*{Failure of TAREF and switchover to a different clock source}

It is important to emphasise once more that the system can be switched to an offered exchange line clock with the aid of synchro management in the event of a total failure of the TAREF or upon separation of the connection to the CL2ME: Due to the "quality" of the exchange line clock, it is not possible to guarantee that continued operations will be absolutely smooth. However, should a longer period of "only exchange line clock" operation be unavoidable, the switch 1 of the 4 Dip switches must be set to OFF on all boards of the type CF22/CF2E.

\subsection*{11.1.4 Connection of the external high precision reference clock to the CSI55}

A device from the firm R.A.M. with the designation TAREF is used as external high precision reference clock. A coax socket is located on the back of this device for the 2 MHz output, which serves as the connection for the CL2ME line. This connect is supplied by the R.A.M. company together with the TAREF, including all of the required "mini-transmitters" for the implementation of the coax connection on a symmetrical transmission with a 120 Ohm termination according to CCITT G703. The maximum length of these connecting cables is 10 metres. Only connect the braid screen of the cable with the casing of the ICS module. A screened sub-D-plug in 9-pin design is used as a plug connection to the CS155, connection to the adapter module and therefore to the CL2ME. This enables "plug and play" functions.

The device will be fitted with a second output for 2 MHz within the framework of a redesign (supply starts in June 2001). This means that only one TAREF device is required for a doubled multi-module (ICS or B3 module). The system transmitter will also be integrated in the system. This coax connection to TAREF will then also be modified by R.A.M and the cable is adapted.

\subsection*{11.2 Supply of the DECT-Net Base Station to the Integral 55}

The introduction of the Bosch DECT-base station and the PSL55 provides a new and extended calculation basis for the Integral 55.

A PSL55 in one rack can feed a maximum of 5 DECT21 boards. The three vacant slots can be equipped with boards that do not require 48 V .

R1

*CB = ACB/HSCB
\(C F^{*}=C F 22 / C F 2 E\)
AO* \(=\) Connecting circuit (only boards without 48V-requirement)
A second PSL55 provides a redundant power supply for this expansion.

In cases which necessitate up to 8 DECT21 boards per rack, the rack must be fitted with two PLS55s. PS redundancy is not possible with this configuration.

R1

*CB = ACB/HSCB
\(\mathrm{CF}^{*}=\mathrm{CF} 22 / \mathrm{CF} 2 \mathrm{E}\)

There is also an adaption module - seePS350 Adaption \(\rightarrow 94\) available. Up to 7 DECT21 boards can be operated with it. However, with an additional PSL55 no 48V redundance was reached with this configuration.

\subsection*{11.3 Suitable cable types used to connect DECT RBS}

\section*{General requirements}
- A RBS has two UPN-interfaces. The wire pairs of both Un-interfaces must run in the same cable.
- The opposite wires of star-quad cables form a pair.
- No branch lines may be laid out.
- Non-connected connections to UPO-end devices in its cable must be avoided.
- The maximum allowed loop resistance of the cables is 130 Ohm/km.

\section*{Minimum cable requirements}
```

J-Y(ST)Y, St III 2x2x0.6
or
2x2xAWG22 S/UTP category 3
(or higher)
or
nx2xAWG22 S/UTP category 3 according to DIN EN 50173 and ISO/IEC 11801. n = 4, 6, 8, ..
(or higher)

```

\section*{Wiring to Multiple RBS}
\(J-Y(S T) Y n x 2 x 0.6 \mathrm{Lg} \quad\) static shielded cable with \(n\) wire-pair (wire-pairs stranded in positions) according to VDE 0815. \(n=4,6,8, \ldots\)
static shielded cable with 2 wire-pairs (twisted quad cable, opposing wires form a pair, to be ensured upon installation!) according to VDE 0815.

\section*{or}

2x2xAWG22 S/UTP category 3 (or higher)
according to DIN EN 50173 and ISO/IEC 11801
``` (or higher)
號
```

## Recomendation:

For new installations it is generally recommended the use of twisted pair cables (e. g. J-Y(ST)Y 2x2x0,6 GR, CU 13 or more pairs) or the use of Cat 3 cables (or higher). With these cables the best experiences could be achieved in the field.

## Note:

The laying of parallel wire pairs to different terminals within the same cable may under certain circumstances cause problems if the near-end cross talk level (NEXT) is too high. Cable types of higher quality should therefore be used in the event of problems, e.g. S/STP types.

When using twisted pair cables such problems are not known to us.

## Remarks on data cables according to DIN EN 50173 and ISO/IEC 11081:

- AWG (american wire gauge) must be 22 or smaller. 22 corresponds to an wire diameter of $>0.643 \mathrm{~mm}$. The smaller the AWG, the larger the wire diameter.
- S/UTP screened/unshielded twisted pair; cable shielded but the individual wire-pairs are not.
- S/STP screened / unshielded twisted pair; cable and individual wire pairs are electro-statically shielded.
- Category

1. for analog transmissions
2. up to $4 \mathrm{Mbit} / \mathrm{s}$
3. up to $10 \mathrm{Mbit} / \mathrm{s}$.

### 11.4 The structure of the cables

The wires of the cable are star quad twisted. The wires of the star qued have always the same colour. Five star quads form a basic bundle with all colours.

1. A-wire : without marks
2. B-wire : with a ring
3. 2A-wire : with two rings, long distance
4. 2B-wire : with two rings, short distance

## another example of star-quad:

| Abbr. | Meaning | Application |  |
| :---: | :---: | :---: | :---: |
| UTP | "Unshielded Twisted Pair" unshielded, twisted in pairs, symmetrical copper cable for data with 2 or 4 wire pairs | Local networks in the close workplace area, connection or installation cable |  |
| S/ UTP | "Screened Unshielded Twisted Pair" 2 or 4 wire pairs, twisted in pairs, symmetrical copper cable for data with an additional outer shield | Installation cable for horizontal cabling |  |
| FTP | "Foll Twisted Pair" shielded by foil, twisted in pairs, symmetrical copper cable for data | Installation cable for horizontal cabling |  |
| $\begin{aligned} & \text { S/ } \\ & \text { FTP } \end{aligned}$ | "Screened Foll Twisted Pair" screened in layers and shielded by foil, twisted in pairs, symmetrical copper cable for data | Installation cable for horizontal cabling |  |
| STP | "Shielded Twisted Pair" 2 or 4 wire pairs, symmetrical cooper cable for data with individually shielded wire pairs | for data transmission up to $100 \mathrm{MBit} / \mathrm{s}$ or <br> for the close workplace area, e. g. between floor distributor and data connection |  |
| $\begin{aligned} & \text { S/ } \\ & \text { STP } \end{aligned}$ | "Screened Shielded Twisted Pair" <br> 2 or 4 wire pairs cooper cable for data with individually shielded pairs and additional outer shield | Installation cable for horizontal cabling |  |
| PiMf | "Pair in Metallfoil" shielded with metal foil, twisted pair of a copper cable for data with high close crosstalk attenuation | for wiring of large systems or for transmission of high bit-rates or installation cable for horizontal cabling |  |
| ViMf | "Vierer in Metallfolie" quad shielded with matal foil, four wires, copper cable for data | Installation cable for horizontal cabling |  |

## 12 Notes to VoIP

Starting with software E07, the communication server Integral 55 offers the integration of voice over IP (VoIP). Here Integral 55 outlying extensions are integrated into the customer's existing IP-based data network environment (LAN, WAN, corporate network). In addition, the networking of Integral 55 systems to different locations via the IP infrastructure is possible.
The performance characteristic description as well as the set-up are shown in the relevant documents.
VoIP in Integral 55 (1)
VoIP in Integral 55 (2)

## 13 Operator sets

Notes on the installation and service of the OS13 are available in the service and installation manual 0S13, OSM and OSPC - see OS13.

Notes on the installation and for the service of the OS33 are available in the service and installation manual 0S33, OSM and OSPC - see: OS33.

## 14 Measuring and Testing Tools

### 14.1 BA Board Adapter

## Short description

The board adapter is used for service purposes. The modules to be processed must be inserted in the board adapter, so that it can be subsequently inserted into the PBX.

Board Adapter

1. PIN 1-2 Current reading, PIN 3 Voltage reading
2. Meas. points
3. see table
4. Clock meas. points
5. CBI speed setting
6. Selection of the adapted board (GCU/ICU or CFx)
7. BA chip submodule
8. not clock supplied (only with adapted ICU)
9. clock supplied (only with adapted ICU)
10. Measuring points for C-bus clock

Connectors for C-bus data test pins (3.):

| 1 | GND |
| :--- | :--- |
| 2 | GND |
| 3 | GND |
| 4 | GND |

| 5 | PF 1 |
| :--- | :--- |
| 6 | PF 2 |
| 7 | ERRV |
| 8 | FCPS |
| 9 | WSYN |
| 10 | ERLINE 1 |
| 11 | ERLINE 2 |
| 12 | ERBAT |
| 13 | ERDPS 2 |
| 14 | REMCNTR 1 |
| 15 | ERDPS 1 |

### 14.2 CBT C-Bus Tester

## Short description

The C-bus tester serves as a testing tool for the CS155.
The C-bus tester has two applications:

- Lists the message transfer in the system.
- Tests the other printed circuit boards in the laboratory.

Using this program, it is possible to control two different functions:

- Edit messages and send them to the system via the C-bus tester.
- Save messages from the telephone system on the PC hard disc, and display them on the PC screen.

The C-bus tester is made up of two parts:

- A printed circuit board, which is inserted into the CS155 system.
- A DOS program, named CBTPC.

CBT board, component side

1. Memory
2. HGS Slot
3. Battery

The CBTPC program does not perform an analysis of the messages. The MPA (Message Protocol Analysis) program is required for this purpose. However, if the protocol is recorded in ASCII format, it can be viewed in any text program.
Packets which are to be dispatched within only one control cannot be recorded.

### 14.2.1 Hardware and Software Conditions

You require an AT-compatible PC with a free serial interface (COM1: or COM2:) and at least 512 kB free RAM. A mouse and colour monitor are recommended.

In order to save the protocol data of a C-bus test, the PC's hard disc should have at least 20 MB of free memory.

The CBTPC program is a DOS program. It will not function in Windows.

### 14.2.2 Installing the Printed Circuit Board

Before a C-bus protocol can be recorded, the printed circuit board for the C-bus tester must be installed in the I55. The following printed circuit boards can be used:

- CBI1T
- CBI1A (Using this CBI may result in a data loss when recording!)

### 14.2.3 Conditions

The following components are needed to make a connection to the system:

- Printed circuit board for the C-bus tester with at least 4 MB RAM. In the event of several memory modules being installed, they must be on top of each other in the main memory area.
- AV24B adapter module
- Connection cable for connection of two PC-AT's (9-pin, hand shake via RTS/CTS).

### 14.2.4 Procedure

Insert the printed circuit board in a free slot in the system. The B3 module contains a slot specifically for the CBT.

You should not used the following slots under any circumstances: 0E and 0F reserved slots

### 14.2.5 Connection cable between CBT and PC

The CBT board and the PC with CBTPc must be connected by a cable.
Insert the AV24B printed circuit board on the back side of the system. Connect the COM 1 or COM 2 interface on the PC to the 1st V. 24 interface on the AV24B printed circuit board.

In AV24B, the 1st interface is marked V. 24

The cable connects two serial interfaces and must be configured as follows (zero modem):

| Signal designation | PC 25-pin socket | PC 9-pin socket | CBT 9-pin socket |
| :--- | :--- | :--- | :--- |
| TxD | 2 | 3 | 2 |
| RxD | 3 | 2 | 3 |
| CTS | 4 | 7 | 8 |
| RTS | 5 | 8 | 7 |
| DSR | 6 | 6 | 4 |
| GND | 7 | 5 | 5 |
| DTR | 20 | 4 | 6 |

### 14.2.6 LEDs and Switch Functions

CBT board, front side

## Meanings of LEDs

The LEDs signal the different phases of the reset process (the bottom two LED's are missing on the old CBTs). If a module locates a fault, the red LED flashes whilst in the corresponding test, and then lights up again once the reset has been completed.

| 0 | 0 | -Resets-tests CPU |
| :---: | :---: | :---: |
| 0 | X |  |
| 0 | X |  |
| 0 | X |  |
| 0 | X |  |
| 0 | 0 | -Resets-tests memory |
| 0 | 0 |  |
| 0 | 0 |  |
| 0 | 0 |  |
| 0 | 0 |  |
| X | 0 | -Resets-tests clock component timed interruptions. If this test fails, no further tests are carried out. |
| 0 | 0 |  |
| 0 | X |  |
| 0 | 0 |  |
| 0 | 0 |  |
| X | 0 | -Resets-tests CBI <br> (Master and slave reset, describes the Init register, transmits and receives packets, etc.). |
| 0 | X |  |
| 0 | 0 |  |
| 0 | 0 |  |
| 0 | 0 |  |
| X | 0 | -Reset-tests DUART (local transmission, buffer (FIFO) on the receiver side). |
| 0 | X |  |

| 0 | X |  |
| :---: | :---: | :---: |
| 0 | 0 |  |
| 0 | 0 |  |
| X | 0 | Initializes the individual modules (clock, CBI, DUART ...) The LEDs on the right side have the same denotations as above. |
| 0 | 0 |  |
| 0 | 0 |  |
| 0 | X |  |
| 0 | 0 |  |
| 0 | 0 | Logging active Recording messages |
| 0 | 0 |  |
| 0 | 0 |  |
| 0 | 0 |  |
| 0 | X |  |

X = LED on
$\mathrm{O}=\mathrm{LED}$ off

## Switch Function

| S1 | Reset switch |  |
| :--- | :--- | :--- |
|  | Middle: | Operating status |
|  | Left: | Reset board, locking, restart |
|  | Right: | Warm start |
| S2 | Memory test switch |  |
|  | Left: | Big memory test |
|  | Right: | Small memory test |
| S3 | No function |  |
| S4 | No function |  |

### 14.2.7 Removing and Inserting the board

The CBT board may be removed or inserted during system operation, if the S 1 switch handle has been moved to the left.

Further information can be found in the C-Bus Tester Manual, material number 20.0003.0950, release: 04/95.

### 14.3 MAHC Measuring Adapter Half Channel

## Short description

The MAHC (Measuring Adapter Half Channel) provides the measuring interface for transmission-technical half channel measurements on analogue and digital peripheral connectors for the CS155.

For use in the CS155, the front panel plus lever must be removed. It is possible to use the board lever of the CS155, material number: 4.999.017.193, in conjunction with screw BGH, material number: 4.999.017.192 and axis BGH, material number: 4,999,017,191 is to be used. These parts are required twice per board.

Operation is virtually identical to that of the MAH board for the I33x (8030). See I33x manual DSV, material number 20.0003.0013.

The measuring adapter is located on a pc board which is inserted into the slot on an ASCxx analogue line circuit in order to carry out the half channel measurements in a I55 system.

MAHC module, component side
The board is divided into five function groups:

- Adaptation part for the control and the analog interfaces.
- Line circuit for the connection of the testing device for connection setup.
- Digital measuring interface for the connection of measuring devices with digital access.
- Analog measuring interface for the connection of analog measuring devices.
- Control elements and display board for setting and displaying the operating functions.

### 14.3.1 Line Circuit

The line circuit function group is provided for connection setup (switch S3 in 'Test' position). The test connection is set up using a DTMF or pulse dialling test telephone instrument which is inserted onto the connector studs. These are located on the component side of the pc board. For test connections in an incoming seizure direction, the test telephone instrument must be called. The test telephone instrument maintains the test connection while the measurement is being taken. Because the receiving direction remains through-connected during the measurement, the measuring signals can be overheard.

### 14.3.2 Digital Measuring Interface

This interface is a $64 \mathrm{kBit} / \mathrm{s}$ codirectional interface in accordance with CCITT. For purposes of function control and correct setting of the measuring device, a digital short-circuit connection has also been implemented (switch S3 in 'Test' position).

### 14.3.3 Analog Measuring Interface

This interface is a 600 ohm, 4 -wire measuring interface that can be switched to ZR. The following features are relevant for the interface:

- The relative input and output level is 0 dBr
- Deviations of the relative level and the frequency response are up to $+/-0.2 \mathrm{~dB}$
- Input or output impedance (measured as deflection attenuation) $>20 \mathrm{~dB}$

If the analog interface is to be used for exact measurements, the respective deviation must be established (second MAHC) and the measuring result corrected accordingly.

In order to check the analog measuring interface (switch S3 in 'Test' position), a short-circuit connection has been provided on the digital side. In doing this, the deviations of the input and output are added.

### 14.3.4 LEDs and Switch Functions

MAHC board, front side

1. red
2. green

## 3. yellow

## Meanings of LEDs

| L1 | Seizure |

### 14.4 SP1 Spy Probe 1 (SP1)

## What is Spy and how can I use this tool?

Spy is designed in such a way because it can record as many system events as possible. The Sky predecessor, the CBus Tester (CBT), only recorded CBus packets. The SKy concept permits simultaneous recording, display and decoding of:

- CBus packets
messages which run over the CBus. Packets are recorded in separate modules.
- CBus special events

This includes: Packet losses, blocking times of $\mu$ Ps, packet transmission repetition times, CBus load etc.

- Ethernet packets

Ethernet packets can be recorded via a network card of the PC card to be recorded at the same time as the CBus recording.

- CBT recording

Event type which results when reading in BIN files (recordings of CBT)

- Console messages
event type S01, HGS, FRP-events on the system console. The corresponding capture files can be import and mixed with a recording and therefore can be brought into a temporal relationship.
- Conversion

The SPY-generated .frec files can be converted to.bin-files. As a result, further use of this is possible through MAT (MessageAnalysesTool).

- IDM (planned)
messages between system and terminals or other systems
- Local highways (planned)
recording of which highway is occupied, number of the occupied highways
- I2C-Bus (planned)

I2C-Bus signalling in the backplane
For further information on SP1 see SPY1.

### 14.5 V24IA V24 Interface Adapter

## Short description

The V24IA is used as a debugging interface in connection with the DS02, ADM, DUPN or ASC2 boards.
Note: $\quad$ The use of the V24IA board in the Integral 55 Compact is not necessary, because the requirements already have been implemented.

It is connected as an interface between a terminal or PC and the board. The 9-pin Cannon socket is inserted directly onto the terminal or PC. Between the board and the adapter, an 8 -pin RJ45-RJ45 cable required ( S0-cable, patch cable).
1.

2.

V24IA board, component side

1. Terminal or PC
2. via cable to DSO2/ADM/DUPN or ASC2 board
3. Shrink pipe

The activation of the display at the terminal or PC is carried out via the space key.
The displayed menu items may now be selected.
The following controls may be carried out (DEBUG MENU):

- D channel monitor
- C-BUS monitor
- Layer 1 monitor (crc/abort)
- resource monitor
- show error counters (Bit errorr)
- ci monitor

The reaction times of the board may be increased by activating the controls.

## Removing and Inserting the board

The board may be removed and inserted during system operation.
All debugging tasks should be switched off before removing the cable from the board.

## 15 Integral 55 Compact / Integral 55 Compact LX

### 15.1 About this Manual

This manual contains information for sales personnel, service technicians and installers for the acquisition, installation, service, maintenance and expansion of the Communication Server Integral 55 Compact.

A separate manual is available for each individual application.

### 15.2 Important notes

## Safety Information

Prior to completing the connection of the system to the mains power, all wiring of the Integral 55 Compact must be completed and checked!
System service and repairs are the exclusive domain of an authorised specialist!
During installation of the Integral 55 Compact in 19" cabinets, desktop, standing or wall mounting, enough strain relief for all cables and accesses must be ensured.

When connecting circuits to the V. 24 interfaces, only use the supplied shielded cables.
The Integral 55 Compact must be connected to the potential equalization!
The presence of strong magnetic fields in the vicinity of the Integral 55 Compact must be avoided!
The Integral 55 Compact must not be exposed to shock, impact or vibrations!
For EMC and conformity reasons, in the Integral 55 Compact only boards may be used that are approved and equipped with metal front panels!
ESD-measures must be accomplished when working with boards susceptible to electrostatic shock.
For reasons of EMC, vacant slots should be covered with frontplates.
In case of wall mounting, a minimum distance for extracting/inserting the boards must be kept.
The following regulations or guidelines must be considered during system installation, commissioning and operation:

- DIN VDE 0100 Setting up heavy current systems
- DIN VDE 0105 Operating heavy current systems
- DIN VDE 0132 Fire countermeasures in electrical systems
- DIN VDE 0298 Use of cables and insulated wiring for heavy current systems
- DIN VDE 0800 Telecommunications engineering
- DIN VDE 0891 Use of cables and insulated wiring for telecommunication and information processing systems
- DIN 4102 Combustive properties of building materials and components
- DIN 5035 Interior lighting with artificial light
- VDI 2054 Air conditioning systems for data processing environments

Additional regulations or guidelines may apply in special or individual circumstances.

## Transport

The Integral 55 Compact may be transported only in the original packing or installed in a 19" cabinet.
Check that the system is complete by referring to the delivery note and the accompanying installation documents.

## Connections to V. 24 Interfaces

To prevent the destruction of the V. 24 interface driver and receiver components when connecting devices, it is imperative, to use the following cables:

| Cable for logging (PK HAL Cat5, grey, 1:1) | Length | Material number |
| :---: | :---: | :---: |
|  | 1m | 4.999.045.210 |
|  | 3 m | 4.999.045.212 |
|  | 5 m | 4.999.045.214 |
|  | 10m | 4.998.045.215 |

Additionally, the adapter plug RJ45/D-Sub, material number: 4.999.059.171, is available.

### 15.2.1 Environmental Conditions

The following placement guidelines must be considered in order to ensure trouble free operation of the Integral 55 Compact:

- The room must be dry and provide options for ventilation.
- Weight in the case of full capacity, see Technical data.
- The floor covering should possess antistatic properties. It should be easy to clean and abrasion resistant.
- The Integral 55 Compact should not be exposed to heat (e.g. radiator).
- An additional number of earthed mains sockets must be provided for service purposes.

Climatic conditions for operation, storage and transportation - see Tecnical data.
The access to the Integral 55 Compact must be guaranteed from the front and the back. In the case of wall mounting, a minimum distance for extracting/inserting the boards must be kept.

Technical Data $\rightarrow 596$

### 15.2.2 Required Servicing Procedures

If servicing is required the Helpdesk has been called by:

- the customer,
- the technician/service technician,
- Remote alarm signalling
- TNS (off hours)

In most cases, the Helpdesk will already have located the fault through the use of remote diagnostics. If this is the case, if necesary, simply replacing the faulty module will suffice. It should be stated, however, that remote diagnostics are not capable of locating every fault.

You must then:

- Condense the available information
- Interpret fault returns/indications or displays
- Locate the fault using the service PC
- Carry out diagnostics with the aid of the Helpdesk.

### 15.3 Product description

The Integral 55 Compact is the ideal platform in modern business communication for medium-sized and large companies with branch offices. It is designed primarily for linking branch structures to the headquarter. It supports the standard interfaces of conventional technology as well as VoIP solutions and IP network connections. The integrated VoIP - interface can be configured for subscribers as well as for network connections. Furthermore, this technology converts the Integral 55 Compact into an ideal supplement of already existing Integral systems.

### 15.3.1 Comparison Integral 55/Integral 55 Compact

| Power supply |

As a member of the Integral 55 family in a new, compact 19" housing, Integral 55 Compact offers virtually the same features as the other Integral 55 systems. The main purpose of the Integral 55 Compact was to achieve a cost reduction in minor expansion options.

- The integration of central components and subscriber/line interfaces on a HW platform (given configuration),
- a cost- and function-optimized power supply unit,
- relinquishment of the rarely used HW interfaces,
- and a new, optimized design,
made it feasible to offer the Integral 55 with a variety of features at a competitive price, even in the under 50 subscriber segment.

The Integral 55 Compact runs on the same system software as the other Integral 55 systems. The same service and network administration applications (ISM, ICU-Editor, CAT, ADN, etc.) are also employed for the administration and monitoring of the Integral 55 Compact.

The following differences exist between the Integral 55 Compact system and the Integral 55 system:

## General

- 19 " mounting system with 3 vertical modules With the appropriate mounting attachments it can be wallmounted or used as a table or upright unit.
- No rear cable adaptors (boards) with champ plugs are used for wiring the interfaces. The interfaces are all accessible from the front and are installed with RJ-45 cabling.
- Only single module configuration is possible. Integral 55 Compact has no IML (inter module link) interface; twin- and multi-module configurations are therefore not possible with the I55 Compact.
- Module type is O1, Integral 55 Compact is currently not upgradeable.
- CF doubling is not possible.
- Integral 55 Compact has no error signalling LEDs, relay contacts or optocoupler inputs. An ESB/EDU cannot be equipped.
- Integral 55 Compact has no free switching points.
- No connection of ISDN emergency phones is necessary (no EESOB board).
- In comparison to the 155 with its standard single fan, the 155 Compact has a redundant double fan system. If one of the blowers fails, the system continues to work in the permissible temperature range.

## Integrated components

- The functions of the HSCB/ACB, CF22, ADM and DUPN boards are firmly integrated into the base unit (BU). CBI addresses / slot assignment are predetermined:
- Slot 3 / CBI address 08: ADM
- Slot 5 / CBI address 0A: DUPN
- Slot 9 / CBI address 0E: HSCB/ACB
- Slot 10 / CBI address 0F: CF22
- Only the non-isolated V. 24 interface is located on the HSCBO and ACBO boards. An isolated V. 24 interface is not possible.
- The MI switch function has not been implemented on the HSCBO.
- The HSCBO uses only CompactFlash as a medium for the backup memory. Other media such as hard disks may not be used!
- The DUPN built into the motherboard (MBO) supports only 24 subscribers instead of 32.
- The ADM is also integrated into the motherboard (MBO) of the base unit (BU).
- ADM submodule 1 is an ABSM (ports 0 to 3): It is built-in (4 analog subscriber interfaces).
- ADM submodule 4 is an STSM (ports 12 to 15) and also built-in (four S0 or T0 interfaces).
- ADM submodules 2 and 3 can be configured as UPSM, STSM or ABSM. Submodule UKSM cannot be used in the BU.
- Integral 55 Compact has no single port occupation LEDs for the integral ADM/DUPN functions.

## Expansion slots

- Integral 55 Compact has two slots for boards. These are only to a limited extent selectable.
- The following rules apply to board slots:
- Slot 1 / CBI address 06 (upper slot on BU): Only the VoIP, DSPF or IPN boards may be inserted into this slot.
- Slot 7 / CBI address 0C (lower slot on BU): Boards ATA, CAS, DECT21, DT21, DSPF or IPN may be inserted into this slot.
- When using the DT21 module, the optical $2 \mathrm{Mbit} / \mathrm{s}$ interface (submodule OFAS) and coax connection (CA4x) cannot be connected.
- When using the DECT21 board a maximum of 8 base stations may be configured.
- No auxiliary highways are present at these two slots. The DSPF board may therefore only be equipped with a maximum of two ASN3 submodules. i.e. DSPF has access to 64 channels, which is sufficient for the configuration of the Integral 55 Compact.
- When using the DT21 board for connection to an S2M NT, voltage must be supplied to the network terminator (NT) via an external plug-in power supply (material number 27.4402.1056).

## Power supply unit

- The Integral 55 Compact power supply unit PSO is built-in. The PSU cannot be doubled.
- No 110V network supply.
- No -60V partial voltage generation in the BU.

Therefore the -72 V supply voltage of the UKO interfaces on the UKSM submodule cannot be generated for the integrated ADM.

- No external -48 V battery supply.
- No 25 Hz ringing voltage.

### 15.3.2 Technical Data

| Connection options |
| :--- |
| up to 52 voice or data channels in the basic configuration |
| up to 240 VoIP voice channels |
| up to 8 radio base stations (DECT) or $1 \times$ S2M |

| Network interfaces |  |  | T0 |
| :--- | :--- | :--- | :--- |
| 4 wire ISDN basic <br> access | BRI | B+B+D channel <br> structure |  |
| ISDN Primary Rate Access (if required) PRI S2M |  | $30 x B+D$ channel <br> structure |  |

| Basic configuration |  |
| :--- | :--- |
| S0-Interfaces | 4 |
| UPN-(B+B+D) interfaces | 24 |
| a/b interface | 4 |

| Expansions |  |
| :--- | :--- |
| a/b or | max. $1 \times$ per system |
| S0 or | max. $1 \times$ per system |
| UPN | max. $1 \times$ per system |
| VoIP | 240 channels for networking and subscribers |
| DECT | 8 RBS |
| DT21 | one S2M-Interface (exchange line (T2) - or FV(TIE, <br> tie line)), 120 Ohm symm. |
| ATA | 8 analog exchange accesses (PSTN) |
| CAS | one S2M-Interface (exchange interface, connection <br> line or special interface) |

* If DT21 is used, DECT is not possible. In this case DECT over IP!

| Dimensions |  |
| :--- | :--- |
| Integral 55 Compact (WxHxD) | $482 \times 132 \times 483,5 \mathrm{~mm} \mathrm{(3} \mathrm{U)}$ |
| Wall-mounted device (wall mount bracket and Integral 55 <br> Compact, WxHxD) | $510 \times 530 \times 135,1 \mathrm{~mm}$ |
| Floor-mounted device (wall mount bracket, pedestal and <br> Integral 55 Compact, WxHxD) | $510 \times 574 \times 444,8 \mathrm{~mm}$ |

| Weights |  |
| :--- | :--- |
| Integral 55 Compact | 11.00 kg |
| Wall-mounted device (wall mount bracket and Integral 55 <br> Compact) | 16.25 kg |
| Floor-mounted device (wall mount bracket, pedestal and <br> Integral 55 Compact) | 20.50 kg |

| Colour |  |
| :--- | :--- |
| Wall mount bracket, pedestal and Integral 55 Compact | RAL 7016 (anthracite grey) |

| Network connection | $230 \mathrm{~V} \pm 10 \%$ |
| :--- | :--- |
| Mains voltage | $50 \mathrm{~Hz}-6 \%+26 \%$ |
| Mains frequency | 0.6 A |
| Maximum power consumption | 16 A automatic circuit breaker C type |
| Electrical circuit protection |  |

| Additional data |  |
| :--- | :--- |
| Heat output at full configuration | 75 W |
| Sound pressure level (at 1 m distance to EN ISO <br> 3744 ) | $<45 \mathrm{~dB}(\mathrm{~A})$ |

## Telephones/terminals

Al the telephones available for the Communication Server Integral 55 can be connected:

- IP telephones
- ISDN telephones
- Analogue telephones

| Ambient conditions/air conditioning |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | DIN ETS | Temperature <br> range | Relative humidity | Comments |
| Storage: | $300.019-\mathrm{KI.1.1}$ | $-5^{\circ} \mathrm{C}$ to $+45^{\circ} \mathrm{C}$ |  |  |
| Transport: | $300.019-\mathrm{KI} .2 .2$ | $-25^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |  |  |
| Operation: | $300.019-\mathrm{KI} .232$ | $-5^{\circ} \mathrm{C}$ to $+45^{\circ} \mathrm{C}$ |  | stationary use, <br> weather protected |

## Reliability

In all of the values stated herein, the power supply device was also taken into consideration. However, the failure of power supply devices is less frequent than the failure of mains voltage due to the the power plant. If UPS (uninterrupted power supply) is not used, this will lead to total system failure in both cases. This must be taken into account during the use of the values.

| Reliability |  |  |
| :--- | :--- | :--- |
| MTBF for the whole system | $>/=35$ years |  |
| Fault rate of individual boards | $</=0.75 \%$ | in the 1st year |
|  | $</=0.5 \%$ | in the 2nd year |

## Traffic capacity

The term traffic capacity subdivides itself into the dynamic one and the static traffic capacity.
The dynamic traffic capacity is the one provided by the system. It is given by the unity BHCA, i.e. Busy Hour Call Attempts and identifies the number of processed call attempts per main traffic hour. It is given by the unity BHCA, i.e. Busy Hour Call Attempts and identifies the number of processed call attempts per main traffic hour.

The static traffic capacity describes the performance of the switching matrix. It is shown in the unit Erlang (Erl).

The basis for the dimensioning of telephone systems is the FTZ Guideline 12TR3. For digital subscribers $(2 B+D)$ it results in a traffic intensity value of 0,3 Erlang (see BAPT - Bundesamt fuer Post- und TelekomAngelegenheiten regulations for traffic intensity values).

The values listed below in the table apply for the Integral 55 Compact:

| Traffic capacity |  |
| :--- | :--- |
| Dynamic | 8000 BHCA |
| Static | Non-blocking (1 Erlang/B channel) |

### 15.4 Base Unit

Die Base Unit integriert die zentralen Komponenten, Teilnehmer- / Leitungsschnittstellen sowie die Stromversorgung.

Es stehen nur zwei Steckplätze zur Verfügung. Grundsätzlich wurde die BU für die VOIP und DECT Baugruppen konzipiert. Dennoch können diese im Bedarfsfall mit folgenden Baugruppen ersetzt oder kombiniert werden:

- ATA
- CAS
- DSPF (nur 32 Kanäle stehen zur Verfügung)
- DT21
- IPN

## Peripherie-Baugruppen der Base Unit (BU) und die Lage ihrer Anschlussorgane

1. je nach gesteckter AO-Baugruppe

Die Tabelle zeigt die Kombinationsmöglichkeiten aller einsetzbaren Baugruppen in einer Matrix dargestellt.

|  | VoIP | DECT21 | DT21 | DSPF | ATA | IPN | CAS |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| VoIP | - | $X$ | $X$ | $X$ | $X$ | $X$ | $X$ |
| DECT21 | $X$ | - | - | $X$ | - | $X$ | - |
| DT21 | $X$ | - | - | $X$ | - | $X$ | - |
| DSPF | $X$ | $X$ | $X$ | - | $X$ | $X$ | $X$ |
| ATA | $X$ | - | - | $X$ | - | $X$ | - |
| IPN | $X$ | $X$ | $X$ | $X$ | $X$ | - | $X$ |
| CAS | $X$ | - | - | - | $X$ | - |  |
| $X=$ possible combinations |  |  |  |  |  |  |  |

### 15.4.1 Layout

The base unit $(\mathrm{BU})$ is accommodated in a universal housing. It is intended for mounting in a 19" cabinet (three vertical modules) and can be used as a wall, floor or table-top housing.

- The rack is installed in the 19" cabinet with the aid of two simple mounting brackets and sliding rails.
- As a table-top unit with rubber feet in the base.
- The rack is mounted on the wall by means of a simple enamelled wall holder.
- The basic housing can be used as an upright unit with simple accessories.

All interfaces and control/display elements can be accessed from the front. The blowers can be replaced from the outside during operation.

Interior view of the Integral 55 Compact (motherboard as a board solution lying in housing), seen from above.

1. Blower
2. Socket for third submodule of the ADM (SO, T0, UPN or $a / b$ )
3. Socket for second submodule of the ADM (S0, T0, UPN or a/b)
4. RJ45 connector strips

### 15.4.2 Front

Front view of the Integral 55 Compact

1. $2 x \mathrm{HGS}$

- top = HGS1
- bottom = HGS2

2. LEDs and control elements HSCBO/ACBO
3. RJ45 jack and $2 x$ USB jacks for ACBO

- top = CU Eth (Ethernet interface for ACBO control unit)
- centre = USB/1 (universal serial bus interface 1)
- bottom = USB/2 (universal serial bus interface 2 )

4. RJ45 jacks for HSCBO/ACBO

- top $=$ CU V.24/1 (first V. 24 interface for HSCBO/ACBO control unit)
- bottom = CU V.24/2 (second V. 24 interface for HSCBO/ACBO control unit)

5. Slot for additional VOIP/DSPF or IPN board
6. Slot for additional ATA/CAS/DECT21/DT21/DSPF or IPN board
7. RJ45 jacks

- top = EU (extension unit port, R1RG/1)
- bottom = SPY (R1RG/2 SPY)

These two ports are reserved for future applications and are not yet usable.
8. LEDs and control elements of the MBO board
9. RJ45 jacks for AO ports

### 15.4.3 Housing open

If the housing must be opened (e.g. for retro-fitting submodules), proceed as follows:

- Loosen the five Torx screws with several rotations (1.)

- Pull the housing cover towards you.

- Lift the housing cover over the screw heads.

- Now the cover can be removed by pulling it away.

Use the reverse procedure to close the housing.

### 15.4.4 Table unit

If the base unit is set on a table, it must be fitted with four rubber feet (included in the mounting set) on the underside of the housing.

### 15.4.5 Install in the cabinet

When installing in a cabinet the base unit must be mounted on sliding rails.

Fit the sliding rails in the cabinet for the base unit.
Provide the appropriate holes in the mounting channels with M6 cage nuts.
The base unit is supplied with mounting brackets already fitted. Place the unit into the proposed verticle module. Secure it in the cabinet by means of four torx screws.

The following illustration shows an installed base unit of the Integral 55 Compact.

### 15.4.6 Mounting on the wall.

The Integral 55 Compact base unit must be placed in the wall-mounting bracket so that the LED and switch block are always on top.

|  | The base unit must be assembled in the preferred state, i.e. left-hand access to boards and patch field. |  | If the access is on the right, the cable should be long enough to permit the boards to be pulled out for servicing. The excess cable after commissioning can be stored in the rear. |
| :---: | :---: | :---: | :---: |

Three points (1.) for the drillholes can be marked
on the wall with the aid of the drilling jig (packaging
with punched drillhole diagram).
Drill the holes and insert the enclosed plugs.

The wall bracket should be mounted to suit the given circumstances!
Observe: Wall spacing
Sufficient space must be provided for plugging and unplugging the boards.

| The holder should then be hung on the upper two |
| :--- | :--- |
| screws and locked in place with the lower screw. |
| Tighten up all three screws. |
| The connecting cables of the Integral 55 Compact |
| must be secured on the pull-throughs (2.) and |
| strain relief bars (3.) on the left and right side with |
| cable fasteners. |

Set the Integral 55 Compact base unit on the lower plate of the wall-mounting bracket. Push the unit inside. The springy bracket and mounting bracket at the front will determine the full depth and positioning in the wall-mounting bracket.

Secure the unit on the wall-mounting bracket with four torx screws.
Plug the connecting cable into the corresponding RJ45 jacks on the front of the base unit.

### 15.4.7 Setting up in the room

Place the holder in the foot with rubber studs.

Foot (from above)

Wall-mounting bracket

1. Connect the holder to the foot with the four torx screws.

The connecting cables of the base unit must be secured with cable fasteners on the pull-throughs at the left and right of the wall-mounting bracket (see illustrations).
Push the Integral 55 Compact base unit into the holder from the side shown in the following illustration.

1. Secure the unit on the wall-mounting bracket with four torx screws.
2. Plug the connecting cable into the corresponding RJ45 jacks on the front of the base unit.

3. Fastening for cables with fast binders (strain relief).
4. Strain relief lug for earthing wire
5. Clamp for earthing wire
6. IEC power plug

Mounting on the wall. $\rightarrow 605$

### 15.5 Boards

The boards inserted in the front side may be removed and inserted during system operation. The ESD measures must be followed

For EMC and conformity reasons in the Integral 55 Compact are used only released boards equipped with metalic front strips!
For reasons of EMC, vacant slots should be covered with frontplates.

| Board | Base Unit |
| :--- | :--- |
|  |  |
| ACBO $\rightarrow 610$ |  |
| ASC2 |  |
| ASC21 |  |
| ASCxx |  |

### 15.5.1 ACBO Advanced Computer Board Office

## Short description

The ACBO board is the basic equipment in the Integral 55 Compact LX. They are located in the Base Unit (BU). This computer board is used when the software IEEx (Linux operating sistem) is used.

| Features |  |
| :---: | :---: |
| ETX-PC <br> The ETX-Board is a complet PC-System. All functions the current PCs offer are realized on this Board. Performance same as Pentium III/400MHz or higher. | 512 MByte of main memory, (only one SO DIMM Modul) |
|  | Boot flash PROM with Phoenix Bios |
|  | Voltage generation |
|  | Real-time clock (RTC) |
| Hardware watchdog |  |
| RTC battery (8 years buffer operation) |  |
| Ethernet interface 10/100 Base T |  |
| two V. 24 interfaces (not isolated) |  |
| Interface to the PCM highway (4 independent B channel accesses) |  |
| PCI Bus (5V tolerant) 32Bit/33MHz |  |
| Two CBus interfaces (ISA Bus) on for system control reasons one as SPY-remote Interface (SPY = System Protocoller and Analyser) |  |
| IDE interface for Compact Flash (HGS) |  |
| USB1/2 for more V. 24 interfaces |  |

The hardware prerequisites for remote logging with SPY are contained on the board.

| $!$ | As the software for the logging from remote is currently not implemented, it must be made <br> locally using a SP1 board (reference number: 49.9902.8112) and a PC. |
| :--- | :--- |

ACBO board, component side

1. HGS, Compact Flash (component side); boot flash, Compact Flash, (conductor side)
2. Ethernet USB 1.1
3. $2 \times \mathrm{V} .24$
4. Battery
5. Transformer 10/100 Base T
6. ETX-PC
7. CBI
8. PCM highway controller
9. CBT
10. PCM highway controller
11. SEPL
12. Ribbon cable
13. ISA Bus testconnector
14. Power supply plug

| Other features |  |  |
| :--- | :--- | :--- |
| Power demand +5 V | 2200 mA | with 2 * Compact Flash |

### 15.5.1.1 LEDs and Switch Functions

1. Position of the control elements and LEDs (Control Unit)

LEDs and switches of the ACBO

ACBO board, front side

## Switch Position in Normal Operation

| S1 | Middle: |
| :--- | :--- |
| S2 | Below |

## Switch Function

| S1 | Reset switch |  |
| :--- | :--- | :--- |
|  | Middle: | Operating status |
|  | Below: | Hardware reset of the board, locking |
|  | Above: | ACB is shut down (by the operating system), keying |
| S2 | Hard Disk Change Request (HDCHR) |  |
|  | Below: | Operating status: IDE Hard Disk in operation |
|  | Above: | Service position: Removing and Inserting the IDE Hard Disk |

## Meanings of LEDs

| L3 | on: | CBI access |
| :--- | :--- | :--- |
| L4 | on: | Access to Compact Flash 1/2 |
| L5 | on: | Compact Flash (HSG) can be removed/inserted |
| L2 | on: | Power OK |
| L7- L10 | These LEDs indicate the statuses from reset to operation. After the voltage supply has been <br> switched on a functional check is carried out (LEDs light up briefly). |  |

The commissioning status is divided into four groups:

1. ACBO loading from flash software
2. ACBO loading from HGS to operating system level
3. ACBO loading from HGS to application level
4. ACBO loading in special status (APS change) during operation.

| No. | L7 | L8 | L9 | L10 | Gr. | Status | Phase name |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 15 | 1 | 1 | 1 | 1 | 0 | Commissioning starts | BIOS is running; LED test. |
| 14 | 1 | 1 | 1 | 0 | 0 | Operating system takes up <br> work | Linux-Kernel has been <br> loaded. <br> GRUB finished and <br> initialization RAM Disc <br> started. |
| 13 | 1 | 1 | 0 | 1 | 0 | Load operating system via <br> CBI | ACB board without HGS is <br> loaded as slave via C bus. <br> Status 11 and 12 skipped. |
| 12 | 1 | 1 | 0 | 0 | 0 | Load operating system via <br> Ethernet | ACB board without HGS is <br> loaded as master via <br> Ethernet. <br> Status 11 and 13 skipped. |

| No. | L7 | L8 | L9 | L10 | Gr. | Status | Phase name |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 11 | 1 | 0 | 1 | 1 | 0 | Load operating system via <br> local bus | ACB board with HGS is <br> loaded as master directly. <br> Status 11 to 13 are not <br> processed in the normal <br> order. |
| 10 | 1 | 0 | 1 | 0 | 0 | Flash software update | ACB flash software in <br> progress. |
| 9 | 1 | 0 | 0 | 1 | 1 | PAL starts | The PAL server is ready. <br> All known Pascal tasks are <br> started. |

| $2-3$ | Watchdog disable |
| $4-5$ | SCOCON fulfilled (Service entry) |
| $5-6$ (default) | SCOCON not fulfilled |

### 15.5.2 ASC21 Analog Subscriber Circuit 21

## Short description

The ASC21 board provides $32 \mathrm{a} / \mathrm{b}$ connections for analog terminals, according to country-specific requirements with the following features:

Country-specific variants are configurable using board software for the following countries:

Germany, Austria, Switzerland, Netherlands, Great Britain, Italy, Spain, Belgium, Venezuela, Hungary, Czech Republic, Slovakian Republic, Mexico, Hong Kong, USA, Russia and France

| Power demand +5V | 600 mA |  |
| :---: | :---: | :---: |
| Interfaces | $32 \times \mathrm{a} / \mathrm{b}$ |  |
| Constant current supply | 22 mA convertible to 30 mA |  |
|  | Line resistance | $2 \times 235$ Ohm |
|  | range: | 1.7 km installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,4 \mathrm{~mm}$ <br> 4.0 km installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,6 \mathrm{~mm}$ <br> 7.5 km installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,8 \mathrm{~mm}$ |
| DTMF/pulse dialling |  |  |
| $25 / 50 \mathrm{~Hz}$ ringing current (convertible) |  |  |
| Short and long flash time (end device dependent) |  |  |
| Overvoltage protection up to 4 kV |  |  |
| Board software download |  |  |
| Board identification using board pass |  |  |
| Maintenance function |  |  |
| Polarity reversion for "message waiting" signalling |  |  |
| Connection of external announcement devices |  |  |

The connection on the MDF is carried out via the CA2B or CARUB boards.

### 15.5.2.1 Changing the Supply Current

The supply current on the board can be set between 22 mA (standard) and 30 mA per connecting circuit.
The following steps must be taken:
The number of the $A O$ for which the current changeover can be made is stated on the conductor path side and on the component side.

## Example:

The power supply component for AO 01 is located on the component side. The soldering points for setting the higher loop current are located on the conductor path side. For this reason the 01 marking is also located on the conductor path side.
The marking *3 is to be found in each AO area, close to which are four mounting spots for two not equipped resistors (0 ohm).

These mounting spots must be connected in pairs by wire jumpers. It is important to solder two wire jumpers per AO.

ASC21 board

1. Power supply component per $A O$
2. jointly for four AOs
3. Connector to backplane of $I 55$

For better orientation, please turn the board so that the connector (3) is facing you and the numbers of the AOs are legible.

The following is a section from the component side on which you can see the position of the mounting spots to be bridged.

1 on component or soldering side, depending on port
The mounting spots must be vertically connected to each other.
The marking *3 relates to the mounting spots marked with an arrow.
The current increase can be set on the component side for the following AOs:

| AO number |  |
| :---: | :---: |
| Number for xx | Number for yy |
| 02 | 04 |
| 05 | 07 |
| 10 | 12 |
| 13 | 15 |

| 18 | 20 |
| :---: | :---: |

The components are arranged in the same way in all AOs marked with $x x$ or $y y$.
The following is an section from the conductor side on which you can see the position of the mounting spots to be bridged.
A different arrangement applies to AO 01 and the remaining AOs. First of all, the component arrangement for AOs 01 and 03:
$\begin{array}{ccc}C & \mathrm{R} & \mathrm{C} \\ -П & \square & \square \square\end{array}$

$R \square$ ロ $\quad$ ロ
$R \square$

## SLAB

-1

$\square$

1 on component or soldering side, depending on port
In AO 01 the two bridges to be vertically soldered lie side by side.
The marking *3 relates to the mounting spots marked with an arrow.
The components arrangement is the same for the remaining AUs on which the current increase can be set on the conductor side:

## SLAC <br> *1

1 on component or soldering side, depending on port
The marking *3 relates to the mounting spots marked with an arrow.
The current increase can be set on the conductor side for the following AOs:

| AO number |  |
| :---: | :---: |
| Number for xx | Number for yy |
| 01 \#1 | 03 |
| 06 | 08 |
| 09 | 11 |
| 14 | 16 |

| 17 | 19 |
| :--- | :--- |
| 22 | 24 |
| 25 | 27 |
| 30 | 32 |

\#1 The component arrangement is different on AO 01.
The components are arranged in the same way in all AOs marked with xx or yy.
Please connect (vertically) only the mounting spots which are marked accordingly! Bridges which are soldered differently may result in serious malfunctioning.

### 15.5.2.2 LEDs and Switch Functions

### 15.5.3 ASCxx Analogue Subscriber Circuit

## Short description

The ASC board is available in the following variants:
ASCEU: Europe with the following characteristics:

| Country-specific variants are configurable using board software for the following countries: | Germany, Spain, Netherlands, Switzerland, Italy, Belgium, Austria, Greece, Mexico and Venezuela |  |
| :---: | :---: | :---: |
| Power demand +5V | 620 mA |  |
| Interfaces | $16 \mathrm{a} / \mathrm{b}$ (connectors for analog terminals in accordance with country-specific guidelines) |  |
| Constant current supply | 24 mA , switchable to 30 mA (mounting of a 0 Ohm resistance) |  |
|  | Line resistance | $2 \times 475$ Ohm |
|  | Range | 4 km installation cable (J-Y(ST)Y $\varnothing 0,4 \mathrm{~mm}$ 9 km installation cable (J-Y(ST) Y $\varnothing 0,6 \mathrm{~mm}$ 15 km installation cable ( $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,8 \mathrm{~mm}$ Line lengths for Message waiting |
| DTMF/pulse dialling, flash and earth button detection, Telecom-specific (dependent on terminals) |  |  |
| Short and long flash time, Telecom-specific (dependent on terminals) |  |  |
| Overvoltage protection up to 4 kV |  |  |
| Board software download |  |  |
| Board identification using board pass |  |  |
| Maintenance function |  |  |
| Polarity reversion for "message waiting" signalling |  |  |
| Connection of external announcement devices |  |  |

ASCF: France with the following characteristics:

| Power demand +5 V | 620 mA |
| :--- | :--- |

| Interfaces | $16 \mathrm{a} / \mathrm{b}$ (connectors for analog terminals in accordance with French guidelines <br> and voice terminals) |
| :--- | :--- |
| Resistance feed (const. <br> voltage) | $2 \times 400$ Ohm |
| DTMF/pulse dialling, polarity reversal and button detection |  |
| Overvoltage protection up to 4 kV |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |
| Symmetric call supply |  |
| Polarity reversion for "message waiting" signalling |  |
| Connection of external announcement devices |  |

## ASCGB: Great Britain

| Power demand +5 V | 620 mA |
| :--- | :--- |
| Interfaces | $16 \mathrm{a} / \mathrm{b}$ (connectors for analog terminals in accordance with British guidelines) |
| Constant current supply | 30 mA |
|  | Loop range |
| DTMF/pulse dialling, flash and earth button detection |  |
| Overvoltage protection up to 4 kV |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |
| Polarity reversion for "message waiting" signalling |  |

### 15.5.3.1 Line lengths for Message waiting

The range for Message waiting signaling for analogue subscribers of the ASCEU board with the ICU programme ASCEU018.ICP in connection with the various apparatus types and seizure (pick up on call) and outgoing seizure (pick up) with the installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,4 \mathrm{~mm}$ is:

|  | Outgoing seizure (pick up) |  | Incoming seizure (pick up in call) |  |
| :--- | :--- | :--- | :--- | :--- |
| Apparatus types | Line length [m] | Line length [W] | Line length [m] | Line length [W ] |
| Tel. T40 | 1400 | 379 | 1400 | 379 |
| Tel. TE51 | 1000 | 272 | 1000 | 272 |
| Tel. TE91 | 1000 | 272 | 1000 | 272 |
| Tel. TC91 | 1100 | 298 | 1100 | 298 |
| Tel. TB510LED <br> DE | 1100 | 298 | 600 | 163 |
| Tel. TB519D | 900 | 245 | 900 | 245 |
| Tel. TK40-20-2 | 300 | 83 | 300 | 83 |

## Recommendation

The line length with which the performance feature Message waiting is to be operated with conventional signaling (permanently illuminated LED signal), should not exceed

| 600 m | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0.4 \mathrm{~mm}$ ) |
| :--- | :--- |
| 1.3 km | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0.6 \mathrm{~mm}$ ) |
| 2.4 km | (Installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,8 \mathrm{~mm}$ ) |

Malfunctions may occur when establishing a connection if the lines are any longer.
The tel. TK40-20-2 should only be operated with a 300 m (83W) line length.
Deviations from the recommended line length are possible.
If the lines are any longer, a different Message waiting signal (signal LED blinks) should be selected. Signalling is implemented in the ICU programme ASCEU019.ICP for the ASCEU board.

### 15.5.3.2 Bridge positions

The power supply can be increased from 24 mA (standard) to 30 mA per line in this board: The increase in the supply current is implemented by inserted 0 Ohm resistors or bridges at the following coordinate points:

| AO1 | 197077 |
| :--- | :--- |
| AO2 | 199128 |
| AO3 | 173069 |
| AO4 | 179116 |
| AO5 | 155077 |
| AO6 | 157128 |
| AO7 | 131069 |
| AO8 | 137116 |
| AO9 | 113077 |
| AO10 | 115128 |
| AO11 | 089069 |
| AO12 | 095116 |
| AO13 | 071077 |
| AO14 | 073128 |
| AO15 | 047069 |
| AO16 | 053116 |

### 15.5.3.3 LEDs and Switch Functions

ASCxx board, front side

### 15.5.4 ATA Analog Trunk Interface A

## Short description

The ATA board provides the interface for up to 8 analog exchange accesses (PSTN) in accordance with country-specific guidelines. It is a universal Euro-based trunk module and can be adapted to individual countries by means of the corresponding submodule and software (level, impedances etc.).

| Submodule | Countries of application |
| :--- | :--- |
| SIGA Signalling Unit A | Germany, Russia |
| SIGB Signalling Unit B | Switzerland |
| SIGC Signalling Unit C | Luxemburg |
| SIGD Signalling Unit D: | Austria |
| SIGE Signalling Unit E | Austria |
| SIGF Signalling Unit F | Belgium |
| SIGG Signalling Unit G | Hungary |

A mixed combination of ATA boards and submodules is not possible.
The board can accommodate a maximum of 4 two-part submodules.

ATA board, slots

| Other features |  |
| :--- | :--- |
| Power demand +5 V | 530 mA with eight occupied connecting circuits |
| Interfaces | $8 \times \mathrm{a} / \mathrm{b}$ |
| DTMF/pulse dialling |  |
| Overvoltage protection up to 4 kV |  |

| Other features |
| :--- |
| Dial tone identification, charge count |
| Board software download |
| Board identification using board pass |
| Maintenance function |

In the Integral55, an emergency operation switchover can be set up by inserting an EES1B (EES8B) board behind the ATA board; this is not possible in the Integral55 Compact.

### 15.5.4.1 Installation

## Base Unit

The ATA board must be inserted into the slot shown below.

1. Slot for the ATA board

## Details

## Use on the ATA slot

| Slot address: | 01-01-07-xx |
| :--- | :--- |
| CBI address: | 0C hex. |
| $x x=$ port number |  |

Connections ATA to contact strip 1
Connections see: Connections from the BU $\rightarrow 680$.

### 15.5.5 CAS Channel Associated Signalling

## Short description

The CAS board is a PCM30 interface for up to 30 B channels in accordance with CCITT. The board contains the following features:

| Other features |  |
| :--- | :--- |
| Country of <br> application | National and international |
| Power demand +5 V | 930 mA |
| Line signalling in channel 16 (CAS) in accordance with CCITT or country/customer specifications. |  |
| Register signalling in $30 \mathrm{~B} \mathrm{channels} \mathrm{(inband)} \mathrm{in} \mathrm{accordance} \mathrm{with} \mathrm{CCITT} \mathrm{or} \mathrm{country/customer}$ <br> specifications. |  |
| Can be used as an exchange interface, connection line or special interface. |  |
| Incoming, outgoing and bothway traffic direction, can also be mixed as required |  |
| Overvoltage protection up to 4 kV |  |
| Board software download. |  |
| PCM30 interface configuration via board software. |  |
| Board identification using board pass |  |
| Maintenance functions |  |

### 15.5.5.1 Installation

## Base Unit

The CAS board can be plugged into the slot shown below.

1. Slot of the CAS board

Details

| Slot address: | 01-01-07-xx |
| :--- | :--- |
| CBI address: | 0C hex. |
| $\mathrm{xx}=$ port number |  |

Connections CAS to contact strip 1
Connections see: Connections from the BU $\rightarrow 680$.

### 15.5.5.2 CAS-TIELINE User Program

## Introduction

The CAS-TIELINE user program was developed for the 155 system on the CAS hardware platform, and is a tie-line transmission program. The 16 different tie-line transmission variants are designated E1 to E10/2.

The user data is adapted to individual requirements by means of the ICU mask.

## Hardware

The CAS board (channel associated signalling) is used here. Depending on the application, the $2 \mathrm{MBit} / \mathrm{s}$ interface can be configured using the confidata (see Section "ICU mask and confidata") with impedance of 75 W (unsymmetrical) or 120 W (symmetrical).

Depending on that, for the line connection one of the following adapter boards (only Integral 55) is then required:

- CA1B for 75 W
- CA4B for 120 W

Further general information about the CAS board, in particular about the controls and denotations of the front panel, can be gathered from the appropriate paragraphs.

## SoftWare

The CAS board is set up with KAD (customer specific user data) for TIELINE application. This requires the corresponding load list name for the accompanying slot address to be entered.

The necessary parameters (confidata) are then set up using the ICU editor. The corresponding ICP files and the confidata subsequently end up on the CAS board by means of a download.

## Short description of Applications

The TIELINE user program supports inband signalling (DTMF dial codes, call progress tones) and line signalling (signalling channel bit a). The following applies to line bits $b, c$ and $d$ : $b c d=101$. Only changes to bit 'a' will be processed by the user program. Changes to the bcd bits will be ignored.

16 different signalling plans are produced from the available signal stock. These plans can be selected using the confidata and always apply to all 30 connecting circuits (AO).
In principle all the AOs are set up for both-way throughput.
Line signalling will not be carried out if all the signals appear as pulsed signals.
DTMF (dual tone multi-frequency dialling) and pulse dialling are suitable dialling systems.
The suffix dialling facility is guaranteed for the entire duration of an outgoing call, and for a predefined period of an incoming call.

If the criterion "message" is identified, an active call will be cancelled and the digits memory will be deleted.
The elegibility or inelegibility of a line can be set up by the confidata seperately for incoming and outgoing AOs.
In the same way, a 425 Hz continuous tone can be connected to the switching matrix as a proceed-to-select signal for outgoing traffic, or a 425 Hz busy tone to the line for incoming traffic according to configuration.

Up to 10 digits can be programmed for a destination number in outgoing traffic. The destination number will be chosen automatically according to the preset timeout when "elegible" or "inelegible" in the absence of the "dialling" message.

If "elegible"; incoming "dialling" messages are ignored once the timeout has ended. If "inelegible"; they will always be ignored. The suffix dialling facility is also guaranteed for the previous destination number when in call status.

Outgoing DTMF signals which are "called through" will be identified, and incoming "dialling" messages are subsequently ignored.

An area code may be programmed, which will be relayed to the GCU global control unit during incoming seizure once the proceed-to-select criterion (signal, time) has been met.
Where "dial" or "message" information is absent, the release which has been initialized by the user program's watchdog exists neither for incoming nor for outgoing traffic.

If a fault occurs, trouble signalling to the opposite side can be activated using confidata.
In the same way, an unblocking function can be set up for each connecting circuit: When active (blocking-n = on), and with the front panel switches TBS (total blocking switch) and TBS-N (total blocking switch minus n) switched on, the corresponding connecting circuit will not be blocked.

## Specification of Inband Signals

The available DTMF transmitters and receivers are set out in accordance with CEPT recommendation T/CS 46-02.

The tone identifier will certainly operate in the range of 350 to 500 Hz with $-30 \mathrm{dBm0}$.
The tone generator supplies a 425 Hz frequency with a transmission level of -3 dBm . In outgoing traffic, it can be sent to the switching matrix as a proceed-to-select signal (continuous tone). In incoming traffic, it can be connected to the line as a busy tone (German rhythm).

## Synchronization

The CAS board can generally be used as the synchronous clock supplier for synchronization purposes. In the TIELINE application, however, this is only meaningful if no digital exchange interfaces or tie lines are present.
. This is the reason for the default setting of "No synchronous clock". This setting can be changed via the configuration data.

### 15.5.5.3 Identifying the Operation Phase

As described above, the boot software controls

- initialization,
- test and download procedures after a reset and
- indicates various statuses and possible faults by means of the LED's on the front panel.

If no faults are found and all GCU messages (test messages, "startup ready" etc) have been received, L1 will flash eleven times and L9, L7, L8, L15 and L16 will go out, indicating that the operation phase has been reached.

### 15.5.5.4 LED and Switch Functions

The functions of the switches and LED's on the front panel differ in boot phase from those in operation phase. Following a reset, the boot software carries out initialization, test and download procedures, and indicates various statuses as well as possible faults via the LEDs on the front panel.
If no faults are found and all necessary GCU messages (test messages, "ready for startup" etc.) have been received, the CAS board will reach the operation phase, where user software is put into effect.

** $\quad$ The denotation of the LEDs depends on the application (display of R2 register, DTMF receiver/transmitter, tone transmitter/receiver)

### 15.5.6 DECT21 ICU for DECT-Applications 21

## Short description

The DECT21 board is used to connect the Radio Base Station RM 588, material number 4.998.001.296, to the CSI55.
It carries out an automatic run time measurement. The manual measurement of the individual routes up to 1 km is not applicable as long as no repeater is connected between.

| Other features | National and international |
| :--- | :--- |
| Country of application | 1100 mA |
| Power demand +5 V | 8 UPD interface for RBS <br> One UPD interface physically corresponds to 2 UPN <br> interfaces. |
| Interfaces | The ADPCM (Adaptive-Differential-Pulse-Code-Modulation, 32 kbit/s) conversion is carried out on the <br> board. |
| One of the two D channels is used for the transmission of synchronization information between the <br> DECT21 board and the RBS. |  |
| Overvoltage protection up to 4 kV |  |
| Download board software |  |
| Board identification using board passport |  |
| Maintenance function |  |

### 15.5.7 DSPF Digital Signal Processing Function

## Short description

The DSPF as the basic board accommodates the ASM3 announcement module. The announcement module serves for recording and playback of ACD spoken announcements and for hotel applications. Depending on the application the DSPF can be equipped with up to:

| 4 ASM3 | for access to 128 time slots | in I55 |
| :--- | :--- | :--- |
| 2 ASM3 | for access to 64 time slots | in I55C |

| Other features |  |
| :--- | :--- |
| Country of application | National and international |
| Power demand +5 V | 850 mA |

For more detailed information about configuration with ASM3 please refer to the service manual.

### 15.5.7.1 Inserting the submodule

The used ASM3 modules are inserted in the submodule slots "submodule 1" - "submodule 2" of the DSPF.

DSPF board, component side

1. Submodule 1
2. Submodule 2

The position must correspond to the setting in the confidata. The following allocation must be observed:

| "Submodule number" <br> parameter in the ICU Editor | Labelling | Labelling on the DSPF board |
| :--- | :--- | :--- |
| 0 | Submodule 1 | SUB1 |
| 1 | Submodule 2 | SUB2 |

### 15.5.7.2 Installation

## Base Unit

The DSPF board can be inserted in the slots shown below.

1. Slots of the DSPF board

### 15.5.7.3 Time slot management

The Integral 55 Compact is designed so that the DSPF can only be plugged into an uneven slot.
Each ASM3 submodule represents an ICU. The DSPF has access to a total of 64 time slots in the Integral 55 Compact. It can realize a maximum of two ICUs. The ICU of the board's physical slot of the (time slots 0-31) logs on with ICU type DSFM (DSPF master). The further ICU is realized on the same hardware by logical address entries (time slots 32-63) in the CBI. These log on with the ICU type DSFS (DSPF slave).
The configuration of a second DSPF in the same module is not expedient.
Allowing for the above conditions, the two submodule slots and thus each of the two ICUs can be assigned to an application (ACD or HOTCOM).
Prior to operation of the PABX the DSFM and DSFS ICUs are assigned with the CAT application and during operation with the service and administration programs with ICU editor.

This module has no external connections.

### 15.5.7.4 LEDs and Switch Functions

DSPF board, front panel
Meaning of the switch on the front panel of the DSPF board
Up to 4 ICUs (1* DSFM and 3 * DSFS) can be implemented on the DSPF board. The common status of the ICUs can be controlled via the S1 front panel switch as follows:

| S1 | Reset and blocking switch |  |
| :--- | :--- | :--- |
|  | Middle position | All ICUs in operating status |
|  | Left position | All ICUs in preparatory disabling |
|  | Right position | All ICUs in reset |
|  | Left position after board <br> reset | Master ICU DSMF (DSPF board) receives a forced ICU <br> download. After commencing the loading process, the <br> switch must be returned to the middle position. |

## Meaning of the LEDs on the front panel of the DSPF board

Up to 4 ICUs (1* DSFM and 3 * DSFS) can be implemented on the DSPF board. The common status of the ICUs is displayed via the two front panel LEDs L1 and L10 according to the following pattern:
The display appears according to priority, i.e., if several functions of the scheme are represented by one LED, the one with the highest priority is implemented. Prio 1 is the highest priority, and prio 5 the lowest. In the cases with priority 1 , the board is still in the reset or download phase, whereby the additional ICUs (DSFS) are not yet active.

| L1 | flashing 5Hz | At least 1 ICU is still in startup, waiting for "Switching On" <br> message | Prio 2 |
| :--- | :--- | :--- | :--- |
|  | flashing 1 <br> Hz | All ICUs are preparatory disabled, the board is removeable | Prio 3 |

|  | an (in) | At least 1 ICU has a seizure in terms of switching technology <br> in at least one channel. <br> All ICUs (entire board) are in reset processing (if L10 is also <br> on) | Prio 4 <br> Prio 1 |
| :--- | :--- | :--- | :--- |
|  | off | All ICUs are in a resting state with their ports, the board is not <br> occupied | Prio 5 |
|  | flashing 5Hz | At least 1 ICU is still waiting for commissioning <br> Master ICU DSFM (DSPF board) ICU Download in progress | Prio 2 <br> Prio 1 |
|  | flashing 1 <br> Hz | $/$ | Prio 3 |
|  | an (in) | Master ICU DSFM (DSPF board) in reset processing (if L1 is <br> also on) <br> Master ICU DSMF (DSPF board) Programming procedure in <br> ICU download | Prio 1 <br> Prio 1 |
|  | off | All ICUs in operation | Prio 4 |

### 15.5.8 DT21 Digital Linecard T2 Variant 1

## Short description

The DT21 board provides one configurable S2Minterface.

| Other features |  |
| :---: | :---: |
| Country of application | National and international |
| Power demand +5 V | 400 mA |
| Interfaces | a S2Minterface (CO (T2) - or Tie (TIE)), 120 Ohm symmetric or <br> 75 Ohm asymmetric. ( not intended for use in I55C) |
|  | Driver for optical interface( not intended for use in 155C) |
|  | Switchable digital attenuation for speech connections (B-channels), adjustable via the ICU Editor |
| 2.048 MHz pulse output ( not intended for use in I55C) |  |
| V .24 Test interface (front panel) |  |
| Overvoltage protection up to 4 kV |  |
| Board software download |  |
| Board identification using board pass |  |
| Maintenance function |  |

| Cable adapter |  |  |
| :--- | :--- | :--- |
| if used in I55 | Possible adapter boards: | CA1B, CA4B, OFA2B, OFAS |
|  | Power supply NT | via ESBx |
| if used in I55C | none, direct connection on front side |  |
|  | Power supply NT | via external plug power supply (material number <br> $27.4402 .1056)$. |

## Ranges

| if used in I55 |  |  |
| :--- | :--- | :--- |
| 37 dB attenuation range |  |  |
| Wire interfaces (CA1B or CA4B) | 0.9 km | Installation cable |
| 120 Ohm symmetric | 1.8 km | TF cable |
|  | 1.5 km |  |
| 75 Ohm coax | monomode cable $9 / 125$ micrometer, 11 dB max. attenuation <br> for entire optical path (e.g. max. 20 km at $0.4 \mathrm{~dB} / \mathrm{km}$ and 7 <br> plug connections $0.4 \mathrm{~dB} /$ plug $)$ |  |
| Optical interface (OFA1B) |  |  |

| if used in I55C |  |  |
| :--- | :--- | :--- |
| dB attenuation range |  |  |
| Wire interfaces (direct connection on the front side) |  |  |
| 120 Ohm symmetric | 0.9 km | Installation cable |
|  | 1.8 km | TF cable |

### 15.5.8.1 Installation

## Base Unit

The DT21 board can be plugged into the slot shown below.

1. Slot for the DT21 board

## Details

| Slot address: | 01-01-07-xx |
| :--- | :--- |
| CBI address: | 0C hex. |
| $\mathrm{xx}=$ port number |  |

Connections DT21 (slot for DECT21) to contact strip 1
The connections for DECT21 are located in the first 16 block of the Western socket (RJ45) Thus the trunk line interface of the DT21 is also there.

Illustration of a 16 block:

Front view of $16 \times$ RJ45 jacks
The two DECT21 connections for the first RBS stations are in jack 8.

Connection of jack 8
Wire DECT A1 leads to contact no.: 4 (shown in green)
Wire DECT-B1 leads to contact no.: 5 (shown in green)
This corresponds to lines TX+ and TX- when a DT21 is used
Wire DECT A2 leads to contact no.: 6 (shown in yellow)
Wire DECTㄹㄹ leads to contact no.: 3 (shown in yellow)
That corresponds to wires RX+ and RX- when using a DT21

### 15.5.8.2 LEDs and Switch Functions

DT21 board, front side

$2=$ TXD
3 = RXD
$4=$ not assigned
5 = GND
6 = D channel data upstream
7 = D channel data downstream
8 = Clock burst 2.048 MHz
$9=+5 \mathrm{~V}$

## Switch Position in Normal Operation

| S1 | Neutral position |
| :--- | :--- |
| S2 | Neutral position |

## Switch Function

| S1 | links: | Preparatory disabling |
| :--- | :--- | :--- |
|  | Mean: | Operating status/release |
|  | Right: | Reset board |
|  | Right, then left: | Forced board download |
| S2 | Left, then right: | Report (fault statistic message to the system console) The <br> switch must be moved back to the middle position after use (2 <br> MHz clock output off) or to the right (2 MHz clock output on). |
|  | Mean: | Normal operating mode / 2 MHz clock output off |
|  | Right: | 2 MHz clock output on |

## Meanings of LEDs

| L1 | On: | Board is busy with switching functions |
| :--- | :--- | :--- |
|  | Flashing: | Board removable after preparatory disabling |
|  | off: | Board is not busy |
| L2 | On: | Module is synchronous clock supplier |
| L3 | On: | Remote Alarm Indication RAI (opposite side reporting fault <br> status) |
| L4 | On: | Alarm Indication Signal AIS (opposite side reporting "Out of <br> Order") |
| L6 | On: | Loss of Signal LOS (no receiving signal) |
| L7 | On: | Rx E bit errors |
|  | On: | Flashing: |
|  | off: | Board reset in progress |
| L8 | On: | Board in operation |
| L9 | On: | Normal operation (layer 1 active, no alarm) |
| L10 | On: | Bit error rate > 10-6 |
| L11 | On: | Bit error rate > 10-3 |
| L12 | On: | Loss of Framing LOF (loss of frame synchronization) |
|  | The LED signals an activated debug monitoring. LED 12 is <br> used as indicator as this debugging applies to the real time <br> function of the module. It is possible to activate the debugging <br> with a connected terminal and finally removing the terminal - <br> then the debugging remains on and unaffected. |  |

In order to connect an IDM to the front panel, an optional component must be inserted on the DT21, reference number: 49.9801.4247.

### 15.5.9 HSCBO High Speed Computer Board Office

## Short description

HSCBO (High Speed Computer Board Office) is a computer board (central system control) with dynamic RAM.

| Features |
| :--- |
| Optionally with parity |
| 128 kByte ERROR flash-PROM |
| 512 kByte Boot flash-PROM |
| Buffered real time clock |
| Two-level hardware watchdog |
| Hardware status register |
| C-bus interface |
| 4 B channel accesses |
| 2x V.24 interfaces (not insulated) |
| Downloadable |
| $2 x$ interfaces for Compactflash memory cards |

| Other features |  |  |
| :--- | :--- | :--- |
| Power demand +5 V | 1900 mA | with 1 * Compact Flash (HGS) |
| The Compact Flash can be replaced during operation. |  |  |

### 15.5.9.1 LEDs and Switch Functions

$0=$ LED off

### 15.5.10 IPN Intelligent Private Network

## Short description

The board IPN module enables the operation of intelligent private networks between systems (CSI55, I33) by means of data transmission in the speech channel of a digital dial-up line.

| Other features |
| :--- | :--- |
| Power demand $+5 \mathrm{~V} \quad 710 \mathrm{~mA}$ |
| Up to 15 IPN connections are possible per board. |
| Board software download. |
| Board identification using board pass |
| Maintenance function |

The board must operate in conjunction with an ISDN exchange board.

### 15.5.10.1 Installation

## Base Unit

The IPN board can be inserted in the slots shown below.

1. Slots of the IPN board

## Details:

The IPN board has no connection via the Western socket.

### 15.5.10.2 LEDs and Switch Functions

|  | off: | Operating status |
| L7 | on: | Logging switched on |
| L8 | flashing: | See L3 function |
|  | off: | Operating status |
| L9 |  | No function |
|  | 12x | Main program runtime $>125 \mu$ s |
| L10 | on: | At least one channel blocked |
|  | flashing: | At least one channel defective |
|  | off: | Operating status |

### 15.5.11 MBO Motherboard Office

## Short description

The MBO board (Motherboard Office) combines in the BU the functional units of the central functions (CF22) and part of the analogue and digital interfaces (max. 40 port). For cost reduction of the MBO (number of layers), the digital signalling processors that belong to the CF22 have been passed to the DSPO submodule.

Together with the HSCBO board and the PSO they constitute the fundamental components of the I55-Compact system. Via the adapter module SBAO the VOIP and DECT21 boards can be connected to the system.

## Features

## Clock Supply and Module Synchronization

External synchronization via network nodes (S0, S2M)
Master free-run clock mode (internal clocking)

## Module Switching Matrix

Bit rate 4,096 MBit/s
Module internal non-blocking

## 11 DTMF receiver sets, 4 DTMF transmitters (only for dialling)

## Call Progress Tones

A maximum of 16 call progress tones can be generated as customer-specific or country-specific and can be cyclically repeated. At the same time unrestricted supply is possible.
In addition, a maximum of 3 tones with burst character can be supplied.

## Short Voice Messages

Up to 8 voice messages or "music on holds" can be used. The total duration of all brief voice messages must be no longer than 64 sec .

## Long Voice Messages

2 voice messages with unspecified time limits and confidata can be set up (connecting message devices via analogue subscriber line circuits). At the same time unrestricted supply is possible.

## Tone Injection in Two-Party Conversations

Up to 3 various cyclic tones can be generated which may be fed into a maximum of 15 two-party conversations (e.g. call waiting tone, rolling tone etc.).

## Conferences

The system software only allows three-party conferences.

## Call number ID

8 DTMF transmitters for CLIP (call number indication on analogue terminals for incoming calls)

With basic equipment, the circuit of the analogue digital Mixboards ADM contains the function of:

- 24 digital UPN interfaces as subscriber poarts
- four ports for SO or TO for subscribers or exchange lines (ADM submodule 4, STSM, built in, port 12 through 15)
- four ports for analogue subscribers, a/b (ADM submodule 1, ABSM, built in, port 0 to 3 )

In addition, two ADM submodules, from the following list, can be plugged on this port, according to the requirements or configuration (see the following figure).

| Submodule | Features |
| :--- | :--- |
| STSM | four S0/T0 interfaces as exchange, permanent connection or subscriber <br> connection |
| UPSM | four UPN interfaces as subscriber ports |
| ABSM | four analogue subscriber ports $(\mathrm{a} / \mathrm{b})$ |

2nd slot for subboard 2 (SUB2, port 4-7)
3rd slot for submodule 3 (SUB3, port 8-11)

For the ADM board the "Call Reference Length - (CRL)" can be set to a length of one or two bytes for the whole board by means of the ICU editor. The call reference length of 2 bytes is required for QSIG network connection with some third-party PBX. If this setting is used, all ports have CRL=2 bytes no matter which protocol is selected. This led to the fact that it was not possible to connect subscribers / lines with the protocols TN1R6, 1TR6, DKZN, VN3, NI2 and ETSI with CRL=1 to this ADM board.
As of software version ADM0900.ICL / ADM00009.ICP of the ICU, the behaviour of the ADM board and of the Integral 55 Compact-ADM port has changed. The CRL setting is only adopted for the ports of the board which uses the "QSIG" protocol. For all other protocolos the call reference length will always be CRL=1.
This makes it possible to configure QSIG ports with CRL=2 for networks with third-party systems, while on other ports with the protocols TN1R6, 1TR6, DKZN, VN3, NI2 and ETSI the $C R L=1$ is used.

| Other features |  |  |  |
| :--- | :--- | :--- | :--- |
| Countries of application | Application in all countries |  |  |
| Power demand +5 V | 6000 mA |  |  |
| Interfaces | Standard | 24 times | UPN |
|  |  |  |  |

| Other features |  |  |
| :---: | :---: | :---: |
|  | 4 times | a/b |
|  | 4 times | S0 |
| Optional (max. 2 | 4 times | UPN |
| submodules) | 4 times | a/b |
|  | 4 times | S0 |
| Overvoltage protection up to 4 kV |  |  |
| Download board software |  |  |
| Board identification using board passport |  |  |
| In case of logging adapter plug RJ45/D-Sub, material number: 49.9905.9171, has to be used. |  |  |
| In conjunction with ports of the ADM and DUPN protocol interfaces for boards on the PBX front side. |  |  |

### 15.5.11.1 Details

## ADM on MBO

| Slot address: | $03.01 .01-\mathrm{xx}$ |

Connections port DUPN on MB0 to contact strip 1 (port) and contact strip 2

### 15.5.11.2 Current setting

Changes on the MBO are to be executed carefully and using suitable tools because work on a fundamental component is performed.

The circuit of the analog/digital Mixboards ADM includes the ABSM, which realises four ports for analogue subscribers a/b, with a constant power supply of 24 mA . A current changeover to 30 mA is possible. It is implemented per port, connecting the soldering points shown under 1.

Section of the MBO, position of the ports for analogue subscribers

1. Per port $(\mathrm{AO})$ in case of current changeover to 30 mA , insert bridge.

Section of the MBO, soldering points for one port (AO)

| Other features |  |
| :--- | :--- |
| Line resistance | $2 \times 475$ Ohm |
| range: | 4 km installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,4 \mathrm{~mm}$ |
|  | 9 km installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,6 \mathrm{~mm}$ |
|  | 15 km installation cable $\mathrm{J}-\mathrm{Y}(\mathrm{ST}) \mathrm{Y} \varnothing 0,8 \mathrm{~mm}$ |

### 15.5.12 SBAO System Board Adapter Office

## Short description

The SBAO board (System Board Adapter Office) is a small backplane which provides two connecting circuit slots with most signals and tensions used in the I55. It is built in the BU.

### 15.5.13 VOIP Voice over IP Board

## Short description

For the VOIP board and all additional information for setup, dimensioning etc. you can find a detailed description under Notes concerning VoIP.

It is shown once again in the figure below.

VOIP board, component side

1. Speech compression / packetizing
2. Echo cancellation

The basic board VOIP (material number: 49.9903.7976) has 6 slots for SOM-2 submodules, with two DSP chips each(Digital Signal Processing Small Outline Module 2, material number: 49.9903.7980) in order to increase the number of DSP chips used in the system. These DSP chips have two functions:

- Voice compression, in order to pack voice information from the highway into data packets and thus to compress the speech data when desired (from G. $71164 \mathrm{kbit} / \mathrm{s}$ to G .729 A 8kbit/s)
- Echo cancellation for the voice connection from the IP terminal to the ISDN/analog terminals

The upper three slots (in the centre of the board) are used for voice compression and packetizing, while the lower three slots are used for echo cancellation.

Due to the very high cost of DSP chips, the number of SOM-2 submodules must be selected in accordance with the customer configuration (see calculation of the number of SOM-2 submodules).

In addition, 4 DSP chips are soldered on the VoIP board. These are responsible for central functions such as announcements, mixers, and tone input, and support a fixed number of channels for voice compression and echo cancellation.

The VOIP board connection to the peripherals is done via the AEV24B cable adapter.

| Other features |  | Integration of the CSI55 extensions into the existing IP-based data network <br> environment of the customer (LAN, WAN, Corporate Network) |
| :--- | :--- | :--- |
| Application | additionally per SOM-2: 240 mA |  |
| Power demand +5 V | 1800 mA |  |

### 15.5.13.1 Installation

## Base Unit

The VOIP board is always inserted into the upper slot (slot 01).

1. Slot for the VoIP board

In the Integral 55 Compact the slots are addressed in such a way that the neighbouring slots always remain free. Therefore, the VOIP board can occupy 64 channels if required.

## Details

| Slot address: | $01.01 .01-11$ to 01.01.01-62 |
| :--- | :--- |
|  | $01.01 .01-00-\mathrm{S}$ to 01.01.01-62-S |
|  | $02.01 .01-00$ to 02.01.01-62 |
|  | $02.01 .01-00-\mathrm{S}$ to 02.01.01-62-S |
| CBI address: | 06 hex. |

### 15.6 Power supply

In principle, the Integral 55 Compact can be connected to the mains voltage $\mathbf{2 3 0} \mathbf{V}, 50 \mathbf{~ H z}$ and $60 \mathbf{~ H z}$. The fuse protection for every electric circuit consists of a C Type 16 A slow acting automatic circuit breaker. It is a separate electric circuit (phase and fuse).

As power supply module the PSO is available. This device is designed for direct supply.

### 15.6.1 PSO Power Supply Office

## Short description

The PSO board (Power Supply Office) provides the required voltages for the Integral 55 Compact. Additionally, two module fans are connected to it.

It has the following features:

- Harmonics as per EN 61000 (PFC).
- Jamming immunity input 4 kV (1.2/50).
- Delayed disconnection of the -48 V output in the case of overload/short-circuit
- Delayed disconnection of device during overload/short-circuit of +5 V output.
- Board passport
- I2C-bus connection

## Technical data

| Voltages and Frequencies |  |
| :--- | :--- |
| Mains voltage | $230 \mathrm{~V} ; \pm 10 \%$ (single-phase alternating current) |
| Mains frequency | $47-63 \mathrm{~Hz}$ |
| Reduced voltage | $+5,1 \mathrm{~V},-5 \mathrm{~V},-48 \mathrm{~V}$ |
| AC ringing voltage | 72 V |
| Ringing voltage frequency | $47-63 \mathrm{~Hz}$ |
| Protection class | 1 (in accordance with VDE 0100) |
| Radio interference <br> suppression | Limit class B (in accordance with EN 55022 and VDE 878) |

| Device Input Side, power and currents |  |
| :--- | :--- |
| Pprim | 138 W |
| Iprim | 0.6 A |

| Device Output Side, power and currents |  |
| :--- | :--- |
| P | 102 W |
| +5.1 V | 10 A |
| -5 V | 0.2 A |
| -48 V | 1 A, included fan |
| 72 V | $0,04 \mathrm{~A}$ |

All outputs are short-circuit-proof.
In the embedded document on
PSO
you can find more information about the product.

### 15.6.1.1 Replacement

If necessary, the power supply module is replaced on site.
Proceed as follows:

1. Withdraw the power cable on the IEC power plug.
2. Remove the IEC power plug from the rear side of the housing (two screws).
3. Open the unit (refer to openingof housing).
4. Remove the cover plate from the PSO (1 screw).
5. Pull the connecting cable from the PSO (two blower- and 1 connecting cable).

6. Loosen fixing screws (five screws).
7. Loosen earthing screw (one screw marked with the earthing symbol).

8. Remove PSO and replace.
9. To reassemble, follow this procedure in reverse.

Ensure good contact between the housing floor and the PSO circuit board by means of the earthing screw, so that the requirements of EN 60950 have been fulfilled (earth conductor to housing </= 0.1 ohm).

Housing open $\rightarrow 602$

### 15.6.2 PE or FPE

The Integral 55 Compact can be connected with either a PE or an FPE.
PE
The Integral 55 Compact can be protected by fixed earthing conductor (PE) with lockable plug and cable:

- Length 3m, part no. 4,998,045,750
- Length 5m, part no. 4,998,069,828

By this alternative, connection of the Integral 55 Compact to the equipotential bonding strip via a separate copper wire is not necessary. The main application is likely to be in the form of table and upright units.

## FPE

If an FPE is available, this can be used. The main application in this case will be wall and cabinet mounting, althought this does not rule out the table and upright unit.

For connecting the Integral 55 Compact to the mains supply use the power cable with cut off PE:

- Length 3m, material number: 4.999.079.215
- Length 5 m , material number: 4.999.079.453

The Integral 55 Compact may only be connected with a variant (PE or FPE).
Loop formation!

### 15.6.2.1 Connection of the PE

Insert the earthing pin plug of the connecting cable into the Integral 55 Compact.
If you insert the earth plug into the receptacle and press the black lock, the plug will be locked.

1. Wall socket
2. Lock (black)
3. Earth plug, lockable with cable

Putting the system into operation.

## Unlocking and pulling the earth plug

Shut down the system.
Use a screwdriver to pull out the black lock approx. 10 mm .
The plug is unlocked and can be removed.

1. Wall socket
2. Lock (black)
3. Screwdriver

### 15.6.2.2 Connection of the FPE

Secure the earthing wire with a cable fastener onto the lug of the housing (1.).

Clamp the insulated end of the stripped copper wire (FPE=green/yellow, $>/=4 \mathrm{~mm} 2$ ) in the terminal (2.) at the back of the housing.

Check that the FPE on the equipotential bonding strip and PABX has been properly connected!

When you place the Integral 55 Compact into the cabinet, a $2,5 \mathrm{~mm}$ earth conductor2 with wire sleeves on both ends is available. The earth conductor is a delivered together with the cabinets.

### 15.7 View of module in the ISM

The module view shows a sample configuration with VoIP and DECT21 boards.

Modultyp : 01

### 15.8 Commissioning

Make sure that all cables have been secured.
Cover the free slots of the front AO boards with slot covers.
Insert the safety plug of the power supply cord into the earthing contact socket provided for the purpose.

1. Position of the control elements and LEDs

Switching on with ACBO module (= Advanced Computer Board Office)
The module is switched on and loads the programs in less than 15 minutes. It is ready for operation when

- the yellow LEDs L7 to L10 are off,
- the green LED L3 flashes and
- the green LED L2 is lit.

Switching on with HSCBO module (= High Speed Computer Board Office)
The module is switched on and loads the programs in less than 10 minutes. It is ready for operation when

- the yellow LEDs L7 to L10 are off and
- the green LED L2 is flashing.

### 15.9 Cable network

Join the cables from the connecting devices at the front side(s) of the Integral 55 Compact with the patch field or main distribution frame using the cable set.

### 15.9.1 Cross-connect cable

Two cable versions are available for connecting the AO ports on the front side(s) of the Integral 55 Compact with the main distribution frame and a Y adapter for the RBS port:

### 15.9.1.1 Cable with open end

Cable with solid copper wires, like installation cable $J-Y(S T) Y$, must be used for connecting the Integral 55 Compact to a conventional main distribution frame (e.g. plug-and-cut method).

## $8 x$ WE8/4 cable with open end

The cable with material number 4.999.020.564 conforms to requirements and fits all connecting devices. This also applies to an S2M interface when a DT21 is plugged into the BU instead of the DECT21.

Internal ring (2.)

Assignment of the WE plugs

## Cable WE8/8, with open end

The cable with material number 4.999.089.690 (length 10 m ) is used when

- a T0exchange line (ADM board with STSM) at a NTBA
or
- the ATA board with eight exchange lines is inserted in the BU
must be connected.

Cable WE8/8 (10m) with assignment, material number: 4.999.089.690

| W | 1 | WH (P4) |
| :--- | :--- | :--- |
| E 1 | 2 | BN (P4) |
|  | 3 | WH (P2) |
|  | 4 | RD (P1) |
|  | 5 | $\mathrm{BL}(\mathrm{P} 1)$ |
| 6 | $\mathrm{YE}(\mathrm{P} 2)$ |  |
| 7 | WH (P3) |  |
|  | 8 | $\mathrm{GN}(\mathrm{P} 3)$ |

e.g. P4 = pair 4

Assignment of the WE plug

## Connection of the RBS

For the DECT connections in the BU are required (see RBS connection $\rightarrow 680$ ). It splits the two connections. Alternately, in the BU it is also possible to use the WE8/8 cable with open end for wiring the DECT connections.

### 15.9.1.2 Patch Cable

The following connecting cables are used for the connection of the connecting circuits (RJ45 sockets on the front side(s) of the Integral 55 Compact) to an main distributor made up of patch panels:

| Patch cords | Length | Material number |
| :--- | :--- | :--- |
|  | 1 m | 4.998 .051 .621 |
|  | 3 m | 4.999 .045 .218 |
|  | 5 m | 4.999 .048 .490 |
|  |  |  |

|  | 10 m | 4.998 .055 .426 |
| :--- | :--- | :--- |

Y adapters are required for the DECT connections (see RBS connection $\rightarrow 680$ ). It splits the two connections.

## Exception!

When a T0 exchange line must be wired, the WE8/8 cable with open end (length 10 m ), material number 4.999.089.690 must be used and connected to the NTBA.

### 15.9.1.3 RBS connection

Note that at the DECT21 sockets, in case of direct connection of the cable, only 1 RBS can be operated per plug. If both RBS connections of one socket are to be used, between cable plug and connection socket, the Y-adapter $8 / 8$ to $2 \times 4 / 8$, material number: $4,999,028,515$ is to be used.

The adapter splits the two connections.
The pinning of the RJ45 sockets for the RBSs on the front side results in the pinning of the RJ45-Y-adapter $8 / 8$ to $2 x 4 / 8$.

### 15.9.2 Connections from the BU

The connections of the connecting circuits are located on the front side of the Integral 55 Compact

1. Contact strip 1
2. Contact strip 2
3. Contact strip 3

## RJ45 socket pin assignment

On the contact strip 1 are present:

- Protocol interface of the ADM board
- Protocol interface of the DUPN board
- Protocol interface of the VOIP board
- Ethernet connection of the VOIP board
- Connections for eight Radio Base Stations

1. RBS $0 / 1$
2. RBS $2 / 3$
3. RBS $4 / 5$
4. RBS 6/7
or
at 1st the S2Mconnection for the DT21 board
or
at 1st and 2nd eight analog exchange lines of the ATA board
or
at 1st S2Mconnection of the CAS board

- Connections for the last eight UPN subscribers

- Connections of DECT21 (RBS/S2M) or DT21

Connections of DECT21 (RBSO) or DT21
Wire DECT A1 leads to contact no.: 4
Wire DECT B1 leads to contact no.: 5
This corresponds to lines TX+ and TX- when a DT21 is used
wire DECT A2 leads to contact no.: 6
Wire DECT B2 leads to contact no.: 3
This corresponds to lines RX+ and RX- when a DT21 is used
Connections of DECT21 (RBS1)
Wire DECT A3 leads to contact no.: 7
Wire DECT B3 leads to contact no.: 8
Wire DECT A4 leads to contact no.: 1
Wire DECT B4 leads to contact no.: 2

On the contact strip 2 are present:

- Connections for the first 16 UPN subscribers

On the contact strip 3 are present:

- Connections for four analogue $a / b$ subscribers
- Connections for four S0 or T0 for subscribers or exchange lines
and optionally (depending on the equipment of the two slots of the ADM with submodules UPSM, ABSM or STSM)
- Connections for four UPN subscribers
- Connections for four analogue $a / b$ subscribers
or
- Connections for four S0 or T0 for subscribers or exchange lines
