Notice

Every effort was made to ensure that the information in this document was complete and accurate at the time of printing. However, information is subject to change.

Warranty

Avaya Inc. provides a limited warranty on this product. Refer to your sales agreement to establish the terms of the limited warranty. In addition, Avaya's standard warranty language as well as information regarding support for this product, while under warranty, is available through the following Web site: http://www.avaya.com/support.

Preventing Toll Fraud

"Toll fraud" is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or is not working on your company's behalf). Be aware that there may be a risk of toll fraud associated with your system and that, if toll fraud occurs, it can result in substantial additional charges for your telecommunications services.

Avaya Fraud Intervention

If you suspect that you are being victimized by toll fraud and you need technical assistance or support, in the United States and Canada, call the Technical Service Center's Toll Fraud Intervention Hotline at 1-800-643-2353.

How to Get Help

For additional support telephone numbers, go to the Avaya support Web site: http://www.avaya.com/support. If you are:

- Within the United States, click the *Escalation Management* link. Then click the appropriate link for the type of support you need.
- Outside the United States, click the *Escalation Management* link. Then click the *International Services* link that includes telephone numbers for the international Centers of Excellence.

Providing Telecommunications Security

Telecommunications security (of voice, data, and/or video communications) is the prevention of any type of intrusion to (that is, either unauthorized or malicious access to or use of) your company's telecommunications equipment by some party.

Your company's "telecommunications equipment" includes both this Avaya product and any other voice/data/video equipment that could be accessed via this Avaya product (that is, "networked equipment").

An "outside party" is anyone who is not a corporate employee, agent, subcontractor, or is not working on your company's behalf. Whereas, a "malicious party" is anyone (including someone who may be otherwise authorized) who accesses your telecommunications equipment with either malicious or mischievous intent.

Such intrusions may be either to/through synchronous (time-multiplexed and/or circuit-based) or asynchronous (character-, message-, or packet-based) equipment or interfaces for reasons of:

- Utilization (of capabilities special to the accessed equipment)
- Theft (such as, of intellectual property, financial assets, or toll facility access)
- Eavesdropping (privacy invasions to humans)
- Mischief (troubling, but apparently innocuous, tampering)
- Harm (such as harmful tampering, data loss or alteration, regardless of motive or intent)

Be aware that there may be a risk of unauthorized intrusions associated with your system and/or its networked equipment. Also realize that, if such an intrusion should occur, it could result in a variety of losses to your company (including but not limited to, human/data privacy, intellectual property, material assets, financial resources, labor costs, and/or legal costs).

Responsibility for Your Company's Telecommunications Security

The final responsibility for securing both this system and its networked equipment rests with you - Avaya's customer system administrator, your telecommunications peers, and your managers. Base the fulfillment of your responsibility on acquired knowledge and resources from a variety of sources including but not limited to:

- Installation documents
- System administration documents
- Security documents
- Hardware-/software-based security tools
- Shared information between you and your peers
- Telecommunications security experts

To prevent intrusions to your telecommunications equipment, you and your peers should carefully program and configure:

- Your Avaya-provided telecommunications systems and their interfaces
- Your Avaya-provided software applications, as well as their underlying hardware/software platforms and interfaces
- Any other equipment networked to your Avaya products

TCP/IP Facilities

Customers may experience differences in product performance, reliability and security depending upon network configurations/design and topologies, even when the product performs as warranted.

Standards Compliance

Avaya Inc. is not responsible for any radio or television interference caused by unauthorized modifications of this equipment or the substitution or attachment of connecting cables and equipment other than those specified by Avaya Inc. The correction of interference caused by such unauthorized modifications, substitution or attachment will be the responsibility of the user. Pursuant to Part 15 of the Federal Communications Commission (FCC) Rules, the user is cautioned that changes or modifications not expressly approved by Avaya Inc. could void the user's authority to operate this equipment.

Product Safety Standards

This product complies with and conforms to the following international Product Safety standards as applicable:

Safety of Information Technology Equipment, IEC 60950, 3rd Edition including all relevant national deviations as listed in Compliance with IEC for Electrical Equipment (IECEE) CB-96A.

Safety of Information Technology Equipment, CAN/CSA-C22.2 No. 60950-00 / UL 60950, 3rd Edition

Safety Requirements for Customer Equipment, ACA Technical Standard (TS) 001 - 1997

One or more of the following Mexican national standards, as applicable: NOM 001 SCFI 1993, NOM SCFI 016 1993, NOM 019 SCFI 1998

The equipment described in this document may contain Class 1 LASER Device(s). These devices comply with the following standards:

- EN 60825-1, Edition 1.1, 1998-01
- 21 CFR 1040.10 and CFR 1040.11.

The LASER devices operate within the following parameters:

- Maximum power output: -5 dBm to -8 dBm
- Center Wavelength: 1310 nm to 1360 nm

Luokan 1 Laserlaite

Klass 1 Laser Apparat

Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposures. Contact your Avaya representative for more laser product information.

Electromagnetic Compatibility (EMC) Standards

This product complies with and conforms to the following international EMC standards and all relevant national deviations:

Limits and Methods of Measurement of Radio Interference of Information Technology Equipment, CISPR 22:1997 and EN55022:1998.

Information Technology Equipment – Immunity Characteristics – Limits and Methods of Measurement, CISPR 24:1997 and EN55024:1998, including:

- Electrostatic Discharge (ESD) IEC 61000-4-2
- Radiated Immunity IEC 61000-4-3
- Electrical Fast Transient IEC 61000-4-4
- Lightning Effects IEC 61000-4-5
- Conducted Immunity IEC 61000-4-6
- Mains Frequency Magnetic Field IEC 61000-4-8
- Voltage Dips and Variations IEC 61000-4-11
- Powerline Harmonics IEC 61000-3-2
- Voltage Fluctuations and Flicker IEC 61000-3-3

Federal Communications Commission Statement

Part 15:

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Part 68: Answer-Supervision Signaling

Allowing this equipment to be operated in a manner that does not provide proper answer-supervision signaling is in violation of Part 68 rules. This equipment returns answer-supervision signals to the public switched network when:

- answered by the called station,
- answered by the attendant, or
- routed to a recorded announcement that can be administered by the customer premises equipment (CPE) user.

This equipment returns answer-supervision signals on all direct inward dialed (DID) calls forwarded back to the public switched telephone network. Permissible exceptions are:

- A call is unanswered.
- A busy tone is received.
- A reorder tone is received.

Avaya attests that this registered equipment is capable of providing users access to interstate providers of operator services through the use of access codes. Modification of this equipment by call aggregators to block access dialing codes is a violation of the Telephone Operator Consumers Act of 1990.

REN Number

For MCC1, SCC1, CMC1, G600, and G650 Media Gateways:

This equipment complies with Part 68 of the FCC rules. On either the rear or inside the front cover of this equipment is a label that contains, among other information, the FCC registration number, and ringer equivalence number (REN) for this equipment. If requested, this information must be provided to the telephone company.

For G350 and G700 Media Gateways:

This equipment complies with Part 68 of the FCC rules and the requirements adopted by the ACTA. On the rear of this equipment is a label that contains, among other information, a product identifier in the format US:AAAEQ##TXXXX. The digits represented by ## are the ringer equivalence number (REN) without a decimal point (for example, 03 is a REN of 0.3). If requested, this number must be provided to the telephone company.

For all media gateways:

The REN is used to determine the quantity of devices that may be connected to the telephone line. Excessive RENs on the telephone line may result in devices not ringing in response to an incoming call. In most, but not all areas, the sum of RENs should not exceed 5.0. To be certain of the number of devices that may be connected to a line, as determined by the total RENs, contact the local telephone company.

REN is not required for some types of analog or digital facilities.

Means of Connection

Connection of this equipment to the telephone network is shown in the following tables.

For MCC1, SCC1, CMC1, G600, and G650 Media Gateways:

Manufacturer's Port Identifier	FIC Code	SOC/REN/ A.S. Code	Network Jacks
Off premises station	OL13C	9.0F	RJ2GX, RJ21X, RJ11C
DID trunk	02RV2-T	0.0B	RJ2GX, RJ21X
CO trunk	02GS2	0.3A	RJ21X
	02LS2	0.3A	RJ21X
Tie trunk	TL31M	9.0F	RJ2GX
Basic Rate Interface	02IS5	6.0F, 6.0Y	RJ49C
1.544 digital interface	04DU9-BN	6.0F	RJ48C, RJ48M
	04DU9-IKN	6.0F	RJ48C, RJ48M
	04DU9-ISN	6.0F	RJ48C, RJ48M
120A4 channel service unit	04DU9-DN	6.0Y	RJ48C

For G350 and G700 Media Gateways:

Manufacturer's Port Identifier	FIC Code	SOC/REN/ A.S. Code	Network Jacks
Ground Start CO trunk	02GS2	1.0A	RJ11C
DID trunk	02RV2-T	AS.0	RJ11C
Loop Start CO trunk	02LS2	0.5A	RJ11C
1.544 digital interface	04DU9-BN	6.0Y	RJ48C
	04DU9-DN	6.0Y	RJ48C
	04DU9-IKN	6.0Y	RJ48C
	04DU9-ISN	6.0Y	RJ48C
Basic Rate Interface	02IS5	6.0F	RJ49C

For all media gateways:

If the terminal equipment (for example, the media server or media gateway) causes harm to the telephone network, the telephone company will notify you in advance that temporary discontinuance of service may be required. But if advance notice is not practical, the telephone company will notify the customer as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe it is necessary.

The telephone company may make changes in its facilities, equipment, operations or procedures that could affect the operation of the equipment. If this happens, the telephone company will provide advance notice in order for you to make necessary modifications to maintain uninterrupted service.

If trouble is experienced with this equipment, for repair or warranty information, please contact the Technical Service Center at 1-800-242- 2121 or contact your local Avaya representative. If the equipment is causing harm to the telephone network, the telephone company may request that you disconnect the equipment until the problem is resolved.

A plug and jack used to connect this equipment to the premises wiring and telephone network must comply with the applicable FCC Part 68 rules and requirements adopted by the ACTA. A compliant telephone cord and modular plug is provided with this product. It is designed to be connected to a compatible modular jack that is also compliant. It is recommended that repairs be performed by Avaya certified technicians.

The equipment cannot be used on public coin phone service provided by the telephone company. Connection to party line service is subject to state tariffs. Contact the state public utility commission, public service commission or corporation commission for information.

This equipment, if it uses a telephone receiver, is hearing aid compatible.

Canadian Department of Communications (DOC) Interference Information

This Class A digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

This equipment meets the applicable Industry Canada Terminal Equipment Technical Specifications. This is confirmed by the registration number. The abbreviation, IC, before the registration number signifies that registration was performed based on a Declaration of Conformity indicating that Industry Canada technical specifications were met. It does not imply that Industry Canada approved the equipment.

Declarations of Conformity

United States FCC Part 68 Supplier's Declaration of Conformity (SDoC)

Avaya Inc. in the United States of America hereby certifies that the equipment described in this document and bearing a TIA TSB-168 label identification number complies with the FCC's Rules and Regulations 47 CFR Part 68, and the Administrative Council on Terminal Attachments (ACTA) adopted technical criteria.

Avaya further asserts that Avaya handset-equipped terminal equipment described in this document complies with Paragraph 68.316 of the FCC Rules and Regulations defining Hearing Aid Compatibility and is deemed compatible with hearing aids.

Copies of SDoCs signed by the Responsible Party in the U. S. can be obtained by contacting your local sales representative and are available on the following Web site: http://www.avaya.com/support.

All Avaya media servers and media gateways are compliant with FCC Part 68, but many have been registered with the FCC before the SDoC process was available. A list of all Avaya registered products may be found at: http://www.part68.org by conducting a search using "Avaya" as manufacturer.

European Union Declarations of Conformity

CE

Avaya Inc. declares that the equipment specified in this document bearing the "CE" (*Conformité Europeénne*) mark conforms to the European Union Radio and Telecommunications Terminal Equipment Directive (1999/5/EC), including the Electromagnetic Compatibility Directive (89/336/EEC) and Low Voltage Directive (73/23/EEC). This equipment has been certified to meet CTR3 Basic Rate Interface (BRI) and CTR4 Primary Rate Interface (PRI) and subsets thereof in CTR12 and CTR13, as applicable.

Copies of these Declarations of Conformity (DoCs) can be obtained by contacting your local sales representative and are available on the following Web site: http://www.avaya.com/support.

Japan

This is a Class A product based on the standard of the Voluntary Control Council for Interference by Information Technology Equipment (VCCI). If this equipment is used in a domestic environment, radio disturbance may occur, in which case, the user may be required to take corrective actions.

この装置は、情報処理装置等電波障害自主規制協議会（ＶＣＣＩ）の基準に基づくクラスＡ情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

1 About this book

Overview

This document provides procedures to monitor, test, and maintain an Avaya Media Server or Gateway system. It covers many of the faults and troubles that can occur and provides simple procedures to correct them. Simple, traditional troubleshooting methods are sometimes sufficient to locate and clear faults. The traditional methods include substitution, visual inspections, continuity checks, and clarification of operating procedures with end users.

Using this documentation, the Avaya technicians and the technicians of their business partners and customers should be able to follow detailed procedures for:

- Monitoring, testing, and maintaining an Avaya Media Server, Media Gateway, and many other system components.
- Using troubleshooting methods to clear faults.
- Required replacements, visual inspections, continuity checks, and clarifying operating procedures with end users.

Structure of book

The following document contains combined Maintenance Alarms information for:

- S8100, S8300, S8500, and S8700 media servers
- MCC1, SCC1, and CMC1 media gateways
- G600, G650, and G700 media gateways

The document includes new information developed for Communication Manager Release 2.0, and preexisting or modified information brought together from Release 1.3 maintenance documentation.

This document is the first of three reference documents:

- Maintenance Alarms Reference (555-245-102)
- Maintenance Commands Reference (555-245-101)
- Maintenance Procedures (555-245-103)

The basis for these reference documents was the Release 1.3 S8700 media server with the MCC1 and SCC1 media gateways maintenance document. To this document were added Release 1.3 maintenance information for the S8300 and S8100 media servers, the G700, G600 and CMC1 media gateways, as well as new material developed for the S8500 media server and G650 media gateway.

In order to present maintenance information from all these sources side-by-side, when it was not clear from a chapter or section title, marking conventions were adopted to delineate material specific to a particular source. The markers act on three levels:

- Chapters or Maintenance Objects (MOs)
- Major and minor sections
- Paragraphs or in-line comments

Chapters or Maintenance Objects (MOs)

At the Chapter or MO level, bold names of the server(s) or gateway(s) that are represented within the sections to follow are inserted immediately after the Chapter title or MO title. For example, the heading for the SER-BUS (Serial communication bus) MO looks like:

SER-BUS (Serial communication bus)

G650

The **G650** after the title indicates that the material in this MO relates to the G650 media gateway.

Major and minor sections

At the Major and minor sections level, a similar bold name along with a ruled line delineates the beginning of a section of material specific to the media server or gateway identified. At the conclusion of the section, another ruled line marks the end of the specific material and a return to common text. For example, a section of material specific to the S8100 media server looks like:

S8100 only

For the Processor Port Network (PPN)

1. Terminate the TDM Bus so that it extends within the control carrier.
2. Run the **test tdm** system technician command. If any of the TDM Bus tests fail, perform Procedure 2 and/or Procedure 3 for only the circuit packs in those carriers connected to the *shortened* TDM Bus. Procedure 2 is performed for port circuit packs (purple slots) and Procedure 3 for control carrier circuit packs.
3. If none of the TDM Bus tests fail, extend the TDM Bus to another carrier and repeat this procedure. When a carrier is added that causes some of the TDM Bus tests to fail, perform Procedure 2 and/or Procedure 3 for only the circuit packs in that carrier.

Such sections can occasionally extend for several pages.

Paragraphs or in-line comments

At the paragraph level and for comments in-line, the specific media server or gateway is indicated by its bold name, and the parenthetical information follows immediately afterward. For example, a paragraph insert for the S8700 and S8500 media servers might looks like:

1. If the Tone-Clock circuit is a slave clock, then the EI to which it is listening is providing a bad timing source. Follow the diagnostic procedures specified for TDM-CLK Error Code 2305.
2. **S8700** / **S8500**: If no problem can be found with the incoming synchronization signal, replace the IPSI or Tone-Clock circuit pack. See Replacing the IPSI or Tone-Clock Circuit Pack on page 1911.

In such cases, it is not necessary to delineate the beginning and end of the material.

An example of an in-line comment might look like:

Error Type 1282 — Indicates that the TN2182 tone-clock (**S8100**: TN2314 Processor/Tone Clock) was synchronized to a DS1 facility and that the reference frequency provided by the DS1 drifted beyond a range that could be tracked by the TN2182 (**S8100**: TN2314).

It is hoped that, by these techniques, material specific to several different sources can be combined and viewed side-by-side without confusion.

Audience

The information in this book is intended for use by:

Avaya technicians, provisioning specialists, business partners, and customers, specifically:

- Trained Avaya technicians
- A maintenance technician dispatched to a customer site in response to a trouble alarm or a user trouble report
- A maintenance technician located at a remote maintenance facility
- The customer's assigned maintenance technician

  The technician is expected to have a knowledge of telecommunications fundamentals and of the particular Avaya Media Server and/or Media Gateway to the extent that the procedures in this book can be performed, in most cases, without assistance.

This book is not intended to solve all levels of troubles. It is limited to troubles that can be solved using:

- The Alarm Log
- The Error Log
- Trouble-clearing procedures
- Maintenance tests
- Traditional troubleshooting methods

If the trouble still has not been resolved, it is the maintenance technician's responsibility to escalate the problem to a higher level of technical support. Escalation should conform to the procedures in the Technical and Administration Escalation Plan.

Downloading this book and updates from the Web

You can download the latest version of this book f*rom the Avaya Web site.* You must have access to the Internet, and a copy of Acrobat Reader must be installed on your personal computer.

Avaya makes every effort to ensure that the information in this book is complete and accurate. However, information can change after we publish this book. Therefore, the Avaya Web site might also contain new product information and updates to the information in this book. You can also download these updates from the Avaya Web site.

Downloading this book

To download the latest version of this book:

1. Access the Avaya web site at http://support.avaya.com.
2. At the top center of the page, click **Product Documentation**.

   The system displays the Welcome to Product Documentation page.
3. In the upper-left corner type the 9-digit book number in the Search Support field**,** and then click **Go**.

   The system displays the Product Documentation Search Results page.
4. Scroll down to find the latest issue number, and then click the book title that is to the right of the latest issue number.
5. On the next page, scroll down and click one of the following options:
   - **PDF Format** to download the book in regular PDF format
   - **ZIP Format** to download the book in zipped PDF format

Safety labels and security alert labels

Observe all caution, warning, and danger statements to help prevent loss of service, equipment damage, personal injury, and security problems. This book uses the following safety labels and security alert labels:

CAUTION:
A caution statement calls attention to a situation that can result in harm to software, loss of data, or an interruption in service.

WARNING:
A warning statement calls attention to a situation that can result in harm to hardware or equipment.

DANGER:
A danger statement calls attention to a situation that can result in harm to personnel.

SECURITY ALERT:
A security alert calls attention to a situation that can increase the potential for unauthorized use of a telecommunications system.

Safety precautions

When performing maintenance or translation procedures on the system, users must observe certain precautions. Observe all caution, warning, and danger admonishments to prevent loss of service, possible equipment damage, and possible personal injury. In addition, the following precautions regarding electromagnetic interference (EMI) and static electricity must be observed:

Electromagnetic interference

This equipment generates, uses, and can radiate radio frequency energy. Electromagnetic fields radiating from the switch may cause noise in the customer's equipment. If the equipment is not installed and used in accordance with the instruction book, radio interference may result.

WARNING:
To maintain the EMI integrity of the system, maintenance personnel must ensure that all cabinet panels, covers, and so forth, are firmly secured before leaving the customer's premises.

How to use this Document

Most maintenance sessions involve analyzing the Alarm and Error Logs to diagnose a trouble source and replacing a component such as a circuit pack or media module. The information in Chapter 5, "Communication Manager Maintenance-Object Repair Procedures" of this reference will generally suffice to address these needs. Certain complex elements of the system require a more comprehensive approach. Special procedures for these elements appear in Chapter 6, "Troubleshooting" of *Maintenance Procedures (555-245-103)*.

NOTE:
This document is designed to be read online and in paper format. Because of the large volume of information, additional cross-references have been added to make it easier to locate information when using the manual online.

Organization

Chapter 2, "LEDs", contains information on the definition and interpretation of LED indicators to be found on various system components, including servers, gateways, circuit packs, and media modules.

Chapter 3, "Server Alarms", contains information on alarms generated on various platforms, including the S8300, S8500, and S8700 media server. These alarms cover such categories as process watchdog , environmental, login, translation monitoring, and power supply alarms. Alarm identifications, levels, and resolutions are given.

Chapter 4, "G700 Media Gateway Traps", contains information on traps that can occur on media gateways. Trap identifications, alarm levels, trap descriptions, and recommended resolutions are given.

Chapter 5, "Communication Manager Maintenance-Object Repair Procedures", contains specific troubleshooting and repair instructions for every component in the system. The maintenance objects are listed alphabetically by name as they appear in the Alarm and Error Logs. Under each maintenance object appears a description of the object's function, tables for interpreting alarm and error logs, and instructions on how to use tests, commands, and replacements to resolve associated problems.

Conventions used in this document

Table 2, Typography used in this book, on page 23 lists the typographic conventions in this document.

Table 2: Typography used in this book

To represent . . .	This typeface and syntax are shown as . . .	For example, . . .
SAT commands	• Bold for **literals** • Bold italic for ***variables*** • Square brackets **[ ]** around optional parameters • "|" between exclusive choices	**refresh ip-route [all** | *location***]**
SAT screen input and output	• Bold for **input** • Constant width for `output (screen displays and messages)`	Set the `Save Translation` field to **daily**. The message `Command successfully completed` should appear.
Linux commands	• Constant-width bold for **`literals`** • Constant-width bold italics for ***`variables`*** • Square brackets **`[]`** around optional arguments • "Or" sign **`|`** between exclusive choices	**`testmodem [-s] | [-t arg]`**
Linux output	`Constant width`	Linux returns the message `almdisplay 4: Unable to connect to MultiVantage`.

Table 2: Typography used in this book

To represent . . .	This typeface and syntax are shown as . . .	For example, . . .
Web interface	• Bold for **menu selections, tabs, buttons,** and **field names** • Right arrow > to separate a sequence of menu selections	Select **Alarms and Notification,** the appropriate alarm, and then click **Clear**. Select **Diagnostics** > **View System Logs**, then click **Watchdog Logs**.
Keys	Special font for keyboard keys and SAT screen clickable buttons	Press Tab. Click Next Page.
		2 of 2

Other conventions used in this book:

- Physical dimensions are in English [Foot Pound Second (FPS)] units, followed by metric [Centimeter Gram Second) (CGS)] units in parentheses.

  Wire-gauge measurements are in AWG, followed by the diameter in millimeters in parentheses.
- Circuit-pack codes (such as TN790 or TN2182B) are shown with the minimum acceptable alphabetic suffix (like the “B” in the code TN2182B).

  Generally, an alphabetic suffix higher than that shown is also acceptable. However, not every vintage of either the minimum suffix or a higher suffix code is necessarily acceptable.

Useful terms

Table 3, Terminology summary, on page 24 summarizes some of the terms used in this book and relates them to former terminology.

Table 3: Terminology summary

Present Terminology	Former Terminology
Communication Manager	MultiVantage Avaya Call Processing
S8300 Media Server	ICC, Internal Call Controller
S8700 Media Server (or non-co-resident S8300)	ECC, External Call Controller
MGP, Media Gateway Processor	860T Processor
Layer 2 Switching Processor	P330 Stack Processor Cajun Stack Processor i960 Processor

2 LEDs

This chapter describes the meanings of the LEDs on system components and the alarm levels they indicate. The chapter includes the following topics:

- Alarm levels on page 25
- Terminal alarm notification on page 26
- Attendant console LEDs on page 26
- Circuit pack LEDs on page 27
- Expansion Interface circuit pack LEDs on page 28
- Maintenance circuit pack LEDs on page 29
- DS1C (TN574/TN1654) circuit pack LEDs on page 30
- Switch Node Interface LEDs on page 34
- Tone-Clock circuit pack LEDs on page 34
- S8700 Media Server LEDs on page 41
- IPSI LEDs on page 37
- Duplication memory card LEDs on page 41

Alarm levels

If a maintenance object in the system begins to fail some of the periodic tests, the system automatically generates an alarm that indicates the system needs to be restored to a normal condition. The system identifies three levels of alarms:

- **Major alarms** — Failures that cause critical degradation of service and require immediate attention.
- **Minor alarms** — Failures that cause some degradation of service, but do not render a crucial portion of the system inoperable. This condition requires action, but its consequences are not immediate. Problems might be impairing service to a few trunks or stations or interfering with one feature across the entire system.
- **Warning alarms** — Failures that cause no significant degradation of service or failures in equipment external to the system.

Alarms are communicated to the system users and technicians by entries in the alarm log and the lighting of LEDs located on the attendant console, on all circuit packs, on the server, on the Cajun Ethernet switch if there is one, and, optionally, on customer-designated voice terminals. Warning alarms are not reported to the attendant console.

Terminal alarm notification

Terminal alarm notification is an optional feature which displays several types of alarms on voice terminals with administered feature buttons or the attendant console. A maximum of 10 digital and/or hybrid voice terminals may be used.

When an alarm occurs, the green status LED associated with the assigned button will be in a steady state. The LED may be turned off by pressing the button associated with the lighted alarm LED. If the LED is turned off and the alarm has not been resolved by the time maintenance reschedules testing, the green status LED will resume its steady state.

The following alarms are displayed:

ac-alarm	Administered Connection alarm: A locally administered connection (ADM-CONN) has a major, minor, or warning alarm active.
pr-awu-alm	Auto Wakeup Journal Printer alarm: The automatic wakeup journal printer has a major, minor, or warning alarm active.
off-bd-alarm	DS1 or ATM Facility alarm: An off-board major, minor, or warning alarm is active on a DS1-BD, UDS1-BD, or ATM-TRK board.
trk-ac-alm	Facility Access alarm: The facility access trunk test feature is activated.
major-alrm	Major alarm: The system has logged a major alarm.
mj/mn-alrm	Major/Minor alarm: The system has logged a major or minor alarm.
pr-pms-alm	The Property Management System (PMS) printer has a major, minor, or warning alarm active.
rs-alert	Reset-Alert: **reset system 2** or **3** has been performed.
cdr1-alrm	Call Detail Recording alarm: The primary CDR link has a major, minor, or warning alarm active.
cdr2-alrm	Call Detail Recording alarm: The secondary link has a major, minor, or warning alarm active.
pr-sys-alm	System Printer alarm: The System Printer (SYS-PRNT) has a major, minor, or warning alarm active.
pms-alarm	The Property Management System has a major, minor or warning alarm active.

Attendant console LEDs

The console has two red LEDs, labeled “ALM” and “ACK.” The ALM LED lights steadily when there is a major or minor alarm at the switch cabinet. The ACK LED lights steadily if the alarm has been successfully reported. If the system is unable to report the alarm, the LED flashes; this signals the attendant to call the Avaya alarm receiving system and report the alarm.

Circuit pack LEDs

Typically each circuit pack has three LEDs on the front panel visible at the front of the carrier. There are some exceptions to this (for example, DS1CONV or IPSI circuit pack) that are covered later in this section. On most circuit packs, the LEDs indicate the following when lit (Table 4, LED indicators, on page 27). Exceptions to these indications are explained in subsequent sections.

Table 4: LED indicators

LED Color	State	Interpretation
Red	Alarm	The system has detected a fault in this circuit pack. The alarm log should contain an on-board alarm for this circuit pack or one of the maintenance objects associated with it. The red LED is also lit briefly when a circuit pack is inserted or reset. If the circuit pack passes its initialization tests, the LED is extinguished. If a fault is detected, it remains lit.
Green	Testing	The system is currently running tests on this circuit pack as part of background maintenance or demand testing. This LED is also lit briefly during initialization tests when a circuit pack is inserted or reset.
Yellow	Busy	The circuit pack is currently in use by the system.

This section includes LED interpretation on the following circuit packs:

- LED alarms without Alarm Log entry or with Error Type 1 on page 27
- Expansion Interface circuit pack LEDs on page 28
- Maintenance circuit pack LEDs on page 29
- DS1C (TN574/TN1654) circuit pack LEDs on page 30
- Switch Node Interface LEDs on page 34
- Tone-Clock circuit pack LEDs on page 34
- IPSI LEDs on page 37

LED alarms without Alarm Log entry or with Error Type 1

Whenever the system or a part of the system is reset, every affected circuit pack will briefly light their red and green LEDs as they are initialized. Upon power up of a newly installed system, several alarm indicators may remain lit until the circuit packs are administered. These alarms should be ignored until administration is completed.

Boards with a “P” suffix have downloadable firmware. If such a board has both its green and yellow LEDs lit simultaneously, a download may be in progress and the board will not appear to be recognized. Use either the SAT command **status firmware download** or **status firmware download last** to verify this condition.

After a circuit pack has been initialized, a red LED should be accompanied by an alarm in the alarm log. A single fault can sometimes light alarm LEDs on several circuit packs, as in the following examples.

- A TDM bus problem may cause several port circuit packs to display red LEDs.
- A Maintenance circuit pack can prevent an Expansion Interface (EI) circuit pack from initializing.
- Extensive interactions in the Center Stage Switch (CSS) can cause multiple alarms from single faults in DS1C, SNI and SNC circuit packs and fiber links.
- Tone-Clock problems may cause other circuit packs to report alarms.
- Misconnected optical fiber cables may cause several circuit packs to alarm.
- Packet-bus faults can cause several port circuit packs to display red LEDs.

If a circuit pack has had at least five minutes to be initialized, and the red LED is lit without an associated alarm in the alarm log, the circuit pack may not be in communication with the system. This may also be the case when a circuit pack is properly administered and present in its slot, but there is an error type 1 logged against it. To determine whether this is so, proceed as follows:

1. Issue the **list configuration board *UUCSS*** command. If the system does not detect the circuit pack, this command will return:

   `identifier not assigned` or `no board`.

   If the documentation for the associated maintenance object gives no special instructions for this situation, go to the next step.

2. Check the hardware error log for TONE-BD or TDM-BUS errors. If the board has a “P” suffix execute the **reset board *UUCSS*** command, otherwise execute the **test tdm** and **test tone-clock** commands and use the appropriate maintenance procedures to resolve any identified faults. If this does not resolve the problem, go to the next step.

3. Reseat the suspect circuit pack.

   CAUTION:
   This procedure can cause a partial or total service outage. Consult thoroughly the documentation for the associated maintenance object before proceeding. Observe the precautions and procedures described above.

4. Inspect the backplane connectors for bent pins.

5. If the system seems to be functioning correctly, but the circuit pack in question will not communicate with the system, replace the circuit pack.

Expansion Interface circuit pack LEDs

The Expansion Interface (EI) TN570 circuit pack has the standard red, green and yellow LEDs. The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress.

The yellow LED displays various flashing patterns to provide status information useful in isolating faults in the fiber link and other components connected to the fiber link. Table 5, Expansion Interface yellow LED flashing codes, on page 29 illustrates the EI yellow LED states.

Table 5: Expansion Interface yellow LED flashing codes

LED on	LED off	Condition
0.1 sec	0.1 sec	Fiber Out-of-Frame. This state indicates a failure of test #989. This may be caused by absence of the opposite end EI or Switch Node Interface (SNI), a broken or missing fiber, or a missing lightwave transceiver on either endpoint.
0.5 sec	0.5 sec	In Frame — No Neighbor. This state corresponds to a failure of test # 237, usually due to a failure of this EI or of the EI or SNI at the other end of the fiber.
2 sec	0.2 sec	EI Active. This is the normal state of an active EI that is an archangel of an EPN.
solid on		EI Active. This is the normal state for an active EI that is not an EPN archangel. These include EPN EIs connected to other EPN EIs in direct connect configurations, and EIs located in the processor port network.
	solid off	EI Standby. This is the normal state for a standby EI in systems with a duplication option.

Maintenance circuit pack LEDs

TN775D PN maintenance circuit packs have seven LEDs on their front panels. The top three LEDs are the standard group of red, green and yellow, and indicate the status of the circuit pack. The green LED on TN775Ds blinks faintly once per second, indicating continual self-testing.

The second group of three LEDs, labeled “ALARMS”, reflects maintenance conditions throughout the system and indicates alarms reported against other components, as shown in Table 6, Maintenance circuit pack LED interpretation, on page 29.

Table 6: Maintenance circuit pack LED interpretation

LED color	State	Level/ Function	Interpretation
Red	flashing	MAJOR	Major alarm against a component in the same cabinet.
	solid	MAJOR	Major alarm against a component in another cabinet.
	solid	MINOR	Minor alarm against a component in another cabinet.
	flashing	MINOR	Minor alarm against a component in the same cabinet.

Table 6: Maintenance circuit pack LED interpretation

Yellow	flashing	WARNING	Warning alarm against a component in the same cabinet.
	solid	WARNING	Warning alarm against a component in another cabinet.
Green	on	ACK	Acknowledged; alarm has been reported.
Red	on	EMERGENCY TRANSFER	Emergency transfer has been invoked. This occurs upon power-up as well as during disabling failures.

These LEDS are illustrated Figure 1, TN775 circuit pack LEDs on faceplate, on page 30.

Figure 1: TN775 circuit pack LEDs on faceplate

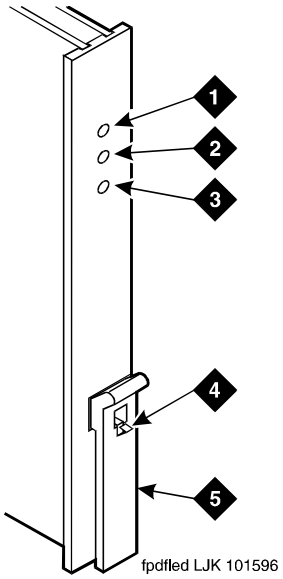

Figure notes

1	Alarm LED (Red)	**4**	Latch pin
2	Test LED (Green)	**5**	Locking lever
3	Busy LED (Yellow)		

DS1C (TN574/TN1654) circuit pack LEDs

The TN574 and the TN1654 LEDs provide an indication of the state of the DS1 converter and facilities.

NOTE:
DS1 converters are used exclusively with a CSS.

TN574 circuit pack LEDs

Seven LEDs provide an indication of the state of the DS1 converter (DS1C-BD) TN574 circuit pack and the DS1 facilities. The top group has the standard red, green and yellow LEDs. The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress. The four green LEDs on the bottom indicate the status of the DS1 facilities (see following section).

The yellow LED is used to indicate the state of the fiber interface, the fiber channel, and the DS1 channel as listed in Table 7, DS1C yellow LED flashing states, on page 31 in order of priority.

Table 7: DS1C yellow LED flashing states

LED on	LED off	Condition
0.1 sec	0.1 sec	Fiber Out-of-Frame or Fiber Loss of Signal
0.5 sec	0.5 sec	In Frame, fiber channel down. The fiber channel communicating between the DS1C and the other fiber endpoint (EI or SNI) is down.
1 sec	1 sec	In Frame, DS1 channel down. The channel between the two DS1Cs in the DS1C complex is down.
solid on		DS1C active. This is the normal state for an active DS1C.
	solid off	DS1C standby. This is the normal state for a standby DS1C in critical-reliability systems (duplicated PNC).

DS1 Facility LEDs

Below the three standard LEDs on the DS1C circuit pack are four green LEDs that indicate whether a receive signal is present for each of the four DS1 facilities. Figure 2, TN574 DS1 Converter circuit pack LEDs, on page 32 shows which facility (A, B, C, or D) corresponds to each LED. If a green LED is off, there is a Loss of Signal condition on the DS1 facility associated with that LED. The presence of a signal does not guarantee that the signal is using the correct framing format or line coding; an Alarm Indication Signal indicating that the opposite end of the DS1C complex is out of service may be present.

Figure 2: TN574 DS1 Converter circuit pack LEDs

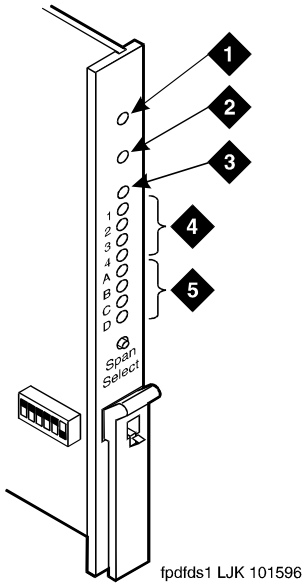

Figure notes

1	Alarm LED (Red)	**4**	STATUS LEDs
2	Test LED (Green)	**5**	SPAN LEDs
3	Busy LED (Yellow)		

TN1654 circuit pack LEDs

The TN1654 DS1C-BD board has 11 LEDs on its faceplate. The top three system standard LEDs indicate the state of the DS1C-BD board. These LEDs are under firmware control until the board has established a link to the S8700 Media Server via the EI or SNI. Once the link is established, software controls the three LEDs. If the link breaks, the LEDs are again under firmware control.

The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress. The red and green LEDs are also turned on during circuit pack initialization by firmware. When the control link to the circuit pack is lost, firmware controls the red LED to indicate an alarm condition.

The yellow LED under firmware control is used to indicate the state of the physical fiber interface, the Fiber Channel (link to EI or SNI), the DS1 Control Channel (link to opposite DS1CONV board), and the S8700 Media Server communications link in the following manner and order of priority. (The yellow LED remains on for longer periods of time as the DS1CONV complex becomes closer to being fully operational.)

1 If the fiber is Out of Frame or if a Fiber Loss of Signal condition exists, the yellow LED will flicker at a 5 Hz rate (on for 100 mS, off for 100 mS).

2 If the fiber channel is down (DS1 Converter circuit pack/fiber endpoint communications), the yellow LED will flash at a 1 Hz rate (on for 500 ms, off for 500 ms).

3 If the DS1 control channel is down between the two DS1CONVs in the DS1CONV complex, the yellow LED will pulse at a 0.5 Hz rate (on for 1 second, off for 1 second).

4 If the S8700 Media Server communications link is down, the yellow LED will wink off every 2 seconds for 200ms (2 sec on, 200 msec off).

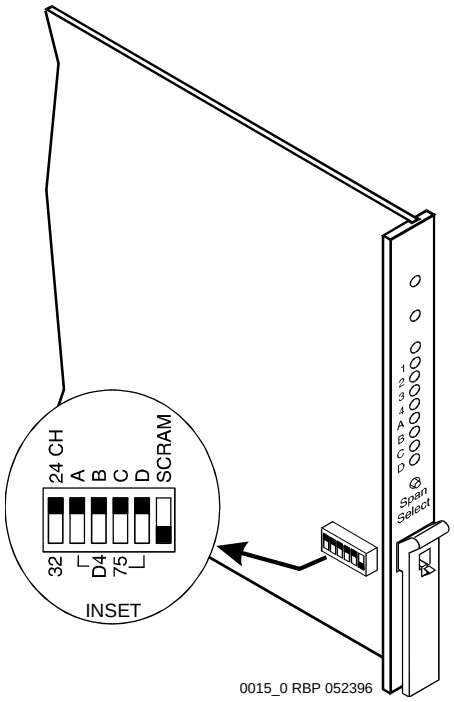
5 If all is well with the fiber interface and every communications channel, the yellow LED will remain on continuously in a standard- or high-reliability system configuration. In critical-reliability systems (duplicated PNC), an active DS1CONV circuit pack will have its yellow LED on continuously, and a standby DS1CONV circuit pack will have its yellow LED off. The LED will then be under software control.

The bottom four green LEDs on the TN574 DS1CONV board are under hardware control. The four green LEDs indicate, for each DS1CONV facility, whether a receive signal is present for the DS1 facility

The next four LEDs on the TN1654 DS1CONV board are labeled STATUS LEDs and are for future use. These LEDs will not be lit.

The bottom four LEDs on the TN1654 board are labeled SPAN LEDs. These LEDs are under firmware control. If the facility is not administered, then the LED is not lit. The LED is lit amber if the facility is running alarm free. If the facility is detecting either a red alarm (loss-of-signal or loss-of-frame), a yellow alarm (remote frame alarm) or a blue alarm (AIS signal) then the LED is lit red. The SPAN SELECT switch on the TN1654 faceplate is for future use. Pushing the switch will have no effect on the board. See Figure 3, TN1654 DS1CONV circuit pack, on page 33 for a view of the faceplate on the TN1654 DS1CONV circuit pack.

Figure 3: TN1654 DS1CONV circuit pack



Switch Node Interface LEDs

The Switch Node Interface (SNI) TN573 circuit pack has the standard red, green, and yellow LEDs. The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress.

The yellow LED displays various flashing patterns to provide status information useful in isolating faults in the fiber link and other components connected to the fiber link. Table 8, Switch Node Interface (SNI) yellow LED flashing states, on page 34 illustrates the SNI yellow LED states.

Table 8: Switch Node Interface (SNI) yellow LED flashing states

LED on	LED off	Condition
0.1 sec	0.1 sec	Fiber Out-of-Frame. This state indicates a failure of test #238, which may be caused by absence of the opposite end EI or Switch Node Interface, a broken or missing fiber, or a missing lightwave transceiver on either endpoint.
0.5 sec	0.5 sec	In Frame — No Neighbor. This state corresponds to a failure of test # 237, usually due to a failure of this SNI, or the EI or SNI at the opposite of the fiber. This condition may also be due to a faulty Switch Node Clock (SNC).
solid on		SNI Active. This is the normal state for an active SNI.
	solid off	SNI Standby. This is the normal state for a standby SNI in systems with a duplication option.

Tone-Clock circuit pack LEDs

The Tone-Clock circuit packs found in non-IPSI-connected port networks have the standard red, green and yellow LEDs. The red LED has the traditional meaning. The yellow and green LEDs flash in specific patterns to indicate the status of the circuit pack. The standby status applies only to systems with a duplication option.

Maintenance/Test circuit pack LEDs

The TN771D maintenance/test circuit pack has the standard red, green, and yellow LEDs. The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress.

The yellow LED can be off or on continuously or flashing, depending on the mode of operation of the TN771D and whether or not it has detected errors. The yellow LED is on steady when the TN771D's analog test port or digital test ports are being used to test trunks or line circuits. The yellow LED is also used to indicate packet-bus status. Table 9, TN771D Maintenance/Test Yellow LED States, on page 35 illustrates the maintenance/test yellow LED states as they apply to packet-bus activity.

Table 9: TN771D Maintenance/Test Yellow LED States

LED State[1]	TN771D Mode	Condition
Solid off	Normal	The Maintenance/Test circuit pack detects no packet-bus faults.
Solid on[2]	Normal	The Maintenance/Test packet-bus port has successfully reconfigured the packet bus around a fault.
Flashing (1 Hz)	Normal	The Maintenance/Test packet-bus port is unable to reconfigure the packet bus around a fault.
Solid off	Standalone[3]	The Maintenance/Test detects no packet-bus faults.
Solid on	Standalone	This condition cannot normally occur. The LED is always either off or blinking in standalone mode.
Flashing (1 Hz)	Standalone	The Maintenance/Test packet-bus port detects a packet-bus fault.

1 It takes 5 to 10 seconds for the yellow LED to respond to a change in the state of the packet bus.

2 Because the yellow LED on the Maintenance/Test circuit pack can also be on steady when the digital and analog test ports on the circuit pack are in use, exact interpretation of the yellow LED may require that the technician busy out the analog and digital test ports or examine the error and alarm logs for PKT-BUS errors and alarms.

3 "Standalone" refers to the TN771D's capability to operate autonomously as a troubleshooting aid.

A detailed description of the TN771D standalone mode is provided in the Standalone mode on page 253 section of Chapter 7, "Packet and serial bus maintenance".

Avaya Ethernet Switch LEDs

The Avaya Ethernet switch's LEDs are shown in Figure 4, Avaya Ethernet switch LEDs, on page 36.

Figure 4: Avaya Ethernet switch LEDs

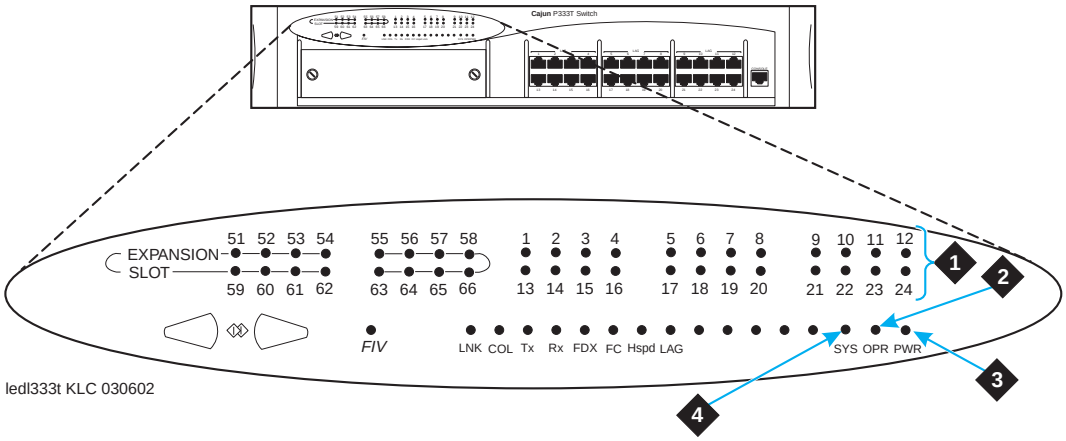


Figure notes

1	Ports in use	**3**	Power
2	CPU boot status	**4**	Lights if this module is the Cajun P33x stack master

The following three LEDs are the primary indicators:

- SYS shows whether this module is the Cajun P330 stack master.
- OPR shows CPU boot status.
- PWR shows when power is on.

For all other LEDs, refer to the quick start guide and user guide that came with the Avaya Ethernet switch.

UPS LEDs

All Ethernet hubs and UPSs have LEDs to indicate that they are powered on or off. LEDs "on" imply the device is powered on. LED "off" implies the device is powered down.

The Powerware front panel has the LEDs shown in Figure 5, UPS LEDs, on page 37.

Figure 5: UPS LEDs

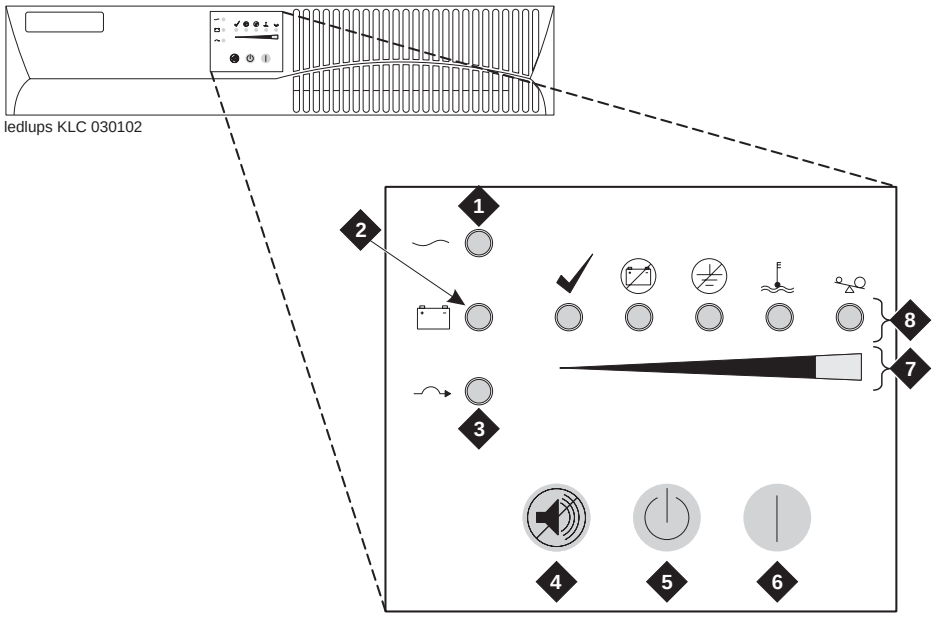

Figure notes

1	Normal mode indicator	**5**	Off button
2	Battery mode indicator	**6**	On button
3	Bypass mode indicator	**7**	Bar graph indicators
4	Test/Alarm reset button	**8**	Alarm indicators

When the Normal mode LED is steady green, it has power. If the LED is flashing, the UPS is in standby mode.

For information on the other LEDs, refer to the UPS user's guide that came with the Powerware UPS unit.

IPSI LEDs

There are four LEDs on the TN2312AP IPSI faceplate, and five LEDs on the TN2312BP IPSI faceplate. The top three LEDs are the standard ones found on most TN circuit packs. The fourth LED imitates the TN2182B Tone-Clock's amber LED. The archangel flashes the yellow LED when active, 2 seconds on and 200 msec off. In addition, the TN2312BP has a fifth LED that shows the emergency transfer control status.

Figure 6: IPSI display showing connectivity status

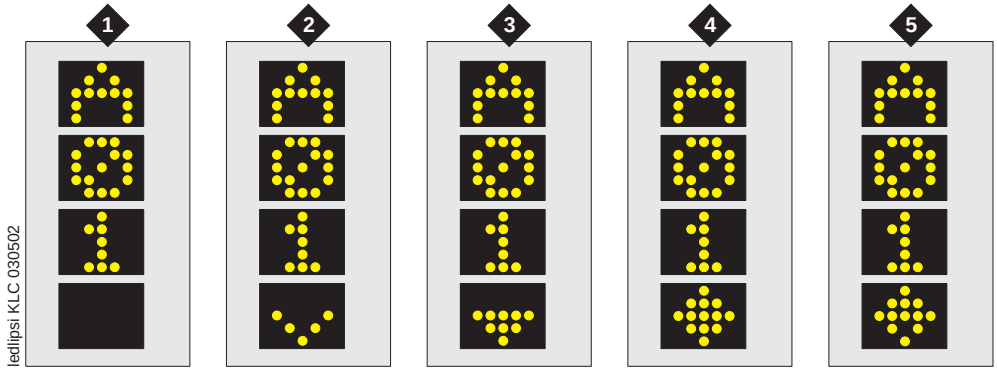

Table 10: IPSI connection status (figure notes)

Connectivity status	1	2	3	4	5
IPSI is connected to Avaya Ethernet switch	no	yes	yes	yes	yes
IPSI has an IP address	no	no	yes	yes	no
Laptop computer is connected to IPSI services port	no	no	no	yes	yes

Figure 7: S8700 IP-Connect IPSI display

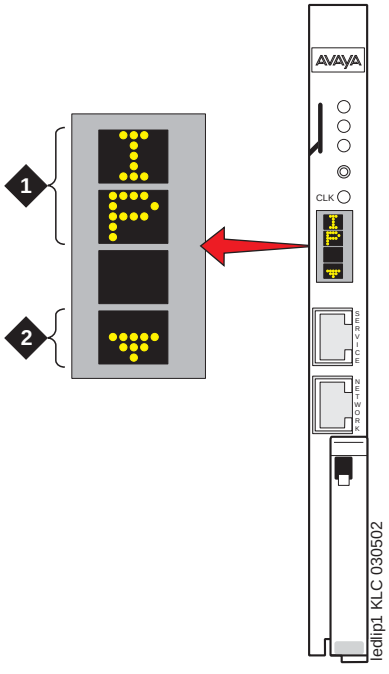

Figure notes

2 Cabinet

3 IPSI has connectivity and an IP address

655A Power Supply LEDs

The G650 media gateway normally has two 655A power supplies. Each has a set of five LEDs, the function of which is indicated in Table 11, 655A Power Supply LEDs, on page 39.

Table 11: 655A Power Supply LEDs

LED	Color	Function
1	Red	Failure of power supply or fan
2	Yellow	Status of power supply OK
3	Green	AC input voltage applied
4	Green	DC input voltage applied
5	Green	Power supply providing ring voltage

Normally the ring voltage LED (#5) on the left power supply is ON and the ring voltage LED on the right power supply is OFF. This changes momentarily when the ringer interchange test is run. The ring voltage LED will only remain lit on the right power supply when there is a power supply failure of the left hand supply or the left hand supply is removed.

LED indicators of serial bus commands to the power supply

Operation of the 655A power supply LED indicators for visual indication of serial bus commands to the power supply for power supply shutdown and ringing shutdown are described below.

Power supply shutdown

The 655A power supply can be commanded off for a period selectable from 1 to 255 seconds. The intent is to allow a hard reset to the G650 chassis remotely. The yellow LED indicating correct operation of the 655A power supply is on for normal power supply operation. When the power supply is commanded off, the yellow LED blinks at a rate of 1 second on and 100ms off, indicating that the power supply is operational but commanded off by the serial bus.

Ringing shutdown

The left hand power supply in the G650 cabinet is the master ringer. If the master ringer fails, ringing is transferred to the redundant power supply, if present, and the red LED on the left hand power supply turns on and the yellow LED turns off, indicating failure of the power supply.

The serial bus can command the ringer off for a period of 1 to 255 seconds. The purpose of this command is to verify redundant ringer operation through the serial bus, remotely from the G650 chassis. The red LED blinks at a rate of 1 second on and 100ms off, indicating that the power supply is operational but commanded off by the serial bus.

A second command relating to ringer operation is the to command the master ringer off, which shuts down the master ringer and transfers control to the redundant power supply. This command is used to permanently transfer ring voltage to the redundant power supply through the serial bus, in order to resolve a problem with the master ringer. The red LED blinks at a rate of 1 second on and 100ms off, indicating that the power supply is operational but commanded off by the serial bus.

Duplication memory card LEDs

The Duplication memory card has LEDs that indicate active/standby, fiber link integrity/activity states. Also see System shutdown LEDs on page 42.

Testing the Duplication Memory card LEDs

When you test the LEDs, the DAJ-1 duplication memory card LED should blink according to the following pattern:

1 second red, 1 second red off, 1 second green, 1 second green off

and so on for a total of one minute.

If the LED shows any of the following flashing patterns, an abnormal condition is indicated. Table 12, Duplication memory card abnormal LED conditions, on page 41 describes the condition and suggests actions to take to resolve it.

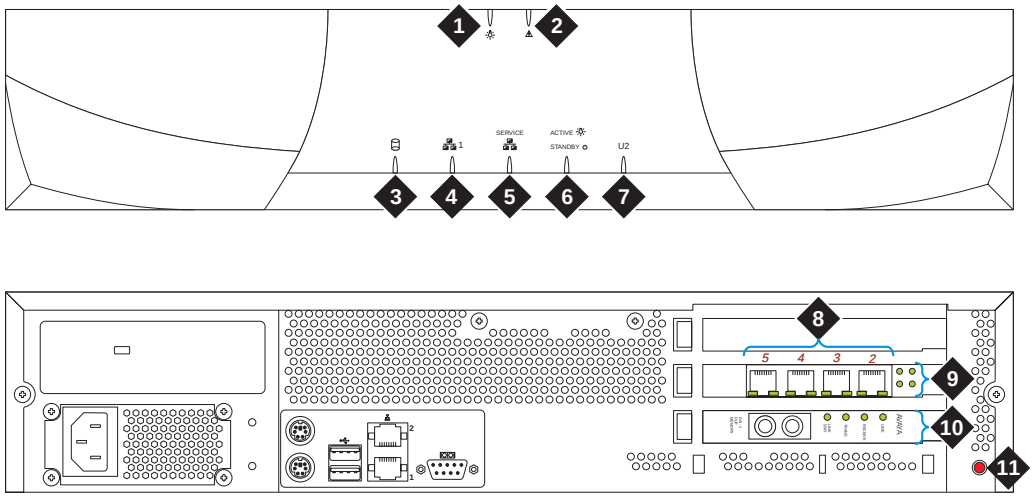
Table 12: Duplication memory card abnormal LED conditions

LED Color	Behavior	Indication	Resolution
Red	Flashes 1 second, off 3 seconds in a repeating pattern	The green element is burned out	Replace the server.
Green	Flashes on 1 second, off 3 seconds, in a repeating pattern	The red element is burned out	Replace the server.
	LED remains off continuously	The DAJ-1 card is not getting power, or the server is hung	If the server is hung, it should automatically reboot itself. If it does not, power it down and reboot it.
Green or Red	Flashed continuously	The server is hung	If the server is hung, it should automatically reboot itself. If it does not, power it down and reboot it.

S8700 Media Server LEDs

The S8700 Media Server has an LED called Active/Standby that indicates whether the server is the active server or the standby server. The Active/Standby LED in the “on” state implies active and in the “flashing” state implies standby. It flashes at the rate of 400 ms “on” and 600 ms “off” when in standby mode.

Figure 9: S8700 Media Server LEDs—Front and Back



scdlled KLC 030502

Figure notes

1	Power	**7**	U2 (not used)
2	Configuration fault	**8**	4 NIC ports (the numbers indicate their assigned Ethernet ports)
3	Disk activity	**9**	LEDs for the NIC ports
4	Network activity (not used)	**10**	LEDs for fiber optic duplication connectivity
5	Service—configuration health (not used)	**11**	Status LED (not used)
6	Active or standby mode indicator		

System shutdown LEDs

All server and Avaya duplication memory card LEDs are in the “off” state but still powered “on” when the server is shut down.

Testing server LEDs

Using the media server Web interface, click **Diagnostics > Test Server LEDs** to make sure that the Active/Standby LED on the server and the transmit LED on the DAJ1 duplication memory card are controllable and not burned out, and that the server is not hung.

During the test, the Active/Standby LED on the media server and the transmit LED on the duplication memory card should blink slowly (1 second on, 1 second off) for 1 minute.

To test the server LEDs:

1. On the main menu, under **Diagnostics**, click **Test Server LEDs**.
2. On the **Test Server LEDs** screen, click **Test LEDs**.
3. Observe the Active/Standby LED on your server and the transmit LED on your duplication card to ensure they are blinking.

Interpreting the test results

An abnormal condition is indicated if an LED shows any of the following flashing patterns.

LED color / behavior	Indication
Flashes **red**	The green element is either burned out or not controlled.
Flashes **green**	The red element is either burned out or not controlled.
Flashes between **red** and **amber**	The green element is stuck on.
Flashes between **green** and **amber**	The red element is stuck on.
Stays **amber** continuously	Either the server is hung or the LED controller is stuck.
Stays off continuously	The server is hung or powered off, the controller is stuck, or the server is using a new or different LED controller.

Also see Testing the Duplication Memory card LEDs on page 41.

Resolving problems

If the server is hung, you do not need to do anything. It should automatically reboot and fix itself. If the server does not reboot itself, power it down and then reboot it.

If an LED is clearly stuck or has a burned out element, ignore the indicators until you can conveniently replace the server.

S8500 Media Server LEDs

The S8500 Media Server has:

- Five (5) LEDs on the front panel (Figure 10, S8500 front panel, on page 44)
- Four (4) LEDs on the back (Figure 11, S8500 rear panel, on page 44)

Figure 10: S8500 front panel

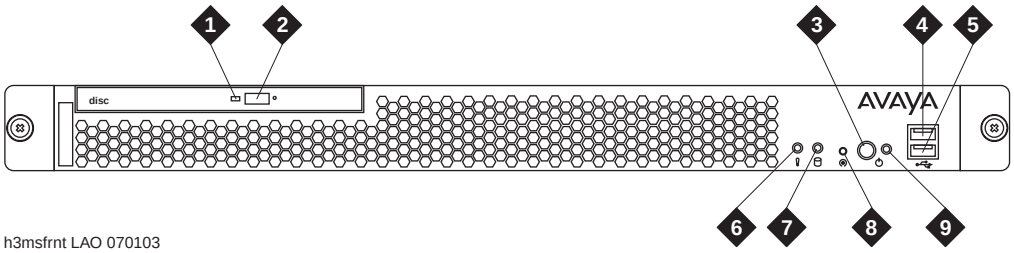


Figure notes

1	CD-ROM drive activity LED (green)	**6**	System-error LED (amber)
2	CD eject button	**7**	Hard disk drive activity LED (green)
3	Power-control button	**8**	Reset button
4	USB connector 1	**9**	Power-on LED (green)
5	USB connector 2		

The four LEDs on the S8500 back panel are shown in Figure 11, S8500 rear panel, on page 44.

Figure 11: S8500 rear panel

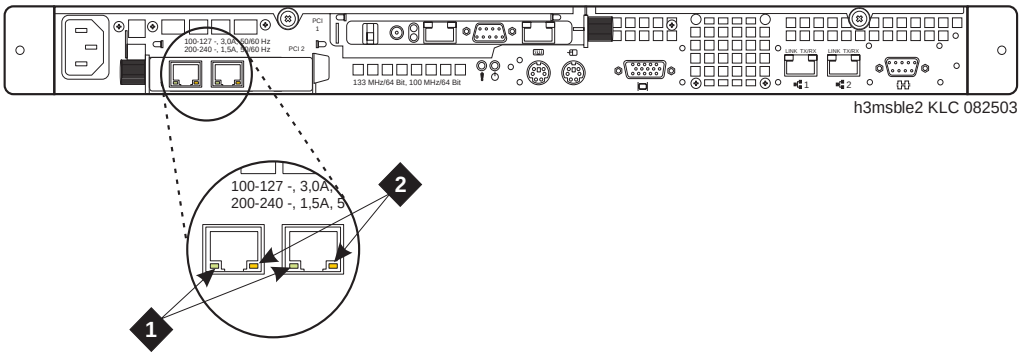

Figure notes

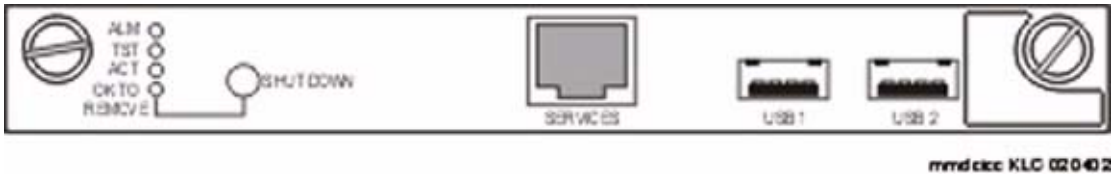
1	Activity	**2**	Connection speed • LED is off: there is a 10 BASE-T active link. • LED is green: there is a 100 BASE-T active link. • LED is orange: there is a 1000 BASE-T active link.

S8300 Media Server LEDs

Figure 12: S8300 Media Server



The S8300 Media Server has a total of 6 LEDs on the faceplate (Figure 12, S8300 Media Server, on page 45), the three standard LEDs and three additional LEDs:

- A fourth LED labeled “OK-to-Remove”, which indicates when the S8300’s disk is properly shut down.
- Fifth and sixth LEDs, located on the lower left and right sides, respectively, of the Services Port, which indicate whether or not data is being sent over the RJ45 jack, and the data rate.

GREEN “OK-to-Remove” LED

The S8300 has a hard drive that must be shut down prior to removal of the S8300. Initiate a shutdown process by first depressing the shutdown button located next to the fourth GREEN “Ok-to-Remove” LED for 2-4 seconds (specific to the S8300). The GREEN LED will first blink; then go steady. Once steady, the GREEN LED indicates that the disk drive has been shut down properly and the S8300 is ready to be removed. Follow standard Media Module removal procedures after the GREEN LED indicates that the disk drive has been properly parked.

There are three different ways that you can properly shut down the S8300 before it is removed:

- Press the shutdown button on the faceplate for 2-4 seconds.
- Initiate shutdown via the Web interface with a computer connected either:
  - Remotely, on the customer’s LAN
  - Locally, on the S8300 using the Services Port on the faceplate of the S8300

GREEN or YELLOW Services Port LEDs

One LED is located on the lower left side of the Services port. It indicates the data rate of the connection:

- When GREEN, this LED indicates a 10MB connection.
- When YELLOW, this LED indicates a 100MB connection.

A second LED, located on the lower right side of the Services port, indicates whether or not data is being sent over the RJ45 jack. This LED serves as a visual status of the Services’ Ethernet interface (TX/RX).

S8300 LED differences from Media Modules

Certain behaviors of the traditional S8300 LEDs differ from the Media Modules because the S8300 is a Media Server running Communication Manager.

- Situations like “insanity” and IP concepts of “registered” through H.248 do not necessarily apply to other Media Modules.
- The RED LED provides a major alarm indication. Software turns off the RED LED during system startup. After startup, software turns on the RED LED whenever a major alarm is present, and turns off the RED LED whenever a major alarm clears. Since the S8300 sees a major alarm whenever a G700 Media Gateway becomes unregistered, this means the RED LED turns on. If the Media Gateway subsequently becomes registered, the major alarm clears, and the RED LED turns off.

  NOTE:
  For an S8300 configured as an LSP, the converse is true. If a G700 Media Gateway registers with an LSP, a major alarm is generated, and the RED LED turns on. When the Media Gateway unregisters, the RED LED turns off.

  The RED LED can be turned on by software to report an application or other error. The RED LED can also be turned on by a hardware watchdog that has not been cleared for at least 10ms, when the processing complex has ceased to function.
- The GREEN LED provides self-testing and maintenance indication.
- The YELLOW LED provides active “in use” indication. For an S8300, the software turns on the YELLOW LED during system startup, and turns off the LED during shutdown. During normal call processing operation, the YELLOW LED turns on whenever a G700 Media Gateway, an IP station, or an IP console is registered with the S8300. Likewise, it turns off when none of the IP endpoints are registered.

Table 13, Major alarm (red LED), on page 47 through Table 17, ENET Link/Activity (green LED), on page 48 illustrate the states of S8300 LEDs.

Table 13: Major alarm (red LED)

S8300 LED lighting sequence

In general, S8300 LEDs light in order from top to bottom, then from left to right on the S8300 faceplate.

The following order applies during restart or boot of the S8300:

1. ALM - RED: lights up first then turns off.
2. TST - GREEN: lights up second then turns off.
3. ACT - YELLOW: lights up third then turns off.
4. OK To REMOVE - GREEN: lights up fourth then turns off.
5. LEFT LED in SERVICES jack - GREEN (10 MB link speed): lights up fifth then turns off.
6. LEFT LED in SERVICES jack - YELLOW (100 MB link speed): lights up sixth then turns off.
7. RIGHT LED in SERVICES jack - GREEN: lights up seventh then turns off.

S8100 Media Server LEDs

This section describes the location and interpretation of LEDs for the S8100 media server. The S8100 LEDs indicate the status of various maintenance components in the S8100 system. LEDs are located on:

- The attendant console
- All circuit packs in the switch cabinets
- Customer-designated voice terminals (option)

The following LEDs are included in the system:

- TN2314 processor circuit pack LEDs
- Attendant console LEDs
- Circuit pack status LEDs
- Power supply LEDs
- LED Usability Enhancements

TN2314 processor circuit pack LEDs

The front pane has two groups of LEDs. One group indicates the status of the pack, and the other group (which includes the Major, Minor, and Warning alarms described in the Alarm levels section) reflects maintenance conditions in the entire system. See Figure 13, LED indicators on the TN2314 processor circuit pack, on page 53 and Table 18, TN2314 processor circuit pack LEDs, on page 50.

NOTE:
Alarms on the SW-CTL, PKT-INT, PR-MAINT, TRAN-STO, PR-TN-BD, TONE-PT, TDM-CLK, PR-SSP and PR-ADX maintenance objects are indicated by the red LED on the Processor circuit pack.

Table 18: TN2314 processor circuit pack LEDs

Red (alarm)	Alarm--The system has detected a fault in this circuit pack
Green Test	Test--the system is running tests on this circuit pack
Amber	Handshake--In an operating system, this LED indicates that the handshaking between the firmware and the Windows 2000 operating system is occurring by flashing briefly once every 10 seconds
Amber	PCMCIA--The flash disk is in use
Red	Major Alarms
Red	Minor Alarms
Amber	Clock--Blinks every 4 seconds
Red	EX-MFR-- Indicates emergency transfer has been invoked
Green	OK Remove--Indicates that it is OK to remove the TN2314 processor circuit pack

NOTE:
If the AC power cord is unplugged, the emergency transfer feature invokes, however the EMERGENCY TRANSFER LED (red) is not lit due to loss of AC power.

WARNING:
DO NOT REMOVE the TN2314 circuit pack unless the ***OK to REMOVE*** LED is illuminated. Failure to heed this warning may result in loss of data and/or damage to equipment.

WARNING:
When the TN2314 is replaced, a new license file must be downloaded to the system before the system will become operational. Refer to “Obtaining a License File” in Chapter 3 of *Installation and Upgrades for the Avaya™ S8100 Media Server with the Avaya™ G600 Media Gateway and the Avaya™ CMC1 Media Gateway, 555-233-146*.

Table 19, TN2314 circuit pack states, on page 51 summarizes the TN2314 circuit pack LED states.

Table 19: TN2314 circuit pack states

		Boot Sequence = 3 min, 45 sec								Shutdown Sequence		Other

flash1— 800ms ON, 200ms OFF
flash2— 500ms ON, 500ms OFF
flash3— 200ms ON, 800ms OFF
flash4— 200ms OFF on every sanity heartbeat
flash5— 1 sec ON, 1 sec OFF

sw— Software Controlled
clk— Similar to the TN2182 Tone/Clock LED

NOTE:
When system status is “up” you will go through stat 1-8. After 8, S8100 will start up in 20 seconds and you should be able to dial. INTUITY AUDIX continues to initialize for about 5 minutes.

Sequence Legend:

1 Power-on reset.

2 860 Core test in progress. Testing ROM, RAM, 860, etc. (usually lasts about 35 seconds).

3 860 Core test finished successfully. Remote Maintenance (RM) initialized.

4 Pentium released from reset. Waiting for Windows 2000 to start booting.

5 Booting Windows 2000.

6 Booting PC operating system. Waiting for application firmware download.

7 Jump to application firmware. Remote maintenance initialized (this time in application firmware).

8 SPE is up. The TN2314 circuit pack In Use yellow LED turns off for 200ms every time (approximately every 10 seconds) firmware receives handshake from software. This is the heartbeat that software and firmware is alive and talking. S8100 software starts up.

9 Shutdown is in progress. It’s OK to Remove green LED flashes. Don’t remove the circuit pack yet.

10 Shutdown is complete. It’s safe to remove the circuit pack.

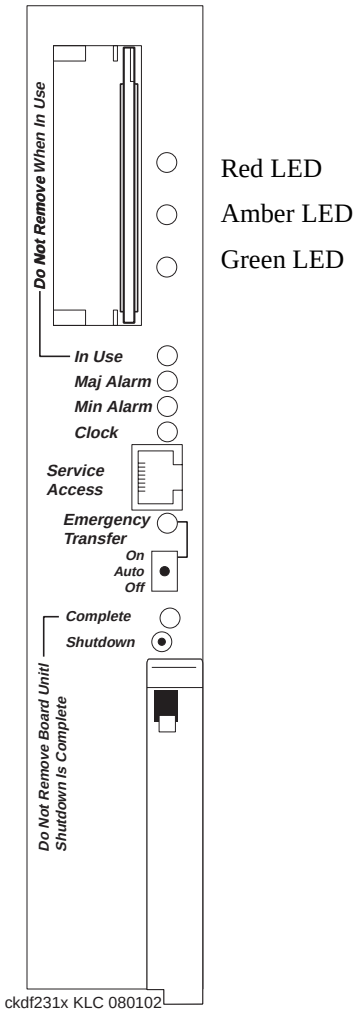
11 860 Core test failed. Try power cycling the circuit pack. Replace circuit pack if it keeps failing.

12 Pentium BIOS update mode is activated.

13 Entering factory diagnostic mode. Wait about 35 seconds for 860 Core test to finish.

In factory diagnostic mode.

Figure 13: LED indicators on the TN2314 processor circuit pack



Attendant console LEDs

The console has two red LEDs, labeled ALM and ACK. The left LED lights steadily when there is a Major or Minor alarm at the switch cabinet. The right LED lights steadily if the alarm has been successfully reported to INADS. If the system is unable to report the alarm to INADS, the LED flashes, signaling the attendant to call INADS and report the alarm.

Circuit pack status LEDs

Each circuit pack has three LEDs on the front panel visible at the front of the carrier. On all circuit packs, except the 650A Power Unit, the LEDs indicate:

1 Red (alarm) — If the circuit pack is communicating with the system, the system has detected a fault in this circuit pack. An on-board alarm for this circuit pack is displayed in the Alarm Log.

The circuit pack also lights this LED when either the circuit pack has not yet initialized communication with the system or when the circuit pack loses contact with the system and stops functioning (circuit pack is said to be “in reset”). In these cases, there may not be an alarm in the Alarm Log. To determine if the red LED is lit because the circuit pack is not in contact with the system, issue the **list configuration board *location*** command, where ***location*** refers to the slot containing this circuit pack. If the system does not detect the circuit pack, this command returns `Identifier not assigned` or `no board`.

If the circuit pack has just been inserted, the system may still be initializing the circuit pack. If, after 5 minutes, the circuit pack still has not initialized communications with the system, check the MO for any special instructions (for example, EPN Maintenance circuit pack can stop EXP-INTF circuit pack from initializing). If the MO does not provide the needed information, perform the following steps:

- Check the Error Log for TONE-BD and TDM-BUS errors. Enter **test tdm *P*** where ***P*** is the port network containing the relevant slot. Refer to Restarting Non-Functioning Port Circuit Packs in the general description of the TDM-BUS (TDM Bus). Enter **test tone-clock PC**, where P is the network containing the relevant slot, and C is the carrier containing the relevant slot. Follow appropriate sections for any TONE-BD and TDM-BUS errors.
- Reseat the suspect circuit pack.

WARNING:

Reseating the TN2314 may be very destructive.

WARNING:

When the TN2314 is replaced, a new license file must be downloaded to the system before the system will become operational. Refer to “Obtaining a License File” in Chapter 3 of *Installation and Upgrades for the Avaya™ S8100 Media Server with the Avaya™ G600 Media Gateway and the Avaya™ CMC1 Media Gateway, 555-233-146*.

- Wait 5 minutes. Then issue the **list configuration board *location*** command. If the result indicates that the system still has not registered the circuit pack, go to next step.
- Try to insert the circuit pack into a different slot and try to insert a different circuit pack into the suspect slot (provided the maintenance documentation for this circuit pack does not warn against either of these actions).
- If the system seems to be functioning correctly, but the circuit pack does not start communicating with the system, replace the circuit pack.

2 Green (test) — the system is running tests on this circuit pack.

3 Yellow (busy) — indicates that the circuit pack is in use.

NOTE:

A port circuit pack also lights its red LED when it performs initialization tests (for example, when the circuit pack is initially inserted into the system). If all initialization tests pass, the red LED is turned off. If any initialization tests fail, the red LED remains lighted and the circuit pack is not placed into service.

During the various states of operation (start-up testing, normal operation, circuit failure, and so forth) circuit pack status LED indications appear as shown in Table 20, Control and port circuit pack status LEDs, on page 55.

Table 20: Control and port circuit pack status LEDs

Equipment type	LED	Description
Port Circuit Packs	Red	Briefly on during power up, circuit pack reseating, resetting, and system reset. Steadily on if circuit pack fails start-up test or fails while in use. Off during normal operation.
	Green	Briefly on during circuit pack testing following power up, circuit pack reseating, and system reset. On during periodic, scheduled, and system technician demanded testing. Off during normal operation.
	Yellow	On when any port in the circuit pack is in use, otherwise, off.
Control Circuit Pack	Red	Briefly on during power up and system reset. Steadily on if circuit pack fails start-up test or fails while in use. Off during normal operation.
	Green	On briefly during board testing following power up and system reset. Also on during periodic, scheduled, and system technician-demanded testing. Off during normal operation.
	Yellow	Processor • Lit during processor initialization • Lit during system initialization (stays lit until Emergency Transfer is turned off) Tone Detector/Generator • Slow blinking when clock is in use • Otherwise, off

Power supply LEDs

Table 21, LED and alarm conditions, on page 56 shows the LED and alarm conditions for the 650A Power Supply. Ring voltage and neon bus output do not activate alarm status.

Table 21: LED and alarm conditions

Condition	LED status	Alarm state	Fan alarm
Normal	Red off; Yellow on	Open	Normal
No input power	Red off; Yellow off	Closed	No input power
DC output not present (except Neon)	Red on; Yellow off	Closed	DC output not present (except Neon)
Fan alarm	Red on; Yellow on	Closed	Fan alarm

LED Usability Enhancements

LED enhancements have been added for two new events:

- ‘860 Core Test
- SPE Down

‘860 Core Test (done at powerup/board insertion)

The Major Alarm (red), Minor Alarm (red), and Tone Clock (yellow) LED’s now scroll to show activity during core test. When the core tests have finished, the LED trio flashes twice.

The ‘860 Core Test consists of the following:

- ‘860 registers (R0-R31) test (very fast)
- Permanent boot code checksum test (fast)
- 16MB SDRAM pattern test (very slow. The LED trio scrolls one step every time 1 MB of SDRAM has been tested)
- 16MB SDRAM address test (slow. The LED trio scrolls one step for this test)

Seventeen “scrolls” of the LEDs should occur during the core test before the double flash. This activity gives some feedback to the user that something is going on.

SPE Down

The Major Alarm (red) LED now flutters. This is very noticeable, and should help in determining when the board is in an SPE Down condition. Each time an SPE Down condition occurs, the following steps take place:

- SPE Down #1 -- A message is logged in firmware, and the platform reboots (tries to bring the platform up automatically)
- SPE Down #2 -- A message is logged; INADS dialout; SPE Down 7 min. waiting period
- SPE Down #3 -- A message is logged; INADS dialout (if not already done before); SPE Down 7 min. waiting period
- SPE Down #4 -- A message is logged; INADS dialout (if not already done before); SPE Down 46 min. waiting period (that's 46 minutes)

The process then repeats at SPE Down #1.

NOTE:
Removing/reinserting the TN2314 circuit pack resets the SPE Down count back to zero.

G700 and Media Module LEDs

LEDs are important status indicators for technicians during on-site installation, maintenance, troubleshooting, and repair. They encompass three major areas: Alarms, Testing, and Usage Activity. Some LEDs are specialized to support specific procedures (such as removing the S8300 Media Server). When alarms or problems occur, LEDs are present to indicate that attention by a technician is needed.

LEDs appear on the G700 LED panel, and each Media Module. The G700 LEDs are the same as those on the Avaya Cajun P330, with the following exceptions:

- Slight modifications to two of the LEDs (OPR and SYS)
- Addition of the Alarm LED to the LED Panel to display prominently any error condition

See *"Table 2-1: Avaya P333T LED Description*, in the *"Avaya P333T User's Guide"* for a complete listing of LEDs.

Some Media Modules have additional LEDs, although each Media Module has the three standard LED. Table 22, LED Interpretation, on page 57 indicates the meanings associated with standard DEFINITY server LEDs. Although in some cases these LEDs have been augmented or modified for the S8300 Media Server and G700 Media Gateway, it is important to be aware of their standard meanings when viewing the system.

Table 22: LED Interpretation

Red	Upon power-up or module insanity, this LED is turned on. Upon passing diagnostics, this LED is turned off.
Green	During power-up self testing and maintenance testing, this LED is turned on.
Yellow	This LED indicates that the module is in service.

NOTE:
The four multi-color specialized status LEDs that have appeared on various DEFINITY server TN boards like the T1/E1/DS1 board (TN464F) do not appear on the Media Modules.

NOTE:
LEDs can also be viewed using the embedded Device Manager on the L2 Switching Processor; however, it displays LED position only, and does not indicate status.

LED panel location on the G700

As shown in Figure 14, G700 LED Panel Location, on page 58, the LED panel is located on the top left corner of the G700. Directly below the LED panel is Media Module slot V1, which can be occupied by any type of Media Module. However, the S8300 Media Server can reside only in this particular slot because of height restrictions (for a specific discussion of the S8300 LEDs, see S8300 Media Server LEDs on page 45.

Figure 14: G700 LED Panel Location

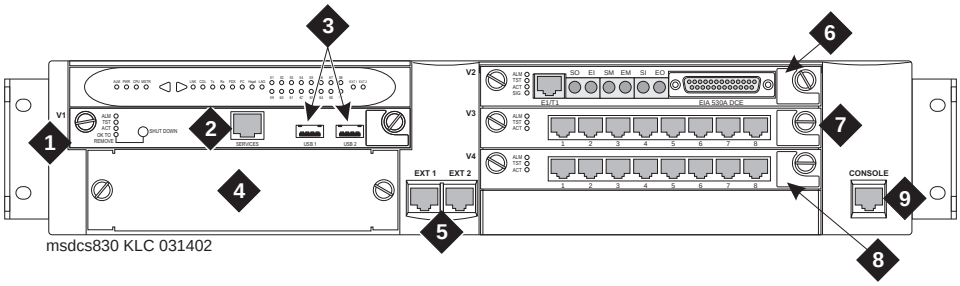


Figure notes

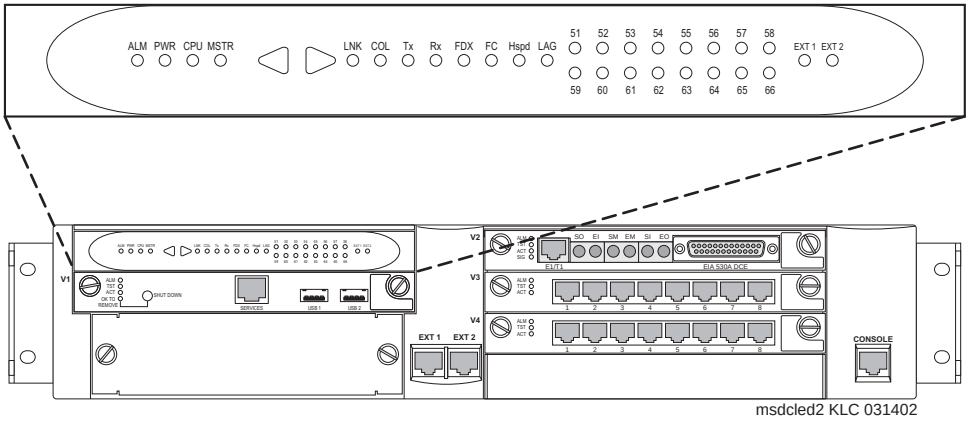
1	Media Module Slot #1 (V1)	**5**	10/100 Base-T Ethernet Ports (Ext1, Ext2)
2	S8300 Services Port (Used with cross-over ethernet cable)	**6**	Media Module Slot #2 (V2)
3	S8300 USB-Series Modem connection	**7**	Media Module Slot #3 (V3)
4	Avaya Expansion Module Slot	**8**	Media Module Slot #4 (V4)
		9	Console Interface (use with serial cable)

Figure 15, G700 LED Panel, on page 59 shows an expanded view of the G700 LED panel.

Figure 15: G700 LED Panel



Front panel LEDs

The front panel includes the following LEDs (Figure 16, G700 Front Panel LEDs, on page 59):

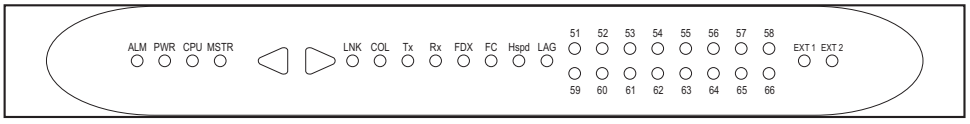
- 4 LEDs in Voice/Data Module zone (ALM, PWR, CPU, MSTR)

  NOTE:
  The LEDs labeled OPR and SYS on the P330 are labeled CPU and MSTR, respectively, on the G700.

- 16 LEDs representing the Data Ports associated with the Personality Module or Data Expansion Ports
- 8 LEDs in Data Function zone (LNK, COL, Tx, Rx, FDX, FC, Hspd, LAG)
- 2 LEDs (EXT 1 and EXT 2) for two 10/100 Mb data ports on the chassis

  NOTE:
  The four LEDs (ALM, PWR, CPU, MSTR) are positioned as closely as possible to the top left corner of the LED Panel so that important motherboard-related information can be quickly located by the service technician.

Figure 16: G700 Front Panel LEDs



A total of 30 LEDs appear on the LED Panel for the G700. The following three LEDs have been added to the Avaya Cajun LEDs (see *"Avaya P330 Manager User Guide")*:

- RED ALM or Alarm LED
- EXT 1 LED
- EXT 2 LED

The G700 MSTR LED differs from the Avaya Cajun LED in that the bottom G700 in a stack of 10 G700s with the same version firmware is always elected master (therefore, its MSTR light is lit). But, if the firmware versions are not the same, the G700 with the latest firmware version is elected master and its MSTR light is lit. If there is only one G700 in a stack, its MSTR light is always lit.

Navigating using the front panel LEDs

Navigation using the front panel LEDs on the G700 is that same as with the Avaya Cajun P330 series. *"Table 2-2: Avaya P330 <--> Select buttons, in the "Avaya P333T User's Guide"*. For example, a technician can use the arrows to move left and right between the LEDs, and check the following:

- LNK (link)
- Col (collision)
- Tx (send)
- Rx (receive)

In addition, a technician can query the status of the ports using 51-66 in the LED panel.

Use the push buttons (on the right and left of data mode LEDs) for selecting the function to be reported simultaneously by all 16 of the Port data expansion LEDs. The function you are selecting is indicated by a lightened LED in that Function zone. Each time you press on the right (or on the left) push-button, the function currently lighted moves by one to the right (or to the left) accordingly.

For example, if the COL LED is lit, all 16 Ports associated with the data expansion module LEDs are reporting the Collision status of their respective port. If you want to select the LAG function, press 6 times on the right push-button. Afterwards, if you want to select the Rx function, press 4 times on the left push-button.

For the G700, the LEDs display the information of ports 2 External 10/100Base-T Ethernet links and data expansion ports 51-66. At power up the LEDs indicate the Link status of ports 51-66 and ext 1 & ext 2. Push the right button once to move the indication to Collision status of ports 51-66 and ext 1 & ext 2. Push the left button to move the indication backwards.

NOTE:
Eight pushes in one direction complete a full cycle of display.

If you press the right and the left pushbuttons simultaneously for:

- 1.5sec, the module resets the Layer 2 Switching Processor but not the Media Gateway Processor
- 4 sec, the whole stack resets (performing slot renumbering)
- 18sec, the module enters the debug mode – module disabled for data traffic

NOTE:
Currently, there is no physical button or sequence of button presses defined to reset the Media Gateway Processor or G700. Complete software resets by using the Command Line Interface (CLI) for the Device Manager of the G700.

RED ALM or Alarm LED

The RED ALM or Alarm LED is on the top-left most corner of the LED Panel next to other important system LEDs (PWR, CPU, MSTR), as specified in Figure 16, G700 Front Panel LEDs, on page 59. The presence of this RED ALM LED is primarily for on-site service technicians or dispatches. It alerts technicians of major failures that require a physical replacement or removal of equipment. Most major G700 components controlled or monitored by the motherboard can be a cause of illumination. This includes the Avaya VoIP Media Module, but not other Media Modules.

NOTE:
The RED ALM LED lights for motherboard problems only. Check for a RED ALM LED for problematic G700s and also check all of the Media Module LEDs for any Media Module specific RED ALM LEDs.

NOTE:
If the RED ALM LED is lit on a non-VoIP Media Module, check the G700 alarm screens and the Avaya Communication Manager alarm screens to determine where the fault lies.

The RED ALM LED indicates the health of the G700 by lighting under two distinct circumstances:

- G700 hardware failure
  - Impaired functions of the Layer 2 Switching Processor, Media Gateway Processor, or VoIP engine
  - Power supply voltage out of bounds
  - Unit overheating
- The G700 cannot communicate to any server

The following are a few examples:

- The RED ALM LED is lighted when two or more fans have failed.

  Various warnings, alarms, and a graceful shutdown are performed based on the fan and thermal sensor conditions.
- The RED ALM LED is lit from the time power is applied until diagnostics end.
- The RED ALM LED turns “OFF” when:
  - Physical conditions such as temperature are rectified and return to normal or acceptable operating ranges.
  - The alarm is cleared manually.

EXT 1 LED

EXT 1 LED appears on the LED Panel (Figure 16, G700 Front Panel LEDs, on page 59), which reports the status of the first 10/100 MB/sec port (these LEDs report the 8 different functional statuses dictated by the left and right arrow buttons).

EXT 2 LED

EXT 2 LED appears on the LED Panel (Figure 16, G700 Front Panel LEDs, on page 59), which reports the status of the second 10/100 MB/sec port (these LEDs report the 8 different functional statuses dictated by the left and right arrow buttons).

G700 LED panel definitions

Table 23, LED Definitions, on page 62 illustrates the LED definitions for the G700 LED Panel.

Table 23: LED Definitions

No.		LED Name	Description	LED States
1		ALM	Alarm Status Color is RED	OFF - No alarms exist ON (RED) - Alarm exists on the chassis itself
2		PWR	Alarm Status Color is GREEN	OFF - Power is down ON - Power is up Blinking - every 1.2 seconds (400ms on, 800ms off) when 5 volts power is not available to the riser board and the Media Modules
3		CPU	CPU Operation Color is GREEN	OFF - CPU is in boot operation or is running BIST ON - CPU boot operation and BIST completed
4		MSTR	Master/Slave Status Color is GREEN	OFF - Slave box of the stack ON - Master of the stack and redundant cable is not present or not active 1 Blink every 1.5 sec - Master of the stack and active redundant cable
5	a	LNK port 51-66, Ext 1-2	Port Status Color is GREEN	OFF - Port disabled or not existent. At phase 1, or link fail of Giga ports. ON - Port is enabled and link is OK. 1 Blink every 1.5 sec - Link test fail (of 10/100M ports only at phase 1) 2 Blinks every 1.5 sec - Partition
	b	COL Port 51-66, Ext 1-2	Collision (GREEN)	OFF - No collision or FDX port ON - Collision occurred on line
	c	Tx Port 51-66, Ext 1-2	Transmit to line (GREEN)	OFF - No transmit activity ON - Data transmitted on line
	d	Rx Port 55-66, Ext 1-2	Receive from line (GREEN)	OFF - To receive activity ON - Data received from the line
	e	FDX Port 51-66, Ext 1-2	Half/Full Duplex (GREEN)	OFF - Half Duplex mode of operation ON - Full Duplex mode of operation, or for 10/100Base-T ports when link test fail with auto-negotiation enabled

1 of 2

Table 23: LED Definitions

No.	LED Name	Description	LED States
f	FC* Port 51-66, Ext 1-2	Symmetric Flow Control (GREEN)	OFF - Port is in an Asymmetric Flow control mode, or in Flow Control mode disabled, or it is in half duplex ON - Port is in full duplex and in a symmetric Flow Control mode
g	HSpd Port 51-66, Ext 1-2	High Speed (GREEN)	OFF - 10Base-T or for an expansion port that does not exist ON - 100Base-T, 100Base-F, 1000Base-X, and OC-12, or for 10/100Base-T ports when link test fail with auto-negotiation enabled
h	LAG Port 51-66, Ext 1-2	Link Aggregation "Trunking" (GREEN)	OFF - No LAG defined with this port ON - Port belongs to a LAG
6	Data	16 data expansion ports 51-66 (GREEN)	OFF - see notes on No. 5 a-h ON - see notes on No. 5 a-h
7	EXT 1	RJ 45 to Non-Avaya equipment (GREEN)	OFF - see notes on No. 5 a-h ON - see notes on No. 5 a-h
8	EXT 2	RJ 45 to Non-Avaya equipment (GREEN)	OFF - see notes on No. 5 a-h ON - see notes on No. 5 a-h

* For Giga ports, when auto-negotiation is enabled and the link is down, FC LED reflects the last mode

If the user resets the module/stack, then all of the module's/stack's LEDs light on (test lamp) for 150ms. The COL, Tx, and Rx LED signals must be at least 150ms.

2 of 2

Media Module LEDs

Media Gateway physical LEDs provide the technician with information regarding the ability to troubleshoot the Media Module as a whole.

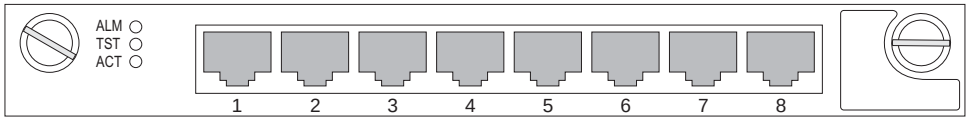
NOTE:
The physical LEDs provide board level status information, while the SAT provides port level status information.

LED Locations on the Media Modules

All Media Modules have three standard LEDs on the faceplate (Figure 17, Faceplate of Media Modules with Standard LEDs, on page 64). On the Avaya VoIP (MM760), Avaya BRI (MM720), Avaya DCP (MM712), and Avaya Analog (MM711) Media Modules, these are the only LEDs present. In addition,

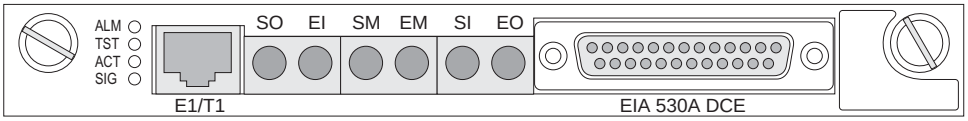
the Avaya T1/E1 Media Module (MM710) has an additional LED, as shown in Figure 18, T1/E1 Media Module with Fourth LED, on page 64.

Figure 17: Faceplate of Media Modules with Standard LEDs



mmdc712 KLC 022702

Figure 18: T1/E1 Media Module with Fourth LED



mmdc710 KLC 020402

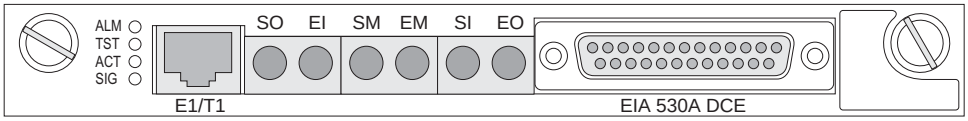
MM710 T1/E1 Media Module LEDs

The T1/E1 Media Module has four LEDs on its faceplate (see Figure 19, T1/E1 Media Module LEDs, on page 65). Table 24, T1/E1 LEDs, on page 64 shows their color and functions. The first three are the standard LEDs, which are under software control.

Table 24: T1/E1 LEDs

Name	Color	Location	Description
ALM	RED	Top	Upon power-up, this LED is turned on. Upon passing diagnostics this LED is turned off. During normal circuit pack operation this LED is not turned on except for certain alarm states.
TST	GREEN	Second	During power-up self-testing and maintenance testing requested by the SPE, this LED is turned on.
ACT	YELLOW	Third	This LED indicates that the clock is synchronized with a source (usually the Central Office). The LED is blinking 2700 ms ON and 300 ms OFF. This is the most common condition. The opposite blinking of the YELLOW LED is 300 ms ON and 2700 ms OFF. This is an error condition, and indicates that the MM710 T1/E1 Media Module is not synchronized with a clock. An infrequent occurrence is a steady YELLOW LED. This indicates in-use activity, only when clock synchronization is set to local.
SIG	GREEN	Bottom	This LED indicates whether the link to the Central Office (CO) is up (equivalent to the TN464F circuit pack Status 3 GREEN LED). See Figure 19, T1/E1 Media Module LEDs, on page 65.

Figure 19: T1/E1 Media Module LEDs



The supported portion of the LED control message allows software to change the status of the three standard LEDs on the T1/E1 Media Module faceplate. Power-up and alarm states are the only conditions where hardware sets the state of the LEDs independent of ANGEL firmware control.The exceptions to letting software turn off the LEDs are:

- The board is in reset (RED ALM LED remains on)
- A call is up (YELLOW ACT LED remains on while the E1 line is in-frame and at least one voice/data call is up)
- During board reset initialization testing (GREEN TST LED remains on until initialization testing is complete)

NOTE:
For ISDN operation, the Yellow LED will be turned on if ANY port has an active TDM connection (including the D-channel).

Synchronization

The YELLOW ACT LED on the front of the MM710 Media Module can tell you the status of that module regarding synchronization.

- If the YELLOW ACT LED is solidly on or off, it has NOT been defined as a synchronization source. If it is on, one or more channels is active. If it is an ISDN facility, the D-channel will count as an active channel and will cause the YELLOW ACT LED to be on.
- When the MM710 is driving a clock sync source line to the G700 main clock, the YELLOW ACT LED does not indicate port activity, but instead indicates that the MM710 is the sync source by flashing with a regular 3-second period:
  - It is on for 2.8 seconds and flashes off for 200 milliseconds if it has been specified as a sync source and is receiving a signal that meets minimum requirements for the interface.
  - If it has been specified as a sync source and is not receiving a signal, or is receiving a signal that does not meet minimum requirements for the interface, then the YELLOW ACT LED will be off for 2.8 seconds and flash on for 200 milliseconds.

T1/E1 Initialization

The T1/E1 Media Module LEDs behave in the following manner during initialization. The Angel provides a visual indication of the Media Module's status through the three faceplate LEDs:

- During initialization the YELLOW ACT LED is held off, while the RED and GREEN LEDs are on during the entire initialization sequence.
- Upon power up or reset, if only the RED ALM LED comes on, the Angel processor is dead or the board is being held permanently in reset.
- Upon completion of the diagnostics and initialization, the GREEN TST LED turns off.

- If the initialization tests fail, the RED ALM LED remains on.
- If the tests all pass, then all LEDs are extinguished until Communication Manager starts using the Media Module.

Operational control

After successful initialization, the T1/E1 Media Module's LEDs are controlled as follows:

- The Angel lights the YELLOW ACT LED when there is at least one non-idle trunk. If Communication Manager sends a message to drive the clock sync signals, the YELLOW ACT LED indicates this instead of the port busy/idle status.
- The Media Server may independently light and extinguish the three LEDs through downlink LED Control messages, subject to the constraint that it may not turn off a YELLOW ACT LED turned on by the Angel as a result of port activity.
- If the Media Module resets for any reason and is not released from reset, the RED ALM LED lights and the YELLOW ACT and GREEN TST LEDs are held off.

3 Server Alarms

S8700 / S8500 / S8300 / S8100

This chapter provides background information on server alarming. For detailed information on G700 Media Gateway Traps, refer to Chapter 4, “G700 Media Gateway Traps”.

Introduction

During normal operations, software or firmware may detect error conditions pertaining to specific Maintenance Objects (MOs) or other subsystems. The system automatically attempts either to fix or circumvent these problems. Errors are detected in two ways:

- Firmware on the component during ongoing operations
- A “periodic test” or a “scheduled test” started by software

  The technician can run tests on demand that are generally more comprehensive (and potentially disruptive) than are the "scheduled tests".

When an error is detected, the maintenance software puts the error in the Error Log and increments the error counter for that error. When an error counter is “active” (greater than 0), there is a maintenance record for the MO. If a hardware component incurs too many errors, an alarm is raised.

Alarms on the Linux media servers can occur in several areas:

- Media Modules, Media Servers, the Media Gateway Processor, and the Layer 2 Switching Processor are all capable of detecting internal failures and generating traps and alarms.
- Media gateways, such as the G700, detect faults and alert the Media Server; the Media Server then raises an alarm, and sends the alarm to an appropriate network management site.
- Communication Manager alarms reflect health status of network elements such as media gateways, circuit packs, media modules, and their associated links, ports, and trunks.
- Messaging alarms provide health status of embedded or external messaging systems.

Alarms may be viewed using the following:

- Maintenance Web Interface

  Provides alarms information related to Communication Manager, the media server, and messaging.

  NOTE:
  For non-Communication Manager alarms, use the Web Page header "Alarms and Notification" and "Diagnostics: View System Log". Choose the appropriate heading and, if necessary, call Avaya support.

- Media Server bash shell

  Provides alarms information related to Communication Manager, the media server, and messaging.

- Media Server SAT CLI

  Provides alarms information related to Communication Manager.

- MGP CLI (on the G700 Media Gateway)

  Provides alarms and traps information related to the G700 platform and its subsystems.

- Layer 2 Switching Processor CLI (on the G700 Media gateway)

  Provides information related to the media gateway stack.

Information related to Communication Manager, the media server, and messaging alarms can be displayed using either the Maintenance Web Interface or the media server bash shell; however, this document (*Maintenance Alarms Reference (555-245-102)*) provides maintenance information only for Communication Manager (Chapter 5, “Communication Manager Maintenance-Object Repair Procedures”)and media server alarms (Chapter 3, “Server Alarms”). For messaging alarms and repair procedures, refer to the appropriate documentation for your messaging system.

Alarm Classifications

Alarms are classified depending on their effect on system operation:

- MAJOR alarms identify failures that cause a critical degradation of service. These alarms require immediate attention.
- MINOR alarms identify failures that cause some service degradation but that do not render a crucial portion of the system inoperable. Minor alarms require attention. However, typically a minor alarm affects only a few trunks, stations, or a single feature.
- WARNING alarms identify failures that cause no significant degradation of service or equipment failures external to the switch. These failures are not reported to INADS or to the attendant console.
- ON-BOARD problems originate in the circuitry on the alarmed Media Module.
- OFF-BOARD problems originate in a process or component that is external to the Media Module.

Background Terms

Table 25, Alarming Background Terms, on page 69 gives a useful explanation of terms.

Table 25: Alarming Background Terms

Term	Explanation
TRAP	A trap is an event notification that is sent to the SNMP trap manager and received from the Media Gateway Processor, Layer 2 Switching Processor, or RTCP Monitor (Avaya VisAbility).
ALARM	Some traps are determined to be an alarm. If determined to be an alarm they are sent to an appropriate alarm management site, such as INADS.
INADS	Initialization and Administration System, a software tool used by Avaya services personnel to initialize, administer, and troubleshoot customer communications systems remotely.
SNMP	Simple Network Management Protocol, the industry standard protocol governing network management and the monitoring of network devices and their functions.
RTCP	Real Time Control Protocol, contained in IETF RFC 1889.
ISM	Intelligent Site Manager, a VPN gateway on the customer's LAN that provides a means for services personnel to access the customer's LAN in a secure manner via the Internet.
VPN	Virtual Private Network, a private data network that makes use of the public telecommunication infrastructure, maintaining privacy through the use of a tunneling protocol and security procedures.

Alarm-Related LEDs

Table 26, Alarm-Related LEDs, on page 70 shows alarm-related LEDs on the faceplate of the G700 or on an attendant console, and shows how certain LEDs reflect specific alarm situations.

Table 26: Alarm-Related LEDs

LED	Location	Alarm-Related Cause
ALARM LED	Attendant Console	The system alarm causes the attendant console ALARM LED to light.
ACK LED	Attendant Console	The ACK LED on the attendant console reflects the state of acknowledgement of the alarm report from INADS. However, this is only possible for S8700-based Media Servers.
RED ALM or ALARM LED	LED Panel of G700 Media Gateway	The RED ALM or ALARM LED indicates the "health" of the G700 by lighting when there are impaired functions of the Media Gateway Processor, Layer 2 Switching Processor, or VOIP engine. It lights, for example, when the power supply voltage is out of bounds, if the G700 cannot locate a Media Servers, or when the unit is overheating. It also indicates when the system is in Power-up mode, or when a Media Module is resetting.

Alarm Content

Alarms logged by Communication Manager are stored in an alarm log. All alarms include a date and time stamp that reflects the date and time of the sending device. The alarm contains:

- Device type
- Component type
- Device name
- Current ip address
- Additional information necessary for identification of alarm origination
- Severity level to indicate the priority of the alarm

Alarms originating in a specific media server, such as an S8300, have a prefix denoting that of an S8300.

QOS Alarms

An RTCP monitor using the local SNMP agent generates traps to a pre-administered trap collector. The following QoS alarms are generated:

- The **voip-callqos** alarm is generated if a single session exceeds configured QOS levels. It can generate a warning or an SNMP trap. Warnings are used for less severe problems. They can be accumulated internally within Avaya VoIP Monitoring Manager for use by the alarms defined below.
- The **voip-systemqos** alarm is generated if the number of voip-callqos warnings from all terminals exceeds a configured count over a given period (e.g. 100 alarms over 24 hours). The alarm causes a SNMP trap to be sent.
- The **voip-terminalqos** alarm is like the voip-systemqos alarm except it applies to a single terminal. If any one terminal generates a number of voip-callqos warnings that exceed a threshold then the alarm is generated.

Alarm Management

This section describes methods to determine the source of alarms that are generated when an error occurs. The alarm log is viewable and follows that defined in *Maintenance for Avaya DEFINITY® Server R, 555-233-117*. Technicians can view alarms via the Web Interface, CLI, and SAT command-line interface.

SNMP management is a function of the Avaya MultiService Network Manager application. For additional information, including information on event logs and trap logs, please refer to the *Avaya™ P333T User's Guide*.

Alarm management follows the S8700 Media Server Alarming Architecture Design; see *Maintenance for the Avaya™ S8700 Media Server with an Avaya™ SCC1 Media Gateway or an Avaya™ MCC1 Media Gateway, 555-233-143*.

Connection Strategies to a Services Organization

A services organization, such as INADS, receives alarms from the Media Server and connects to the media server for troubleshooting. There are currently two product-connect strategies: dialup modem access and Virtual Private Network (VPN) access over the Internet.

For dialup modem access:

1. Connect a USB modem, connected to a telephone line, to the USB port on the faceplate of the media server.
2. Enable the modem from the media server Web Interface. In addition, use the Setup Modem Interface under the Configure Server pages.
3. With this modem, a client PC uses the Point-to-Point Protocol (PPP) to access the media server and connect via telnet to a Linux shell.
4. Once logged into the media server, you can telnet out to media gateways, such as the G700, and other devices on the network.

NOTE:
Additionally, this modem can be used to allow the media server to call out to the INADS or other alarm receiving system to report alarms. When performing remote diagnostic tests, Services personnel should disable alarm call-outs to INADS to avoid generating unnecessary alarms. Alarm suppression is released after 30 minutes. If you are remotely logged in through the modem you prevent alarms from being sent because you are using the modem, but you do not prevent an alarm noting the absence of alarm reporting service being logged at the alarm receiving site.

The VPN alternative is achieved by the use of the Intelligent Site Manager (ISM) application. The ISM is a VPN gateway that resides on the customer's LAN and provides a means for services personnel to gain access to the customer's LAN in a secure manner over the Internet. Telnet is then used to access the media server and/or media gateways and other IP network equipment.

Alarms in Linux Media Servers

S8700 / S8500 / S8300

A Linux-based media server can be configured so that it serves as the trap collector and provides external alarm notification.

A process called the Global Maintenance Manager (GMM) runs on the media server and collects events that are logged to the Linux syslog_d process. These events consist primarily of failure notification events logged by Communication Manager and INTUITY maintenance subsystems, or of traps sent by media gateways (**G700**). For events that require external notification, one option is to call the Avaya technical service center's INADS (Initialization and Administration System). However, other possible options include sending an e-mail to specified destinations, or sending an SNMP trap to a specified network management address.

The media server has an SNMP trap manager that collects traps from:

- Uploads and downloads to media modules
- VoIP Media Modules
- VoIP engines on G700 motherboards
- G700-associated UPS systems

Media server alarms perform a similar role to Communication Manager alarms in a traditional telephony context. Media Server alarms:

- Comprise related sets of alarms, known as MOs
- Create an internal record of actual or potential problems
- Notify maintenance personnel of a problem

- Help isolate the problem's source
- Point to and facilitate local and remote resolution of a problem

> **NOTE:**
> If a user is logged into a server by an analog modem that is also the server's only alarm-reporting interface, enter **`almsuppress`** to suppress alarm reporting. Otherwise, the other server logs an occurrence of SME Event ID #1 (see SME Alarm in Media Server on page 104).

Clearing Media Server Alarms

A media server is an open standards-based CPU in the ***data***- communications context. Unlike a Communication Manager alarm, which cannot be cleared unless it is also resolved, a server alarm:

- Can be manually cleared from its log, with the **`almclear`** Linux command
- Should not be considered resolved until it is actually repaired

Displaying Media Server Alarms

In following sections, each server alarm is described, and its resolution procedure is provided. Like traditional Communication Manager MOs, the 3-column table for each server MO shows an alarm's:

1 Event ID

2 Severity

3 Definition, probable cause, and troubleshooting procedure

To help isolate a server problem, the 3rd column of these tables begins with quoted text for each event (unlike traditional Communication Manager MOs). The text consists of the verbose (-v) output of the **`almdisplay -v`** Linux command. For example, "interchange hand off failed" is the quoted text for Arbiter's Event ID #3.

If the **`almdisplay`** command returns a failure message, such as:

```
almdisplay: 4: Unable to connect to MultiVantage
```

enter the **`man almdisplay`** Linux command for command-related information.

S8300

Alarming on the S8300 Functioning as a Local Survivable Processor

The S8300 functioning as a Local Survivable Processor (LSP) logs an alarm when it becomes active. It also logs an alarm for every G700 Media Gateway that registers with it. It does NOT log alarms when IP phones register with it; rather, it logs a warning.

Communication Manager Hardware Traps

Table 27, Communication Manager Hardware Traps, on page 74 illustrates hardware traps that apply to Communication Manager.

Table 27: Communication Manager Hardware Traps

Trap	Description
Media Server HW trap	Hardware faults are analyzed by maintenance software and correlate fault conditions to determine the appropriate action. If appropriate action requires attention, a trap of critical severity is sent.
Media Server HW clear trap	Hardware faults that have created traps send a clear trap upon clearing.
Media Server with administered MG that's not registered	If a Media Server has an administered G700 but it has not registered after an appropriate amount of time, send an alarm of major severity indicating such.

NOTE:
The Avaya S8300 Media Server on a G700 Media Gateway platform has several watchdog timers. If any one of them is not verified regularly, a trap of major severity is sent. The timer associated with the S8300 is the S8300 Software watchdog, which resets the S8300 processor if its connection is not verified regularly.

Backup and Restore Traps

The S8300 uses the LAN to backup a copy of its translation data. Table 28, Backup and Restore Traps, on page 75 illustrates the backup and restore traps.

Table 28: Backup and Restore Traps

Trap	Description
successfully stored backup	A trap of informational severity is sent when backup is successful. (REPLY_ACK) The trap reads “Successful backup of S8300 translation data,” and names the backup location stored in the string “BACKUP_LOCATION.” This information also goes to the local maintenance screen, since it is very possible that a backup is being requested as a result of an on-site attempt to replace the S8300.
no backup data stored	A trap of major severity is sent as soon as a REPLY_ERROR message is returned. The trap states “Translation Data backup not available,” and names the backup location stored in the string “BACKUP_LOCATION.”

Linux Media Server MOs and Alarms

Hardware MOs

The server’s hardware MOs are described in the following sections:

- DAJ1 (Duplication Memory Board) on page 85
- RALM-SVC (Remote Alarm Service) on page 103
- USB1 (Modem Testing) Alarms on page 120
- UPS (Uninterruptible Power Supply) on page 114
- Remote Maintenance Board (RSB) Alarms on page 137

Server-related alarms

Server-related alarms and their troubleshooting procedures are described in the following tables:

- DAJ1 Alarms in S8700 Media Server on page 90
- ARB (Arbiter) on page 76
- DUP (Duplication Manager) on page 91
- ENV (Environment) on page 95
- FSY (File Synchronization) on page 100
- NIC (Network Interface Card) on page 102

- SME Alarm in S8700 Media Server on page 104
- SVC_MON (Service Monitor) on page 105
- _TM (Translation Manager) on page 114
- UPS Alarms to the Media Server on page 118
- _WD (Watchdog) Alarms on page 123
- Login Alarms on page 136
- Virtual Alarms on page 136

ARB (Arbiter)

S8700 only

The Arbiter process runs on S8700 Media Servers to:

- Decide which server is healthier and more able to be active
- Coordinate data shadowing between servers, under the Duplication Manager's control

At the physical and data-link layers, an Ethernet-based duplication link provides an interarbiter UDP communication path to:

- Enable this arbitration between the active and standby servers
- Provide the necessary status signaling for memory refreshes

Table 29, ARB Alarms in Media Server, on page 77 describes the Arbiter's alarms and their troubleshooting procedures. See DUP (Duplication Manager) on page 91 for more information.

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
3	MIN	"Interchange hand off failed" — Standby server could not process active server's interchange request. The interchange does not occur, and the active side remains active. **1** See if the standby side is RESET, either from the: — Web interface's **Server** section, by selecting **View Summary Status** — Linux command line, by entering **`server`** **2** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **3** If the problem persists, troubleshoot the standby server. **a** See if the standby side is RESET, either from the: — Web interface's **Server** section, by selecting **View Summary Status** — Linux command line, by entering **`server`** **b** Check for application problems, either from the: — Web interface, by selecting **View Process Status** — Linux command line, by entering **`statapp`**, and restore any applications with problems. **c** Check for problems with an Ethernet interface, either from the: — Web interface, by selecting the **Execute Pingall** diagnostic — Linux command line, by entering **`pingall -a`** Check both sides of each failed link, and make any necessary repairs. **4** If the applications and interfaces are okay **but** the problem persists, escalate the problem.

1 of 9

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
7	MAJ	"Arbiter in invalid/unknown state" — Memory corruption or bad code/build **1** Verify that the server's state is "Corrupt!", either from the: — Web interface's **Server** section, by selecting **View Summary Status** — Linux command line, by entering **`server`** **2** Compare the suspected `arbiter` with the one in `/root2` — using the Linux commands: **`acpfindvers /opt/ws/arbiter`** (This command shows the arbiter's version string.) **`cksum /opt/ws/arbiter`** **`[This command runs a cyclical redundancy check (CRC) against the arbiter, and then shows both the CRC's output value and the number of bytes in the arbiter file.]`** **3** If the two `arbiter` files differ: **d** Get a fresh copy of `arbiter` from the CD. **e** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **4** If the `arbiter` file is OK **or** the problem persists, escalate the problem.
8	MIN	"Both servers thought they were active" **1** To verify this condition, either from the: — Web interface's **Server** section, select **View Summary Status** — Linux command line, enter **`server`** **2** To distinguish the cause, examine the trace logs for Interarbiter messages with timestamps shortly before to shortly after the loss of heartbeat, either from the: — Web interface, by: **a** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **b** Specifying the **Event Range** for the appropriate time frame **c** Matching the **Interarb** pattern — Linux command line, by entering **`logv -t ts`** Depending on the cause, continue with either 3 or 4:

2 of 9

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
8 (cont'd)	MIN	**3** A high-priority process caused the active Arbiter to hang for at least 4.5 seconds (causing an interchange). Then, the hang lifted, and each Arbiter realized that the other had assumed the active role. An automatic resolution process should leave the newly active server active, while the other server backs down to the standby role. **f** If so, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **g** If the problem recurs, escalate the problem. **4** Every Interarbiter link is down or misconfigured. **h** Check for problems with an Ethernet interface, either from the: — Web interface, by selecting the **Execute Pingall** diagnostic — Linux command line, by entering **`pingall -a`** Check both sides of each failed link, and make any necessary repairs. **i** If the links are OK **but** the problem persists, escalate the problem.
9	WRN	<SOH (state-of-health) string> — ***Before*** an interchange, the standby server is ***significantly*** healthier than the active server requesting the interchange. (The active server is probably unable to sustain call processing.) **Understanding ARB Event #9's String Pairs** ARB Event #9 generates pairs of SOH strings, where in each string pair, the: • 1st string represents the active • 2nd string represents the standby server's SOH just ***before*** an interchange. Since – (unless prevented by external circumstances) – Event 9 triggers a server interchange, the 1st string normally represents the less healthy server – which became the standby. So, the 1st string's data is usually more pertinent.

3 of 9

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation

9 (cont'd)	WRN	The following is a sample string pair generated by ARB Event #9. Within this sample, four pairs of digits in each string have special meaning, and are labeled "aa" through "dd."
		`aa bb cc dd`
		`↓↓ ØØ ØØ ØØ`
		`gmm 0700, pcd 00/00, dup 270, wd 81, actv 004`
		`gmm 0700, pcd 06/06, dup 370, wd 01, actv 014`
		• For "aa," any value other than "00" indicates a hardware problem. (For example, the value "20" is common for a power failure.)
		In the previous sample, neither server had hardware trouble.
		• For "bb" and "cc," different values within the ***same*** string indicate a problem connecting to one or more IPSI-connected PNs.
		A PN reset can cause both server's strings to reflect equally degraded health, but that event (in itself) should not trigger a server interchange.
		In the previous sample, both servers' connectivity to IPSI-connected PNs is OK. (The 1st and 2nd strings have like "00" and "06" values, respectively.)
		• For "dd," any value other than "01" indicates a failed software process. (More precisely, a certain value indicates a problem with a discrete portion of the platform's process set, including:
		— "21" for a Linux daemon (for example, "atd", "httpd", "inetd", or "xntpd")
		— "41" for a platform service (for example, "dbgserv", "prune", or "syslog")
		— "81" for reloaded Communication Manager software, as in the previous sample
		Troubleshooting ARB Event #9
		1 Compare the health of both servers, either from the:
		— Web interface's **Server** section, by selecting **View Summary Status**
		— Linux command line, by entering **`server`**
		2 Using the output from 1, check the health of each server's individual processes.
		3 Check the health of the ***active*** server's individual processes, either from the:
		— Web interface, by selecting **View Process Status**
		— Linux command line, by entering **`statapp`**
		and restore any applications with problems.

4 of 9

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
9 (cont'd)	WRN	**4** See if the standby side is RESET, either from the: — Web interface's **Server** section, by selecting **View Summary Status** — Linux command line, by entering **`server`** **5** Check the health of the ***standby*** server's individual processes, either from the: — Web interface, by selecting **View Process Status** — Linux command line, by entering **`statapp`**, and restore any applications with problems. **6** Check for problems with an Ethernet interface, either from the: — Web interface, by selecting the **Execute Pingall** diagnostic — Linux command line, by entering **`pingall -a`** Check both sides of each failed link, and make any necessary repairs. **7** If the standby's applications and interfaces are OK **but** the problem persists, escalate the problem. ***After*** the interchange, the newly active server's health should be significantly better (lower SOH value) than the standby server's. If **so**, troubleshoot the standby server: If **not**: **1** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **2** If the problem recurs, escalate the problem.
11	WRN	"Cannot create receive socket;" "cannot create transmit socket;" "cannot bind receive socket;" "cannot bind send socket" Since the Arbiter continuously attempts to create or bind the socket, the problem may resolve itself. Once resolved, the Arbiter can send and receive across every Interarbiter link (no subsequent error messages in the trace log). **1** Examine the alarm log to distinguish between a: Bind or create problem Send or receive socket problem by accessing either the: — Web interface, by: **d** Selecting **Alarms and Notification** and the appropriate alarm **e** Selecting the **View System Logs** diagnostic

5 of 9

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
11 (cont'd)	WRN	**f** Selecting the **Logmanager Debug** trace **g** Specifying the **Event Range** for the appropriate time frame **h** Matching the "cannot create" pattern — Linux command line, by entering **`almdisplay -v`** **2** Check for both the completeness and consistency of the servers' `hosts` and `servers.conf` files (containing IP addresses of the system's configured components), either from the: — Web interface, by selecting **Configure Server** — Linux command line, by entering: **`more /etc/hosts`** **`more /etc/opt/ecs/servers.conf`** **3** If the files are OK, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **4** If this problem affects call processing **or** if the problem persists, continue with 5 now. If **not**, continue only at the customer's convenience. **5** **Escalate** this problem for explicit guidance with steps 5j through 6 **j** Enter **`server`** to verify that the suspected server is the standby. **k** If **not**, enter **`server -if`** to force a server interchange. **l** Busy out the standby server from the Linux command line, by entering **`server -b`**. **m** Reboot the server (as the standby), either from the: — Web interface, by selecting **Shutdown This Server** — Linux command line, by entering **`shutdown -r now`** **6** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier. ***6 of 9***

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
12	MIN	"Interchange without doing prep" — Since the Arbiter could not create a thread to request a file synchronization, some files did not get shadowed. **1** Examine the trace logs for the entry, `Can't create interchange-prep thread`, either from the: — Web interface by: **i** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **j** Specifying the **Event Range** for the appropriate time frame **k** Matching the "interchange-prep" pattern — Linux command line, by entering **`logv -t ts`** **2** Resubmit any translation changes entered during the last 15-minute file-synchronization interval. **3** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
13	MIN	"Heartbeat timeout from ACTIVE" — When the timeout occurs, this alarm is **only** logged on the standby side. After logging the alarm, the servers **should** have interchanged, so that the: • Alarm normally resides on the newly active (healthier) server • Previously active server has backed down to the standby role **As potential causes, either the:** **Alternate side is in normal shutdown (irregular, but possibly innocuous).** **1** On the standby server, look for occurrences of the **`stop`** command, either from the: — Web interface, by: **l** Selecting **View System Logs** **m** Selecting **Platform command history log** **n** Specifying the **Event Range** for the appropriate time frame **o** Matching the "Stop" pattern — Linux command line, by entering **`listhistory`** **Note:** From the system's perspective, this is normal behavior. However, in terms of potential service outage due to human error, this is quite irregular. Shutting down a server effectively downgrades a duplex-, high-, or critical-reliability system to an unsupported standard-reliability system.

7 of 9

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
13 (cont'd)	MIN	**2** From the Linux command line, enter **`start -a`** to restart the standby server. **3** Prevent any future misuse of the **`stop`** command. **4** Manually clear the alarm on the active server, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **Either the:** • The alternate side is hung (ARB Event 8 is **not** being generated) • Two or more Interarbiter links are down (ARB Event 8 is also being generated) Therefore, **if** the servers **interchanged** (the previously active server backed down to standby), use the following procedure: **1** Check for problems with an Ethernet interface, either from the: — Web interface, by selecting the **Execute Pingall** diagnostic — Linux command line, by entering **`pingall -a`** Check both sides of each failed link, and make any necessary repairs. **n** If the Ethernet interfaces are OK, see if the standby server is busied-out, either from the: — Web interface, by selecting **View Summary Status** — Linux command line, by entering **`server`** **o** If **so**, release the standby server, either from the: — Web interface, by selecting **Release Server** — Linux command line, by entering **`server -r`** If **not**, check for related alarms to troubleshoot the standby. **2** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **3** If the problem persists, escalate the problem.

8 of 9

Table 29: ARB Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
13 (cont'd)	MIN	**If** the servers did **not** interchange, use the following procedure: **1** See if the standby server is busied-out, either from the: — Web interface, by selecting **View Summary Status** — Linux command line, by entering **server** **2** If **so**, release the standby server, either from the: — Web interface, by selecting **Release Server** — Linux command line, by entering `server -r` If **not**, **escalate** this problem for explicit guidance with general troubleshooting of **both** servers.

9 of 9

Back to: Hardware MOs Server-related alarms

DAJ1 (Duplication Memory Board)

S8700 only

This MO supports each S8700 media server's Duplication Memory board, a NIC (network interface card) serving as the physical and data-link interface for an Ethernet-based duplication link between the servers. This link provides a ***call-status data*** path for sending:

- TCP-based communication between each server's Process Manager
- UDP-based communication between each server's Arbiter to:
  - — Enable arbitration between the active and standby servers
  - — Provide status signaling for memory refreshes

NOTE:
This call-status data is separate from the translations and Linux files shadowed between servers. (See FSY (File Synchronization) on page 100.)

(Table 33, DAJ1 Alarms in Media Server, on page 90 describes the DAJ1's alarms and their troubleshooting procedures.) [See also, ARB (Arbiter) on page 76, DUP (Duplication Manager) on page 91, and NIC (Network Interface Card) on page 102.]

Both periodic and on-demand testing is provided for this MO. The periodic test runs the Read Error Register test at 15-minute intervals. On-demand testing includes the Read Error Register and Local Loop tests.

MO's Name (in Alarm Log)	Alarm Level	Initial Linux Command to Run[1]	Full Name of MO
DAJ1	MAJOR	**testdupboard**	Server Dup Mem board
DAJ1	MINOR	**testdupboard**	Server Dup Mem board
DAJ1	WARNING	**testdupboard**	Server Dup Mem board

1 Usage: **testdupboard [-s] | [-l] | [-t *arg*] | [-?]**

no argument Performs "short" test.

-s Short test, performs read_err_reg test,

this is also the default option.

-l Performs "short" tests, and localloop test

-t *arg* Specific test to perform. Possible values for

arg are: read_err_reg | localloop.

-? Usage (this).

Alarm Log Entries

Table 30: DAJ1 Alarm Log Entries

EVENT ID#	Associated Test	Alarm Level	On/Off Board	Linux Test to Clear Value
2 (a)	Read Error Register test (EDC single-bit errors)	WARNING	ON	testdupboard
3 (b)	Read Error Register test (SDRAM multibit errors)	MAJOR	ON	testdupboard
4 (c)	DAJ1 Local Looparound test	MINOR	ON	testdupboard
5 (d)	Read Error Register test (Link Receiver CRC errors)	MINOR	ON	testdupboard
6 (e)	Read Error Register test (Link Receiver CRC errors)	MAJOR	ON	testdupboard

Notes:

a **Event ID #2** Test failed — Error counter query for single-bit EDC (bad error register) on the SDRAM is pegging. If the test detects 20 consecutive failures, the following Warning alarm is logged:

#1,ACT,DAJ1,A,2,WRN,Single-bit EDC test (bad SB err count)

b **Event ID #3** SDRAM has multiple bit errors — The DAJ1 board can also generate this event as an in-line error.

If this test detects a failure, the media server's state of health is lowered to its most critical level, and the following Major alarm is logged:

#1,ACT,DAJ1,A,3,MAJ,DAJ1 SDRAM multibit errors

c **Event ID #4** Looparound test failed — Either a mismatched address or a mismatched bit pattern could have caused a failure.

If this test detects 3 failures, the following Minor alarm is logged:

#1,ACT,DAJ1,A,4,MIN,Local Looparound test failure

d **Event ID #5** Optical Line Receiver experiencing CRC errors — If this test detects 3 failures, the following Minor alarm is logged:

#1,ACT,DAJ1,A,5,MIN,Link Receiver CRC errors

e **Event ID #6** Inability to open a communications link with the DAJ1 board. The board is out of service if this failure occurs once, and a Major alarm is logged:

#1,ACT,DAJ1,A,6,MAJ,Failed to open DAJ1 card

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order shown in. By clearing error codes associated with the first test, you may clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Read Error Register test	X	X	D
DAJ1 Board Local Loop test	X	X	D

1 D = Destructive; ND = Nondestructive

Read Error Register Test

The Read Error Register test queries three registers including the:

- Optical line receiver's CRC error register

  CRC errors indicate problems with the optical interface between the active and standby servers.

- SDRAM's single-bit error register

  Although the DAJ1can "self heal" single-bit errors in the SDRAM's error register, chronic problems can indicate a more serious problem.

- SDRAM's multiple-bit error register

  An SDRAM multiple-bit error condition indicates a problem in the DAJ1 board's memory, and cannot be recovered.

The following errors can be detected:

Table 31: TEST Read Error Register Test

Error Code	Test Result	Description / Recommendation
Open failed to MDD	ABORT	The Memory Duplication Driver (MDD) is the system driver that communicates with the DAJ1 board. If this driver cannot be opened, then the DAJ1 board's registers cannot be read. **1** This is a system type error, try again.
System Error – MDD failed to return data	ABORT	The test ran, but, for some reason the MDD could not return data. **1** This is a system type error, try again.
DAJ1 err count query, code=? ?= 1 to 7	FAIL	Test failed "DAJ1 err count query, code=?" — where "?" indicates which of the DAJ1 board's error counters had positive data. The failure code can be 1–7 and is determined by the bit vector, "0xxx". (Every "x" bit could be set, indicating that every error register had errors.) Specifically, if bit: 1 is set (0xx**1**) – Single-bit errors occurred. 2 is set (0x**1**x) – CRC errors occurred. 3 is set (0**1**xx) – Multibit errors occurred.

DAJ1 Local Loop Test

NOTE:
This is an on-demand test that only runs on the standby media server when it is busied out.

This test runs a local loop-around test on the standby media server's DAJ1 board. A 32-bit data number is written to an address and verified for correct transmission. The test reads the contents of the:

- Last data received registers
- Last address received register

and then compares the data. If the data matches, the test passes. If not, the test fails.

The following errors can be detected:

Table 32: TEST DAJ1 Local Loop Test

Error Code	Test Result	Description / Recommendation
Open failed to MDD	ABORT	The MDD is the system driver that communicates with the DAJ1 board. If this driver cannot be opened, the DAJ1 board's registers cannot be read. This is a system type error, try again.
System Error MDD failed to return data	ABORT	The test ran, but for some reason the MDD could not return data. This is a system type error, try again.
Loop-around test failed	FAIL	The last address received does not match the address that was written, or the last data received does not match the data that was written.

Back to: Hardware MOs Server-related alarms

DAJ1 Alarms in S8700 Media Server

S8700 only

Table 33, DAJ1 Alarms in Media Server, on page 90 describes the DAJ1 MO's alarms and their troubleshooting procedures.

Table 33: DAJ1 Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
2	WRN	"Single-bit EDC test (bad SB err cnt)" — Single-bit SDRAM error occurred 20 times. Software automatically clears the single-bit error register. This is a log-only indication of the error's occurrence. **1** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
3	MAJ	"Multibit EDC Test (bad err register)" — Catastrophic multibit SDRAM error occurred. (Usually due to a hardware problem.) **1** Enter **`testdupboard`** on the Linux command line. **2** If the test fails, **escalate** this problem for explicit guidance with 3 through 5. **3** Power-cycle the server. **4** Enter **`testdupboard`** again. **5** If the test still fails, replace the server.
4	MIN	"Local-loop failure" — On-demand local-loop test failed 3 times. (Cannot read from or write to DAJ1 buffers.) The Localloop test only runs on a busied-out standby server. **1** If the on-demand test is failing (but a running duplicated system has **no** problems), do nothing. If the running duplicated system has problems, continue with 2 **2** Enter **`testdupboard`** on the Linux command line. **3** If the test fails, **escalate** this problem for explicit guidance with 4 through 6. **4** Power-cycle the server. **5** Enter **`testdupboard`** again. **6** If the test still fails, replace the server.

1 of 2

Table 33: DAJ1 Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
5	MIN	"Optical link received CRC errors" — Received multiple CRC errors across the fiber link. **1** Run **`testdupboard`** on both servers. **2** If CRC errors are occurring on both servers, it may be a: • Likely problem with the fiber link • Far less likely problem with both DAJ1 cards If **not**, the other server's DAJ1 card may be faulty. **3** If the running system has duplication-related problems, **escalate** this problem to replace the server. If **not**, ignore the alarm.

2 of 2

Back to: Hardware MOs Server-related alarms

DUP (Duplication Manager)

S8700 only

The Duplication Manager process, via coordination of the Arbiter process, runs on each S8700 Media Server to control data shadowing between them.

At the physical and data-link layers, an Ethernet-based duplication link provides a TCP communication path between each server's Duplication Manager to enable their control of data shadowing.

Table 34, DUP Alarms in Media Server, on page 92 describes the Duplication Manager's alarms and their troubleshooting procedures.

See ARB (Arbiter) on page 76 and DAJ1 (Duplication Memory Board) on page 85 for more information.

Table 34: DUP Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MAJ	"Duplication card error" — Duplication Manager determined that the duplication card is not functioning, but it cannot distinguish between a bad card, an unplugged card, or a bad fiber link. **1** Check the physical fiber connectivity at each server. **2** Verify the alarm, by accessing the trace log, either from the: • Web interface, by: **p** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **q** Specifying the **Event Range** for the appropriate time frame **r** Matching the "dup" pattern • Linux command line, by entering **`logv -t ts`** **3** Examine the trace-log query's output for one of these messages: "glbi: couldn't open Dup Card, errno=<#>. ndm exiting" "glbi: mmap failed, errno=<#>. ndm exiting" "Haven't heard from active dupmgr. Dup fiber link down." "san_check_rsp() FAILED: Dup Fiber link down." **4** See if the dup link is **both** "up" and "refreshed", either from the: • Web interface's **Server** section, by selecting **View Summary Status** • Linux command line, by entering the **`server`** command **5** If **so**, manually clear the alarm, either from the: • Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** • Linux command line, by entering **`almclear -n #id`**

1 of 3

Table 34: DUP Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1 (cont'd)	MAJ	If **not** and at the customer's convenience: Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **p** Force a server interchange to make the suspected server standby, either from the Linux command line, by entering **`server -if`**. **q** Busy out the standby server from the Linux command line, by entering **`server -b`**. **r** Reboot the standby server, either from the: — Web interface, by selecting **Release Server** — Linux command line, by entering **`server -r`** **6** If the problem persists, you can try: **s** Replacing the fiber between the two servers **t** Rebooting the standby server **7** If the problem continues to persist, **escalate** for a probable server replacement.
2	MAJ	"Duplication link down" — One server's Duplication Manager cannot communicate with the other server's Duplication Manager. **1** Access the trace log, either from the: — Web interface, by: **s** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **t** Specifying the **Event Range** for the appropriate time frame **u** Matching the "dup" pattern — Linux command line, by entering **`logv -t ts`** **2** Examine the trace-log query's output for one of these messages: "mainlp: get_addrs returned ***. Could not get IP address for other server. Verify name and address in servers.conf. ndm exiting." "san_check_msg() sync_msg failed: DUPLINK DOWN."

2 of 3

Table 34: DUP Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
2 (cont'd)	MAJ	**3** See if the dup link is "up", either from the: — Web interface's **Server** section, by selecting **View Summary Status** — Linux command line, by entering the **`server`** command **4** If **so**, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If **not**, check the duplication interface's Ethernet connectivity, either from the: — Web interface, by selecting the **Execute Pingall** diagnostic — Linux command line, by entering **`pingall -d`** **5** If **pingall** passes, check the other server's applications, either from the: — Web interface, by selecting **View Process Status** — Linux command line, by entering **`statapp`**

3 of 3

Back to: Hardware MOs Server-related alarms

ENV (Environment)

S8700 / S8300

The ENV MO monitors environmental variables within the server, including temperature, voltages, and fans. Table 35, ENV Alarms in Media Server, on page 95 describes the ENV MO's alarms and their troubleshooting procedures.

Table 35: ENV Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MAJ	"Temperature reached critical low" — Motherboard's temperature reached a critically low level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
2	MIN	"Temperature reached warning low" — Motherboard's temperature reached a warning low. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
3	MIN	"Temperature reached warning high" — Motherboard's temperature reached a warning high. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

1 of 6

Table 35: ENV Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
4 **S8300**	MAJ	"Temperature reached critical high" — Motherboard's temperature reached a critically high level. **1** Look for any obstructions blocking the server's fans. **2** Check for any fan alarms, and clear those alarms. **3** Shut down and restart the system. **4** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **5** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear**. — Linux command line, by entering **`almclear -n #id`**
6	MAJ	"+3.3 voltage reached critical low" — Motherboard's nominal +3.3 voltage reached a critically low level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
8	MAJ	"+3.3 voltage reached critical high" — Motherboard's nominal +3.3 voltage reached a critically high level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

2 of 6

Table 35: ENV Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
10	MAJ	"+5 voltage reached critical low" — Motherboard's nominal +5 voltage reached a critically low level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
12	MAJ	"+5 voltage reached critical high" — Motherboard's nominal +5 voltage reached a critically high level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
14	MAJ	"+12 voltage reached critical low" — Motherboard's nominal +12 voltage reached a critically low level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and Clear — Linux command line, by entering **`almclear -n #id`**

3 of 6

Table 35: ENV Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
16	MAJ	"+12 voltage reached critical high" — Motherboard's nominal +12 voltage reached a critically high level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
18	MAJ	"-12 voltage reached critical low" — Motherboard's nominal -12 voltage reached a critically low level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
20	MAJ	"-12 voltage reached critical high" — Motherboard's nominal -12 voltage reached a critically high level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

4 of 6

Table 35: ENV Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
22	MAJ	"CPU core voltage reached critical low" — Motherboard's CPU core voltage reached a critically low level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
24	MAJ	"CPU core voltage reached critical high" — Motherboard's CPU core voltage reached a critically high level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
26	MAJ	"CPU I/O voltage reached critical low" — Motherboard's CPU I/O voltage reached a critically low level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

5 of 6

Table 35: ENV Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
28	MAJ	"CPU I/O voltage reached critical high" — Motherboard's CPU I/O voltage reached a critically high level. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
29	MAJ	"All fan failure" — Every fan is running at a critically low speed. **1** See if the alarmed condition is still present, either from the: — Web interface, by selecting the **View Temperature/Voltage** diagnostic — Linux command line, by entering **`environment`** **2** If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

6 of 6

Back to: Hardware MOs Server-related alarms

FSY (File Synchronization)

S8700 / S8500

The File Synchronization (FSY) process uses TCP-based communication over 100Base-T Ethernet links to provide synchronized duplication of critical data-shadowed files, including translations and important Linux files.

NOTE:
This set of files is separate from the data shadowed between each server's DAJ1 (Duplication Memory Board) on page 85.

Table 36, FSY Alarm in Media Server, on page 101 describes the FSY MO's alarms and their troubleshooting procedures.

Table 36: FSY Alarm in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MIN	"File sync failed" — File synchronization operation failed. **1** See if the filesyncd (file sync daemon) process is up, either from the: — Web interface, by selecting **View Process Status** — Linux command line, by entering **`statapp`** **2** Check the trace log for more granular information. (The file sync daemon can report failures of synchronizing one or more files.) Access the trace log, either from the: — Web interface, by: **v** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **w** Specifying the **Event Range** for the appropriate time frame **x** Matching the "file sync failed" pattern — Linux command line, by entering **`logv -t ts`** **3** (Except **S8500**) Verify that the dup link is **both** "up" and "refreshed", either from the: • Web interface's **Server** section, by selecting **View Summary Status** • Linux command line, by entering the **`server`** command (Neither side should be "off-line" nor "down".) **4** (Except **S8500**) Make sure that the Ethernet duplication link is up, either from the: — Web interface, by selecting the **Execute Pingall** diagnostic — Linux command line, by entering **`pingall -a`** If **not**, check each side of this failed link, and make any necessary repairs. **5** (Except **S8500**) Check the physical fiber connectivity at each server to verify that this alarm is not a consequence of other duplication-related problems. **6** If the problem persists, escalate the problem.

Back to: Hardware MOs Server-related alarms

NIC (Network Interface Card)

S8700 / S8500

This MO supports the NICs in each S8700 media server providing the physical and data-link interfaces for Ethernet-based links.

Table 37, NIC Alarms in Media Server, on page 102 describes NIC's alarms and their troubleshooting procedures. See DAJ1 (Duplication Memory Board) on page 85 for more information.

Table 37: NIC Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MIN	"eth0 NIC Link is Down" — Ethernet link on native NIC 0 is down. **1** Verify Ethernet connectivity, either from the: — Web interface, by selecting the **Execute Pingall** diagnostic — Linux command line, by entering **`pingall -a`** Check both sides of each failed link, and make any necessary repairs. **2** If the ping test fails, check the physical connections of NIC 0's Ethernet cable. If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
2	MIN	"eth1 NIC Link is Down" — Ethernet link on native NIC 1 is down. **1** Verify Ethernet connectivity, either from the: — Web interface, by selecting the **Execute Pingall** diagnostic — Linux command line, by entering **`pingall -a`** Check both sides of each failed link, and make any necessary repairs. **2** If the ping test fails, check the physical connections of NIC 0's Ethernet cable. If not, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and "Clear" — Linux command line, by entering **`almclear -n #id`**

Back to: Hardware MOs Server-related alarms

RALM-SVC (Remote Alarm Service)

S8700 only

For the RALM-SVC MO, maintenance software performed special periodic testing every 60 seconds.

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
RALM-SVC	MAJOR	None	Remote Alarm Service
RALM-SVC	MAJOR	None	Remote Alarm Service

Alarm Log Entries

These tests verify that the standby media server's components are operating correctly.

Table 38: RALM-SVC Alarm Log Entries

EVENT ID#	Aux Data	Associated Test	Alarm Level	On/Off Board	Linux Test to Clear Value
1 (a)		SME_ARB test	MAJOR	ON	`testdupboard`
2 (b)		Standby_PN Check test	MAJOR	ON	`testdupboard`

Notes:

a **Event ID #1** SME_ARB test failed — This test determines the other server's alarm-generation capability by querying the local server's Arbiter to report on the other server's Remote Alarm Service functionality. Both media servers must have their own alarm-generation utilities. If the test fails 3 consecutive times, the following Major alarm is logged:

#1,ACT,SME,A,1,MAJ,Far-end alarm service is down

b **Event ID #2** Standby_PN_Check test failed — This periodic test:

1. Queries the standby media server about its PNs' state of health
2. Compares the acquired information to an administered value

A failure indicates that a mismatch occurred and that the standby media server is out of sync. If this test fails 2 consecutive times, the following Major alarm is logged:

#1,ACT,SME,A,2,MAJ,Standby Port-Network check failed

System Technician-Demanded Tests: Descriptions and Error Codes

This MO provides no on-demand tests for system technicians.

Back to: Hardware MOs Server-related alarms

SME Alarm in S8700 Media Server

Table 39, SME Alarm in Media Server, on page 104 describes the SME alarm (for RALM-SVC (Remote Alarm Service) and its troubleshooting procedures.

Table 39: SME Alarm in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MAJ	"Far-end alarm service is down" — No remote alarm service is available since the other server is unable to report alarms — due to a failure of either the GMM or administered reporting mechanisms (SNMP and/or modem). **1** Look for any GMM failures on the **other** server, either using the: — Web interface, by selecting **Diagnostics > View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** If a GMM failure was found: **u** See if the GMM application is up, either from the: **—** Web interface, by selecting **View Process Status** **—** Linux command line, by entering **`statapp`** **v** If so, continue with 3. If **not**, try to restart this application by entering **`start -s GMM`** on the Linux command line. **w** If the GMM application successfully restarts, continue with 4. If **not**, **escalate** the problem to the next higher tier. **3** If a GMM failure was **not** found, see if alarm reporting failed by looking in the trace log for a string that includes "snd2Inads", either from the: — Web interface, by: **y** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **z** Specifying the "Event Range" for the appropriate time frame **aa** Matching the "snd2Inads" pattern — Linux command line, by entering **`logv -t ts`** **4** Test the administered reporting mechanisms, by entering **`testinads`** on the Linux command line. **5** Once the alarm is resolved, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

Back to: Hardware MOs Server-related alarms

SVC_MON (Service Monitor)

S8700 / S8500

SVC_MON is a media server process, started by Watchdog, to monitor Linux services and daemons. It also starts up threads to communicate with a hardware-sanity device.

Table 40, SVC_MON Alarms in Media Server, on page 106 describes the SVC_MON MO's alarms and their troubleshooting procedures.

[For information about Watchdog, see also Watchdog and applications on page 124 in *Maintenance Procedures (555-245-103)*. For alarm-related information about Watchdog, see _WD (Watchdog) Alarms on page 123.

Table 40: SVC_MON Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MIN	"service atd could not be restarted" — The Linux at daemon is down. Scheduled services such as session cleanup or daily filesync will not work. **1** Enter **`service atd restart`** to restart the at daemon. **2** If the daemon restarts, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If not, **escalate** this problem for explicit guidance with steps 2x through 3 **x** Enter **`grep svc_mon /var/log/messages`** to investigate why the daemon failed. **CAUTION:** Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **y** If the **`grep`** command's output does not help: • **S8700**: enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. • **S8500**: Proceed to Step d. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **z** **S8700**: Reboot the standby server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **aa** **S8500**: Reboot the server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **3** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier.

1 of 8

Table 40: SVC_MON Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
2	MIN	"service crond could not be restarted" — The Linux cron daemon is down. Periodic services such as session cleanup or daily filesync will not work. **1** Enter **`service cron restart`** to restart the cron daemon. **2** If the daemon restarts, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If not, **escalate** this problem for explicit guidance with steps 2ab through 3 **ab** Enter **`grep svc_mon /var/log/messages`** to investigate why the daemon failed. Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **ac** If the **`grep`** command's output does not help: • **S8700**: enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. • **S8500**: Proceed to Step d. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **ad** **S8700**: Reboot the standby server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **ae** **S8500**: Reboot the server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **3** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier. ***2 of 8***

Table 40: SVC_MON Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
3	MIN	"service inet could not be restarted" — The Linux internet server daemon is down. Networking services will not work. **1** Enter **`service inet restart`** to restart the inet daemon. **2** If the daemon restarts, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If **not**, **escalate** this problem for explicit guidance with steps 2af through 3 **af** Enter **`grep svc_mon /var/log/messages`** to investigate why the daemon failed. **ag** If this problem affects call processing, continue with the following steps now. If **not**, continue only at the customer's convenience – since the following commands cause a brief service outage. The following commands cause a brief service outage. **ah** If the **`grep`** command's output does not help: • **S8700**: enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. • **S8500**: Proceed to Step e. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **ai** **S8700**: Reboot the standby server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **aj** **S8500**: Reboot the server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **3** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier.

3 of 8

Table 40: SVC_MON Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
4	MIN	"service syslog could not be restarted" — Linux "syslog" service is down. Event logging to syslog and alarm generation will fail. **1** Enter **`service syslog restart`** to restart the syslog service. **2** If the service restarts, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If not, **escalate** this problem for explicit guidance with steps 2ak through 3 **ak** Enter **`grep svc_mon /var/log/messages`** to investigate why the daemon failed. Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **al** If the **`grep`** command's output does not help: • **S8700**: enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. • **S8500**: Proceed to Step d. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **am** **S8700**: Reboot the standby server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **an** **S8500**: Reboot the server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **3** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier. ***4 of 8***

Table 40: SVC_MON Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
5	MIN	"service xntpd could not be restarted" — The Linux network time protocol daemon is down. The server's clock and recently logged time stamps may be inaccurate. **1** Enter **`service xntpd restart`** to restart the xntpd daemon. **2** If the daemon restarts, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If not, **escalate** this problem for explicit guidance with steps 2ao through 3 **ao** Enter **`grep svc_mon /var/log/messages`** to investigate why the daemon failed. **ap** If this problem affects call processing, continue with the following steps now. If **not**, continue only at the customer's convenience – since the following commands cause a brief service outage. The following commands cause a brief service outage. **aq** If the **`grep`** command's output does not help: • **S8700**: enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. • **S8500**: Proceed to Step e. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **ar** **S8700**: Reboot the standby server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **as** **S8500**: Reboot the server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **3** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier.

5 of 8

Table 40: SVC_MON Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
6	MIN	"service dbgserv could not be restarted" — Debug server is down, and Gemini debugger may not work. Although losing this service does not affect operations, the debugging of a running system is prevented. **1** Enter **`service dbgserv restart`** to restart the dbgserv service. **2** If the service restarts, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If not, **escalate** this problem for explicit guidance with steps 2at through 3 **at** Enter **`grep svc_mon /var/log/messages`** to investigate why the daemon failed. Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **au** If the **`grep`** command's output does not help: • **S8700**: enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. • **S8500**: Proceed to Step d. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **av** **S8700**: Reboot the standby server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **aw** **S8500**: Reboot the server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **3** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier. ***6 of 8***

Table 40: SVC_MON Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
7	MIN	"service prune could not be restarted" — The prune service is not running. The hard disk's partition usage is not being monitored or cleaned. **1** Enter **`service prune restart`** to restart the prune service. **2** If the service restarts, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If not, **escalate** this problem for explicit guidance with steps 2ax through 3 **ax** Enter **`grep svc_mon /var/log/messages`** to investigate why the daemon failed. **ay** If this problem affects call processing, continue with the following steps now. If **not**, continue only at the customer's convenience – since the following commands cause a brief service outage. The following commands cause a brief service outage. **az** If the **`grep`** command's output does not help: • **S8700**: enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. • **S8500**: Proceed to Step e. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **ba** **S8700**: Reboot the standby server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **bb** **S8500**: Reboot the server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **3** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier. ***7 of 8***

Table 40: SVC_MON Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
8	MIN	"service httpd could not be restarted" — The hypertext transfer protocol daemon is down. The Web interface will not work. **1** Enter **`service httpd restart`** to restart the http daemon. **2** If the daemon restarts, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** If not, **escalate** this problem for explicit guidance with steps 2bc through 3 **bc** Enter **`grep svc_mon /var/log/messages`** to investigate why the daemon failed. Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **bd** If the **`grep`** command's output does not help: • **S8700**: enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. • **S8500**: Proceed to Step d. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **be** **S8700**: Reboot the standby server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **bf** **S8500**: Reboot the server, either from the: • Web interface, by selecting **Shutdown This Server** • Linux command line, by entering **`shutdown -r now`** **3** If rebooting the standby does not help **or** if the problem recurs, escalate the problem to the next higher tier.

8 of 8

Back to: Hardware MOs Server-related alarms

_TM (Translation Manager)

S8700 / S8500 / S8300

The _TM MO is an S8700 Media Server that monitors the server's ability to read Communication Manager translations. Table 41, _TM Alarm in Media Server, on page 114 describes the _TM MO's alarm and its troubleshooting procedures.

Table 41: _TM Alarm in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MAJ	"Cannot read translations" — Server could not read translations. Usually, indicates a failure loading translations, but can also infrequently occur on a running system. **S8700**: The servers spontaneously interchange. **S8500**: The server reboots. **1** Check the integrity of the translation files xln1 and xln2 in /etc/opt/defty, and verify that they are of the same non-zero length. **2** Enter the Linux command **`cksum`** to verify the checksum of the files. **3** **S8700**: Copy the translation files from the backup or the other server. **4** **S8500**: Copy the translation files from the backup. **5** If 1 to 3 do not help, load the system with null translations. **6** If the system comes up, this is probably a translation problem. If **not**, escalate the problem. **7** Once resolved, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

Back to: Hardware MOs Server-related alarms

UPS (Uninterruptible Power Supply)

S8700 / S8500 / S8300

The UPS MO supports the UPS device for each media server. This MO's maintenance software reacts to UPS-generated in-line errors via SNMP traps.

NOTE:
This MO provides no periodic or on-demand tests.

UPS Traps to Media Server

Table 42, Enterprise-Specific UPS Traps to Server, on page 115 contains the various UPS-generated SNMP traps to the media server.

Table 42: Enterprise-Specific UPS Traps to Server

SNMP Trap from UPS	Event ID	Definition of Trap
Trap (1)	#6 (1–8)	Alarm string = #1, ACT, UPS, A, 6, MAJ, power failure: Shutting down in 6 minutes. If the Event ID is 6, the UPS battery's power is in a critically low condition, with an estimated 6 minutes of remaining holdover. • A warning is written to every logged-in user of the server. • When 6 minutes elapse, the server begins shutting down. (For troubleshooting procedures, see Events #1–8 on page - 118.)
Trap (1)	#7 (1–8)	Alarm string = #1, ACT, UPS, A, 7, MAJ, power failure: Shutting down in 7 minutes. The UPS battery's power is in a critically low condition, with an estimated 7 minutes of remaining holdover. • A warning is written to every logged-in user of the server. • When 7 minutes elapse, the server begins shutting down. (For troubleshooting procedures, see Events #1–8 on page - 118.)
Trap (1)	#8 (1–8)	Alarm string = #1, ACT, UPS, A, 8, MAJ, power failure: Shutting down in 8 minutes. The UPS battery's power is in a critically low condition, with an estimated 8 minutes of remaining holdover. • A warning is written to every logged-in user of the server. • When 8 minutes elapse, the server begins shutting down. (For troubleshooting procedures, see Events #1–8 on page - 118.)
Trap (3) upsAlarmShutdownPending	#12	Alarm string = #1, ACT, UPS, A, 12, WRN, Miscellaneous trap, e.g., bad battery. (For troubleshooting procedures, see Event #12 on page - 118.)

1 of 3

Table 42: Enterprise-Specific UPS Traps to Server

SNMP Trap from UPS	Event ID	Definition of Trap
Trap (3)[1] upsAlarmShutdownImminent	#13	Alarm string = #1,ACT, UPS, A, 13, MAJ, Miscellaneous trap, e.g., bad battery. (For troubleshooting procedures, see Event #13 on page - 118.)
Trap (3)[1] upsAlarmDepletedBattery	#14	Alarm string = #1,ACT,UPS,A,14,MAJ,Miscellaneous trap, e.g., bad battery. (For troubleshooting procedures, see Event #14 on page - 118.)
Trap (3)[1] upsAlarmBatteryBad	#15	Alarm string = #1,ACT,UPS,A,15,MIN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #15 on page - 118.)
Trap (3) upsAlarmInputBad	#16	Alarm string = #1,ACT,UPS,A,16,MIN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #16 on page - 118.)
Trap (3) upsAlarmTempBad	#17	Alarm string = #1,ACT,UPS,A,17,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #17 on page - 118.)
Trap (3) upsAlarmCommunicationsLost	#18	Alarm string = #1,ACT,UPS,A,18,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #18 on page - 119.)
Trap (3) upsAlarmBypassBad	#19	Alarm string = #1,ACT,UPS,A,19,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #19 on page - 119.)
Trap (3) upsAlarmLowBattery	#20	Alarm string = #1,ACT,UPS,A,20,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #20 on page - 119.)
Trap (3) upsAlarmUpsOutputOff	#21	Alarm string = #1,ACT,UPS,A,21,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #21 on page - 119.)
Trap (3) upsAlarmOutputBad	#22	Alarm string = #1,ACT,UPS,A,22,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #22 on page - 119.)

2 of 3

Table 42: Enterprise-Specific UPS Traps to Server

SNMP Trap from UPS	Event ID	Definition of Trap
Trap (3) upsAlarmOutputOverload	#23	Alarm string = #1,ACT,UPS,A,23,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #23 on page - 119.)
Trap (3) upsAlarmChargerFailed	#24	Alarm string = #1,ACT,UPS,A,24,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #24 on page - 119.)
Trap (3) – upsAlarmFanFailure	#25	Alarm string = #1,ACT,UPS,A,25,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #25 on page - 120.)
Trap (3) – upsAlarmFuseFailure	#26	Alarm string = #1,ACT,UPS,A,26,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #26 on page - 120.)
Trap (3) – upsAlarmGeneralFault	#27	#1,ACT,UPS,A,27,WRN,Miscellaneous trap, e.g., bad battery (For troubleshooting procedures, see Event #27 on page - 120.)

3 of 3

1. These events will degrade the server's state of health.

System Technician-Demanded Tests: Descriptions and Error Codes

This MO provides no on-demand tests for system technicians.

Back to: Hardware MOs Server-related alarms

UPS Alarms to the Media Server

S8700 / **S8500** / **S8300**

Table 43, UPS Alarms to the Media Server, on page 118 describes the server's UPS-related alarms and their troubleshooting procedures.

Table 43: UPS Alarms to the Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1–8	MAJ	"upsEstimatedMinutesRemaining" — UPS does not have an AC-power source. **1** Restore AC power to the UPS.
12	MAJ	"upsAlarmShutdownPending" — A shutdown-after-delay countdown is underway (i.e., the UPS has been commanded off). **1** Stop countdown timer. (Can be done via SNMP messages.)
13	MAJ	"upsAlarmShutdownImminent" — The UPS will turn off power to the load in < 5 seconds. **1** Restore AC power to the UPS.
14	MAJ	"upsAlarmDepletedBattery" — If primary power is lost, the UPS could not sustain the current load. **1** Charge or replace the batteries in the UPS, according to procedures in its *Site Preparation, Installation, and Operator's Manual, 167-405-035*.
15	MAJ	"upsAlarmBatteryBad" — One or more batteries needs to be replaced. **1** Replace any defective batteries in the UPS, according to procedures in its *Site Preparation, Installation, and Operator's Manual, 167-405-035*.
16	MIN	"upsAlarmInputBad" — An input condition is out of tolerance. **1** Provide appropriate AC power to the UPS.
17	MIN	"upsAlarmTempBad" — The internal temperature of a UPS is out of tolerance. (On the UPS, the "over temperature" alarm indicator flashes, and the UPS changes to Bypass mode for cooling. Either: **1** Look for and remove any obstructions to the UPS's fans. **2** Wait at least 5 minutes, and restart the UPS. **3** Check for and resolve any fan alarms (Event ID 25) against the UPS. **4** Either: • Change (increase or decrease) the environment's temperature. • Change the alarming thresholds.

1 of 3

Table 43: UPS Alarms to the Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
18	MIN	"upsAlarmCommunicationsLost" — The SNMP agent and the UPS are having communications problems. (A UPS diagnosis may be required.) **1** Behind the UPS in its upper left-hand corner, verify that an SNMP card (with an RJ45 connector) resides in the UPS — instead of a serial card with DB9 and DB25 connectors. **2** Verify that the server is physically connected to the UPS via the RJ45 connector. **3** Verify that the SNMP card is properly administered according to the procedures in its users guide, provided by the vendor. **4** If necessary, replace the SNMP card in the UPS. **5** If the problem persists, replace the UPS, and diagnose it later.
19	WRN	"upsAlarmBypassBad" — The "source" power to the UPS, which (during a UPS overload or failure) also serves as "bypass" power to the load, is out of tolerance — incorrect voltage by > ±12% or frequency > ±3%. This on-line UPS normally regenerates its source power into clean AC power for the load. However, the source power's quality is currently unacceptable as bypass power to the load). **1** Verify that the UPS expects the correct "nominal input voltage" from its power source. **2** If **so**, restore acceptable AC power to the UPS. If **not**, reconfigure the UPS to expect the correct voltage, according to procedures in its *Site Preparation, Installation, and Operator's Manual, 167-405-035*.
20	WRN	"upsAlarmLowBattery" — The battery's remaining run time ≤ specified threshold. **1** Restore AC power to the UPS.
21	WRN	"upsAlarmUpsOutputOff" — As requested, UPS has shut down output power. The UPS is in Standby mode. **1** Turn on output power. (Can be done via SNMP messages.)
22	WRN	"upsAlarmOutputBad" — A receptacle's output is out of tolerance. (A UPS diagnosis is required.) **1** Replace the UPS, and diagnose it later.
23	WRN	"upsAlarmOutputOverload" — The load on the UPS exceeds its output capacity. The UPS enters Bypass mode. **1** Reduce the load on the UPS. **2** Verify that the UPS returns to Normal mode.
24	WRN	"upsAlarmChargerFailed" — The UPS battery charger has failed. (A UPS diagnosis is required.) **1** Replace the UPS, and diagnose it later.

2 of 3

Table 43: UPS Alarms to the Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
25	WRN	"upsAlarmFanFailure" — One or more UPS fans have failed. Unless lightly loaded, the UPS enters Bypass mode. **1** Replace the UPS, and diagnose it later.
26	WRN	"upsAlarmFuseFailure" — One or more UPS fuses have failed. **1** Replace the UPS, and diagnose it later.
27	WRN	"upsAlarmGeneralFault" — A general fault occurred in the UPS. (A UPS diagnosis is required.) **1** Replace the UPS, and diagnose it later.

3 of 3

This MO provides periodic and on-demand testing. The periodic test runs the "handshake" test every 15 minutes. The on-demand tests include the "handshake", "off-hook", and "reset_usb" tests.

Hardware MOs ***Server-related alarms***

USB1 (Modem Testing) Alarms

S8700 / S8500

This MO provides periodic and on-demand testing. The periodic test runs the "handshake" test every 15 minutes. The on-demand tests include the "handshake", "off-hook", and "reset_usb" tests.

MO's Name (in Alarm Log)	Alarm Level	Initial Linux Command to Run	Full Name of MO
USB1	MAJOR	**testmodem**	USB Port Modem Testing
USB1	MINOR	**testmodem**	USB Port Modem Testing
USB1	WARNING	**testmodem**	USB Port Modem Testing

Usage: **testmodem [-s] | [-l] | [-t *arg*] | [-?]**	
no argument	Performs "short" test.
`-s`	Short test, performs handshake and off-hook tests this is also the default option.
`-l`	Performs "long" tests.
`-t` *arg*	Specific test to perform. Possible values for arg are: reset_usb | handshake | off-hook |
`-?`	Usage (this).

Alarm Log Entries

Table 44: USB1 Alarm Log Entries

EVENT ID#	Aux Data	Associated Test	Alarm Level	On/Off Board	Linux Test to Clear Value
1 (a)		Handshake test	MINOR	ON	`testdupboard`
2 (b)		Modem Off-Hook test	MAJOR	ON	`testdupboard`

Notes:

a **Event ID #1** Handshake Test failed — With 3 consecutive failures of either the periodic or on-demand test, the following Minor alarm is logged:

```
#1,ACT,USB1,A,1,MIN,USB Modem handshake test failed
```

b **Event ID #2** Modem Off-Hook test failed — With 3 consecutive failures of this test, the following Major alarm is logged:

```
#1,ACT,USB1,A,2,MAJ,USB Modem Off-Hook test failed
```

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table. For example, by clearing error codes associated with the Handshake test, you may also clear errors generated by other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Handshake test	X	X	D
Off-Hook test	X	X	D
Reset USB test	X	X	D

1 D = Destructive; ND = Nondestructive

Handshake Test

This test is **destructive**.

This test verifies that modem's hardware is attached and that the modem can "handshake" with the USB port. The test:

1 Tries to open the device

2 Sends a handshake string (ATZ) to the modem

The modem should return an "OK" string.

The following errors can be detected:

Table 45: TEST Handshake Test

Error Code	Test Result	Description / Recommendation
Modem in use, try again later	ABORT	Another application is currently using the modem. Try again later.
Could not open USB port	ABORT	System error: An attempt to open the USB device failed. **1** Retry the test in about 5 minutes. **2** If the test still fails, escalate the problem.
Read error, could not run test	ABORT	After the ATZ is sent, a read of the USB device is done. If the read fails, a probable system error aborted the test. **1** Retry the test in about 5 minutes. **2** If the test still fails, escalate the problem.
Modem Handshake test failed	FAIL	The modem did not return an “OK” string within a 15-second interval.

Off-Hook Test

This test is **destructive**.

This test runs an off-hook test for the modem attached to the USB port on the server. The test sends an ATH1 string to check that a line is connected to the modem. The following errors can be detected:

Table 46: TEST Off-Hook Test

Error Code	Test Result	Description / Recommendation
Modem in use, try again later	ABORT	Some other application is currently using the modem. Try again later.
Could not open USB port	ABORT	System error: An attempt to open the USB device failed. Try again later
Read error, could not run test	ABORT	After the ATZ is sent, a read of the USB device is done. If the read fails, a probable system error aborted the test. Try again.
Modem Off-Hook test failed	FAIL	Modem Off-Hook test failed: The modem did not return an “OK” string within a 15-second interval. This indicates that dial tone was not detected in the allotted time.

Reset USB Test

This test is **destructive**.

This test causes the modem to be reset, even if the modem is in use. Although no failures are produced by this test, the following error can be detected:

Table 47: TEST Reset USB

Error Code	Test Result	Description / Recommendation
Could not open USB port	ABORT	System error: An attempt to open the USB device failed. Try again later.

Back to: Hardware MOs Server-related alarms

_WD (Watchdog) Alarms

S8700 / S8500 / S8300

The Watchdog MO is a media server process that:

- Creates other Communication Manager processes
- Monitors their sanity
- Can recover their failures

These applications come up and start heartbeats to the Watchdog. For more information about Watchdog, see Watchdog and applications on page 124 in *Maintenance Procedures (555-245-103)*. Table 48, _WD Alarms in Media Server, on page 124 describes the _WD MO's alarms and their troubleshooting procedures.

Watchdog also starts up a script to monitor Linux services and daemons, and threads to communicate with a hardware-sanity device. For alarm-related information about these services, daemons, and threads, see SVC_MON (Service Monitor) on page 105.

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
4 **S8300**	MAJ	"Application <name> (pid) TOTALLY FAILED" — An application is present, but not launching. The application could not start the maximum allowed number of times. (This alarm usually occurs with Event ID #20.) **1** To verify the alarm, look for the application's name or process ID (PID)," either using the: — Web interface, by selecting **`Diagnostics`** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** If the application is down, enter **`start -s application`** to start the application. **3** If the application comes up, continue with 7. If **not**, check the trace log to further investigate why the application fails, either from the: — Web interface by: **ab** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **ac** Specifying the **Event Range** for the appropriate time frame **ad** Matching the application's PID as the pattern — Linux command line, by entering **`logv -t ts`** Look for a related core-dump file in `/var/crash`, and **escalate** for an analysis of this file. **4** Verify that the executable file named in the log exists and is executable. To locate the application's executable file, enter the Linux command: **`ls -l /opt/ecs/sbin/`*`appl`*** If the executable is present, Linux returns a symbolic link to its location.

1 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
4 (cont'd)	MAJ	**5** If **so** (**less** common): **bg** Enter **`ls -l`** on the symbolic link's address. **bh** Verify that the executable has "execution" permissions. **bi** If not, enter **`chmod +x`** to enable execution of the application. If **not** — Linux has returned a "null link" (**more** common): — Acquire the executable from the CD. **6** Enter **`start -s application`** to start the application. **7** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **8** If the problem recurs, escalate the problem.

2 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
5	MIN	"WARNING: timeout waiting for reqsvr to initialize" — During each server's boot process, the server's Watchd process waits up to 2 minutes for its "reqsvr" (request server) thread to initialize. If the 2-minute waiting interval elapses, this server logs this alarm, and its boot process hangs. (Meanwhile, if the other server is already booted or subsequently boots, it assumes the active role.) In that (when this alarm occurs) a server hangs during its booting process, this alarm's external symptoms resemble those of two other _WD alarms, #13 (Except S8500) and #14 (Except S8500). Therefore, carefully discriminate between these three events. **1** To inspect the symptoms of this problem, verify that the: **bj** Linux OS and the Web interface are **up** (including the commands: **`telnet`**, **`statapp`**, **`server`**, **`logv`**, **`cat`**, **`grep`**, **`tail`**, **`vi`**, etc.) **bk** Watchdog application is **partially up**, but **no** other Communication Manager software is up **bl** The **`almdisplay`** command displays **no** alarms. Instead, the command returns the message: "`almdisplay: 4: Unable to connect to MultiVantage`" Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **2** **Escalate** this problem for explicit guidance with the following steps. **3** Enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **4** Reboot the standby server, either from the: — Web interface, by selecting **Shutdown This Server** — Linux command line, by entering **`shutdown -r now`** **5** Once the standby server has booted, verify that Event ID #5 was logged, either using the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **6** If rebooting the server does not help **or** if the problem recurs, escalate the problem to the next higher tier.

3 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
6 **S8300**	MAJ	"Application <name> (pid) not started, config parm errors" — Watchdog cannot read its configuration file, `/etc/opt/ecs/watchd.conf`. **1** To verify the alarm, look for the application's name or process ID (PID), either using the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** Get a fresh copy of `watchd.conf` from the CD. **3** Enter **`start -s application`** to start the application. **4** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**
7 **S8300**	MAJ	"Application <name> not started, parm file errors" — Since an application's specified location in `watchd.conf` is incorrect, Watchdog cannot start the application. **1** To verify the alarm, look for the application's or process ID (PID), either using the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** Verify that the executable file named in the log exists and is executable. To locate the application's executable file, enter the Linux command: **`ls -l /opt/ecs/sbin/`*`appl`*** If the executable is present, Linux returns a symbolic link to its location. **3** If **so** (**less** common): **bm** Enter **`ls -l`** on the symbolic link's address. **bn** Verify that the executable has "execution" permissions. **bo** If not, enter **`chmod +x`** to enable execution of the application. If **not** — Linux has returned a "null link" (**more** common): — Acquire the executable from the CD. **4** Verify that the string in `watchd.conf` is correct. **5** Enter **`start -s application`** to start the application. **6** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

4 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
13 (Except **S8500**)	MIN	"ERROR: could not dup socket fd in reqsvr.c, heartbeat thread not created, errno=<x>" — As either a: • Booting application initiates • Restarting application **re**initiates heartbeating with Watchdog (see Event ID #5), the "reqsvr" (request server) thread tries to create a duplicate socket for the hearbeating thread. This alarm indicates that reqsvr could not create the socket. (Meanwhile, if the other server is already started or subsequently starts, it assumes the active role.) In that (when this alarm occurs) a server hangs, this alarm's external symptoms resemble those of two other _WD alarms, #5 and #14 (Except S8500). Therefore, carefully discriminate between these three events. **1** To inspect the symptoms of this problem, verify that the: **bp** Linux OS and the Web interface are **up** (including the commands: **`telnet`**, **`statapp`**, **`server`**, **`logv`**, **`cat`**, **`grep`**, **`tail`**, **`vi`**, etc.) **bq** Watchdog application is **partially up**, and **some** other Communication Manager processes may be up, either using the: — Web interface, by selecting **View Process Status** — Linux command line, by entering **`statapp`** **br** If the GMM process is up, the **`almdisplay -v`** command shows Event #13's message string. If **not**, the Watchdog log shows the message string, either using the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **2** **Escalate** this problem for explicit guidance with the following steps. **3** Enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **4** Reboot the standby server, either from the: — Web interface, by selecting **Shutdown This Server** — Linux command line, by entering **`shutdown -r now`** **5** If rebooting the server does not help **or** if the problem recurs, escalate the problem to the next higher tier.

5 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
14 (Except **S8500**)	MIN	"ERROR in req2svr.p trying to create heartbeat thread, errno=<x>" — After the "reqsvr" (request server) creates a duplicate socket (see Event ID #13 (Except S8500)), it tries to create a heartbeating thread. This alarm indicates that reqsvr could not create the thread. (Meanwhile, if the other server is already started or subsequently starts, it assumes the active role.) In that (when this alarm occurs) a server hangs, this alarm's external symptoms resemble those of two other _WD alarms, #5 and #13 (Except S8500). Therefore, carefully discriminate between these three events. **1** To inspect the symptoms of this problem, verify that the: **bs** Linux OS and the Web interface are **up** (including the commands: **`telnet`**, **`statapp`**, **`server`**, **`logv`**, **`cat`**, **`grep`**, **`tail`**, **`vi`**, etc.) **bt** Watchdog application is **partially up**, but **all** other Communication Manager processes are up, either using the: — Web interface, by selecting **View Process Status** — Linux command line, by entering **`statapp`** **bu** The **`almdisplay -v`** command shows Event #14's message string Since the following commands cause a brief service outage, they should only be executed at the customer's convenience. **2** **Escalate** this problem for explicit guidance with the following steps. **3** Enter **`server`** to verify that the suspected server is the standby. If necessary **and** at the customer's convenience, enter **`server -if`** to force a server interchange. **4** Reboot the standby server, either from the: — Web interface, by selecting **Shutdown This Server** **5** If rebooting the server does not help **or** if the problem recurs, escalate the problem to the next higher tier. ***6 of 12***

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
15 **S8300**	MAJ	"Detected a rolling reboot" — Watchdog has detected "x" number of Linux reboots within "y" minutes (where x and y are configurable in `/etc/opt/ecs/watchd.conf`). Rolling reboots have a wide variety of possible causes. **1** To verify the alarm, look for the message, "WARNING: Rolling reboot detected!!," either using the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** **Escalate** this problem for explicit guidance with the following steps. **3** Paying special attention to Communication Manager errors, continue examining the Watchdog log (from 1), and try to determine which application failed. **4** Verify that every executable file listed in `watchd.conf` exists and is executable. Rolling reboots are often caused by executables in unexpected locations. **5** If the files and their locations are OK, investigate the trace log to isolate the cause, either from the: — Web interface by: **ae** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **af** Specifying the **Event Range** for the appropriate time frame **ag** Matching the "rolling reboot" pattern — Linux command line, by entering **`logv -t ts`**
18 **S8300**	WRN	"Application <name> restarted. Retry <retry count>, New Pid: <pid>" — An application has failed, and Watchdog successfully restarted it. **1** To verify the alarm, look for the application's name or process ID (pid), either using the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** **No** resolution. Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

7 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
19 **S8300**	MIN	"Application failed unintentionally" — Watchdog is bringing the system down because an application failed to start correctly. The application may have failed to start either because: • The file did not exist (coincident with Event ID #7). • Required application parameters were missing or invalid in `watchd.conf`. **1** To verify the alarm, look for the message, "Application num <#> (<application path>) not started. Watchdog exiting NOW," either using the: — Web interface, by selecting **Diagnostics > View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** Verify that the file named in the log exists and is executable. **3** Verify that the string in `watchd.conf` is correct. **4** If 2 and 3 are OK, investigate the trace log to see why the application fails, either from the: — Web interface by: **ah** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **ai** Specifying the **Event Range** for the appropriate time frame **aj** Matching the application's number as the pattern — Linux command line, by entering **`logv -t ts`** **5** Once resolved, manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`**

8 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
20 **S8300**	MAJ	"Application <name> (pid) TOTALLY FAILED" — Application failed the maximum allowed number of times. (This alarm usually occurs with Event ID #4.) **1** To verify the alarm, look for the application's name or process ID (PID), either using the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** See if the application is up, either from the: — Web interface, by selecting **View Process Status** — Linux command line, by entering **`statapp`** **3** If the application is down, enter **`start -s application`** to start the application. **4** If the application comes up, continue with 8. If **not**, check the trace log to further investigate why the application fails, either from the: — Web interface by: **ak** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **al** Specifying the **Event Range** for the appropriate time frame **am** Matching the application's PID as the pattern — Linux command line, by entering **`logv -t ts`** **5** To locate the application's executable file, enter the Linux command: **`ls -l /opt/ecs/sbin/`*`appl`*** If the executable is present, Linux returns a symbolic link to its location. **6** If **so** (**less** common): **bv** Enter **`ls -l`** on the symbolic link's address. **bw** Verify that the executable has "execution" permissions. **bx** If not, enter **`chmod +x`** to enable execution of the application. If **not** — Linux has returned a "null link" (**more** common): — Acquire the executable from the CD.

9 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
20 (cont'd)	MAJ	**7** Enter **`start -s application`** to start the application. **8** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **9** If the problem recurs, escalate the problem.

10 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
22 **S8300**	WRN	"Application <name> (<pid>) terminated" — Watchdog successfully shut down the named application, and (if appropriate) watchdog will try to restart it. **1** To verify the alarm, look for the application's name or process ID (PID), either using the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** On the standby server, look for occurrences of the **`stop`** command, either from the: — Web interface, by: **an** Selecting **View System Logs** **ao** Selecting **Platform command history log** **ap** Specifying the **Event Range** for the appropriate time frame **aq** Matching the "Stop" pattern — Linux command line, by entering **`listhistory`** **3** If a **`stop`** command was inappropriately executed, prevent any future misuse of the **`stop`** command. **Note:** From the system's perspective, this is normal behavior. However, in terms of potential service outage due to human error, this is quite irregular. (Shutting down a server effectively downgrades a duplex-, high- or critical-reliability system to an unsupported standard-reliability system.) **4** If **`listhistory`** shows no **`stop`** commands, then Watchdog responded to abnormal internal processes by shutting down the application. Check the trace log for information about this application, either from the: — Web interface, by: **ar** Selecting the **View System Logs** diagnostic and **Logmanager Debug** trace **as** Specifying the **Event Range** for the appropriate time frame **at** Matching the application's PID as the pattern — Linux command line, by entering **`logv -t ts`** **5** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **6** Watch to see if the alarm recurs. If so, escalate the problem.

11 of 12

Table 48: _WD Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
23 **S8300**	MAJ	"Watchd high-monitor thread is rebooting the system" — The: **1** Lo-monitor thread is missing heartbeats (can't get CPU time). **2** Hi-monitor thread has tried 3 times to recover the system by killing any infinitely looping processes. If after 3 CPU-occupancy profiles and recoveries, the lo-monitor thread is still not heartbeating, then Watchd reboots the server. **1** To verify the alarm, look for messages: Containing the CPU profiling results and attempted recoveries Stating that Watchd is rebooting the server using either the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** A resolution is probably unnecessary. The server has usually rebooted by the time a technician can analyze the system. (A reboot clears the alarm and normally fixes problems with unresponsive software.) **2** Watch to see if the alarm recurs. If so, escalate the problem.
24 **S8300**	MAJ	"Watchd's high-monitor thread is stopping tickling of hw" — Event ID #23's call to reboot the server was unsuccessfully invoked. (A Linux kernel's semaphore is possibly stuck.) After this happens, Watchd stops tickling the HW sanity timer so that the HW sanity watchdog executes a hard reboot of the processor. **1** To verify that the alarm occurred, look for messages about: Stopping the tickling of the HW sanity timer CPU occupancy profiling using either the: — Web interface, by selecting **Diagnostics** > **View System Logs** and **Watchdog Logs** — Linux command line, by entering **`logv -w`** **2** If the HW sanity watchdog successfully executed a hard reboot, the alarm was cleared. (This reboot normally fixes problems due to unresponsive software.) If **not**, power cycle the server to release it from this condition and to clear the alarm. **3** Watch to see if the alarm recurs. If **so**, escalate the problem.

Login Alarms

S8300

Table 49, login Alarms in Media Server, on page 136 describes media server login alarms and their troubleshooting procedures.

Table 49: login Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	WRN	**1** On the Web Interface, choose **View Current Alarms**. **2** Notify Customer.
2	WRN	**1** On the Web Interface, choose **View Current Alarms**. **2** Notify Customer.
3	MIN	Security violation. **1** On the Web Interface, choose **View Current Alarms**. **2** Notify Customer.
4	MIN	Security violation. **1** On the Web Interface, choose **View Current Alarms**. **2** Notify Customer.
5	MAJ	Security violation. **1** On the Web Interface, choose **View Current Alarms**. **2** Notify Customer.

Back to: Hardware MOs Server-related alarms

Virtual Alarms

S8300 only

The Virtual Announcement Media Module faults are managed as server alarms. In the S8300 Media Server, the Virtual Analog Angel (VAA) represents a messaging board. The VAA is a virtual board on the G700. When the G700 reboots, the VAA senses that it has lost connectivity with the G700, and triggers its "removal and re-insertion". The removal of the VAA causes the AUDIX ports to go out-of-service and to return back in service when the re-insertion is complete. An alarm of MAJOR severity is generated,

indicating loss of connectivity with the G700, which must be cleared manually. Table 50, Virtual Alarm in S8300 Media Server, on page 137 summarizes this server alarm.

Table 50: Virtual Alarm in S8300 Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MAJ	Virtual Analog Angel (VAA) loss of connectivity with a G700, resulting in temporary OOS of AUDIX ports. A G700 reboot caused VAA to "remove and re-insert" virtual board. Must be cleared manually. **1** Manually clear the alarm, either from the: — Web interface, by selecting **Alarms and Notification**, the appropriate alarm, and **Clear** — Linux command line, by entering **`almclear -n #id`** **2** Execute **list configuration all** on SAT. Verify that V8 MG MSG BOARD does not show `no board` against it. (`no board` means AUDIX ports OOS.)

Back to: Hardware MOs Server-related alarms

Remote Maintenance Board (RSB) Alarms

S8500 only

The Remote Supervisor Adapter (RSA) board is installed in PCI-X slot 1 of the S8500 Media Server. It monitors and reports alarms on S8500 components and software and provides control to power on and power off the server.

NOTE:
The S8500 has a set of alarms for the RSA card, which is also called the Remote Maintenance Board (RMB). The MO name is RMB.

Table 51: RMB Alarms in the S8500 Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MIN	"RMB driver missing - handshake Failed" - The driver for communicating with the RSA card cannot be found. Several failures can generate this fault: • the Linux bash command **/sbin/lsmod** is missing • the results from running **/sbin/lsmod** could not be read • **/sbin/lsmod** returned nothing • the RSA device driver was not loaded • the RSA device driver does not exist The recommendations are: **1** Be sure **/sbin/ibmod** exists and is executable. **2** Be sure **/tmp** exists as a directory and can be written. **3** Be sure **/lib/modules/ibmasm/ibmasm.o** exists and has read permission. **4** Run the bash command "service ibmasm start".
2	MIN	"RMB cli is not loaded on the server." - The program that talks to the RSA card could not be found. Several failures generate this fault: • the Linus bash command **/bin/ls** is missing or not working properly • the bash command /opt/ecs/rmb/rsa/rsacli is missing or is not executable The resommendations are: **1** Be sure all the above files and directories exist and have read and execute permissions. **2** Reload any missing files from the distribution.

1 of 3

Table 51: RMB Alarms in the S8500 Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
3	MAJ	"RMB reset command failed" - The RSA card did not respond to a reset command. Several failures generate this fault: • the bash command **opt/IBMmpcli/bin/mpcli** is missing or is not executable • the directory **/usr/java/latest** is missing or not symbolically linked to the Java runtime environment (JRE) • the file **/opt/ecs/rmb/rsareset** does not exist or cannot be read • no response from the RSA card • the RSA card did not execute the request The recommendations are: **1** Be sure all the above files and directories exist and have read and execute permissions. **2** Reload any missing files from the distribution. **3** Be sure the RSA card is installed by looking at the back and checking that the green power LED on the RSA card is on, and that the amber error LED is off. **4** Verify that the RSA card is working by dialing into it or logging on to it over the service's port of the RSA card. **5** Restart the RSA card from the RSA modem or service's port and check the LEDs on the back of the card. **6** Verify that the RSA card is plugged into the PCI-X slot of the server. **7** Verify that the flat ribbon cable from the RSA card to the server motherboard has been installed and is firmly seated in the connectors at both ends. **8** Replace the RSA card.

2 of 3

Table 51: RMB Alarms in the S8500 Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
4	MAJ	"RMB failed handshake test" - The RSA card did not respond to commands from the server. Several failures generate this fault: • the bash command **/opt/IBMmpcli/bin/mpcli** is missing or is not executable • the directory **/usr/java/latest** is missing or not symbolically linked to the Java runtime environment (JRE) • the file **/opt/ecs/rmb/rsagetip1** does not exist or cannot be read • no response from the RSA card • the RSA card did not execute the request The recommendations are: **1** Be sure all the above files and directories exist and have read and execute permissions. **2** Reload any missing files from the distribution. **3** Be sure the RSA card is installed by looking at the back and checking that the green power LED on the RSA card is on, and that the amber error LED is off. **4** Verify that the RSA card is working by dialing into it or logging on to it over the service's port of the RSA card. **5** Restart the RSA card from the RSA modem or service's port and check the LEDs on the back of the card. **6** Verify that the RSA card is plugged into the PCI-X slot of the server. **7** Verify that the flat ribbon cable from the RSA card to the server motherboard has been installed and is firmly seated in the connectors at both ends. **8** Replace the RSA card.

Alarms in the S8100 Media Server and Windows 2000 Log Events

S8100 only

Introduction

Alarms and Windows 2000 log events generated by the S8100 Media Server software are stored in the Application Log. This section describes the alarms that can be generated by the co-resident services running on the TN2314 Processor circuit pack, along with advice on how to resolve the alarms.

Co-Resident Services

This section describes the co-resident services.

Table 52: Co-Resident Services

Acronym	Description
GAM	The *global alarm module* (GAM) coordinates alarm reporting for the S8100 system. Its primary functions are to: • Accept and forward alarms from other applications • Generate alarms for Windows 2000 • Manage communication links to the Operations Support System (OSS) See Table 53, GAM Events, on page 142.
GAS	The *global administration subsystem* (GAS) provides • Command line access to administration and maintenance functions • Administration support for parameters in the S8100 system that are not provided elsewhere See Table 54, GAS Events, on page 143.
GSK	The *global sanity keeper* (GSK) ensures that all authorized Avaya applications are executing on an S8100 Media Server. Its major component is the Watchdog process. See Table 55, GSK Events, on page 145.
LAC	The *Lucent access control* software module (LAC) governs maintenance access to the Avaya application software. See Table 56, LAC Events, on page 149.
LIC	The *license server* (LIC) governs permission to execute software applications. See Table 57, LIC Events, on page 150.
VFM	The *virtual fabric manager* (VFM) translates Communication Manager protocols into S8100 methods and messages. See Table 58, VFM Events, on page 150.

Alarms for S8100 Co-Resident Services

All Co-Resident Services alarms reside in the Application Log (except for one in the GSK, see that section). All alarms are listed by their Event Source.

Table 53: GAM Events

Event ID	Alarm Severity	Description	Resolution
2	Minor	Modem failure. Either the modem is not working or is not connected.	**1** Verify modem is connected. **2** run prmaint add link to command test # **3** If problem persists, escalate.

Table 54: GAS Events

Event ID	Alarm severity	Description	Displayed error message	Resolution	Next Step
2	Minor	During backup, command cannot write to the destination add link in the PCMCIA card, or to a network disk.	Cannot write to *destination*	For PCMCIA: Check that PCMCIA card is plugged in and sane. Check permissions on PCMCIA (e: drive) For network disk: Check that f: is mapped to network. Check permissions on mapped network drive (f: drive).	
3	Minor	Archive command failed ”gasp” under d1 backup.	Archive command failed.	Escalate. Possible causes: internal software error, software version mismatch, possible disk corruption.	
12	Minor	“gasp” under d1backup command cannot write to destination.	Cannot write to destination.	For PCMCIA: Check that PCMCIA card is plugged in and sane. Check permissions on PCMCIA (e: drive) For network disk: Check that f:drive is mapped to network. Check permissions on mapped network drive (f: drive).	

1 of 2

Table 54: GAS Events*Continued*

Event ID	Alarm severity	Description	Displayed error message	Resolution	Next Step
13	None	cp command under d1restore attempted to restore nonexistent file. The file: contrybackup/backup_ident on destination is missing.	*Filename* does not exist	locate correct file and reexecute command.	
15	none	D1 Restore command failed (caused by either gzip, cp permissions access contention, or hard drive space). Otherwise, one of the archive files in destination/contrybackup directory is corrupted.	Restore failed (*reason code*)	Escalate	
21	None	Bad or missing installation file	Bad or missing installation file	Re-install S8100. If problem persists, escalate to INADS to acquire new license file.	Install new license file. add link
22	None	Bad password file	Bad password file.	Re-install S8100. If problem persists, escalate to INADS to acquire new password file.	Install new password file. add link
23	None	Failed to add or delete a user in the system	Failed to add or delete a user in the system	Login ID does not have permission to perform operation.	
24	Major	Password file expired	Password file expired	Informed customer escalate to INADS	Escalate to INADS for new installation file.
25	Minor	Failed to retrieve serial number from firmware.	Failed to retrieve serial number from firmware.	Re-install S8100. If problem persists, escalate.	Replace firmware. (link TBA)

2 of 2

Table 55: GSK Events

Event ID	Alarm Severity	Description	Resolution	Next Steps
1	None	Watchog started (Both System and Application logs)		N/A
2	None	Application *application_name* started		N/A
3	None	Application failed unexpectedly and has restarted. Application *application_name* terminated. Executing recovery script (if any) and restarting. Retry Count = *nn*. Could not start application *application_name*. Retrying (retry count = *nn*).		Examine log files for failure reasons. Escalate to Tier 4 or report to development.
4	Major	Watchdog Initiated Reboot. Sanity Timeout to Firmware. System will reboot.	Escalate	Record external activity prior to reboot. Provide system log files to development.
5	Major	Application Total Failure **1** Application *application_name* totally failed. **2** Executable *filename* of application *application_name* not found	Restart S8100. If problem persists, escalate.	**1** Restart application with "start" command. Examine log files for failure reason. Report to development. **2** Restart application using correct executable.
6	Minor	Cannot open log file *watchdog_log_file_name*.	Escalate	**1** Copy corrupted watchdog log file to another location, then remove it from the original location. When the system is restarted, a new log file will be created. **2** Provide copy of corrupt log file to development.

1 of 4

Table 55: GSK Events*Continued*

Event ID	Alarm Severity	Description	Resolution	Next Steps
7	Minor	Internal Software Error **1** Internal Software Error. Clean Shutdown not possible for application *application_name*. **2** Internal Software Error. Orderly System Shutdowns Affected **3** Cannot access registry. No protection against continuous reboots.	Restart S8100 at a convenient time. If problem persists, escalate.	**1** Provide log files to development. Arrange a planned system restart at a time when system is the least busy. **2** Provide log files to development.
8	Major	Watchdog Failure: **1** Watchdog initialization failed. Internal Software Error. Applications will not start. **2** Watchdog initialization failed. Cannot read configuration file *filename.* Applications will not start. **3** Watchdog failed. Internal Software Error. System may reboot.	Escalate	**1** Contact development. Provide watchdog log file. **2** Replace watchdog configuration file. **3** Contact development. Provide log files.

2 of 4

Table 55: GSK Events*Continued*

Event ID	Alarm Severity	Description	Resolution	Next Steps
9	None	Watchdog Request: **1** Addproc request received for application *application_name*. **2** Addwatch (registration) request received for application *application_name*. **3** Delwatch (un-registration) request received for application *application_name*.		Information event only. No action required.
10	None	Process *process_name* missed a heart beat.		Examine log files for failure reasons. Escalate to Tier 4 or report to development.
11	Minor	Recovery script not found **1** Recovery script *filename* for application *application_name* not found **2** Fail script *filename* for application *application_name* not found	Escalate	**1** Arrange a planned application or system restart at a time when system is the least busy. **2** Ensure correct script name is used on restart.
12	None	Watchdog cannot start. Another watchdog may be running or another application has opened watchdog log file. Cannot rename file from *old_filename* to *new_filename*.		If another watchdog is running, do not attempt to start watchdog without first shutting it down in an orderly manner (fro example, via the **shutdownproc** command.) If the watchdog log file is open (for example, is being viewed), close it and then attempt to start watchdog again. Otherwise, contact development and provide watchdog log file.

3 of 4

Table 55: GSK Events*Continued*

Event ID	Alarm Severity	Description	Resolution	Next Steps
13	None	Application *application_name* has been shut down		N/A
14	Major	System continuously rebooting Exceeded the maximum allowable number of system reboots. Watchdog exited	Escalate	Contact development. Provide log files.
15	None	All applications have been shut down		N/A
50	Major	Firmware download failure	Firmware download program could not talk to watchdog. Applications will not start.	Contact development. Provide Avaya log file.
51	Minor	Firmware download failure (Bad boot)	Downloadable boot firmware is invalid. Firmware is running in permanent boot code because all previous attempts to download application firmware using downloadable boot firmware failed.	Contact development. Provide Avaya log file.

Table 56: LAC Events

Event ID	Alarm Severity	Displayed Error Message	Resolution
1	None	*User* attempting login	Informational
2	None	*User* has been locked out	Informational
5	None	Unable to open lac file or invalid lac file	Reinstall license file using loadlicense
6	None	Lac Login file not available	Reinstall license file using loadlicense
7	None	Password file expired	Reinstall license file using loadlicense
8	Minor	Failed to get firmware serial number	Replace TN2314 Processor Board. **WARNING:** When the disk is replaced on the TN2314, a new license file must be downloaded to the system before the system will become operational. Refer to "Obtaining a License File" in Chapter 3 of *Installation and Upgrades for the Avaya™ G700 Media Gateway Controlled by an Avaya™ S8300 Media Server or an Avaya™ S8700 Media Server, 555-234-100*. Retry the command and if the test fails, replace the circuit pack.
9	None	Sanity event not opened	Informational - escalate
10	Major	Invalid login	Reinstall license file using loadlicense
11	None	Error cannot connect to Communication Manager	escalate
12	None	Error cannot connect to INTUITY AUDIX	escalate

Table 57: LIC Events

Event ID	Alarm Severity	Description	Resolution	Next Step
1	Major	Corrupted or missing license file	Re-install S8100. If problem persists, escalate.	Copy in a valid license file.
2	Major	License file expired.	Escalate	Replace licence file.
3	Major	Failed to retrieve serial number from firmware	Escalate	Check firmware
5	None	License denied	Check serial number. Add link	

Table 58: VFM Events

Event ID	Alarm Severity	Description	Resolution	Next Step
1	Minor	Unable to start timer The system will still operate with this alarm. Scheduled maintenance will not run	Restart S8100 at your convenience. If step one does not resolve the problem, see step 2 link to procedure for restarting.	**1** Restart VFM add link to procedure). **2** Restart system
3	Minor	VFM unable to open configuration file	The system will operate with the following restrictions: • INTUITY AUDIX is down. • ISDN cards are down. Re-install S8100 at your convenience. If problem persists, see add link.	**1** Check config file in C:\LucentSoftware\ Definity\vfm.cfg. **2** Verify config file entries are correct. **3** Restart VFM. **4** Restart system.

Windows 2000 Generated Alarm Information

All Windows 2000 Generated alarms reside in the System Log.

Table 59: Windows 2000 Alarms

Event Source	Event ID	Alarm Severity	Description	Resolution	Next Steps
Srv	2001	Major	The server was unable to perform an operation due to a shortage of available resources.	Escalate	Look for a vagrant application in task manager. The page file has reached the maximum page file size and there are no more pages available, either in main memory or in the page file. This generally indicates a memory leak in a another process.
Srv	2002	Major	The server could not create its device. The server could not be started.	Escalate	The server was started on a computer that does not have any memory free.
Srv	2003	Major	The server could not create a process. The server could not be started.	Escalate	The server was started on a computer that does not have any memory free.
Srv	2004	Major	The server could not create a startup thread. The server could not be started.	Escalate	The server was started on a computer that does not have any memory free.
Srv	2010	Major	The server could not start the scavenger thread. The server could not be started.	Escalate	The server was started on a computer that does not have any memory free.
Srv	2012	Major	The server has encountered a network error.	Escalate	If you see many errors of this type in the event log in Event Viewer, they indicate a network hardware or software problem.

1 of 3

Table 59: Windows 2000 Alarms*Continued*

Event Source	Event ID	Alarm Severity	Description	Resolution	Next Steps
Srv	2020	Major	The server was unable to allocate from the system paged pool because the pool was empty.	Escalate	The page file has reached the maximum page file size and there are no more pages available, either in main memory or in the page file. This generally indicates a memory leak in a another process.
Srv	2013	Major	The *disk_name* disk is at or near capacity.	Escalate	You may need to delete some files. Look for oversized log files. Look for unusually large INTUITY AUDIX mailboxes (If necessary send broadcasters delete messages)
Srv	2501	Minor	The server's Registry key %1 was not present. The server could not start.	Escalate	The Registry is corrupted.
Srv	2502	Minor	The server's Registry key *key_name* was not present and could not be created. The server could not start.	Escalate	The Registry is corrupted.
ndis	5000	Minor	*Driver_name*: Has encountered a conflict in resources and could not load.	Escalate	The network driver failed to initialize due to an apparent conflict between the adapter card and some other hardware.
ndis	5006	Minor	*Driver*: The version number is incorrect for this driver.	Escalate	The network driver version number is incompatible with this operating system.

2 of 3

Table 59: Windows 2000 Alarms*Continued*

Event Source	Event ID	Alarm Severity	Description	Resolution	Next Steps
Qic117	151	Minor	The driver could not allocate memory for data transfer buffers. Try restarting the system. If this error persists, more system RAM may be required. From device: *device_name.*	Escalate	
RAS PPTP	1	Minor	Unable to open registry key path for the RAS PPTP driver.	Escalate	
serial	8	Minor	Not enough resources were available for the driver.	Escalate	
Various	41	Major	The file system structure on the disk is corrupt and unusable. Please run the chkdsk utility on the device *device_name* with label "*label*".	Escalate

4 G700 Media Gateway Traps

This chapter applies to the G700 Media Gateway only.

SNMP Alarming on the G700

Setting up SNMP alarm reporting involves two main tasks:

- Configure the primary server to report alarms
- Configure the G700 to Send its Traps to the Primary Server

Configure the primary server to report alarms

The primary server may be either an S8300 Media Server or an S8700 Media Server. The Media Server supports two methods for reporting alarms. Either method, both, or no alarm-reporting method may be used at a given site.

- OSS Method. The server's software applications and hardware devices under its control can generate Operations Support System (OSS) alarms. These alarms are recorded in the server logs, and may be reported to Avaya's Initialization and Administration System (INADS) or another services support agency over the server's modem interface.

  To activate OSS alarm notification: The server requires a USB connection to a modem that is connected to an analog line. The modem must be configured using the Web Interface, in the Set Modem Interface screen, and enabled to send and receive calls using the Enable/Disable Modem screen. Configuration of the OSS alarming method can only be done using Linux shell commands.

- SNMP Method. SNMP traps may be sent in User Datagram Protocol (UDP) to a corporate network management system (NMS) using the Configure Trap Destinations screen. The OSS and SNMP alarm-notification methods operate independently of each other. Either or both may be used. Currently, the following NMSs are supported:

  - Avaya Communication Manager Fault and Performance Manager, as a standalone application, or integrated within
  - Avaya MultiService Network Manager
  - HP Openview

  To activate SNMP alarm notification: On the server Web Interface, use the Configure Trap Destinations screen to set up SNMP destinations in the corporate NMS.

Add INADS Phone Numbers and Enable Alarms to INADS

The following procedure using the primary server's Linux shell commands administers the dial-out modem to send alarms in the OSS method. In this example, the primary server is an S8300, and the services support agency is Avaya's Initialization and Administration System (INADS).

Perform this task after all Communication Manager administration is complete.

To add INADS phone numbers and enable alarms to INADS

1 Connect your laptop to the Services port of the S8300 Media Server

> **NOTE:**
> Do these steps only if the S8300 is the primary controller and the customer has a maintenance contract with Avaya. Use the information acquired from the ART tool (see "*Run the ART Tool for the INADS IP Address*" in Chapter 3 of "*Installation and Upgrades for the Avaya™ G700 Media Gateway Controlled by an Avaya™ S8300 or S8700 Media Server, 555-234-100*"). Also, a USB modem must have already been installed. See "*Universal Serial Bus (USB) Modems*" in Chapter 7 of the same source.

2 Click **Start > Run** to open the Run dialog box

3 Type **telnet 192.11.13.6** and press **Enter**.

4 Log in as **craft**.

5 At the prompt, type **almcall -f *INADS phone number* -s *second-number*** and press **Enter**.

6 At the prompt, type **almenable -d b -s y** and press **Enter**.

7 Type **almenable** and press **Enter** to verify that the alarms are enabled.

8 Log off.

Configure the G700 to Send its Traps to the Primary Server

Configuring the G700 Media Gateway to send SNMP traps to the primary server can be accomplished by two commands:

- Layer 2 Switching Processor CLI command: **set snmp community trap [community string]**
- Media Gateway Processor (MGP) CLI command: **set snmp trap <IP address> enable**

Configure an SNMP community string for traps

SNMP requires community strings to be used for each SNMP "request". You can set only three community strings on the G700 — one each for read requests, write requests, and traps. The command for traps is **set snmp community trap [community string]**.

To configure an SNMP community string for traps

1 Open the Run dialog box.

2 Type **telnet <*IP address of L2 Processor*>** and press **Enter**.

3 Log in as **root**.

4 At the L2 Processor CLI prompt, type **set snmp community trap *[community string]*** and press **Enter**.

5 Type **exit**

Configure the destination for G700 SNMP traps

Events occurring on the G700 cause SNMP traps to be generated. The G700 MGP can be configured to send SNMP traps to any network management system (NMS) in the network, including the primary server (S8300/S8700). The MGP CLI **set snmp trap** command is the way to configure the NMS network element that will receive those traps. The traps are sent in User Datagram Protocol (UDP) on the customer's IP network.

The command syntax is:

set SNMP trap *<IP address> {enable|disable} [{all|power|temp|app|module|config|voice|operations}]*

where ***<IP address>*** is the IP address of the NMS trap receiver that will be receiving the traps from the G700, and

[{all|power|temp|app|module|config|voice|operations}] indicates the groups whose traps will be sent to the specified receiver. If no keywords follow the IP address entry, then all traps will be enabled for the specified receiver.

If "enable" or "disable" is used without a trap designation keyword, then all traps is assumed. Up to ten trap receivers can be configured.

To configure the destination for G700 SNMP traps

1. From the L2 Processor CLI, type **session mgp**
2. At the **mg-xxx-n(super-user)** prompt, type **configure** and press **Enter**.
3. At the **mg-xxx-n(configure)** prompt, type **set snmp trap <*IP address*> *enable*** and press **Enter**.
4. Type **exit**

G700 Alarm Format

G700 Media Gateways (serving either as standalone port networks, or as port networks within an IP or a Multi-Connect system) report alarms to the primary server (either an S8300 or S8700 Media Server) using SNMP traps. Like the primary server's own alarms, alarms from a G700 Media Gateway:

- Reside in the primary server's alarm log
- Can be viewed using the SAT command **display alarms**
- Can be viewed using the Web Interface Display Alarms option

However, the format of these displayed alarms is slightly different. Using the G700 MO's Event ID #1 (the first entry in Table 60, G700 Alarms (SNMP Traps) to the Primary Media Server, on page 159) as an example, a displayed G700 alarm has the following format:

n CMG 1 WRN 07/17/2002:13:45 121.1.1.2:cmgMultipleFanFault

Within the previous alarm-display string, the value:

- "n" is a sequential alarm ID.
- "CMG" identifies a G700 Media Gateway as the MO.
- "1" is the event's ID (1st column of Table 60, G700 Alarms (SNMP Traps) to the Primary Media Server, on page 159).

This table also contains each alarm's corresponding SNMP trap # in the 2nd column of Table 60, G700 Alarms (SNMP Traps) to the Primary Media Server, on page 159. However, many of the MIB-defined traps have been excluded, either because:

- A specific trap (such as, Trap #3) is the SNMP mechanism to clear an alarm logged by another specific trap (in this case, Trap #2).
- The specific event indicated by a trap is not severe enough to justify an entry in the primary server's alarm log.
- A trap is defined, but not implemented.
- A trap # is reserved for future use.

- "WRN" is the event's severity (3rd column of Table 60, G700 Alarms (SNMP Traps) to the Primary Media Server, on page 159).
- "07/17/2002:13:45"is the event's date and time stamp.
- "121.1.1.2"is the IP address for Telnet access to the alarmed G700 Media Gateway Processor (MGP).
- "cmgMultipleFanFault" is an alarm description (4th column of Table 60, G700 Alarms (SNMP Traps) to the Primary Media Server, on page 159).

G700 Traps and Resolutions

Although these alarms can be viewed from the primary server, they are normally resolved from within the G700 Media Gateway. The G700 generates the following traps. Follow the error resolution procedures in

Table 60, G700 Alarms (SNMP Traps) to the Primary Media Server, on page 159 to resolve errors indicated by these traps.

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
1	2	WRN	cmgMultipleFanFault — At least two G700 fans have been operating at less than 90% of their nominal speed for >= 5 minutes. (This may be an early warning of overheating.) **1** Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command **show faults** to display any faults on the G700. **2** If there is a fan/temperature fault, check to see if the fans are working, and/or if there is sufficient space around the G700 for air circulation. **3** Maintenance software monitors voltages applied to the Media Modules and other components of the G700, and compares these to the general power supply unit (PSU) status bit. If none of these voltages are out of tolerance, but the PSU status indicates failure, this generates the fan fault, which will be indicated in the **show faults** command output. Replace the entire G700. Fans and the PSU are not field replaceable.
2	4	MIN	cmgPsuBriefFanFault — A G700's PSU fan has been operating at less than 90% of its nominal speed for between 5 and 15 minutes. (This may be an early warning of overheating.) **1** Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command **show faults** to display any faults on the G700. **2** If there is a fan/temperature fault, check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. **3** Maintenance software monitors voltages applied to the Media Modules and other components of the G700, and compares these to the general power supply unit (PSU) status bit. If none of these voltages are out of tolerance, but the PSU status indicates failure, this generates the fan fault, which will be indicated in the **show faults** command output. Replace the entire G700. Fans and the PSU are not field replaceable.

1 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
3	6	MIN	cmgPsuProlongedFanFault — A G700's fan has been operating at less than 90% of its nominal speed for >= 15 minutes. (This may be an early warning of overheating.) **1** Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command **show faults** to display any faults on the G700. **2** If there is a fan/temperature fault, check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. **3** Maintenance software monitors voltages applied to the Media Modules and other components of the G700, and compares these to the general power supply unit (PSU) status bit. If none of these voltages are out of tolerance, but the PSU status indicates failure, this generates the fan fault, which will be indicated in the **show faults** command output. Replace the entire G700. Fans and the PSU are not field replaceable.
4	10	MIN	cmgCpuTempWarningFault — A G700's CPU temperature sensor has exceeded its warning threshold. **1** Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command **show faults** to display any faults on the G700. **2** If there is a temperature fault, turn off the G700 and allow it to cool. **3** Reboot the G700. Check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. Use the MGP CLI **show faults** command to check for fan problems. **4** Low voltage may be responsible for slower fans. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. If there are no fan faults, use the MGP CLI command **show voltages** to display voltages applied to components on the motherboard and to the Media Modules. **5** If the Media Module voltage is out of tolerance, systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage level. If one is found, replace the Media Module. **6** If no Media Module is found to be bad, the power supply is suspect. Replace the G700.

2 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
5	12	MIN	cmgDspTempWarningFault — The temperature sensor in a G700's DSP complex has exceeded its warning threshold. **1** Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command **show faults** to display any faults on the G700. **2** If there is a temperature fault, turn off the G700 and allow it to cool. **3** Reboot the G700. Check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. **4** Low voltage may be responsible for slower fans. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. If there are no fan faults, use the MGP CLI command **show voltages** to display voltages applied to components on the motherboard and to the Media Modules. **5** If the Media Module voltage is out of tolerance, systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage level. If one is found, replace the Media Module. **6** If no Media Module is found to be bad, the power supply is suspect. Replace the G700.
6	14	MAJ	cmgTempShutdownFault — The temperature sensor in a G700's CPU has exceeded its shutdown threshold. The system is about to begin controlled shutdown. **1** Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command **show faults** to display any faults on the G700. **2** If there is a temperature fault, turn off the G700 and allow it to cool. **3** Reboot the G700. Check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. **4** Issue MGP CLI command **show voltages** to determine voltages for Media Modules and other components of the G700. While the +12V fan supply is not directly monitored, it is included in the general power supply unit (PSU) status bit. Use the **show faults** command to determine if there is a fan problem. If none of the monitored voltages are out of tolerance, but the PSU status indicates failure, this would generate a fan fault. If fans are faulty, then replace the entire G700. Fans are not field replaceable. **5** Voltage may also be reduced by a short in one of the Media Modules. Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels.

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
7	16	MAJ	cmgMgpPowerFault — The voltage reading at the server's +5.1V power source is out of tolerance. **1** Check voltages. Issue the MGP CLI command **show voltages** to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. **2** Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. **3** If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. **4** If a brown-out condition is suspected, use a power monitor to monitor the power line. **5** If the fault persists and the **show voltages** command continues to show the level is out of tolerance, then replace the G700.
8	18	MAJ	cmgMediaModulePowerFault — The voltage reading at the Media Modules' -48V power source is out of tolerance. **1** Check voltages. Issue the MGP CLI command **show voltages** to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. **2** Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. **3** If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. **4** If a brown-out condition is suspected, use a power monitor to monitor the power line. **5** If the fault persists and the **show voltages** command continues to show the level is out of tolerance, then replace the G700.

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
9	20	MAJ	cmgVoipPowerFault — The voltage reading at the VoIP complexes' +3.4V power source is out of tolerance. **1** Check voltages. Issue the MGP CLI command **show voltages** to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. **2** Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. **3** If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. **4** If a brown-out condition is suspected, use a power monitor to monitor the power line. **5** If the fault persists and the **show voltages** command continues to show the level is out of tolerance, then replace the G700.
10	22	MAJ	cmgDspPowerFault — The voltage reading at the DSP units' +1.58V power source is out of tolerance. **1** Check voltages. Issue the MGP CLI command **show voltages** to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. **2** Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. **3** If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. **4** If a brown-out condition is suspected, use a power monitor to monitor the power line. **5** If the fault persists and the **show voltages** command continues to show the level is out of tolerance, then replace the G700.

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
11	24	MAJ	cmg8620PowerFault — The voltage reading at the VoIP Processor's +2.5V power source is out of tolerance. **1** Check voltages. Issue the MGP CLI command **show voltages** to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. **2** Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. **3** If the MM760 Media Module is not present, the VoIP engine on the motherboard is possibly bad. Use the **show faults** command to check for VoIP faults. Replace the G700. **4** If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. **5** If a brown-out condition is suspected, use a power monitor to monitor the power line. **6** If the fault persists and the **show voltages** command continues to show the level is out of tolerance, then replace the G700.

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
14	30	MAJ	cmgSyncSignalFault — Synchronization signal lost. **1** Check that provisioned clock-sync source has a good signal by issuing a Media Gateway Processor (MGP) Command Line Interface (CLI) command **show sync timing** Procedure for setting synchronization timing sources on T1/E1 MM or MM710: **1** Be sure that the T1/E1 MM has been added properly on the Avaya S8300 Media Server or Avaya S8700 Media Server, otherwise go to System Access Terminal (SAT) and issue a **ADD DS1** command before going to the MGP CLI and issuing a **set sync interface** or **set sync source** command. Otherwise the MGP CLI will not allow these commands to be executed. **2** Go to the MGP's CLI, and first specify the primary and secondary clock sources for synchronizing the T1/E1 span, using the **set synch interface** command. Note: You don't specify the internal clock source from the CLI - only the primary and secondary. The local clock is "built-in" and not provisionable. **3** Issue a **set sync source** command to set to the specific MM710 T1/E1 Media Module to be used as the active clock reference. **4** Verify whether or not these commands were executed by issuing a **show sync timing** command to ensure that the source is provisioned and active, or visually inspect the Yellow LED on the MM710 Media Module. Note: When the Yellow LED is on 2.7 seconds and off 0.3 seconds, this means the tone-clock synchronizer is in "active" mode, and an external synchronization source is being used as a synchronization reference. Setting the sync timing was successful. When the Yellow LED is on 0.3 seconds and off 2.7 seconds, this means the tone-clock synchronizer is in "active" mode and the internal (on-board) clock is being used as a synchronization reference. Setting the sync timing was not successful. **5** If there is more than one MM710 Media Module, and they have been set up as primary and secondary, this behavior could be on the second and not the timing of the bus. For more details, please consult the maintenance documentation under LEDs and T1/E1 Media Module, or see http://support.avaya.com/elmodocs2/S8300/cd/index.htm
15	32	MAJ	cmgVoipHardwareFault — A DSP complex serving the VoIP engines has failed. **1** Check IP configuration. **2** Reset or replace Media Module.

7 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
	50		cmgModuleRemove — A Media Module has been removed.
16	51		Reserved
	52		cmgModuleInsertFault — The insertion sequence for a Media Module has failed.
	53		cmgModuleInsertSuccess — A Media Module has been inserted.
	54		cmgMgBusyout — An administrator has busied-out a Media Module or a port.
	55		cmgMgRelease — An administrator has returned a busied-out media module or port back into service.
	56 – 69		Reserved
	74		cmgFirmwareDownloadBegun — A Media Gateway began downloading a software module.
	75		cmgModuleManualReset — A Media Module is beginning a user-requested reset operation.
	76		cmgVoipManualReset — A VoIP engine is beginning a user-requested reset operation.
	77		cmgDsuManualReset — An E1 or T1's DSU is beginning a user-requested reset operation.
	78		cmgConfigUploadBegun — A Media Gateway began uploading a configuration file.
	79		cmgConfigUploadSuccess — The Media Gateway successfully uploaded the configuration file.

8 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
17	90	MAJ	cmgMemoryFault — The Media Gateway Processor has detected a low processor memory condition. If an attempt by a software module to allocate memory fails, or if available memory falls below four million bytes, this trap is generated. If available memory later rises above five million bytes, this trap is cleared. If available memory falls below a half a million bytes, the Media Gateway Processor is automatically reset. **1** Check the Media Gateway Processor and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. **2** If this trap occurs infrequently and is automatically cleared, the trap may be due to an unusual transient condition. Monitor future traps. **3** If this trap occurs frequently and is automatically cleared, it is likely that the Media Gateway Processor software has the wrong limits set for its memory monitoring. These limits are hard coded in the software. Escalate. **4** If this trap occurs and does not clear, the Media Gateway may be functionally impaired. Do not reset the Media Gateway. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis. **5** If this trap occurs and the Media Gateway Processor automatically resets, then a severe processor memory shortage occurred. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis.
18	92	MAJ	cmgDhcpRequestFault — The Media Gateway cannot contact its DHCP server, or the DHCP server did not respond to a request. **1** Either correct the DHCP problem, or correct the Media Module's configuration file.
19	94	MAJ	cmgFirmwareDownloadFault — An attempt to download a software module has failed. **1** Check the event log to find the specific error. **2** Troubleshoot the specific error according to the information found. For example, if the string "File not found" appears in the log, then verify that the image file: **by** Exists **bz** Has the correct name **ca** Resides in the correct directory

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
20	96	WRN	cmgProcessRestart — a software module on the Media Gateway Processor failed. The Media Gateway Processor will attempt to restart the failing module. A successful restart of the module will clear this trap **1** Check the Media Gateway Processor and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. **2** If this trap occurs infrequently and is automatically cleared, the trap may be due to an unusual transient condition.Monitor future traps. **3** If the trap occurs frequently and is automatically cleared, it may indicate an issue with a particular software module. Reset the Media Gateway at a time convenient with the customer. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis. **4** If the trap occurs and does not clear, the Media Gateway may be functionally impaired. Reset the Media Gateway at a time convenient with the customer and consistent with the impairment. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis.
21	98	MAJ	cmgIccMissingFault — An internal communications controller, expected in Slot 1, is missing. **1** Check for presence of S8300. **2** If present, check the G700 administration. **3** If the administration is correct, suspect the S8300.
22	100	MAJ	cmgIccAutoReset — The Media Gateway automatically reset the internal communications controller. **1** If the problem persists, escalate.
23	102	MAJ	cmgPrimaryControllerFault — The Media Gateway cannot contact the first controller in its controller list. **1** Verify that the controller list is correct. From the MGP CLI, issue the command **show mgc list**. The IP address should match the S8700 Media Server CLAN or the S8300 Media Server IP addresses. **2** If needed, correct this in 'configure' mode on the MGP's CLI by clearing the mgc list first with the **clear mgc list** command, and then issuing a **set mgc list** with the correct IP addresses. **3** If so, verify that the primary controller is up. **4** If so, shut down every LSP.

10 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
24	104	MAJ	cmgNoControllerFault — The Media Gateway does not have any controllers in its controller list. **1** Verify that the controller list is empty. From the MGP CLI, issue the command **show mgc list** to verify that there are no controllers listed. **2** If none are listed, correct this by adding the correct IP address of the S8700/S8300. In 'configure' mode on the MGP's CLI, issue a **set mgc list** command with the correct IP address.
25	106	MAJ	cmgRegistrationFault — The Media Gateway cannot register with any controllers in its controller list. **1** Verify that the controller list is correct. From the MGP CLI, issue the command **show mgc list**. The IP address should match the S8700 Media Server CLAN or the S8300 Media Server IP addresses. **2** If needed, correct this in 'configure' mode on the MGP's CLI by clearing the mgc list with the **clear mgc list** command, and then issuing a **set mgc list** with the correct IP addresses. **3** If the IP address in the mgc list matches the S8700 Media Server CLAN or the S8300 Media Server IP addresses, there may be a network problem. **4** Verify that the primary controller is up.
26	108	MIN	cmgH248LinkDown — An H.248 link between the Media Gateway and its controller is down. **1** Check the S8300 or S8700. **2** If down, bring up. **3** If **not**, check the G700 administration. Since the following command causes a brief service outage, it should only be executed at the customer's convenience. **4** If the administration is correct, reboot the G700. **5** If the problem persists, check network connectivity. Use **ping** or **traceroute** to the S8300/S8700 to check connectivity. **6** If the problem persists, escalate.

11 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
29	114	WRN	cmgMgAutoReset — The Media Gateway Processor automatically reset (rebooted). The processor automatically resets when a critical error occurs from which it cannot recover. The error may be software or hardware related. It may also automatically reset in response to a maintenance test running on the call controller. (A reset performed at the request of a SAT or CLI command entered by craft or Tier technical support generates a different trap indicating a manual reset.) Finally, it may automatically reset when it reregisters with a call controller after being out of touch for too long. This trap is generated as the Media Gateway Processor comes back up after resetting. If the Media Gateway Processor resets and fails to come back up, this trap will not be generated. **1** Check to see if a maintenance test that is supposed to reset the processor was run. **2** Check that the reset was not due to the link with the call controlling going down. If the reset is due to a link failure with the call controller, follow call controller link failure troubleshooting procedures. **3** Check the Media Gateway Processor and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. **4** If this trap occurs infrequently, the trap may be due to an unusual transient condition. Monitor future traps. **5** If this trap occurs and the Media Gateway Processor is frequently resetting, manually reset the media gateway. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis. **6** If this trap occurs frequently and the Media Gateway Processor is not resetting, the Media Gateway may be functionally impaired, and is not capable of resetting itself to restore service. If service is impaired, reset the Media Gateway manually. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis.

12 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
30	116	WRN	cmgModuleAutoReset — A Media Module in the Media Gateway automatically reset (rebooted). A Media Module automatically resets when it fails a sanity test performed by the Media Gateway Processor. It may also automatically reset in response to a maintenance test running on the call controller. (A reset performed at the request of a SAT or CLI command entered by craft or Tier technical support generates a different trap indicating a manual reset.). **1** Check to see if a maintenance test that is supposed to reset the Media Module was run. **2** Check the Media Module and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. **3** If this trap occurs infrequently, the trap may be due to an unusual transient condition. Monitor future traps. **4** If this trap occurs and the Media Module does not return to service, or if this trap occurs frequently, attempt to reset the failing module from the SAT or CLI and see if this returns it to stable service. **5** If manually resetting the Media Module does not return it to service, and if a spare Media Module of the same time is available, replace the failing Media Module with the spare and see if the spare Media Module goes into service. If so, follow procedures for dealing with the original, bad, Media Module. **6** If the spare Media Module fails to go into service, it is of course possible that the spare Media Module is bad as well. But that aside, try manually resetting the Media Gateway Processor at a time convenient to the customer and see if this restores service. If so, the both the original and the spare Media Modules can probably be considered okay, and the problem is probably with the Media Gateway Processor itself. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis.
32	118	MIN	cmgModulePostFault — A Media Module failed its power-on start-up test. **1** Reset or replace the Media Module.

13 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
34	122	MAJ	cmgConfigUploadFault — An attempt to upload a configuration file failed. **1** Check the event log for an error message during the backup/restore process. **2** Troubleshoot the specific error according to the information found. **3** Retry the upload (backup) command; for example: copy mgp-config tftp <filename> <ip address> Since the following command causes a brief service outage, it should only be executed at the customer's convenience. **4** If the problem persists, reboot the G700.
			14 of 15

Table 60: G700 Alarms (SNMP Traps) to the Primary Media Server

Event ID	Trap #	Alarm Level	Description / Recommendation
37	128	WRN	cmgVoipAutoReset — A VoIP (Voice Over IP) module in the Media Gateway automatically reset (rebooted). A VoIP module automatically resets when it fails a sanity test performed by the Media Gateway Processor. It may also automatically reset in response to a maintenance test running on the call controller. (A reset performed at the request of a SAT or CLI command entered by craft or Tier technical support generates a different trap indicating a manual reset.) It automatically resets when its IP address is administered. Finally, it automatically resets when it fails a ping test performed by the Media Gateway Processor against the VoIP module's IP address. **1** Check to see if a maintenance test that is supposed to reset the VoIP module was run. **2** Check to see if the VoIP module had its IP address re-administered. **3** Check to see if the IP address administered on the VoIP module is correct. **4** Check to see if the IP address of the Media Gateway itself can be pinged. Physical or logical connectivity issues (cabling or routing problems) in the data network can cause ping failures. **5** Check the VoIP module and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. **6** If this trap occurs infrequently, the trap may be due to an unusual transient condition. Monitor future traps. **7** If this trap occurs and the VoIP module does not return to service, or if this trap occurs frequently, attempt to reset the failing module from the SAT or CLI and see if this returns it to stable service. **8** If manually resetting the VoIP module does not return it to service, and if a spare VoIP module of the same type is available, replace the failing VoIP module with the spare and see if the spare VoIP module goes into service. If so, follow procedures for dealing with the original, bad, VoIP module. **9** If the spare VoIP module fails to go into service, it is of course possible that the spare VoIP module is bad, as well. There may be a power issue, also. **10** Try manually resetting the Media Gateway Processor at a time convenient to the customer and see if this restores service. If so, both the original and the spare VoIP modules can probably be considered okay, and the problem is probably with the Media Gateway Processor itself. Capture the trap information. If possible, capture the event logs, using the **show event-log** CLI command, for analysis. Escalate. **11** If none of this works, capture the trap information. If possible, capture the event logs, using the **show event-log** CLI command, for analysis. Escalate.

5 Communication Manager Maintenance-Object Repair Procedures

NOTE:
This chapter contains neither maintenance objects (MOs) for the DEFINITY Wireless Business System (DWBS), nor MOs for messaging systems. Refer to the maintenance documentation that accompanies these products for this information.

The Communication Manager maintenance subsystem is partitioned into separate entities called Maintenance Objects (MOs). A maintenance object can be:

- An individual circuit pack or media module
- A hardware component that is part of a circuit pack or media module
- An entire subsystem
- A set of monitors
- A process (or set of processes)
- A combination of processes and hardware

“Maintenance names” are recorded in the Error and Alarm logs. Individual copies of an MO are assigned an address that defines the MO’s physical location in the system when applicable. These locations display as the **port** field in the Alarm and Error logs and as output of various commands such as **test board (see** Figure 20, Display of test board command, on page 176**).**

Figure 20: Display of test board command

test board 1v4 long Page 1

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
001V4	MG-DS1		50	ABORT	1412
001V4	MG-DS1		52	PASS	
001V4	MG-DS1		138	PASS	
001V4	MG-DS1		139	PASS	
001V4	MG-DS1		140	PASS	
001V4	MG-DS1		141	PASS	
001V4	MG-DS1		142	PASS	
001V4	MG-DS1		143	PASS	
001V4	MG-DS1		144	PASS	
001V4	MG-DS1		145	PASS	
001V4	MG-DS1		146	PASS	
001V4	MG-DS1		1227	ABORT	1412
001V401	TIE-DS1	0001/001	7	ABORT	1412

Subsystems Maintained by Communication Manager

Communication Manager subsystems are listable using the **list config** command and, in most cases, have some maintenance activities involved.

NOTE:
list config all' on the Communication Manager SAT gives you complete information, including whether or not stations have been administered on a port. **show mg list_config** on the G700 MGP gives you information for the installed equipment in that G700.

G700 Subsystems Maintained by Communication Manager

The G700 subsystems that are applicable to Communication Manager maintenance considerations are identifiable by the presence of 'angels'. Angels may be either physical or virtual, and both types use the CCMS message. Table 61, G700 Subsystems Maintained by Communication Manager, on page 177 lists the applicable subsystems and how they are maintained.

Table 61: G700 Subsystems Maintained by Communication Manager

Subsystem	Angel Maintenance Type
Any Media Module	Physical Angel
Messaging Daughter Board (part of the S8300)	Virtual Angel
Announcement Circuitry (part of the MGP)	Virtual Angel

G700 Media Gateway MOs

The following list shows G700 specific maintenance objects. Other maintenance objects have been modified slightly for the G700.

- MED-GTWY (MEDIA GATEWAY)
- MG-ANA (ANALOG MM711)
- MG-ANN (Voice Announcements)
- MG-BRI (BRI Trunk Media Module MM720)
- MG-DCP (Digital Line Media Module)
- MG-DS1 (DS1 Interface Media Module)
- MG-ICC (Internal Call Controller)
- MG-VOIP (MM760 MED PRO DSP PORT)

MO Groupings by MM Type

Table 62, Media Module Tests, on page 177, on page 9 shows MO groupings by Avaya Media Module type.

Table 62: Media Module Tests

Media Module	Maintenance Object
T1/E1 Media Module (MM710)	Board (MG-DS1)
	DS1 CO Trunk (CO-DS1)
	DS1 DID Trunk (DID-DS1)
	DS1 Tie Trunk (TIE-DS1)
	DS1 ISDN Trunk (ISDN-TRK)
	ISDN-PRI Signaling Link Port (ISDN-LNK)
	ISDN-PRI Signaling Group (ISDN-SGRP)
	Wideband Access Endpoint Port (WAE-PORT)

1 of 2

Table 62: Media Module Tests

Media Module	Maintenance Object
Analog Media Module (MM711)	Board (MG-ANA)
	Analog Line (AN-LN-PT)
	Analog Co Trunk (CO-TRK)
	Analog DID Trunk (DID-TRK)
	DIOD Trunk (DIOD-TRK)
	Alarm Port (ALARM-PT)
DCP Media Module (MM712)	Board (MG-DCP)
	Digital Line (DIG-LINE)
BRI Trunk Media Module (MM720)	Board (MG-BRI)
	ISDN Trunk Side BRI Port (TBRI-PT)
	ISDN Trunk Side Signaling (TBRI-TRK)
VOIP Media Module (MM760)	Board (MG-VOIP)
Voice Announcements (Communication Manager)	Board (MG-ANN)
	Announcement Ports (VAL-PT)
	Ethernet Port (ETH-PT)

2 of 2

Viewing Communication Manager Alarms

The technician views Communication Manager alarms and events through commands, shown in Table 63, Commands for Viewing Communication Manager Alarms, on page 179, that are available via the Web Interface or the SAT command-line interface.

Table 63: Commands for Viewing Communication Manager Alarms

Command	Interface	Purpose	Description
View Current Alarms	Web Interface, under Alarms and Notification	To view a list of outstanding alarms against Communication Manager	Displays a summary of alarms (if present), followed by a detailed table of explanation.
display alarms	SAT CLI	To view logged Communication Manager alarms	These are the alarms that have not yet been cleared, either manually or via an Expert System.

Command Syntax

Maintenence commands use a different command syntax depending upon whether they refer to port network circuit packs or media gateway Media Modules. The command syntax is the following:

test port UUCSSpp for circuit packs

where,

Variable	Definition	Platform	Range
UU	Universal cabinet number	ATM PNC	1-64
		CSS PNC	1-44
		G600	1-64
C	Carrier designation	ATM PNC	A, B, C, D, or E
		CSS PNC	A, B, C, D, or E
		G600	A, B, C, or D
SS	Circuit pack slot	ATM PNC	01-21
		CSS PNC	01-21
		G600	01-10
pp	2-digit port number	All	01, 02,...

and

test port GGGVSpp for media modules,

where,

Variable	Definition	Platform	Range
GGG	Media gateway number	G700	1-250
		G350	1-250
V	Literal: designates media gateway	All	N/A
S	Media module number	G700	1-9
		G350	1-250
pp	2-digit port number	All	01, 02,...

Full test commands can be either short or long, and can be repeated several times. For example, in:

test port UUCSSpp sh r 1

sh = short

r = repeat

1 = the number of times the test should be repeated.

Similarly, in:

test port GGGVSpp l r 2

l = long

r = repeat

2 = the number of times the test should be repeated.

Abort Code 1412

Tests that do not run on the G700 will abort with Abort Code 1412. Tests that abort are listed under each MO, but are not described.

Escalation Procedure

This document is not intended to solve all levels of trouble. When the limits of these procedures have been reached but a problem is not resolved, a technician should escalate to a higher level of technical support.

This escalation should conform to the procedures in the *Technical and Administration Plan*.

Frequently, a repair procedure recommends repeating a test several times after waiting short time intervals, for example, at one minute intervals up to five times. If after these repetitions, no response to the test has occurred, or if the same Abort or Failure has occurred repeatedly, it is understood that a technician should escalate to a higher level of technical support.

ABRI-PORT (ASAI ISDN-BRI Port)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ABRI-PORT [1]	MAJOR MINOR WARNING	**test port *location* l** [2]	ASAI ISDN-BRI port

1 The alarm level for ABRI ports may be administered using the **set options** command. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ABRI port in the system.

2 For information on specifying a location, see Command Syntax on page 179.

For repair procedures, see BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port) on page 499.

AC-POWER

S8700 / S8500

AC Power for AC-Powered Systems

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
AC-POWER	WARNING	**test environment *UU*** [1]	AC Power

1 ***UU*** is the universal cabinet number indicated in the PORT field of the alarm log.

S8700 Multi-Connect systems support two different cabinet types as PNs: multicarrier cabinets and single-carrier cabinets. Both types may be powered by either an AC or DC power source. Environmental maintenance differs according to a cabinet's type and its power supply.

CAUTION:
Before powering down a cabinet or carrier that contains EMBEDDED AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging its software. Instructions for powering down this unit are in *EMBEDDED AUDIX System Maintenance, 585-300-110 for the circuit pack, and in Avaya™ S8300 and Avaya™ S8700 Media Server Library, 555-233-825*.

Power System for Single-Carrier Cabinet

Each single-carrier cabinet has one power supply that distributes DC power and AC ringing voltage to the circuit pack slots in the cabinet.

AC Power Supply (WP-91153)

In an AC-powered cabinet, a single, plug-in, multi-output AC power supply is in the power supply slot. A power cord, with a 3-prong plug on one end and an appliance connector on the other end, connects the supply to a dedicated AC power source. The inputs to the power supply can be (depending on list version):

- 120 VAC, 60 Hz, 15 to 20 Amp; three wires in the power cord (one hot, one neutral, and one ground wire)
- 220 VAC or 240 VAC, 50 Hz, 10 Amp; three wires in the power cord (one hot, one neutral, and one ground wire)

The AC power supply produces the following DC outputs: +5 VDC, -5 VDC, -48 VDC, +12 VDC, and a battery-charging voltage. The DC outputs distribute power on the cabinet backplane to the circuit pack slots.

The AC power supply also produces AC ringing voltage. The AC ringing voltage output value and frequency depend on the country of use. The power supply has a circuit breaker and EMI filtering.

Nominal Power Holdover

Multicarrier Cabinets

Two types of battery holdover are available:

- The small battery assembly provides short-term battery holdover. If AC power fails, 48 VDC batteries power the system for:
  - — 15 seconds in a PN cabinet
  - — 10 minutes in the expansion control carrier in the "A" position of a PN cabinet
- Some AC-powered multicarrier cabinets (MCCs) contain three 48-Volt batteries and a battery charger (397C) to provide backup power in case power is interrupted. The holdover times are identical to those above.

Single-Carrier Cabinets

A holdover circuit in the power supply allows a system to operate normally during AC power interruptions. When AC input power fails, reserve batteries supply power to the memory and processor circuit packs and fans for two minutes. Every port circuit pack is inactive during this time. The power supply contains a battery charger to charge the holdover batteries.

Error Log Entries and Test to Clear Values

Table 64: AC Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test environment** *UU* **sh r 1**
513	Any	AC Power Query test (#78)	WARNING	OFF	**test environment** *UU* **sh r 1**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order shown in the table below. For example, by clearing error codes associated with the Battery and Battery Charger Query test (#5), you may also clear errors from other tests in the testing sequence. Refer to the appropriate sections of this chapter for descriptions of each test.

NOTE:
The following tests apply to J58890CE, J58890CF, and J58890CH.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery & Battery Charger Query test (#5)	X	X	ND
AC Power Query test (#78)	X	X	ND
Power Unit Query test (carrier E) (#127)	X	X	ND
Power Unit Query test (carrier D) (#127)	X	X	ND
Power Unit Query test (carrier A) (#127)	X	X	ND
Power Unit Query test (carrier B) (#127)	X	X	ND
Power Unit Query test (carrier C) (#127)	X	X	ND
Emergency Transfer Query test (#124)	X	X	ND
Cabinet Temperature Query test (#122)	X	X	ND
External Alarm Lead Query test (#120)	X	X	ND
Analog Ring Generator Initialization test (#117)	X	X	ND
Analog Ring Generator Query test (#118)	X	X	ND

1 D = Destructive; ND = Nondestructive

AC Power Query Test (#78)

This test queries either the server's watchdog (via an Ethernet or USB interface) or an MCC PN's Maintenance circuit pack for status of the cabinet's AC power.

Table 65: Test #78 Power Query Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
100, 2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to ABORT with error code 2000, check for system powering problems with the PN's A carrier. Resolve every AC-POWER and CARR-POW (**S8700 IP**: RMC-ENV) alarm. Then, repeat the test. **3** If the test still ABORTs with error code 2000, check for and resolve every MAINT (Maintenance circuit pack) error in a PN. Then, repeat the test. **4** If the test still ABORTs with error code 2000, escalate the problem.
2029, 2319, 2320, 2500	ABORT	Internal system error

1 of 2

Table 65: Test #78 Power Query Test

Error Code	Test Result	Description / Recommendation
1	FAIL	The cabinet is currently without AC power. **NOTE:** For a J58890CE, skip to Procedures for a J58890CE:. **Procedures for a Global MCC (J58890CH):** **1** For a nominal holdover system if there is no AC power at the wall outlet, have a qualified electrician restore power to the outlet. Power should range from 170 to 264 VAC. **2** If there is AC power at the wall outlet, then there could be a problem with the RM0850 rectifiers, BU3200A BIU (battery interface unit), or battery. Resolve every alarm logged against the POWER MO, and rerun the test. If the test still fails, the BIU may be defective. Check the BIU. If the BOD alarm LED is on, replace the BIU. For **S8700 MC**, if the BOD LED is off and the BOK LED is on, then a PN's Maintenance circuit pack may be incorrectly reporting the problem. Resolve every alarm against these MOs, and rerun the test.
1 (cont'd)	FAIL	**Procedures for a J58890CE:** **1** Check for AC power at the wall outlet (99–127 or 200–250 VAC). **2** If AC power is absent, then the problem is not with the system itself. Power must be restored to the wall outlet. If present, there could be a problem with the battery or battery chargers. Resolve every alarm logged against POWER (battery & battery charger), and rerun the test. **3** If the test still fails, then fuse F5 may have opened. Replace this fuse, and rerun the test. **WARNING:** Turn off the 397C Battery Charger before inserting or removing Fuse F5. **4** If the test still fails, then the server's watchdog or a PN's Maintenance circuit pack may be incorrectly reporting the problem. Resolve every alarm against these MOs, and rerun the test. Some watchdog and Maintenance circuit-pack errors *may not* be detected by their respective maintenance routines, but can cause many environment tests to fail. **5** If more than two environment tests are failing, replace the suspected circuit pack (depending on the system configuration), and rerun the test.
100	FAIL	The cabinet is currently without AC power, and AC power maintenance is in the middle of timing the NPH interval. **1** Follow the repair steps for error code 1.
	PASS	The server's watchdog or the PN's Maintenance circuit pack has reported that the cabinet has AC power.

2 of 2

AC-POWER for DC-Powered Systems

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
AC-POWER	WARNING	**test environment** ***location***[1]	AC Power

1 For information on specifying a location, see Command Syntax on page 179.

NOTE:
In a DC-powered multicarrier cabinet, the AC-POWER MO exists, but serves no functional purpose. Because the system cannot determine the type of power used, the AC-POWER test should always pass or abort. The maintenance strategy for power components in DC cabinets is described in CARR-POW (Carrier Power Supply) on page 578.

S8700 MC: S8700 Multi-Connect supports three different cabinet types for PNs: multicarrier cabinets (MCCs), single-carrier cabinets (SCCs), and 19-inch rack mounted cabinets. Every type may be powered by either an AC or DC power source. Environmental maintenance differs according to a cabinet's type and its power supply.

S8700 IP: S8700 IP Connect supports 19-inch rack mounted cabinets that may be powered by either an AC or DC power source.

Error Log Entries and Test to Clear Values

Table 66: AC Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/ Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test environment** *UU* **sh r 1**
513	Any	AC Power Query test (#78)	WARNING	OFF	**test environment** *UU* **sh r 1**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below. For example, by clearing error codes associated with the AC Power Query test (#78), you may also clear errors generated from other tests in the testing sequence. Refer to the appropriate sections of this chapter for descriptions of each test.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery & Battery Charger Query test (#5)	X	X	ND
AC Power Query test (#78)	X	X	ND
Power Unit Query test (carrier E) (#127)	X	X	ND
Power Unit Query test (carrier D) (#127)	X	X	ND
Power Unit Query test (carrier A) (#127)	X	X	ND
Power Unit Query test (carrier B) (#127)	X	X	ND
Power Unit Query test (carrier C) (#127)	X	X	ND
Emergency Transfer Query test (#124)	X	X	ND
Cabinet Temperature Query test (#122)	X	X	ND
External Alarm Lead Query test (#120)	X	X	ND
Analog Ring Generator Initialization test (#117)	X	X	ND
Analog Ring Generator Query test (#118)	X	X	ND

1 D = Destructive; ND = Nondestructive

AC Power Query Test (#78)

This test is not valid for DC-powered cabinets and should always abort or pass (**S8700 IP**: will always abort).

Table 67: Test #78 Power Query Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run test are not available.
100, 2000	ABORT	Response to the test request was not received within the allowable time period.
2029, 2319, 2320, 2500	ABORT	Internal system error. **S8700 MC**: **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 67: Test #78 Power Query Test

Error Code	Test Result	Description / Recommendation
S8700 MC: Any	FAIL	A PN's Maintenance circuit pack is incorrectly reporting an AC power problem. If this test fails, there is a problem with a Maintenance circuit pack. Replace the suspected circuit pack, and run the test again.
S8700 MC	PASS	Since this test is invalid for DC-powered cabinets, this result simply indicates that a PN's Maintenance circuit pack is handling this test properly.

2 of 2

ADJ-IP/ASAI-IP (ASAI Adjunct IP Link)

S8100 only

ADJ-IP and ASAI-IP are the two CTI link types supported by the coresident DEFINITY LAN Gateway (DLG) feature.

The ASAI-IP link (asai-ip) is the Adjunct Switch Application Interface (ASAI) link between the S8100 and an ASAI adjunct. The Adjunct IP link (adj-ip) is the ASAI proprietary link between the S8100 and CentreVu-CT. The ASAI endpoint is connected to an Ethernet LAN.

MO name (in alarm log)	Alarm level	Initial command to run	Full name of MO
ADJ-IP	MAJOR[1]	**test cti-link *n***[2]	Adjunct IP link
ASAI-IP	MAJOR	**test cti-link *n***	ASAI IP link

1 The alarm level may be downgraded using the off-board Adjunct Link entry on the Set Options form

2 *n* is the CTI link number (1–8). This number appears as the port number in the error and alarm logs

To use the ASAI-IP and ADJ-IP link types, the license file must turn on the following features: "Co-Res DEFINITY LAN Gateway" *and* "ASAI Link Core Capabilities" (for ASAI-IP links) and/or "Computer Telephony Adjunct Links" (for ADJ-IP links). These settings can be checked by displaying the System-Parameters Customer-Options form. In addition, the links must be administered on the DLG Administration page of the IP Services form.

The ADJ-IP link is an Avaya proprietary link that enables the complete set of ASAI link capabilities. This link is used for CentreVu CT.

The ASAI-IP link supports three levels of ASAI link capabilities, depending on the RTUs purchased. If this link type is enabled in the license file, the ASAI Link Core Capabilities? is set to **y** on the System-Parameters Customer-Options form. If the second level of capabilities is enabled, the ASAI Link Plus Capabilities? is also set to **y**. A third level of capabilities can be enabled with per-RTU purchases, indicated on the ASAI Enhanced Features page of the System-Parameters Customer-Options form. This link is used for ASAI adjuncts, including CentreVu CT.

On the S8100, the LAN interface is provided by the Ethernet interface on the TN2314 circuit pack and/or by the C-LAN (Control LAN) TN799 circuit pack.

Error log entries and test to clear values

Table 68: ADJ-IP/ASAI-IP error log entries

Error type	Aux data	Associated test	Alarm level	On/Off board	Test to clear value
0[1]		Any	Any	Any	test cti-link 1
2 (a)	2-102	ASAI Link Status Test (#1365)	None		test cti-link 1

1 of 2

Table 68: ADJ-IP/ASAI-IP error log entries

Error type	Aux data	Associated test	Alarm level	On/Off board	Test to clear value
18 (b)	0	None	WARNING	OFF	release cti-link 1
257 (c)		ASAI Link Status Test (#1365)	MAJOR[2]	OFF	test cti-link 1
513 (d)		ASAI Link Status Test (#1365)	WARNING	OFF	test cti-link 1
769 (e)		ASAI Heartbeat Test (#1366)	MAJOR	OFF	test cti-link 1 long
1025 (f)		ASAI Link Status Test (#1365)	MAJOR	OFF	test cti-link 1
2561-2568 (g)		None	None		
3329 (h)		ASAI Link Status Test (#1365)	MAJOR	OFF	test cti-link 1
3584-3839 (i)		None	None		
3840 - 4095 (j)		None	None		

2 of 2

1 Run the Short Test sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 The alarm level for ASAI adjuncts may be administered using the **set options** command for Off-board Adjunct Link Alarms. The alarm level can be set to MAJOR, MINOR, or WARNING for all ASAI adjuncts in the system.

Notes:

a Error Type: 2 - Errors of this type indicate violations of the ISDN-BRI signaling protocol. Timers associated with certain Layer 3 messages have expired before a required response was received. In the following table, the aux data column indicates which timer has just expired. For more information, refer to the Avaya ISDN-BRI Specification.

Aux data	Timer type
2	First T303 (SETUP timer)
3	Second T303 (SETUP timer)
4	T305 (DISConnect timer)
5	First T308 (RELease timer)
6	Second T308 (RELease timer)
10	T316 (RESTart timer)
12	T309 (Layer 2 Failure timer)
16	TM100 (Management Information Message timer 1)
17	TM200 (Management Information Message timer 2)
102	TASAI (ASAI Routing Timer)

b Error Type: 18 - The cti-link has been busied out.

c Error Type: 257 - The ASAI link is not in an “established” state.

d Error Type: 513 - The ASAI link is hyperactive.

e Error Type 769 - No response from the far end to a heartbeat request.

f Error Type: 1025: TCP Tunnel Protocol Connection Failure.

g Error Type: 2561-2568: ASAI Application Message Discard.

h Error Type: 3329 - The TCP tunnel connection is not in an “established” state.

i Error Types: 3584 -3839. Certain ASAI protocol-specific cause codes are logged by switch software. The cause code can be determined for the following formula:

If the error type is greater than 3712, then the ASAI cause code is equal to the error type minus 3712. This code was sent to the adjunct by the switch.

If the error type is less than 3712, then the ASAI cause code is equal to the error type minus 3584. This code was sent to the switch by the adjunct.

A description of the various ASAI cause values is contained in Table 69, ASAI cause values, on page 193. The table shows the actual error log value (3584-3839), rather than the ASAI cause code value. This table also contains recommended craft actions associated with the cause value. Further information can also be found in the AT&T ASAI Specification (AT&T PUB 288-500-03). In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

j Error Types: 3840 - 4095. Certain ISDN cause codes are logged by switch software. The cause code can be determined for the following formula:

If the error type is greater than 3968, then the ISDN cause code is equal to the error type minus 3968. This code was sent to the switch by the adjunct.

If the error type is less than 3968, then the ISDN cause code is equal to the error type minus 3840. This code was sent to the adjunct by the switch.

A description of the various ISDN cause values is contained in Table 70, ISDN cause values, on page 194. This table also contains recommended craft actions associated with the cause value.

Table 69: ASAI cause values

Error log entry	ASAI code	Explanation	Recommendation
3584, 3712	0	(Service or Option Not Available) Unrecognized ASAI protocol operation	The requested ASAI protocol operation is not implemented by the switch or adjuncts. The Aux Data Field or Error Log entry contains the protocol identifier for the unrecognized operation. **1** Consult switch and adjunct documentation to determine which set of operations is supported by the switch and the adjunct. Adjunct administration turning off operations not implemented by the switch may resolve the problem. **2** If step 1 does not resolve the problem, escalate to the next tier. There are no available internal resources to service switch or adjunct request. System transaction capacity for the adjunct or switch is exceeded.
3624, 3752	40	(Service or Option Not Available) Resources not available	**1** See recommendation above for ASAI code 0. **2** Re-engineering of adjunct services may be required. If the problem persists, escalate the problem to the next tier.
3647, 3775	63	(Service or Option Not Available)	The requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resources. There is a potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct. **1** Verify that no overlapping administration of switch resources (for example, requesting notification on a single domain by multiple adjuncts or multiple adjuncts attempting to control a single call) exists across all adjuncts connected to the switch. If overlaps exists, then readminister the adjuncts to guarantee that each adjunct is associated with a unique set of switch resources. **2** If step 1 does not resolve the problem, escalate to the next tier.

1 of 2

Table 69: ASAI cause values

Error log entry	ASAI code	Explanation	Recommendation
3663, 3791	79	(Service or Option Not Implemented)	A requested service or option (or combination of selected options) is not supported (implemented) in the switch or the adjuncts. **1** Consult the switch and adjuncts documentation to determine ASAI service options supported by both the switch and the adjuncts. Readministration of the switch-administered capabilities (see Customer Optional Features form) or those of the adjunct may be necessary to correct the problem. **2** If step 1 does not provide the set of desired services due to deficient implementation, escalate the problem to the next tier.
3671, 3799	87	(Switch Error Conditions) Internal switch audit	There is an inconsistency in switch data records. **1** No action is needed since the switch has corrected the data inconsistency. **2** If a number of these errors continue to occur, then escalate to the next tier.

2 of 2

Table 70: ISDN cause values

ISDN Cause codes

Error log entry	ISDN code	Explanation	Recommendation
3874, 4002	34	Switch resources not available No circuit or channel available	There are no available trunks for outgoing call requests: **1** Verify that the adjunct is administered to support the trunk capabilities of the switch. **2** Investigate trunk group status by issuing status trunk commands from the SAT, or by requesting a trunk group query or queries from the adjunct. **3** Perform trunk diagnostic procedures outline in this manual.

1 of 2

Table 70: ISDN cause values

ISDN Cause codes

Error log entry	ISDN code	Explanation	Recommendation
3890, 4018	50	Requested facility not subscribed	Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct. **1** Display the Customer Optional Features form on the switch to determine which ASAI or Adjunct link capabilities are turned on in the switch. **2** Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administration capabilities, then readminister the switch and/or the adjunct to match.
3921, 4049	81	Adjunct switch error conditions Invalid CRV	An invalid CRV was sent by the adjunct. **1** This may indicate a CRV inconsistency between the switch and the adjunct. See the CallVisor protocol reference manual.

2 of 2

System technician-demanded tests: descriptions and error codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the ASAI Link Status Test (#1365) on page 195, for example, you may also clear errors generated from other tests in the testing sequence.

Table 71: CTI link system technician-demanded tests

Order of investigation	Short test sequence	Long test sequence	D/ND[1]
ASAI Link Status Test (#1365)	X	X	ND
TCP Tunnel Connection Heartbeat Test (#1366)		X	ND

1 D = Destructive; ND = Nondestructive

ASAI Link Status Test (#1365)

This test is nondestructive.

This test queries the Call Processing software for the state of the TCP Tunnel Connection. If the Tunnel Connection is in the “established” state and if the ASAI link is in the “established” state, the test returns with a PASS. Otherwise, the test fails.

Table 72: TEST #1365 ASAI Link Status Test

Error Code	Test Result	Description/ Recommendation
1189	ABORT	The DLG service is not enabled. **1** Enable the asai service administered for this link on the *ip-services* form. **2** If the test continues to abort, escalate the problem.
2500	ABORT	Internal System Error **1** Retry the command at 1-minute intervals a maximum of 3 times. **2** If the test continues to abort, escalate the problem.
[1]	FAIL	The test failed because the ASAI Adjunct link is not up. The state of the link is represented by the error code as presented in Table 71, CTI link system technician-demanded tests, on page 195. **1** Check the link status by entering the **status dlg cti-link** command. **2** If the TCP Tunnel Connection is not established: **cb** Check the entry for the local node on the **ip-services** form. If the entry is **clan***X*, where X is the board number, refer to the maintenance information for the C-LAN board (CLAN-BD (Control LAN Circuit Pack) on page 599) to clear the problem. If the entry is **procr**, refer to the maintenance information for the Processor LAN interface to clear the problem. **cc** If the test continues to fail, escalate the problem. **3** If the ASAI link is not established but the Connection is established: **cd** Use the ping command with the IP address for the remote node. This IP address is the IP-Address specified on the Node Names form for the Remote Node specified on the **ip-services** form. If no response is received, follow the repair procedures above for TCP Tunnel Connection Not Established. **ce** Use the administration information for the *G3 PBX Configuration* screen on CentreVu-CT to verify that the ASAI service is administered correctly.
	PASS	The ASAI link is up. That is, the Tunnel Connection is “established” and the ASAI Link state is “established”.

1 Refer to Table 73, Error Codes for Link Status Test Failures, on page 197.

Table 73: Error Codes for Link Status Test Failures

Error Code	Link Status		
	Connection State Not Established?	Link Hyperactive?	ASAI Link Not Established?
0			
1			X
2		X	
3		X	X
4	X		
5	X		X
6	X	X	
7	X	X	X

TCP Tunnel Connection Heartbeat Test (#1366)

This test is nondestructive.

This test requests that a TCP Tunnel protocol heartbeat message be sent to the far end. It then checks for a response every 2 seconds for a maximum of 20 seconds. The test fails if a response has not been received within 20 seconds.

Table 74: TEST #1399 TCP Tunnel Connection Heartbeat Test

Error Code	Test Result	Description/ Recommendation
1189	ABORT	The DLG service is not enabled. **1** Enable the asai service administered for this link on the *ip-services* form. **2** If the test continues to abort, escalate the problem.
1190	ABORT	The DLG service has not established the TCP Tunnel. **1** Check that the ASAI software in the CentreVu CT processor is running. **2** If the test continues to abort, escalate the problem.
2500	ABORT	Internal System Error **1** Retry the command at 1-minute intervals a maximum of 3 times. **2** If the test continues to abort, escalate the problem

1 of 2

Table 74: TEST #1399 TCP Tunnel Connection Heartbeat Test

Error Code	Test Result	Description/ Recommendation
	FAIL	The test failed since a response to the heartbeat message was not received within 20 seconds **1** Check the link status by entering the **status dlg cti-link** command. **cf** Follow the repair procedures described for the failure of Test #1365 - ASAI Link Status.
	PASS	A response to the heartbeat message was received.

2 of 2

ADM-CONN (Administered Connection)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ADM-CONN	MAJOR, MINOR, or WARNING	**status administered-connection *N*** [1]	Administered Connection

1 Where ***N*** is an administered connection number indicated in the PORT field of the Alarm or Error Log.

An administered connection provides an end-to-end connection between two access endpoints or data modules residing in either the same switch or different switches. When administered, the connection is automatically established and scheduled to be permanently active.

An error is logged whenever an administered connection fails or cannot be established. Failures to establish a connection generate an error whether they occur on an initial try, a retry, a fast retry, a redial or an auto-restoration. A failed connection generates an error whether or not the connection is subsequently reestablished by fast retry, redial, or auto restoration.

An alarm is logged when an administered connection cannot be established either initially or after a connection failure. Both the alarm level (none to major) and a failure threshold can be administered for each administered connection. An alarm is raised when either of the following occurs:

- The number of consecutive failed attempts to establish a connection reaches the administered threshold.
- Software determines that failure to establish a connection is due to a mistake in administration. See Table 75, Administered Connection Error Log Entries, on page 199.

Error Log Entries and Test to Clear Values

Table 75: Administered Connection Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0, or 29	Any	None	Any	OFF	None
1, or 28 (a, b)	Any	None	Any	OFF	None
2 (c)	Any	None	Any	OFF	None
6, 21, 31, or 127(d)	Any	None	Any	OFF	None
16 (a)	Any	None	Any	OFF	None
17 (e)	Any	None	Any	OFF	None
18, or 102 (f)	Any	None	Any	OFF	None

91, 95, 96, 97, 98, 99, 100, or 111	Any	None	Any	OFF	None

2 of 2

For ADM-CONN Errors

None of the above errors have a specific associated test and, except for errors 17 and 127, are valid only for administered connections established over ISDN-PRI facilities. Error 127 is valid for administered connections established over non-ISDN facilities or between two endpoints on the same switch.

Notes:

a These errors are typically associated with administration problems and are not expected to be temporary. The administered connection is not retried and the failure is alarmed immediately. The alarm threshold specified by the customer is ignored.

b The address of the destination endpoint is: an unassigned number (1), has an invalid number format (28), or is restricted from terminating calls due to Class of Restriction ("Access Denied"). Verify that the destination address is correct and that the destination endpoint is administered. The destination endpoint is not administered on the switch where this error is logged.

c A request has been made to use a transit network or common carrier that cannot be accessed. Check the routing pattern used by this administered connection and verify that the inter-exchange carrier specified is correct.

d The exact failure cause is unknown or has been mapped to one of these values. If this is a permanent condition, try reversing the direction of the Administered Connection (originate the administered connection from the destination switch). This may yield another failure cause.

e The destination endpoint is not available. Check the status of the destination endpoint at the far-end switch. The status for the destination endpoint will not be available on the switch where this error is logged. At the far end, use **status access-endpoint** or **status data-module** to see whether the endpoint is busy, out-of-service or otherwise unavailable.

f This switch sent an ISDN message to another switch that either did not respond (18) or did not respond within the allotted time (102). This could be due to link failure, or congestion, or an outage at the other switch.

g The address of the destination endpoint has changed. Change the administered connection accordingly. The destination endpoint will not be administered on the switch where this error is logged.

h These errors indicate that a resource (for example, a circuit or bearer capability) required by the administered connection is not currently available.

i A network failure (38) or temporary failure (41) has occurred. Error Log entries for other MOs (for example, DS1-BD) may indicate a local problem.

ADX8D-BD (AUDIX Circuit Pack)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ADX8D-BD	MINOR or WARNING	**test board *location* sh**	AUDIX circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

The ADX8D-BD MO represents a TN566/TN2169 EMBEDDED AUDIX circuit pack (also called DEFINITY AUDIX) operating in DP (digital-port) mode. For circuit-pack-level problems, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086. Port-level problems are covered by ADX8D-PT.

EMBEDDED AUDIX consists of two circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance which tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *EMBEDDED AUDIX System Maintenance, 585-300-110*.

ADX8D-PT (AUDIX Digital Port)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ADX8D-PT	MINOR	**test port *location* l**	AUDIX digital port
ADX8D-PT	WARNING	**test port *location* sh**	AUDIX digital port

1 For information on specifying a location, see Command Syntax on page 179.

The ADX8D-PT MO represents a port on a TN566/TN2169 EMBEDDED AUDIX circuit pack (also called DEFINITY AUDIX) operating in DP (digital-port) mode. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

The tests described in this section apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *EMBEDDED AUDIX System Maintenance, 585-300-110*.

AUDIX resides on a combined pair of circuit packs: the TN566 MFB (multifunction board) and the TN2169 ALB (alarm board). Because of its size, this combination occupies 5 slots, but only 1 slot is functional as far as the switch is concerned. The other 4 slots are seen by the switch as "AUDIX-reserved" slots (or ADXDP-RS/ADX8D-RS).

In DP mode the TN566 pack supports up to 8 voice ports, each with a primary and a secondary information channel. Ports are administered in increments of two. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, EMBEDDED AUDIX is not an adjunct.

CAUTION:
Never do any of the following without first shutting down AUDIX. Follow instructions on the TN566/TN2169 faceplate:

- *Remove EMBEDDED AUDIX circuit packs*
- *Cycle power to a carrier containing EMBEDDED AUDIX circuit packs*
- *Remove power to a carrier containing EMBEDDED AUDIX circuit packs*

Error Log Entries and Test to Clear Values

Table 76: EMBEDDED AUDIX Digital Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
1 (a)	40987	None	WARNING	OFF	
1 (b)	1 to 20	None	WARNING	OFF	
15 (c)	Any	None			
18 (d)	0	**busyout port** *UUCSSpp*	WARNING	OFF	**release port** *UUCSSpp*
23 (e)	0	None	WARNING	OFF	
130 (f)		None	WARNING	ON	**test port** *UUCSSpp* **sh**
257 (g)	40971	None			
513 (h)	Any	None			
1537 (i)	40968	None	WARNING	OFF	
1793		Voice & Ctrl. Local Loop test (#13)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **l r 3**
2049		NPE Crosstalk test (#9)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **l r 3**
2305 (j)	40967	None			
3840 (k)	40965	None			
3840 (l)	41029	None			

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a Error Type 1: The user may experience a noisy port or link, due to an off-board problem that is detected by the port circuit. If so, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined time.

b Error Type 1: At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented. Also see Note (a).

c Error Type 15: This is an internal type error that occurs when an audit request fails.

d Error Type 18: The port is busied-out by command. Use **release port *UUCSSpp*** to release the port.

e Error Type 23: The circuit pack is administered but not physically installed. The alarm will clear when a circuit pack is inserted.

f Error Type 130: The circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the AUDIX circuit pack (see Caution at the beginning of this section).

g Error Type 257: Something is interfering with transmission to the voice port. This is usually an on-board problem and can be ignored if there are no user complaints.

h Error Type 513: AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. Check out the AUDIX system referring to *EMBEDDED AUDIX System Maintenance*, 585-300-110, if necessary.

i Error Type 1537: An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if there are no user complaints. If the problem persists, replace the circuit pack (see Caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a certain period of time.

j Error Type 2305: The link between the circuit pack and the voice port is successfully reset. No craft action is necessary.

k Error Type 3840: No voice ports are connected to the EMBEDDED AUDIX circuit pack. No maintenance action is required.

l Error Type 3840: The message buffer in the circuit pack is full.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when you are inspecting errors in the system. For example, by clearing error codes associated with the Voice and Control Channel Local Looparound test (#13), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Voice and Control Channel Local Looparound test (#13)		X	ND
NPE Crosstalk test (#9)		X	ND

1 D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for EMBEDDED AUDIX emulates the one for DIG-LINE. The following tests apply only to DIG-LINE and not to EMBEDDED AUDIX. These are referred to as NO-OP tests, and they always return PASS.

- Electronic Power Feed test (#11)
- Station Lamp Updates test (#16)
- Station (Digital) Audits test (#17)

NPE Crosstalk Test (#9)

This test verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. An NPE that is not working correctly may cause 1-way and noisy connections. This test is part of a port's long test sequence, and it executes in about 20 to 30 seconds.

Crosstalk testing is performed on both the primary (for voice) and the secondary (for data) information channel associated with each EMBEDDED AUDIX port. If this test fails on either channel, the voice port is taken out of service.

Table 77: Test #9 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1	ABORT	During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test. **1** Check the port status. **2** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle. **3** Retry the command at 1-minute intervals up to 5 times.
2	ABORT	System resources may not have been available, or the port may have been busy during the test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be active. **1** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle before retesting. **2** Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 77: Test #9 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1004	ABORT	The port was put in use during the test. The test has been aborted. **1** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle before testing.
1020	ABORT	Test disabled by background testing. Use **status station** to determine when the voice port is available for testing.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
1, 2	FAIL	The NPE of the tested port is transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel. **1** Replace the circuit pack.
	PASS	The port is using its allocated time slots correctly. **1** To be sure that this is not an intermittent problem, repeat this test up to 10 times to make sure it continues to pass. **2** If complaints still exist, examine the connections.

2 of 2

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between a server and the EMBEDDED AUDIX port circuit. First, the primary information (voice) channel loop back test is run.

While the primary information channel is still looped around, the Control Channel Looparound test is performed. The Looparound test for the secondary information (data) channel is then performed. This is the same test as the primary information channel's loop-around test.

Next, a Conference test is implemented for the primary information channel. This is the same test as Conference test (#6).

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any tests fail or abort, the sequence is stopped.

Table 78: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. Then try (b).
1000	ABORT	System resources required to run this test are not available. The port may be active. **1** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle before retesting. **2** Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or may have time slots that are out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was put in use during the test. **1** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle before retesting. **2** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
7	FAIL	Conference test failed on the primary channel. Some users may notice a disruption in service. In extreme cases, the conferencing feature may not work at all.
14	FAIL	The primary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.

1 of 2

Table 78: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
15	FAIL	The control channel between the processor and the EMBEDDED AUDIX circuit pack is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.
16	FAIL	The secondary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.
None	FAIL	The test failed for reasons external to the EMBEDDED AUDIX circuit pack. **1** Run circuit tests to check the Tone Generator circuit and the Tone Detector circuit by using the **test board *location* s** command. **2** Resolve any problems that are detected on the Tone Generator circuit or Tone Detector circuit. **3** If both circuit packs are functioning properly and the test still fails, replace the EMBEDDED AUDIX circuit pack (see caution at the beginning of this section).
	PASS	Voice and Control Channel Local Loop test passed. Every channel is transmitting properly. **1** To be sure that this is not an intermittent problem, repeat this test up to 10 times, and see whether it continues to pass. **2** If complaints still exist, examine the connections.

2 of 2

ADX16D-B (16-Port AUDIX Circuit Pack)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ADX16D-B	MINOR	**test board *location* sh**	AUDIX circuit pack
ADX16D-B	WARNING	**test board *location* sh**	AUDIX circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

The ADX16D-BD MO represents a TN566/TN2169 EMBEDDED AUDIX circuit pack combination operating in 16-port mode digital (DP). For circuit-pack-level problems, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086. Port-level maintenance is covered by ADX16D-PT.

EMBEDDED AUDIX consists of two circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy of its own that is described in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.

ADX16A-BD (AUDIX Circuit Pack)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ADXCL-BD or ADX16A-BD	MINOR, or WARNING	**test board *location* sh**	AUDIX circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

The ADX16A-BD MO represents a TN566/TN2169 EMBEDDED AUDIX circuit pack combination operating in control-link (CL) mode. For circuit-pack-level problems, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086. Port-level maintenance is covered by ADX16A-PT.

EMBEDDED AUDIX consists of two circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *EMBEDDED AUDIX System Maintenance, 585-300-110*.

ADX16D-P (16-Port AUDIX Digital Port)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ADX16D-P	MINOR or WARNING	**test port *location* l**	AUDIX Digital port

1 For information on specifying a location, see Command Syntax on page 179.

CAUTION:
Never do any of the following without first shutting down AUDIX. Follow the instructions on the TN566/TN2169 faceplate:

- *Remove EMBEDDED AUDIX circuit packs*
- *Cycle power to a carrier containing EMBEDDED AUDIX circuit packs*
- *Remove power to a carrier or cabinet containing EMBEDDED AUDIX circuit pack*

The ADX16D-P MO represents a port on a TN566/TN2169 EMBEDDED AUDIX circuit pack operating in digital-port (DP) mode. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

The tests described in this section apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction board (MFB) and the TN2169 Alarm board (ALB). Because of its size this combination occupies 5 slots, but the system sees only 1 slot as functional. The other 4 slots are seen by the switch as "AUDIX-reserved" slots (or ADX16-RES/ADX16D-RS).

In 16-port DP mode, the TN566 pack supports up to 16 voice ports, each with a primary and a secondary information channel. Ports are administered in increments of two. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, EMBEDDED AUDIX is not an adjunct.

Error Log Entries and Test to Clear Values

Table 79: EMBEDDED AUDIX Digital Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
1(a)	40987	None	WARNING	OFF	
1(b)	1 to 20	None	WARNING	OFF	
15(c)	Any	None			
18(d)	0	**busyout port** *UUCSSpp*	WARNING	OFF	**release port** *UUCSSpp*
23(e)	0	None	WARNING	OFF	
130(f)		None	WARNING	ON	**test port** *UUCSSpp* **sh**
257(g)	40971	None			
513(h)	Any	None			
1537(i)	40968	None	WARNING	OFF	
1793		Voice and Control Local Loop Test (#13)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **l r 3**
2049		NPE Crosstalk test (#9)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **l r 3**
2305(jj	40967	None			
3840(k)	40965	None			
3840(l)	41029	None			

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow the recommended procedures.

2 Minor alarms may be downgraded to Warning alarms based on the values used in **set options**.

Notes:

a Error Type 1: The user may experience a noisy port or link, due to an off-board problem that is detected by the port circuit. If so, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined time.

b Error Type 1: At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented. Also see Note a, above.

c Error Type 15: An internal type error that occurs when an audit request fails.

d Error Type 18: The port is busied-out by command. Release the port with **release port *UUCSSpp***.

e Error Type The circuit pack is administered but not physically installed. The alarm will clear when a circuit pack is inserted.

f Error Type The circuit pack has been removed or has been insane for more than 21-minutes. To clear the error, reseat or replace the AUDIX circuit pack (see caution at the beginning of this section).

g Error Type 257: Something is interfering with transmission to the voice port. This is usually an on-board problem and can be ignored if there are no user complaints.

h Error Type 513: AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. Refer to *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110,* if necessary.

i Error Type 1537: An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if there are no user complaints. If the problem persists, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a certain period of time.

j Error Type 2305: The link between the circuit pack and the voice port is successfully reset. No craft action is necessary.

k Error Type 3840: No voice ports are connected to the EMBEDDED AUDIX circuit pack. No maintenance action is required.

l Error Type 3840: The message buffer in the circuit pack is full.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below. For example, by clearing error codes associated with the *Voice and Control Channel Local Looparound* test (#13), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Voice and Control Channel Local Looparound test (#13)		X	ND
NPE Crosstalk test (#9)		X	ND

1 D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for EMBEDDED AUDIX emulates the one for DIG-LINE. The tests listed below apply only to DIG-LINE and not to EMBEDDED AUDIX. These tests always return PASS.

- Electronic Power Feed test (#11)
- Station Lamp Updates test (#16)
- Station (Digital) Audits test (#17)
- Digital Terminal Remote Looparound test (#1201)

NPE Crosstalk Test (#9)

This test verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is part of a port's long test sequence, and it executes in about 20 to 30 seconds.

Crosstalk testing is performed on both the primary (for voice) and the secondary (for data) information channel associated with each EMBEDDED AUDIX port. If this test fails on either channel, the voice port is taken out-of-service.

Table 80: Test #9 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1	ABORT	During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test. **1** Check the port status. **2** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the port is active, it is unavailable for this test. Wait until the port is idle. **3** Retry the command at 1-minute intervals up to 5 times.
2	ABORT	System resources may not have been available, or the port may have been busy during the test. **1** Verify that the port's status is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be active. **1** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the port is active, it is unavailable for certain tests. Refer to "Status" commands in Maintenance SAT Commands in Maintenance Commands Reference (555-245-101), for a full description of every possible state. Wait until the port is idle before testing. **2** If the port's status is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 80: Test #9 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors.
1004	ABORT	The port was put in use during the test. The test has been aborted. **1** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the port is active, it is unavailable for certain tests. Refer to "Status" commands in Maintenance SAT Commands in Maintenance Commands Reference (555-245-101) for explanations of every possible state. Wait until the port is idle before testing.
1020	ABORT	Test disabled via background testing. Use **status station** to determine when the voice port is available for testing.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
1, 2	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel. **1** Replace the circuit pack (see caution at the beginning of this section).
	PASS	The port is using its allocated time slots correctly. **1** To verify that this is not an intermittent problem, repeat this test up to 10 times, and make sure it continues passing. **2** If complaints still exist, examine the connections.

2 of 2

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between the server the EMBEDDED AUDIX port circuit. The server sends a message to loop around both the information and control channels for the port. First, the primary information (voice) channel loop back test is run.

While the primary information channel is still looped around, the Control Channel Looparound test is performed. The loop-around test for the secondary information (data) channel is then performed. This test is the same as the primary information channel's loop-around test.

Next, a Conference test is implemented for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any test fails or aborts, the sequence is stopped.

Table 81: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be active. **1** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. Wait until the port is idle before testing. **2** Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots that are out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was put in use during the test. The test has been aborted. **1** Use **display port *UUCSSpp*** to determine the voice port extension of the port. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle before retesting.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources for this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 81: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
7	FAIL	Conference test failed on the primary channel. In some cases, users may not notice a disruption in service. In extreme cases, the conferencing feature may not work at all.
14	FAIL	The primary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.
15	FAIL	The control channel between the processor and AUDIX is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port. This failure could also be disruptive to other users.
16	FAIL	The secondary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.
None	FAIL	The test failed for reasons external to the AUDIX. **1** Run circuit tests to check the Tone Generator circuit and the Tone Detector circuit using **test board *UUCSS* s**. **2** Resolve any problems detected on the Tone Generator circuit or Tone Detector circuit. **3** If both circuit packs are functioning properly and the test still fails, replace the AUDIX (see caution at the beginning of this section).
	PASS	Voice and Control Channel Local Loop test passed. Every channel are transmitting properly. **1** To be sure that this is not an intermittent problem, repeat this test up to 10 times, and see whether it continues to pass. **2** If complaints still exist, examine the connections.

2 of 2

ADX16A-PT (AUDIX Analog Line/Control Link)

S8700 S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ADXCL-PT or ADX16A-PT	MINOR	**test port *location* l**	AUDIX Analog Line/ Control Link
ADXCL-PT or ADX16A-PT	WARNING	**test port *location* sh**	AUDIX Analog Line/ Control Link

1 For information on specifying a location, see Command Syntax on page 179.

CAUTION:
Never do any of the following without first shutting down AUDIX. Follow the instructions on the TN566/TN2169 faceplate:

- *Remove EMBEDDED AUDIX circuit packs*
- *Cycle power to a carrier containing EMBEDDED AUDIX circuit packs*
- *Remove power to a carrier containing EMBEDDED AUDIX circuit packs*

The ADX16A-PT MO represents a port on a TN566/TN2169 EMBEDDED AUDIX circuit pack that is operating in control-link (CL) mode. For circuit-pack-level problems (ADX16A-BD or ANL-16-BD), see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086. For port-level problems with AUDIX operating in digital-port mode, see:

- ADX8D-PT (AUDIX Digital Port) on page 203
- ADX16D-P (16-Port AUDIX Digital Port) on page 212

The tests described in this section apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction board (MFB) and the TN2169 Alarm board (ALB). Because of its size this combination occupies 5 slots, but only 1 slot is functional as far as the switch is concerned. The other 4 slots are seen by the switch as "AUDIX-reserved" slots.

In CL mode the TN566 pack supports up to 16 voice ports. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, EMBEDDED AUDIX is not an adjunct.

Error Log Entries and Test to Clear Values

Table 82: EMBEDDED AUDIX Analog Line/Control Link Error Log Entries

Error Type	Aux Data	Associated Test		On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
1 (a)	40977	None			
18	0	**busyout station** ***extension***	WARNING	ON	**release station** ***extension***
23 (b)	0	None	WARNING	OFF	
130 (c)		None	WARNING	ON	**test port** *UUCSSpp* **sh**
257 (d)	40973	None			
513 (e)	Any	None			
1025 (f)		Looparound test (#161)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 2**
1281		Conference test (#7)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 2**
1537		NPE Crosstalk test (#6)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 2**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a Error Type 1: This is an in-line error that can only be resolved over time. This indicates that no terminal equipment was present when ringing was attempted. Execute the short **test port** ***UUCSSpp*** command.

b Error Type 23: The circuit pack was logically administered but not physically installed. The alarm will clear when the circuit pack is installed.

c Error Type 130: The circuit pack was removed or has been insane for more than 11 minutes. To clear the error, reseat or replace the circuit pack.

d Error Type 257: This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only one analog circuit pack in the system has this problem, replace the circuit pack. If only analog circuit packs on a particular carrier have this error, the ringing generator may not be connected to this carrier. If analog circuit packs on many carriers have this error, check the ringing generator.

e Error Type 513: AUDIX is not available to the switch. Check the AUDIX system, referring to *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.

f Error Type 1025: The TDM bus is out of service. See TDM-BUS (TDM Bus) on page 1832.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented in the table below. For example, by clearing error codes associated with the *Looparound* test (#161), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Looparound test (#161)		X	ND
Conference test (#7)		X	ND
NPE Crosstalk test (#6)		X	ND

1 D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for EMBEDDED AUDIX emulates the one for ANL-16-L. The tests listed below apply only to ANL-16-L and not to EMBEDDED AUDIX. These tests always return PASS.

- Battery Feed test (#35)
- Audits and Updates test (#36)
- Station Present test (#48)

Tests 36 and 48 ABORT when AUDIX is not running.

NPE Crosstalk Test (#6)

This test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of the long test sequence and executes in about 25 seconds.

Table 83: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use the **display port *UUCSSpp*** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the port is active, it is unavailable for certain tests. Wait until the port is idle before testing. **2** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 83: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1001	ABORT	Could not allocate the necessary system resources to run this test.[1]
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, then retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use the **display port *UUCSSpp*** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the port is active, it is unavailable for certain tests. Wait until the port is idle before testing. **2** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	This condition indicates that the test is not applicable when the analog port is used in a combined modem pool. This error can be ignored.
1018	ABORT	Test disabled via administration. **1** To enable the test for the particular analog station being tested, enter the **change station *extension*** command and change the `Test` field on the Station screen to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2012	ABORT	System could not respond to this request.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. **1** Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

2 of 2

Conference Circuit Test (#7)

This test verifies that the NPE channel for the port being tested can correctly perform the conferencing function.

Table 84: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run test are not available. The port may be busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the station extension. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle before retesting. **2** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *UUCSSpp*** to determine the station extension. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** Retry the command at 1-minute intervals up to 5 times.
1018	ABORT	Test disabled by administration. This only applies to analog stations. **1** To enable the test for the analog station being tested, enter **change station *extension*** and change the `Test` field on the Station screen to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources for this test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This causes noisy and unreliable connections. **1** Replace the circuit pack.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.

Loop-Around Test (#161)

This test is designed to check the on-board transmission capabilities of the NPE on the analog port.

Table 85: Test #161 Loop-Around Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources for this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the station extension. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *UUCSSpp*** to determine the station extension. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** Retry the command at 1-minute intervals up to 5 times.
1018	ABORT	Test disabled by administration. To enable the test for the particular analog station, enter **change station *extension*** and change the "Test" field on the Station screen to **y**.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	The reflective loop-around test failed. This causes noisy or unreliable connections or other users calling this port may hear an echo. **1** Replace the circuit pack.
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

ALARM-PT (Alarm Port)

S8700 / S8500 / S8300 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ALARM-PT	MINOR	**test port *location* l**	Alarm-Port
ALARM-PT	WARNING	**test port *location* sh**	Alarm-Port

1 For information on specifying a location, see Command Syntax on page 179.

The Alarm Port MO provides on-board maintenance for an analog line port that is administered as an external device alarm port. Tests are provided to verify the analog line ports ability to detect an external device alarm. The related MO, EXT-DEV ADMIN? Y (External Device Alarm) on page 972, is used for the off-board external device alarm.

S8100

For S8100, the analog line port that is administered for an external alarm may be a port on a virtual alarm board located in slot 1A11. The virtual board provides ports for External Device Alarm contacts to indicate non-Communication Manager alarms or a PC (global) alarm. There is no hardware associated with the virtual alarm board. The MO name for this board is PR-AL-BD and the external name displayed by the list configuration command is VIRTUAL ALARM BOARD. By default, this board is located in slot 1A11.

If the Alarm Port Maintenance Object is located on the virtual alarm board, the maintenance tests described below will always pass and there should never be an alarm or hardware error log entry for that MO.

Error Log Entries and Test to Clear Values

Table 86: 8-Port Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** <*address*>**sh r 1**
15 *	Any	Audits and Updates test (#36)			
18	0	**busyout station <*extension*>**	WARNING	OFF	**release station <*extension*>**
130 *		None	WARNING	ON	**test port** <*address*> **sh**
769 *		Battery Feed test (#35)	MINOR	ON	**test port** <*address*> **sh r 2**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

*** Additional Information:**

Error Type 15: This is a software audit error that does not indicate any hardware malfunction. Run the short test sequence, and investigate errors.

Error Type 130: Indicates that the circuit pack or Media Module was removed or has been insane for more than 11 minutes. To clear the error, reseat or replace the circuit pack or Media Module.

Error Type 769: S8100: This test (Test #35) always passes for S8100.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented in the table below. For example, by clearing error codes associated with the Battery Feed test (#35), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery Feed test (#35)	X	X	ND
Station Status and Translation Audits and Updates test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and trying to detect a current.

S8100: This test always passes for S8100.

Table 87: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
S8100	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be reporting an external device alarm. **1** Before retesting, enter **test external-device-alarm port <*address*>** to determine whether the port is reporting an EXT-DEV failure. **2** If the port has no EXT-DEV failures, retry the command at 1-minute intervals up to 5 times.
S8100 1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension, attendant number, or trunk group/member number of the port. Use the **status station**, **status attendant**, or **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **1** If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port received an EXT-DEV failure during the test. The test has been aborted. **1** Before retesting, enter **test external-device-alarm port <*address*>** to determine whether the port is reporting an EXT-DEV failure. **2** If the port has no EXT-DEV failures, retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 87: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
S8100 1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension of the port. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. **NOTE:** The battery feed circuitry is tested for proper battery voltage by testing the switchhook state. In response to the test message, the on-board firmware terminates the line and checks for switch-hook presence. The termination is then removed, and a check is made for no switch-hook presence. The MET set must be on-hook for the test to execute. **1** If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
S8100 1018	ABORT	Test disabled via software patch.
2000	ABORT	Response to the test request was not received within the allowable time period.
S8100 2000	ABORT	This port may have been busied out by system technician. **1** Look in the Error Log for Error Type 18 (port busied out) for this port. If this error type is present, then release the port via the **release station <extension>** command and run the test again. **2** Make sure that the terminal is connected. **3** Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. **S8100**: This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	The port's battery feed chip is unable to supply sufficient power to sense the external device alarm. This may occur when the test is performed at the same time that the external device contact closure occurs. **1** Before retesting, enter **test external-device-alarm port <*address*>** to determine whether the port is reporting an EXT-DEV failure. Wait until the port has no EXT-DEV failures before retesting. **2** Retry the command at 1-minute intervals up to 5 times.
S8100	FAIL	Battery Feed Test failed. This port is out-of-service. **1** Other ports on this circuit pack are not affected. Place user on a different port, if available, until a replacement circuit pack can be obtained. **2** Replace circuit pack when available.

2 of 3

Table 87: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
	PASS	The port's battery feed chip is able to provide power to the external device alarm to detect contact closure.
S8100	PASS	Battery Feed Test passed. Current flow is properly detected for this port. **1** If users are reporting problems, examine connections to the port.
S8100 0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release busy board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to ensure that there is a valid board inserted.

3 of 3

Station Status and Translation Audits and Updates Test (#36)

S8100: Port Updates Test (#36)

For an analog line port that is administered as an external alarm, this test is limited to updating the software with the switchhook state.

S8100: This test sends port level translation data from switch processor to the circuit pack to assure that the translation is correct. The port audit operation verifies the consistency of the current state of the port in the switch software.

Table 88: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
S8100	ABORT	Internal System Error. **1** Retry the command at 1-minute intervals a maximum of 5 times.

1 of 3

Table 88: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
S8100 1000	ABORT	The test was aborted because system resources required to run this test were not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension of the port. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. **1** If the port is idle, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port received an EXT-DEV failure during the test. The test has been aborted. **1** Before retesting, enter **test external-device-alarm port <*address*>** to determine whether the port is reporting an EXT-DEV failure. **2** If the port has no EXT-DEV failures, retry the command at 1-minute intervals up to 5 times.
1006	ABORT	This port has been busied out by command. **1** Check Error Log for Error Type 18 (port busied out). If present, use **release port <*address*>** to release the port and run the test again.
S8100 1006	ABORT	The test was aborted because the station is out of service. This condition may be accompanied by an error type 18 entry in the error log. You may want to determine why the station was taken out of service. (When stations are taken out of service by maintenance software, the problems that preceded that point must be cleared.) **1** Use the **status station** command to check the service state of the port. If the port is indeed out of service, enter the **release station** command to bring the station back into service. **2** Retry the command at 1-minute intervals a maximum of 5 times. **3** If the test continues to abort, and the service state indicates that the station is in service and idle, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period.
S8100 2000	ABORT	The test was aborted because response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals for a maximum of 5 times. **2** If the test aborts with error code 2000 again, run short test sequence on the associated DS1-BD or UDS1-BD. If tests 138 through 145 on the associated DS1-BD or UDS1-BD are also aborting with error code 2000, hyperactivity on the board or facility is indicated. In this case, the hyperactivity problem should be dealt with first.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

2 of 3

Table 88: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
1	FAIL	This failure does not indicate a hardware problem. The switchhook audit failed. This condition may occur when the audit is performed at the same time that the terminal equipment goes off-hook. **1** Before retesting, enter **test external-device-alarm port <*address*>** to determine whether the port is reporting an EXT-DEV failure. Wait until the port has no EXT-DEV failures. **2** If the port has no EXT-DEV failures, retry the command at 1-minute intervals up to 5 times.
7	FAIL	The translation update failed. This does not indicate a hardware problem but may be an internal software error.
S8100 7 or 8	FAIL	Test failed due to internal system error. Do not replace port board. • Error code 7: the failure occurred during station translation download (to DS1 Interface circuit pack). • Error code 8: the failure occurred during station ringer update. **1** Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The software and the port processor have the same status.
S8100	PASS	Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack and switch software are consistent.
S8100 0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release busy board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

3 of 3

ANL-16-L (16-Port Analog Line)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ANL-16-L	MINOR	**test port *location* l**	16-Port Analog Line
ANL-16-L	WARNING	**test port *location* sh**	16-Port Analog Line

1 For information on specifying a location, see Command Syntax on page 179.

The circuit packs listed below provide 16 analog line ports for single-line voice terminals. The table below indicates which circuit packs are equipped with lightning protection (for off-premises, out-of -building stations), and which ones support the neon message waiting lamp feature.

16-Port Analog Line Circuit Packs

Circuit Pack	Off-Premises	Neon
TN468B	y	
TN479		
TN746		y
TN746B	y	y
TN2135	y	
TN2144	y	
TN2149	y	
TN2180	y	

S8100

These circuit packs provide 16 ports for analog voice terminals. The TN746, TN468, and TN749 support only single-line, on-premises/in-building, analog voice terminals, and not off-premises stations, since these circuit packs are not equipped with lightning protection. The TN746B, TN2144, TN2149, and TN468B support both on-premises and off-premises (that is, out-of-building) analog voice terminals. The TN468, TN468B, TN479, TN2135, TN2144, and TN2149 do NOT support the neon message waiting feature.

No maintenance of the terminal connected to the 16-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power and the common ringing application circuitry are reported as part of common port circuit pack errors; see errors 1281 and 1793 in XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

Ringing Caused by Maintenance Testing

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled in the `Tests` field of the **change station *extension*** screen. Be aware that this action will also disable Tests #6, 7, 161, and 35.

Error Log Entries and Test to Clear Values

Table 89: 16-Port Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp sh* **r 1**
1(a)	40960 40975 40977	none			
15(b)	Any	Audits and Updates test (#36)			
18	0	**busyout station *extension***	WARNING	ON	**release station *extension***
130(c)		None	WARNING	ON	**test port** *UUCSSpp* **sh**
257(d)	40973	none			
513(e)		Station Present test (#48)	WARNING	OFF	**test port** *UUCSSpp* **sh r 2**
769		Battery Feed test (#35)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **sh r 2**
1025		Looparound test (#161)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 2**
1281		Conference test (#7)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 2**
1537		NPE Crosstalk test (#6)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 2**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in **set options**.

Notes:

a Error Type 1: These are in-line errors and can only be resolved over time.

Aux Data 40960 indicates that too many simultaneous incoming ringing attempts were made on this board. Only 4 ports on a board may ring simultaneously. A 5th incoming call causes an inline error from the board.

Aux Data 40975 indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal rings. If the terminal does not ring, then replace it. Otherwise, issue the **test port *UUCSSpp*** command, and follow the procedure for Test #48.

Aux Data 40977 indicates that no terminal equipment was connected when ringing was attempted. Run the short test via the **test port *UUCSSpp*** command, and follow the procedure for the results of Test #48.

b This is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors.

c This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reseat or replace the circuit pack.

d This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only 1 analog circuit pack in the system has this problem, then replace the circuit pack. If only analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If analog circuit packs on many carriers have this error, then it is probably a problem with the ringing generator.

e Associated Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this disturbs the customer or the terminal equipment, disable it by setting the `Tests` field on the **change station *extension*** screen to `n`. On some software releases, this will also disable Tests #6, 7, 161, and 35.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the *Battery Feed* test (#35), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery Feed test (#35)	X	X	ND
Station Present test (#48)	X	X	ND
Looparound test (#161)		X	ND
Conference test (#7)		X	ND
NPE Crosstalk test (#6)		X	ND
Station Status and Translation Audits and Updates test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

S8100: One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conference functions on a per-port basis.

This test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually part of the long test sequence and executes in about 20 to 30 seconds.

Table 90: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. Enter **status station *extension*** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run test are not available. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use the **display port *UUCSSpp*** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the port is active, wait until the it is idle before testing. **2** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).

1 of 2

Table 90: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1018	ABORT	The test has been disabled by administration. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to "**no**" on this station (this may be due to the ringing application Test #48, that can be customer or terminal disturbing. **1** To enable the test for a particular station being tested, enter **change station *extension*** and set the `Test` field on the station screen to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run test are not available. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	This test can fail due to either on- or off-board problems. Off-board problems include EXP-PN and EXP-INTF (**S8700 IP**: RMC-ENV) faults, TDM-BUS faults, and faults associated with the Tone Detectors/Tone Generators. Clear every off-board problem before replacing the board. A TDM-BUS problem is usually the result of a faulty board connected to the backplane, or bent pins on the backplane. **1** Resolve any EXP-PN or EXP-INTF (**S8700 IP**: RMC-ENV) errors. **2** Resolve any TDM-BUS errors. **3** Resolve any TONE-BD or TONE-PT errors. **4** Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Conference Circuit Test (#7)

S8100

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conference functions on a per-port basis. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

This test verifies that the NPE channel for the port being tested can correctly perform the conferencing function.

Table 91: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. Enter **status station *extension*** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1018	ABORT	The test has been disabled by administration. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to "**n**" on this station (this may be due to the ringing application Test #48, which can be customer or terminal disturbing). **1** To enable the test for the particular analog station being tested, enter **change station *extension*** and set the `Test` field on the station to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.

1 of 2

Table 91: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
2100	ABORT	System resources required to run this test are not available. **1** Resolve any TONE-PT errors. **2** **S8100**: If there are no TONE-PT errors in the error log, retry the test at 1-minute intervals for a maximum of 5 times.
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This causes noisy and unreliable connections. **1** Issue **display port** and **status station** to determine whether the station is idle. If the station is idle, issue **test port** for this port. **2** If the test continues to fail, issue **busyout port** and **release port**, and retest. **3** If the test still fails, replace the board.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery and detecting the resulting current.

NOTE:
For the TN746B, Test #35 does not actually run and instead always returns PASS. Test #35 operates in the normal manner for TN746.

Table 92: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. Enter **status station *extension*** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. **1** Use the **display port *location*** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1018	ABORT	The test has been disabled by administration. The default for the `Test` field on the station screen is **y**. Determine why this field was set to **n** on this station. It may be due to the ringing application Test #48, which can be customer or terminal disturbing. **1** To enable the test for the particular analog station being tested, enter **change station *extension*** and set the `Test` field on the station to **y**.
S870 **0S85** **00S8** **300**13 92	ABORT	This port is currently a TTI port and the test will not execute on it. **1** Verify that the port is a TTI port using either **display port**, which shows that the port is a TTI port) or **list config**, which shows a `t` for the port. **2** If the port is *not* a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct for the test, and no action is necessary.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 92: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
	FAIL	The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This could be a marginal test, and the terminal equipment may be operating satisfactorily. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack only if the customer is experiencing problems.
	PASS	The port's battery feed chip is able to provide power to the station equipment to detect on-/off-hook, but may not be able to supply power for touch-tones. If touch-tones are inoperative on this station, then replace the circuit pack because this port is inoperative. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations with information in the software.

S8100

The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

Table 93: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *UUCSSpp*** to determine the station extension. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times. **3** **S8100**: If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1006	ABORT	This port has been busied out by command, or taken out-of-service by the failure of the NPE Crosstalk test. **1** Look in the error log for error type 18 (port busied out) for this port. If this error is present, release the port with **release station *extension***, and run the test again. **2** Check the error log for error type 1025 (NPE crosstalk test failed) for this port. If this error is present, investigate the errors associated with the NPE Crosstalk test (#6). **3** Make sure that the terminal is connected and in service, and then retest.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1	FAIL	This does not indicate a hardware problem. The switchhook audit failed. The other updates were not performed because of this failure. This may occur when the audit is performed at the same time the terminal equipment goes off-hook. **1** Use **status station** to determine when the port is available. **2** Retry the command at 1-minute intervals up to 5 times.
5	FAIL	This may be an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
7	FAIL	The translation update failed. There may be an internal software error. The ringer update was not performed because of this failure.

1 of 2

Table 93: Test #36 Station Status and Translation Audits and Updates *Continued*

Error Code	Test Result	Description / Recommendation
8	FAIL	This does not indicate a hardware problem. There may be an internal software error. The ringer update failed. **S8100**: The switchhook audit failed. The other updates were not performed because of this failure. This may occur when the audit is performed at the same time that the terminal equipment goes off-hook. Use the **status station** command to determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times.
S81005	FAIL	This does not indicate a hardware problem. However, there may be an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
S81007	FAIL	The translation update failed. This does not indicate a hardware problem. However, there may be an internal software error. The ringer update was not performed because of this failure.
S81008	FAIL	This does not indicate a hardware problem. However, there may be an internal software error. The ringer update failed. **1** Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command and resolve problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Station Present Test (or Ringing Application Test) (#48)

This test applies momentary ringing voltage to the terminal equipment and monitors resulting current flow to determine whether terminal equipment is connected to the port. This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing disturbs the customer or the terminal equipment, you can disable it via the Tests field on the **change station** screen. However, on some software releases, Tests #6, 7, 161, and 35 are disabled.

Table 94: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **S8100**: Use the **display port *location*** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. **1** If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle. **3** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1008	ABORT	Could not allocate a ringing circuit. Either every ringing circuit is active or the ringing generator is either defective or incorrectly wired. Retry the command at 1-minute intervals up to 5 times. **1** If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or is incorrectly wired. If it does not occur on other ports, then all four ring phases are active.
1018	ABORT	The test has been disabled by administration. The default for the **Test** field on the station screen is **y**. Determine why this field was set to **n** on this station. It may be due to the brief ringing disturbance that this test may cause. **1** To enable the test for the particular analog station being tested, enter **change station *extension*** and set the Test field on the station to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 94: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
	FAIL	The terminal equipment is not connected to the circuit pack. Some terminal equipment, such as modems, may fail even when connected properly. **1** Remotely test the equipment. **2** If the test fails again, look for RING-GEN errors in the Error Log. **3** Check all of the wiring between the station equipment and the switch. Then, run the test again. **4** If the test still fails, the set may be defective. Check the set, and replace it, if necessary. **5** Some terminal equipment could fail even when it is connected properly. If this is the case, disable the test using the **change station *extension*** command (enter **n** into the `Test` field). Note that this action also disables Tests 6, 7, 161, and 35 on this port.
	PASS	The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. Investigate user-reported troubles on this port by using other port tests or by examining the station and its wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Loop-Around Test (#161)

This test checks the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the analog port. The test passes if the signal measured by the Tone Detector is within acceptable limits.

Table 95: Test #161 Loop-Around Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. If the port is active, wait until it is idle. **3** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. Use **status station** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	This test is not run on ports administered as External Alert, Announcement or combined modem pool ports. This error can be ignored.
1018	ABORT	The test has been disabled by administration. The default for the `Test` field on the station screen is **y**. Determine why this field was set to **n** on this station. It may be due to the ringing application Test #48, which can be customer or terminal disturbing. **1** To enable the test for the particular analog station being tested, enter **change station *extension*** and set the `Test` field on the station to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 95: Test #161 Loop-Around Test

Error Code	Test Result	Description / Recommendation
	FAIL	The reflective loop around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board. **1** Since the test may be affected by a line seizure, repeat the test at 1-minute intervals up to 5 times. **2** Run circuit pack tests to check the IPSI Tone Generator circuit or Tone Generator circuit pack and the IPSI Tone Detector circuit or Tone Detector circuit pack by using the **test board *location* short** command. **3** Resolve any problems on the Tone Generator circuit or the Tone Detector circuit. **4** If the Tone Generator and Tone Detector circuits are functioning properly and the test still fails and a voice terminal is connected and wired properly, replace the analog line circuit pack.
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

ANL-24-L (24-Port Analog Line)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ANL-24-L	MINOR	**test port *location* l**	24-Port Analog Line
ANL-24-L	WARNING	**test port *location* sh**	24-Port Analog Line

1 For information on specifying a location, see Command Syntax on page 179.

The 24-Port Analog Line circuit pack (TN793) provides 24 ports for voice terminals and supports both on-premises and off-premises analog voice terminals.

No maintenance of the terminal connected to the 24-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power and the common ringing application circuitry are reported as part of common port circuit pack errors. See errors 1281 and 1793 in XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

NOTE:
This analog line circuit pack supports analog data modules. When assigned, analog data modules provide access to the NetPkt (TN794) data ports. To activate an analog data module you must assign the port location on the data screen and connect a modem to the port. (The analog data module may be used for connection to a CDR output or other adjuncts as needed.) These ports are tested like any other analog port on the circuit pack.

Ringing Caused by Maintenance Testing

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled in the `Test` field of the **change station *extension*** screen. Be aware that this action also disables Tests #6, 7, 161, and 35.

Error Log Entries and Test to Clear Values

Table 96: 24-Port Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
1(a)	40960 40975 40977	none			
15(b)	Any	Audits and Updates test (#36)			
18	0	**busyout station** *extension*	WARNING	ON	**release station** ***extension***
130(c)		None	WARNING	ON	**test port** *UUCSSpp* **sh**
257	40973	none			
513 (d) (e)		Station Present test (#48)	WARNING	OFF	**test port** *UUCSSpp* **sh r 2**
769		Battery Feed test (#35)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **sh r 2**
1025		Looparound test (#161)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **l r 2**
1281		Conference test (#7)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **l r 2**
1537		NPE Crosstalk test (#6)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **l r 2**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a These are in-line errors and can only be resolved over time.

Aux Data 40960 indicates that too many simultaneous incoming ringing attempts were made on this board. Only 4 ports on a board may ring simultaneously. A 5th incoming call will cause an inline error from the board.

Aux Data 40975 indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal rings. If the terminal does not ring, then replace it. Otherwise, issue the **test port *location*** command, and follow the procedure for Test #48.

Aux Data 40977 indicates that no terminal equipment was connected when ringing was attempted. Run the short test via the **test port *location*** command, and follow the procedure for the results of Test #48.

b This is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors.

c This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reseat or replace the circuit pack.

d This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only 1 analog circuit pack in the system has this problem, then replace the circuit pack. If only analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If analog circuit packs on many carriers have this error, then it is probably a problem with the ringing generator.

e Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this disturbs the customer or the terminal equipment, disable it by setting the `Tests` field on the **change station *extension*** screen to **n**. On some software releases, this also disables Tests #6, 7, 161, and 35.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the *Battery Feed* test (#35), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery Feed test (#35)	X	X	ND
Station Present test (#48)	X	X	ND
Looparound test (#161)	**S8100**: X	X	ND
Conference test (#7)	**S8100**: X	X	ND
NPE Crosstalk test (#6)	**S8100**: X	X	ND
Station Status and Translation Audits and Updates test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

This test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually part of the long test sequence and executes in about 20 to 30 seconds.

Table 97: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. **2** Enter **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle. Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run test are not available. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. If the port is active, wait until it is idle before testing. **3** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1018	ABORT	The test has been disabled by administration. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station (this may be due to the ringing application Test #48, that can be customer or terminal disturbing). **1** To enable the test for a particular station being tested, enter **change station *extension*** and set the `Test` field on the station to **y**.

1 of 2

Table 97: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run test are not available. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	This test can fail due to either on- or off-board problems. Off-board problems include EXP-PN and EXP-INTF (**S8700 IP**: RMC-ENV) faults, TDM-BUS faults, and faults associated with the Tone Detectors/Tone Generators. Clear every off-board problem before replacing the board. A TDM-BUS problem is usually the result of a faulty board connected to the backplane, or bent pins on the backplane. **1** Resolve any EXP-PN and EXP-INTF (**S8700 IP**: RMC-ENV) errors. **2** Resolve any TDM-BUS errors. **3** Resolve any TONE-BD or TONE-PT errors. **4** Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Conference Circuit Test (#7)

This test verifies that the NPE channel for the port being tested can correctly perform the conferencing function.

Table 98: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. **2** Enter **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle, and retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. **3** If the port is active, wait until it is idle, and retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1018	ABORT	The test has been disabled by administration. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station. It may be due to the ringing application Test #48, which can be customer or terminal disturbing. **1** To enable the test for a particular station being tested, enter **change station *extension*** and set the `Test` field on the station screen to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. **1** Resolve TONE-PT errors. **2** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This will cause noisy and unreliable connections. **1** Issue **display port** and **status station** to determine whether the station is idle. If the station is idle, issue **test port** for this port. **2** If the test continues to fail, issue **busyout port** and **release port**, and retest. **3** If the test still fails, replace the board.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.

1 of 2

Table 98: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery and detecting the resulting current.

NOTE:
For the TN746B, Test #35 does not actually run and instead always returns PASS. Test #35 operates in the normal manner for TN746.

Table 99: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. **3** If the port is active, wait until it is idle, and retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 99: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1018	ABORT	The test has been disabled by administration. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station. It may be due to the ringing application test 48, that can be customer or terminal disturbing. **1** To enable the test for a particular station being tested, enter **change station *extension*** and set the `Test` field on the station screen to **y**.
1392	ABORT	This port is currently a TTI port and the test will not execute on it. **1** Verify that the port is a TTI port using either **display port**, which shows that the port is a TTI port, or **list config**, which shows a `t` for the port. **2** If the port is *not* a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct for the test, and no action is necessary.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This could be a marginal test, and the terminal equipment may be operating satisfactorily. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack only if the customer is experiencing problems.
	PASS	The port's battery feed chip is able to provide power to the station equipment to detect on-/off-hook, but may not be able to supply power for touch-tones. If touch-tones are inoperative on this station, then replace the circuit pack because this port is inoperative. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

2 of 3

Table 99: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

3 of 3

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations with information in the software.

Table 100: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. **3** If the port is active, wait until it is idle, and retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).

1 of 3

Table 100: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
1006	ABORT	This port has been busied out by command, or taken out-of-service by the failure of the NPE Crosstalk test. **1** Look in the Error Log for error type 18 (port busied out) for this port. If this error is present, release the port with the **release station *extension*** command, and run the test again. **2** Check the Error Log for error type 1025 (NPE crosstalk test failed) for this port. If this error is present, investigate the errors associated with the NPE Crosstalk test (#6). **3** Make sure that the terminal is connected and in service, and then retest.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1	FAIL	This does not indicate a hardware problem. The switchhook audit failed. The other updates were not performed because of this failure. This may occur when the audit is performed at the same time the terminal equipment goes off-hook. **1** Use **status station** to determine when the port is available and retry the command at 1-minute intervals up to 5 times.
5	FAIL	This may be an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
7	FAIL	The translation update failed. There may be an internal software error. The ringer update was not performed because of this failure.
8	FAIL	This does not indicate a hardware problem. There may be an internal software error. The ringer update failed. **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

2 of 3

Table 100: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify the board's translations are correct. Use the **list config** command and resolve problems. **2** If the board was found to be correctly inserted in step 1, issue **busyout board**. **3** Issue **reset board**. **4** Issue **release board**. **5** Issue **test board long**. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

3 of 3

Station Present Test (or Ringing Application Test) (#48)

This test applies momentary ringing voltage to the terminal equipment and monitors resulting current flow to determine whether terminal equipment is connected to the port. This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing disturbs the customer or the terminal equipment, you can disable it via the `Tests` field on the **change station** screen. However, on some software releases, Tests #6, 7, 161, and 35 are disabled.

Table 101: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. **3** If the port is active, wait until it is idle, and retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).

1 of 3

Table 101: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
1008	ABORT	Could not allocate a ringing circuit. Either every ringing circuit is active, or the ringing generator is either defective or incorrectly wired. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or is incorrectly wired (see errors for RING-GEN). If it does not occur on other ports, then all four ring phases are active.
1018	ABORT	The test has been disabled by administration.The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station. It may be due to the brief ringing disturbance that this test may cause. **1** To enable the test for a particular station being tested, enter **change station *extension*** and set the `Test` field on the station screen to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	The terminal equipment is not connected to the circuit pack. Some terminal equipment, such as modems, may fail even when connected properly. **1** Remotely test the equipment. **2** If the test fails again, look for RING-GEN errors in the error log. **3** Check all of the wiring between the station equipment and the switch. Then, run the test again. **4** If the test still fails, the set may be defective. Check the set, and replace it, if necessary. **5** Some terminal equipment could fail even when it is connected properly. If this is the case, disable the test using the **change station *extension*** command (enter **n** into the `Test` field). Note that this action also disables Tests 6, 7, 161, and 35 on this port.
	PASS	The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. Investigate user-reported troubles on this port by using other port tests or by examining the station and its wiring.

2 of 3

Table 101: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

3 of 3

Loop-Around Test (#161)

This test checks the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the analog port. The test passes if the signal measured by the Tone Detector is within acceptable limits.

Table 102: Test #161 Loop-Around Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. **3** If the port is active, wait until it is idle, and retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 102: Test #161 Loop-Around Test

Error Code	Test Result	Description / Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. **2** Use **status station** to determine the service state of the port. **3** If the port is active, wait until it is idle, and retry the command at 1-minute intervals up to 5 times.
1005	ABORT	This test is not run on ports administered as External Alert, Announcement or combined modem pool ports. This error can be ignored.
1018	ABORT	The test has been disabled by administration. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station (this may be due to the ringing application test 48, that can be customer or terminal disturbing). **1** To enable the test for a particular station being tested, enter **change station *extension*** and set the `Test` field on the station screen to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	The reflective loop around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board. **1** Since the test may be affected by a line seizure, repeat the test at 1-minute intervals up to 5 times. **2** Run circuit tests to check the Tone Generator circuit and the Tone Detector circuit by using **test board *location* short**. **3** Resolve any problems on the Tone Generator circuit or the Tone Detector circuit. **4** If the Tone Generator and Tone Detector circuits are functioning properly and the test still fails and a voice terminal is connected and wired properly, replace the analog line circuit pack.
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

2 of 3

Table 102: Test #161 Loop-Around Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command and resolve any problems. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.

3 of 3

ANL-BD (Analog Line Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name Of MO
S8100: ANL-BD	MINOR WARNING	**test board *location* sh**	8-Port Analog Line circuit pack
S8100: ANL-BD	MINOR WARNING	**test board *location* sh**	8-Port Neon Analog Line circuit pack
ANL-BD	MINOR WARNING	**test board *location* sh**	16-Port Neon Analog Line circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 for circuit pack-level errors. See also ANL-16-L (16-Port Analog Line) on page 232 for related line information.

S8100: See also ANL-LINE, ANL-NE-L (8-Port Analog Line) on page 263 for related line information.

ANL-LINE, ANL-NE-L (8-Port Analog Line)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command To Run[1]	Full Name of MO
ANL-LINE	MINOR	**test port *location* l**	8-Port Analog Line
ANL-LINE	WARNING	**test port *location* sh**	8-Port Analog Line
ANL-NE-L	MINOR	**test port *location* l**	8-Port Neon Analog Line
ANL-NE-L	WARNING	**test port *location* sh**	8-Port Neon Analog Line

1 For information on specifying a location, see Command Syntax on page 179.

The 8-port Analog Line circuit packs,

		S8100:
TN712	TN411 [G3rV2]	TN742
	TN443 [G3r V2]	TN769
	TN443 [G3r V2]	TN467 [G3r V2]

each provide eight ports for single-line, on or off-premises analog endpoints such as analog voice terminals, queue warning level lamps, recorded announcements, dictation machines, PAGEPAC paging equipment, external alerting devices, modems, fax machines, and AUDIX voice ports. Only the TN769 supports a neon message waiting lamp.

NOTE:
PAGEPAC is a registered trademark of Harris Corporation, Dracon Division.

Test #48 may cause some terminal equipment to ring briefly during daily maintenance, which may disturb the customer or the terminal equipment. Test #47 may cause a false alarm when the port is connected to certain off-premises equipment, non-voice terminal equipment, or loop equipment. In either case, the tests can be disabled by entering **n** in the `Tests` field on the **change station *extension*** screen. Be aware that this will disable Tests 6, 35, 47, and 48.

No maintenance of the terminal connected to the 8-Port Analog Line circuit pack or 8-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the common ringing application circuitry and the neon message waiting lamp power (ANL-NE-L only) are reported as errors 1281and 1793 against XXX-BD (Common Port Circuit Pack) in Table 899, Common Port Circuit Pack Maintenance Error Log Entries, on page 2090.

Hardware Error Log Entries and Test to Clear Values

Table 103: 8-Port Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**

1793 (f)					

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a These are in-line errors that can only be resolved over time.

Aux Data 40960 Indicates that too many simultaneous incoming ringing attempts were made on this board. Only 4 ports on a board may ring simultaneously. A 5th incoming call will cause an inline error from the board.

Aux Data 40975 indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal rings. If the terminal doesn't ring, then replace it. Otherwise, issue the **test port** ***location*** command, and follow the procedure for Test #48.

Aux Data 40977 indicates that no terminal equipment was connected when ringing was attempted. Run the short test via the **test port** ***location*** command, and follow the procedure for the results of Test #48.

b This is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate errors (if any).

c This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

d Associated Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled via the **change station *extension*** command. However, on some releases of the software, this will disable Tests #6, 47, and 35 as well as Test #48.

e Associated Test #47 may cause a false alarm when the port is connected to off-premises equipment, some non-voice terminal equipment, and some loop equipment. If this causes a false alarm, use **change station,** and change the `Tests` field to **n** to disable the test.

f See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the *Battery Feed* test (#35), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery Feed test (#35)	X	X	ND
Station Present test (#48)	X	X	ND
NPE Crosstalk test (#6)		X	ND
Loop Around and Conference test (#47)		X	ND
Station Status and Translation Audits and Updates test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more NPEs (Network Processing Elements) reside on each circuit pack with a TDM-bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 104: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-on-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. Enter **status station *extension*** to determine the service state of the port. If the port is active, it will be unavailable for certain tests. Wait until the port is idle before retesting. **2** When the port is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. **1** Resolve TTR-LEV errors. **2** Resolve TONE-PT errors. **3** Retry the test at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *location*** to determine the station extension. Use **status station** to determine the service state of the port. If the service state indicates that the port is active, then the port is unavailable for certain tests. Wait until the port is idle before retesting. **2** Retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort and the port is idle, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This code occurs under either of the following conditions: • This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, a modem pool member or music on hold). • The circuit pack is one of the following: — TN742 vintage 13, 14, or 15 — TN769 vintage 3, 4, or 5

1 of 3

Table 104: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1018	ABORT	Test disabled by administration. The default for the `Test` field on the station screen is **y**; thus, you may want to determine why this field has been set to **n** on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). **1** To enable the test for a particular station, enter **change station *extension*** and set the `Test` field to **y**.
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. **1** Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a Tone-Clock problem). The Tone-Clock and Tone Detectors could be having a communication problem. For example, the companding modes could be out of synchronization. **1** Retry the command at 1-minute intervals up to 5 times.

2 of 3

Table 104: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
Any	FAIL	This test can fail due to either on- or off-board problems. Off-board problems of concern include EXP-PN and EXP-INTF (**S8700 IP**: RMC-ENV) faults, TDM-BUS faults, and faults associated with the Tone Detectors/Tone Generators. Clear every off-board problem before replacing the board. Keep in mind that a TDM-BUS problem is usually the result of a faulty board connected to the backplane or bent pins on the backplane. **1** Resolve EXP-PN and EXP-INTF (**S8700 IP**: RMC-ENV) errors. **2** Resolve TDM-BUS errors. **3** Resolve TONE-BD or TONE-PT errors. **4** Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for circuit packs TN712 prior to Vintage 14 and TN742 prior to Vintage 6 (**S8100**: Vintage 4).
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.

3 of 3

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and trying to detect a current.

Table 105: Test #35 Battery Feed Test Results

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-on-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. Enter **status station *extension*** to determine the service state of the port. Refer to Chapter 1, "Maintenance SAT Commands" in the Maintenance Commands Reference (555-245-101), for a full description of every possible state. If the port is active, it will be unavailable for certain tests. Wait until the port is idle before retesting. **2** When the port is idle, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *location*** to determine the station extension. Use **status station** to determine the service state of the port. If the service state indicates that the port is active, then the port is unavailable for certain tests. Refer to Chapter 1, "Maintenance SAT Commands" in the Maintenance Commands Reference (555-245-101), for a full description of every possible state. Wait until the port is idle before retesting. **2** Retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort and the port is idle, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This error code occurs under either of the following conditions: **1** This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold). **2** The circuit pack is one of the following: — TN742 vintages 13,14, and 15 — TN769 vintages 3, 4, and 5
1018	ABORT	Test disabled via administration. The default for the `Test` field on the is **y**. Determine why this field was set to **n** on this station. It may be due to the ringing application Test E48, which can be customer or terminal disturbing. **1** To enable the test for a particular station, enter **change station *extension*** and set the `Test` field to **y**.

1 of 3

Table 105: Test #35 Battery Feed Test Results

Error Code	Test Result	Description / Recommendation
1392	ABORT	This port is currently a TTI port and the test will not execute on it. **1** Verify that the port is a TTI port using either the **display port** command (the display shows that the port is a TTI port) or the **list config** command (the display shows a `t` for the port). **2** If either **list config** or **display port** indicate that the port is *not* a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct for the test, and no action is necessary.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a Tone-Clock problem). The Tone-Clock and Tone Detectors could be having a communication problem. For example, the companding modes could be out of synchronization. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This may occur when the test is performed at the same time that the terminal equipment goes off-hook. **1** Use **status station** to determine when the port is available for testing. When the port becomes available for testing, retry the command at 1-minute intervals a minimum of five times. **2** If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack only if the customer is experiencing problems.
	PASS	The port's battery feed chip is able to provide power to the station equipment to detect on-/off-hook. However, the battery feed chip may still be unable to provide power for touch-tones. If tones are heard when buttons are pressed, then the battery feed chip is functioning correctly; otherwise, replace the circuit pack because this port is defective. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for circuit packs TN712 prior to Vintage 14 and TN742 prior to Vintage 6.

2 of 3

Table 105: Test #35 Battery Feed Test Results

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.

3 of 3

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations (such as station type, dial type, network connection) with information kept in the software. The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

Table 106: Test #36 Station Status and Translation Audits and Updates Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test.
1004	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *location*** to determine the station extension. Use **status station** to determine the service state of the port. If the service state indicates that the port is active, then the port is unavailable for certain tests. Wait until the port is idle before retesting. **2** Retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort and the port is idle, escalate the problem.

1 of 3

Table 106: Test #36 Station Status and Translation Audits and Updates Test

Error Code	Test Result	Description / Recommendation
1005	ABORT	The test was aborted due to a configuration problem. This error code occurs under either of the following conditions: **1** This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold). **2** The circuit pack is one of the following: — TN742 vintages 13,14, and 15 — TN769 vintages 3, 4, and 5
1006	ABORT	This port has been busied out by command or taken out-of-service by the failure of the NPE Crosstalk test. **1** Look in the Error Log for Error Type 18 (port busied out) for this port. If this error is present, then release the port with **release station *extension*** and run the test again. **2** Look in the Error Log for Error Type 1025 (NPE Crosstalk test failed) for this port. If this error is present, then investigate the errors associated with the NPE Crosstalk test (#6) first. **3** Make sure that the terminal is connected and in service, and then retest.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1	FAIL	This does not indicate a hardware problem. The switchhook audit failed, and the other updates were not performed because of this failure. This condition may occur when the audit is performed at the same time that the terminal equipment goes off-hook. Use the **status station** command to determine when the port is available for testing. **1** When the port becomes available for testing, retry the command at 1-minute intervals up to 5 times.
5	FAIL	This does not indicate a hardware problem but may indicate an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
7	FAIL	The translation update failed. The ringer update was not performed because of this failure. This does not indicate a hardware problem but may be an internal software error.
8	FAIL	This does not indicate a hardware problem but may be an internal software error. The ringer update failed. **1** Retry the command at 1-minute intervals up to 5 times.

2 of 3

Table 106: Test #36 Station Status and Translation Audits and Updates Test

Error Code	Test Result	Description / Recommendation
	PASS	The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for circuit packs TN712 prior to vintage 14 and TN742 prior to vintage 6.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.

3 of 3

Looparound and Conference Test (#47)

Each Analog port consists of:

- An NPE (Network Processing Element) for port connectivity and gain, and conferencing functionality
- A codec that converts TDM Bus digital signals to analog
- A battery feed chip that provides power to the telephone set for signaling, dial pulsing, transmission, and balance.

This test is designed to check the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the Analog port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog port. The Analog port is then instructed to go into loop around mode (see Figure 21, Analog Looparound and Conference Test, on page 274). The test passes if the signal measured by the Tone Detector is within acceptable limits.

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. Test #47 also tests the operation of the port conference circuits in the NPE for three and four parties. In addition, a test is run to measure noise. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

The noise test is performed by filtering out the tone, and then measuring inherent port noise.

NOTE:
This loop-around test is sensitive to the length of the loop, the equipment in the loop, or the equipment terminating the loop, such as off-premises stations. If this test is causing a false alarm, use **change station** for this station and change the `Tests` field to **n**, to disable the test.

Figure 21: Analog Looparound and Conference Test

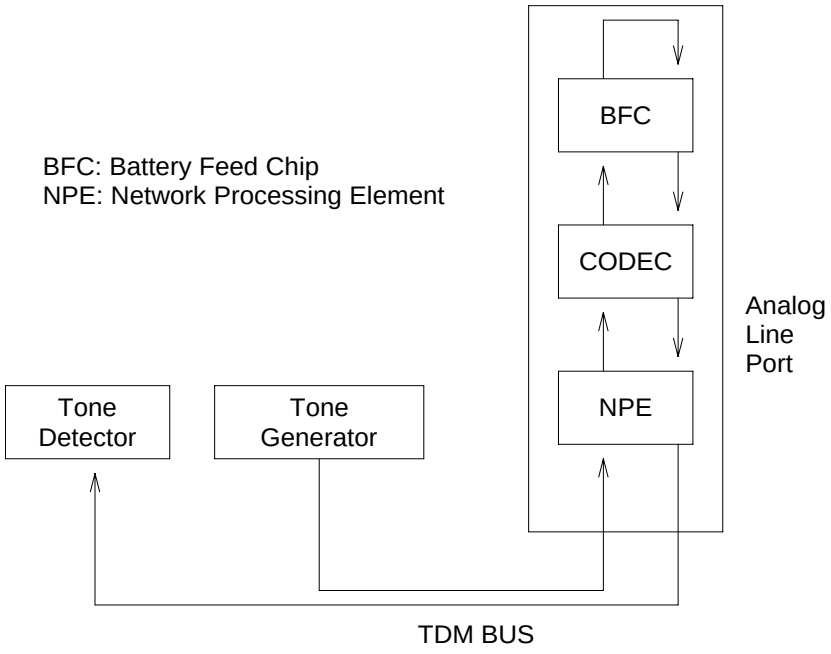

Table 107: Test #47 Loop Around and Conference Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
7	ABORT	The port was seized by a user for a valid call. **1** Enter **display port *location*** to determine the station's extension. Enter **status station *extension*** to determine the service state of the port. If the port is active, it will be unavailable for certain tests. Wait until the port is idle before retesting. **2** If the port is idle, retry the command at 1-minute intervals up to 5 times.

1 of 5

Table 107: Test #47 Loop Around and Conference Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. (This could be a Music-on-Hold port.) **1** Enter **display port *location*** to determine the station's extension. Enter **status station *extension*** to determine the service state of the port. If the port is active, it will be unavailable for certain tests. Wait until the port is idle before retesting. **2** If the port is idle, retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. **1** Resolve TTR-LEV errors. **2** Resolve TONE-PT errors. **3** If neither condition exists, retry the test at 1-minute intervals up to 5 times.
1004	ABORT	The port has been seized for a valid call during the conference or noise test. **1** If the circuit pack is a TN742 of Vintage 10 or less, this test is not valid. Otherwise, proceed with step 2. **2** When the port is available for testing, retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This error code occurs under either of the following conditions: • This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, a modem pool member or music on hold). • The circuit pack is one of the following: — TN742 vintage 13, 14, or 15 — TN769 vintage 3, 4, or 5
1018	ABORT	Test disabled by administration. The default for the `Test` field is **y.** Determine why the field is **n** on this station. It may be due to the ringing application test 48, which can be customer or terminal disturbing. **1** To enable the test for a particular station, enter **change station *extension*** and set the `Test` field on the Station screen to **y**.

2 of 5

Table 107: Test #47 Loop Around and Conference Test

Error Code	Test Result	Description / Recommendation
1392	ABORT	This port is currently a TTI port and the test will not execute on it. **1** Verify that the port is a TTI port using either **display port** to show that the port is a TTI port, or **list config**, where the display shows a `t` for the port. **2** If either **list config** or **display port** indicate that the port is *not* a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct for the test, and no action is necessary.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a Tone-Clock problem). The Tone-Clock and Tone Detectors could be having a communication problem. For example, the companding modes could be out of synchronization. **1** Retry the command at 1-minute intervals up to 5 times.

3 of 5

Table 107: Test #47 Loop Around and Conference Test

Error Code	Test Result	Description / Recommendation
7	FAIL	The conference test or the noise test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board, as described below.
13		The reflective loop around with gain set to low and the 600-ohm balance failed. This will cause noisy or unreliable connections.
14		The reflective loop around test (with the gain set to high, using RC balance) failed. This could cause noisy or unreliable connections. The problem can also be off-board, as described below.
15		The nonreflective loop-around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board as described below. **1** Disconnect the terminal equipment from the circuit pack at the cross-connect and run the test again. **2** If the test fails again, replace the circuit pack and reconnect the terminal equipment. If the test passes the second time, then the test results were affected by the terminal equipment connected to the port. In this case, ignore the results of this test if every other test passes or aborts and the station is operating properly. Failure of test 47 does not cause an alarm. If there are failures of other tests, then investigate those errors. User reported troubles with this port should be investigated by using other port tests, by examining station wiring, and by examining the station to ensure that it is correctly translated as off-premises or on-premises. If the Looparound and Conference circuit test fails for every port on a circuit pack, a -5 Volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with the power unit, see the RMC-ENV MO (**S8700 IP**), or the CARR-POW MO (**S8700 MC**). If a red LED is lit on TN736 or TN752 power unit circuit pack, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test.

4 of 5

Table 107: Test #47 Loop Around and Conference Test

Error Code	Test Result	Description / Recommendation
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for circuit packs TN712 prior to vintage 14 and TN742 prior to vintage 6.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board** command. **3** Issue the **reset board** command. **4** Issue the **release board** command. **5** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.

5 of 5

Station Present Test (or Ringing Application Test) (#48)

This test provides a burst of ringing current to the terminal equipment and detects that current flows. This test is to ascertain whether or not terminal equipment is connected to the port.

This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen. However, on some releases of the software, this action disables Tests #6, 47, and 35, as well as Test #48.

Table 108: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. **1** Use the **display port *location*** to determine the station's extension. Enter **status station *extension*** to determine the service state of the port. If the port is active, it will be unavailable for certain tests. Wait until the port is idle before retesting. **2** If the port is idle, retry the command at 1-minute intervals up to 5 times. **3** Check for phone left off-hook or for wiring problems.
1004	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use the **display port *location*** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is active, then the port is unavailable for certain tests. Wait until the port is idle before retesting. **2** Retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort and the port is idle, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This error code occurs under either of the following conditions: **1** This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold). **2** The circuit pack is one of the following: — TN742 vintages 13, 14, and 15 — TN769 vintages 3, 4, and 5
1008	ABORT	Could not allocate a ringing circuit for one of the following reasons: • Every ringing circuit is active • The ringing generator is defective • It is incorrectly wired **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for Test #48 on other circuit packs as well, then the ringing generator may be defective or incorrectly wired. If it does not occur on other ports, then that circuit pack is currently using all four ringing phases.

1 of 3

Table 108: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
1018	ABORT	The test was disabled by administration. The default for the `Test` field is **y**; thus, you may want to determine why this field has been set to "**n**" on this station (this may be due to the ringing application Test #48, which can be customer or terminal disturbing). **1** To enable the test for a particular station, enter **change station *extension*** and set the `Test` field to **y**.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a Tone-Clock problem). The Tone-Clock and Tone Detectors could be having a communication problem. For example, the companding modes could be out of synchronization. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
	FAIL	The terminal equipment is not connected to the circuit pack or the ringing generator may have failed. **1** Remotely test the equipment. **2** If the test fails again, look for RING-GEN errors in the error log. If present, see RING-GEN (Analog Ring Generator) on page 1587 (analog ring generator) maintenance. **3** Check all of the wiring between the station equipment and the switch. Then, run the test again. **4** If the test still fails, the set may be defective. Check the set, and replace it, if necessary. **5** Some terminal equipment (such as a modem) could fail even when it is connected properly. If this is the case, disable the test using the **change station *extension*** command (enter **n** into the `Test` field). Note that this action also disables Tests 6, 7, 161, and 35 on this port.
	PASS	The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. Investigate user-reported troubles on this port by using other port tests or by examining the station and its wiring. **NOTE:** **S8100**: This test always passes for circuit pack TN742 prior to vintage 6.

2 of 3

Table 108: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **list config** and resolve any problems. **2** If the board was found to be correctly inserted in step 1, use **busyout board**. **3** Issue **reset board**. **4** Issue **release board**. **5** Issue **test board long**. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.

3 of 3

AN-LN-PT (Analog Line Port)

S8700 / S8500 / S8300 / G700 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
AN-LN-PT	MINOR	**test port *location* l**	Analog Line port
AN-LN-PT	WARNING	**test port *location* sh**	Analog Line port

1 For information on specifying a location, see Command Syntax on page 179.

The TN793B/TN2793B Analog Line (w/ Caller ID) and the TN797 Analog Trunk and Line circuit packs both support this MO.

The TN793B/TN2793B Analog Line circuit pack (w/ Caller ID) provides 24 ports for voice terminals and supports both on-premises and off-premises analog voice terminals.

NOTE:
The TN793B/TN2793B analog line circuit pack supports analog data modules. When assigned, analog data modules provide access to the NetPkt (TN794 circuit pack) data ports. To activate an analog data module you must assign the port location on the data screen and connect a modem to the port. The analog data module can be used for connection to a CDR output, or other adjuncts as needed. These ports are tested like any other analog port on the circuit pack.

The TN797 Analog Trunk and Line circuit pack provides 8 ports, each of which may be administered in any of several ways, as described in MO TR-LN-BD.

S8300 / **G700**: The MM711 Analog Trunk and Line Media Module provides 8 ports, each of which may be administered in any of several ways, as described in MO MG-ANA.

NOTE:
Although the AN-LN-PT MO is provided for the G700 Media Gateways, this MO only partially supports the MM711 Analog Media Module.

Ringing caused by maintenance testing

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing disturbs the customer or the terminal equipment, disable it in the `Tests` field of the **change station <*extension*>** form. Be aware that this action also disables Tests #6, 7, 161, and 35 on some software releases.

G700: Tests #6, 7, and 161 abort on the G700 with Error Code 1412.

Error log entries and test to clear values

Table 109: Analog line error log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** <*address*> **sh r 1**
1*	40960 40975 40977	none			
15*	Any	Audits and Updates test (#36)			
18	0	**busy station <*extension*>**	WARNING	ON	**release station <*extension*>**
130*		None	WARNING	ON	**test port** <*address*> **sh**
257*	40973	None			
513*		Station Present test (#48)	WARNING	OFF	**test port** <*address*> **sh r 2**
769		Battery Feed test (#35)	MINOR WARNING[2]	ON	**test port** <*address*> **sh r 2**
1025		Looparound test (#161)	MINOR WARNING[2]	ON	**test port** <*address*> **l r 2**
1281		Conference test (#7)	MINOR WARNING[2]	ON	**test port** <*address*> **l r 2**
1537		NPE Crosstalk test (#6)	MINOR WARNING[2]	ON	**test port** <*address*> **l r 2**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

**** Additional Information:***

Error Type 1: these are inline errors and can only be resolved over time.

- Aux Data 40960 indicates that too many simultaneous incoming ringing attempts were made on this board. Only 4 ports on a board may ring simultaneously. A 5th incoming call causes an inline error from the board.
- Aux Data 40975 indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance.

  1 Call the terminal equipment and verify that the terminal rings.

  2 If the terminal does not ring, replace it.

  3 Otherwise, issue the **test port *location*** command, and follow the procedure for Test #48.

- 40977 indicates that no terminal equipment was connected when ringing was attempted.

  1 Run the short test via the **test port *location*** command, and follow the procedure for the results of Test #48.

Error Type 15: this is a software audit error that does not indicate any hardware malfunction.

1 Run the short test sequence, and investigate any associated errors.

Error Type 130: this error type indicates that the circuit pack or media module has been removed or has been insane for more than 11 minutes.

1 To clear the error, reseat or replace the circuit pack or media module.

Error Type 257: this is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent.

S8700 / S8500 / S8100

1 If only 1 analog circuit pack in the system has this problem, replace the circuit pack.

2 If only analog circuit packs on a particular carrier have this error, the ringing generator may not be connected to this carrier.

3 If analog circuit packs on many carriers have this error, it is probably a problem with the ringing generator.

S8300 / G700

1 If not resolved over time, replace the media module.

Error Type 513: Test #48 can cause some terminal equipment to ring briefly during daily maintenance.

1 If this disturbs the customer or the terminal equipment, disable it by setting the `Tests` field on the **change station *extension*** form to **n**. On some software releases, this also disables Tests #6, 7, 161, and 35.

S8300 / **G700**: In the G700, Tests #6, 7, and 161 abort with Error Code 1412.

System technician-demanded tests: descriptions and error codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the Battery Feed test (#35), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery Feed test (#35)	X	X	ND
Station Present test (#48)	X	X	ND
Looparound test (#161) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Conference test (#7) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
NPE Crosstalk test (#6) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
Station Status and Translation Audits and Updates test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

S8300 / **G700**: This test aborts with Error Code 1412.

This test verifies that the port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually part of the long test sequence and executes in about 20 to 30 seconds.

Table 110: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Necessary system resources could not be allocated to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1000	ABORT	System resources are unavailable. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. **2** Enter **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1001	ABORT	System resources required to run test are not available. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

1 of 3

Table 110: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or have time slots out-of-service due to TDM-BUS errors. **1** Refer to TDM-BUS to diagnose any active TDM-BUS errors. **2** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort, escalate the problem.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. **1** Resolve any TTR-LEV errors in the Error Log. **2** Resolve any TONE-PT errors in the Error Log. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1004	ABORT	A valid call seized the port during the test and aborted the test. **1** Use **display port *location*** to determine the station extension. **2** Use **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle before testing. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1005	ABORT	This test was aborted due to a configuration problem. The test is not applicable for this type of analog port. This error can be ignored.
1018	ABORT	Administration has disabled the test. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station (this may be due to the ringing application Test #48, which can be disturbing to customer or terminal equipment). **1** To enable the test for a particular station being tested, enter **change station *extension***. **2** Change the `Test` field on the station screen to **y**.
S8300 G700 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test request was not received within the allowable time period.

2 of 3

Table 110: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
2100	ABORT	System resources required to run test are not available. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
Any	FAIL	This test can fail due to either on- or off-board problems. Off-board problems include TDM-BUS faults, EXP-PN and EXP-INTF faults (**S8700 IP**: RMC-ENV faults), and faults associated with the Tone Detectors/Tone Generators. Clear every off-board problem before replacing the board. **1** A TDM-BUS problem is usually the result of a faulty board connection to the backplane, or bent pins on the backplane. Resolve any TDM-BUS errors in the error log. **2** Resolve any EXP-PN, EXP-INTF, or RMC-ENV errors in the error log. **3** Resolve any TONE-BD and/or TONE-PT errors in the error log. **4** Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. Investigate user-reported troubles on this port by running other port tests, by examining station wiring, or by inspecting the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check to make sure that the board translations are correct. Use **list configuration** and resolve any problems. **2** If the board is correctly inserted, issue the **busy board** <***address***> command. **3** Issue **reset board** <***address***>. **4** Issue **release board** <***address***>. **5** Issue **test board** <***address***> **long**. This should re-establish the link between the internal ID and the port. If not, verify that a valid board is inserted.

3 of 3

Conference Circuit Test (#7)

S8300 / **G700**: This test aborts with Error Code 1412.

This test verifies that the NPE channel for the port being tested correctly performs the conferencing function.

Table 111: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Necessary system resources could not be allocated to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1000	ABORT	System resources are unavailable. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. **2** Enter **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1004	ABORT	A valid call seized the port during the test and aborted the test. **1** Use **display port *location*** to determine the station extension. **2** Use **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle before testing. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1005	ABORT	This test was aborted due to a configuration problem. The test is not applicable for this type of analog port. This error can be ignored.
1018	ABORT	Administration has disabled the test. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station (this may be due to the ringing application Test #48, which can be disturbing to customer or terminal equipment). **1** To enable the test for a particular station being tested, enter **change station *extension***. **2** Change the `Test` field on the station screen to **y**.
S8300 G700 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. **1** Resolve any TONE-PT errors in the error log. **2** If there are no TONE-PT errors, retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort, escalate the problem.

1 of 2

Table 111: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This causes noisy and unreliable connections. **1** Issue **display port *location*** and **status station *extension*** to determine whether the station is idle. **2** If the station is idle, issue **test port *location*** for this port. **3** If the test continues to fail, issue **busy port *location*** and **release port *location***, and then retest. **4** If the test still fails, replace the board.
	PASS	The port can correctly conference multiple connections. Investigate user-reported troubles on this port by running other port tests; by examining station, trunk, or external wiring; or by inspecting the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check to make sure that the board translations are correct. Use **list configuration**, and resolve any problems. **2** If the board is correctly inserted, use **busy board <*address*>**. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the link between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery power, and detecting the resulting current.

Table 112: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
	ABORT	Necessary system resources could not be allocated to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

1 of 3

Table 112: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources are unavailable. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. **2** Enter **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1004	ABORT	A valid call seized the port during the test and aborted the test. **1** Use **display port *location*** to determine the station extension. **2** Use **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle before testing. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1005	ABORT	This test was aborted due to a configuration problem. The test is not applicable for this type of analog port. This error can be ignored.
1018	ABORT	Administration has disabled the test. The default for the `Test` field on the station form is **y**. Determine why this field has been set to **n** on this station (this may be due to the ringing application Test #48, which can be disturbing to customer or terminal equipment). **1** To enable the test for a particular station being tested, enter **change station *extension***. **2** Change the `Test` field on the station screen to **y**.
1392	ABORT	This port is currently a TTI port and the test does not execute on it. **1** Verify that the port is a TTI port: • Enter the **display port *location*** command (the display shows that the port is a TTI port). • Enter the **list configuration** command (the display shows a `t` for the port). **2** If both commands indicate that the port is a TTI port, the abort is correct for the test, and no action is necessary. **3** If either command indicates that the port is *not* a TTI port, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period.

2 of 3

Table 112: Test #35 Battery Feed Test

Error Code	Test Result	Description / Recommendation
2100	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
	FAIL	The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This test result might be marginal, and the terminal equipment may be operating satisfactorily. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack or media module only if the customer is experiencing problems.
	PASS	The port's battery feed chip is able to provide sufficient power to the station equipment to detect on-/off-hook, but may not be able to supply power for touch-tones. **1** If touch-tones are inoperative on this station, replace the circuit pack or media module, because this port is inoperative. **2** Investigate user-reported troubles on this port by running other port tests, by examining station wiring, or by inspecting the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check to make sure that the board translations are correct. Use the **list configuration** command, and resolve any problems. **2** If the board is correctly inserted, issue the **busy board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the link between the internal ID and the port. If not, verify that a valid board is inserted.

3 of 3

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations with information in the software.

Table 113: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
	ABORT	Necessary system resources could not be allocated to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1004	ABORT	A valid call seized the port during the test and aborted the test. **1** Use **display port *location*** to determine the station extension. **2** Use **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle before testing. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1005	ABORT	This test was aborted due to a configuration problem. The test is not applicable for this type of analog port. This error can be ignored.
1006	ABORT	The port is out-of-service. The **busy station *extension*** has been given to this port. If the port is on a circuit pack, it may have been taken out-of-service by the failure of the NPE Crosstalk test. **1** Look for error type 18 (port busied out) for this port. If this error is present, release the port (**release station *extension***), and run the test again. **2** If the port is on a circuit pack, check for error type 1537 (NPE Crosstalk test failed) for this port. If this error is present, investigate the errors associated with the NPE Crosstalk test (#6). **3** Make sure that the terminal is connected and in service, and then retest.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1	FAIL	The switchhook audit failed. This result does not indicate a hardware problem. The other updates were not performed because of this failure. This may occur if the audit is performed at the same time the terminal equipment goes off-hook. **1** Use the **status station *extension*** command to determine when the port is available. **2** Retry the command at 1-minute intervals up to 5 times. **3** If the test continues to fail, escalate the problem.
5	FAIL	The message waiting lamp update failed. This may be an internal software error. The translation and ringer updates were not performed because of this failure.

1 of 2

Table 113: Test #36 Station Status and Translation Audits and Updates

Error Code	Test Result	Description / Recommendation
7	FAIL	The translation update failed. There may be an internal software error. The ringer update was not performed because of this failure.
8	FAIL	The ringer update failed. There may be an internal software error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, escalate the problem.
	PASS	The software and the port processor have the same status. Investigate user-reported troubles on this port by running other port tests, by examining station wiring, or by inspecting the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check to make sure that the board translations are correct. Use the **list configuration** command, and resolve any problems. **2** If the board is correctly inserted, issue the **busy board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the link between the internal ID and the port. If not, verify that a valid board is inserted.

2 of 2

Station Present Test (or Ringing Application Test) (#48)

This test applies momentary ringing voltage to the terminal equipment and monitors resulting current flow to determine whether terminal equipment is connected to the port. This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing disturbs the customer or the terminal equipment, you can disable it via the `Tests` field on the **change station *extension*** screen. However, on some software releases, Tests #6, 7, 161, and 35 also are disabled.

S8300 / **G700**: In the G700, Tests #6, 7, and 161 abort with Error Code 1412.

Table 114: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
	ABORT	Necessary system resources could not be allocated to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

1 of 3

Table 114: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources are unavailable. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. **2** Enter **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1004	ABORT	A valid call seized the port during the test and aborted the test. **1** Use **display port *location*** to determine the station extension. **2** Use **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle before testing. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1005	ABORT	This test was aborted due to a configuration problem. The test is not applicable for this type of analog port. This error can be ignored.
1008	ABORT	A ringing circuit could not be allocated. Either every ringing circuit is active, the ringing generator is defective, or it is incorrectly wired. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, look for RING-GEN errors in the Error Log. **3** If ABORT 1008 occurs for this test on other circuit packs as well, the ringing generator may be defective or is incorrectly wired (see RING-GEN (Analog Ring Generator) on page 1587. **4** If an ABORT 1008 does not occur on other ports, then all four ring phases are active.
1018	ABORT	Administration has disabled the test. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station (this may be due to the ringing application Test 48, which can be disturbing to customer or terminal equipment). **1** To enable the test for a particular station being tested, enter **change station *extension***. **2** Change the `Test` field on the station screen to **y**.

2 of 3

Table 114: Test #48 Station Present Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
	FAIL	The terminal equipment is not connected to the circuit pack. Some terminal equipment, such as modems, may fail even when connected properly. **1** Remotely test the terminal equipment. **2** If the test fails again, resolve any RING-GEN errors in the error log, if present. **3** Check all of the wiring between the station equipment and the switch. Then, run the test again. **4** If the test still fails, the terminal equipment may be defective. Check and replace it, if necessary. **5** Some terminal equipment might fail even when it is connected properly. If this is the case, disable the test using **change station *extension*** (enter **n** into the `Test` field). Note that this action also disables Tests 6, 7, 35, and 161 on this port.
	PASS	The station is connected properly to the switch. Investigate user-reported troubles on this port by running other port tests, by examining station wiring, or by inspecting the station. **NOTE:** This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check to make sure that the board translations are correct. Use the **list configuration** command, and resolve any problems. **2** If the board is correctly inserted, issue the **busy board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the link between the internal ID and the port. If not, verify that a valid board is inserted.

3 of 3

Loop-Around Test (#161)

S8300 / **G700**: This test aborts with Error Code 1412.

This test checks the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the analog port. The test passes if the signal measured by the Tone Detector is within acceptable limits.

Table 115: Test #161 Loop-Around Test

Error Code	Test Result	Description / Recommendation
	ABORT	Necessary system resources could not be allocated to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1000	ABORT	System resources are unavailable. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. **1** Enter **display port *location*** to determine the station's extension. **2** Enter **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or have time slots out-of-service due to TDM-BUS errors. **1** Refer to "TDM-BUS" to diagnose any active TDM-BUS errors. **2** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort, escalate the problem.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. **1** Resolve any TTR-LEV errors in the Error Log. **2** Resolve any TONE-PT errors in the Error Log. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.

1 of 3

Table 115: Test #161 Loop-Around Test *Continued*

Error Code	Test Result	Description / Recommendation
1004	ABORT	A valid call seized the port during the test and aborted the test. **1** Use **display port *location*** to determine the station extension. **2** Use **status station *extension*** to determine the service state of the port. **3** If the port is active, wait until it is idle before testing. Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1005	ABORT	This test was aborted due to a configuration problem. The test is not applicable for this type of analog port. This error can be ignored.
1018	ABORT	Administration has disabled the test. The default for the `Test` field on the station screen is **y**. Determine why this field has been set to **n** on this station (this may be due to the ringing application Test 48, which can be disturbing to customer or terminal equipment). **1** To enable the test for a particular station being tested, enter **change station *extension***. **2** Change the `Test` field on the station screen to **y**.
S8300 G700 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
	FAIL	The reflective loop-around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board. **1** Since a line seizure may affect the test, repeat the test at 1-minute intervals up to 5 times. **2** Using the **test board *location* short** command, run circuit pack tests to check the Tone Generator and the Tone Detector circuits on the IPSIs or the Tone Generator/Tone Detector circuit packs. **3** Resolve any problems on the Tone Generator or the Tone Detector circuit. **4** If the Tone Generator and Tone Detector circuits are functioning properly, determine whether a voice terminal is connected and wired properly. Resolve any problems found. **5** If the test still fails, replace the analog line circuit pack.

2 of 3

Table 115: Test #161 Loop-Around Test *Continued*

Error Code	Test Result	Description / Recommendation
	PASS	The port provides an analog transmission path to the station equipment. Investigate user-reported troubles on this port by running other port tests, by examining station wiring, or by inspecting the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check to make sure that the board translations are correct. Use the **list configuration** command, and resolve any problems. **2** If the board is correctly inserted, issue the **busy board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the link between the internal ID and the port. If not, verify that a valid board is inserted.

3 of 3

ANN-BD (announcement circuit pack)

S8100 only

MO name (in alarm log)	Alarm level	Initial command to run[1]	Full name of MO
ANN-BD	MINOR	**test board *location* l**	Announcement Circuit Pack
ANN-BD	WRN	**test board *location* l**	Announcement Circuit Pack

1 For information on specifying a location, see Command Syntax on page 179.

NOTE:
The information contained in this MO refers only to the TN750-series of circuit packs. Expressions such as "announcement circuit pack" and "announcement board" are to be interpreted to mean the TN750-series only.

The TN750 Announcement circuit pack is a service circuit which provides an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (for example, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. In addition to the 16 Announcement Ports, the Announcement circuit pack also has one Data Line Circuit Port (port 17). The Data Line Circuit Port is used for uploading/downloading the announcement memory to/from the memory card. If there are any errors associated with port 17, refer to DAT-LINE (Data Line Port) on page 669. If there are any errors associated with any other port, refer to ANN-PT (announcement port) on page 316.

NOTE:
TN750C is required if your system has multiple announcement boards (up to ten are allowed). Only one TN750A/B may be present in the system when a TN750C is used. The announcements from a TN750A/B can be saved and restored to a TN750C — but once the announcements are recorded onto a TN750C, they are not backward compatible with the TN750A/B.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack and communicates with the switch via the control channel on the TDM Bus. The second processor, or Speech Processor (SP), controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

General notes

Here are a few **very important** general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, **especially if the circuit pack needs to be replaced.**

1 The TN750 Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power.* For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be

reset, it is always best to try to reset the circuit pack via the **reset board PCSS** command first. If that does not work, replace the circuit pack. **Announcements are preserved through a software reset, but they are lost when the circuit pack is reseated.**

2 **If a customer has announcements on the Announcement circuit pack, then announcements must be saved on the memory card to ensure that they are not lost.** This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the circuit pack is in proper working order (see Note).

> **NOTE:**
> Unlike translations, announcements are NEVER automatically saved to the memory card.

3 The **save announcements** command replaces the announcement file on the memory card. Care must be taken not to mistakenly enter this command and, as a result, destroy a valid file on the memory card.

4 The **restore announcements** command replaces the Announcement circuit pack speech memory with the announcement file on the memory card. Care must be taken not to mistakenly enter this command, destroying valid speech memory, especially if the memory card does not have a valid announcement file on it.

5 Whenever the Announcement circuit pack is replaced, announcements must always be rerecorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the pack.

6 If announcement speech memory is corrupted, announcements should not be saved [that is, if the Announcement Checksum Test (#209) fails, or if the speech sounds corrupted on playback]. This can ruin a good announcement file on the memory card and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file on the memory card, announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).

7 Due to a hardware fault in the TN750 announcement board, the following sequence of events may cause the announcement file to become corrupted and unusable:

- **a** Fill the board with recorded announcements.
- **b** Delete the last few announcements recorded.
- **c** Re-record the announcements deleted.

If the announcement file becomes corrupted, the only solution is to re-record all announcements. To do this, follow these steps:

- **a** Remove the announcement board.
- **b** Remove the tape cartridge from the tape drive. Do this so that announcements are not automatically restored from tape.
- **c** Re-insert the announcement board.
- **d** Re-record all announcements.
- **e** Insert the tape cartridge in the tape drive.
- **f** Issue the save announcements command to save all the announcements on the tape.

This hardware fault is fixed in the TN750B announcement board. However, the TN750B board will not automatically correct an announcement file which has previously been corrupted by a TN750 board. The only way to correct an announcement file corrupted by the TN750 board is to follow the steps above.

Announcement administration

A brief description of the integrated announcement administration is given here to aid in troubleshooting the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to *Administrator's Guide for Avaya™ Communication Manager, 555-233-506*.

Announcement session

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate Feature Access Code (FAC), administered as Announcement access code on the FACs form. Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted, or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press 2. To delete an announcement, press 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

Uploading/Downloading announcements

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the memory card with the administration terminal **save announcements** command. Likewise, integrated announcements can be downloaded to the Announcement circuit pack with the **restore announcements** command. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a memory card. These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads and/or downloads take between 30 and 45 minutes.

The system **automatically** tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

- An announcement is recorded within 10 minutes of circuit pack insertion.
- An announcement download is invoked sooner with the administration terminal **restore announcements** command.
- No announcement and/or NETCON data module is administered.
- Either the announcement data module is busy or all the administered NETCON data modules are busy.
- No memory card is in the system.
- The memory card in the system does not have a valid announcement file saved on it.

Hardware error log entries and test to clear values

Table 116: Announcement circuit pack error log entries

Error type	Aux data	Associated test	Alarm level (See WARNING message below)	On/Off board	Test to clear value
0[1]	0	Any	Any	Any	test board PCSS sh r 1
1 (a)	0	Circuit pack removed or SAKI Test (#53)	MINOR	ON	
2 (p)		None			
14 (b)	1 to 64	Announcement Checksum Test (#209)			
18	0	busyout board PCSS	WARNING	OFF	release board PCSS
23 (c)	0	None	WARNING	OFF	
125 (d)		None	MINOR	ON	
170 (e)	0	None	MINOR	ON	
217 (f)	0	None	WARNING	OFF	
257	65535	Control Channel Test (#52)	MINOR	ON	test board PCSS l r 20
257 (g)	Any	None			
267 (f)	0	None	WARNING	OFF	
513 (h)	Any	None			
1025 (i)	4363	NPE Audit Test (#50)			test board PCSS l
1281 (j)	17699	None			
1538 (k)	Any	None	MINOR	ON	
1793		Angel-SP Handshake Test (#208)	MINOR	ON	test board PCSS l r 3

2305		140AY Loop Around Test (#210)	MINOR	ON	test board PCSS sh r 3
2561		Super Frame Match Inquiry Test (#211)	MINOR	ON	test board PCSS sh r 3

1 of 2

Table 116: Announcement circuit pack error log entries

Error type	Aux data	Associated test	Alarm level (See WARNING message below)	On/Off board	Test to clear value
	17676	In-line Error			
2817 (l)		Announcement Checksum Test (#209)	MINOR	ON	test board PCSS sh r 3
	17682	In-line Error			
	17699 (m)	In-line Error			
3840 (n)	Any	None			
3999 (o)	Any	None			

2 of 2

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

WARNING:
All alarms are upgraded to MAJOR when the BASE Tone Generator is set to 12 (France).

Notes:

a Error Type 1— This error indicates the circuit pack totally stopped functioning or it was physically removed from the system.

NOTE:
The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, follow the instructions for "Red (alarm)" in Circuit pack status LEDs on page 53.

NOTE:
The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

WARNING:
Reseating and/or replacing the circuit pack results in loss of integrated announcements (TN750/B only). See General notes on page 316 near the beginning of this Maintenance procedure.

b Error Type 14— Whenever the Announcement Checksum Test (#209) fails, this error is logged. The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by the **display announcement** command. This error only appears in the Error Log in conjunction with Error Type 2817. Follow the procedures for Error Type 2817 to troubleshoot Error Type 14.

c Error Type 23—The circuit pack has been logically administered but not physically installed. The alarm is cleared when the circuit pack is installed.

d Error Type 125—A wrong circuit pack is inserted in the slot where this circuit pack is logically administered. To resolve this problem, either remove the wrong circuit pack and insert the logically administered circuit pack OR use the **change circuit-pack** command to readminister this slot to match the circuit pack inserted.

e Error Type 217 and 267— Indicate that there is more than one TN750 Announcement circuit pack inserted in the system. Remove the alarmed circuit pack.

f Error Type 257—This error indicates transient communication problems with this circuit pack. This error is not service-affecting and no action is required.

g Error Type 513—This error, when reported with Aux Data in the range of 4352 to 4358, indicates the circuit pack has reported a hardware failure on the circuit pack. The circuit pack should be replaced.

WARNING:
Replacing the circuit pack results in loss of integrated announcements (TN750/B only). See General notes on page 316 near the beginning of this Maintenance procedure.

h Error Type 1025—This error is not service-affecting and no action is required.

i Error Type 1281—The SP found a fault in the speech main memory (SMM) (that is, it found one or more faulty memory locations). Whenever this error is logged, error 2817 is also logged [see Note (j)], which causes the maintenance system to run the Announcement Checksum Test (#209) to determine if the bad memory location was being used by an announcement.

j Error Type 1538—The hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:

1. The tests run on the ports of this circuit pack are returning with a NO-BOARD.
2. A busyout/release of the circuit pack has no effect on test results.
3. A **list configuration** command shows that the circuit pack and ports are properly installed.

The system tries to restore the circuit pack within 15 minutes. If the error recurs after 15 minutes, replace the circuit pack. (Refer to Reseating and replacing circuit packs in Maintenance Procedures (555-245-103).)

k Error Type 2049 and 2817—These errors are logged in conjunction with Error Type 1281, Aux Data 17699. Since that error [see Note (i)] means that a defective speech memory location was found, the announcement checksum error is also logged. This causes the Announcement Checksum Test (#209) to run, which determines if the defective memory location has corrupted any recorded announcements. If the Checksum Test passes, the faulty memory location is currently not being used, and the SP marks the location as faulty to ensure that future announcements do not attempt to use it.

NOTE:
As memory locations are marked faulty, the amount of available memory decreases, which decreases the total amount of announcement time available on the circuit pack.

l Error Type 2049—A transient error that does not cause an alarm can occasionally occur during a SPE, TDM BUS, or Tone Clock interchange. It is possible for a marginal Tone-Clock circuit pack to cause this error against the ANN-BD without alarming the TONE-BD. If this error occurs again, replacing the Tone-Clock circuit pack may clear up this error. See the FAIL case in the Clock Match Inquiry Test (#212).

m Error Type 3840— This error is not service-affecting and no action is required.

n Error type 3999— Indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

o Error Type 2—Check the Class of Restriction (COR) administered for the Data Line extension assigned to the TN750 for uploading and downloading announcements. The extension can be found by using **list data-module**.

System technician-demanded tests: descriptions and error codes

Always investigate tests in the order presented in Table 117, System Technician-demanded tests: ANN-BD, on page 306 when inspecting errors in the system. By clearing error codes associated with the *Control Channel Loop Around Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 117: System Technician-demanded tests: ANN-BD

Order of investigation	Short test sequence	Long test sequence	Reset board sequence	D/ND[1]
Control channel loop-around test (#52) (a)		X		ND
Angel-speech processor (sp) handshake test (#208)		X		ND
Clock match inquiry test (#212)	X	X		ND
Super frame match inquiry test (#211)	X	X		ND
140AY loop around test (#210)	X	X		ND
Announcement checksum test (#209)	X	X		ND
Connection Audit Test (#50) (a)		X		ND
SAKI Sanity Test (#53) (a)			X	D

1 D = Destructive, ND = Nondestructive

Note:

a For a complete description of these tests, refer to the XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

Angel-speech processor (sp) handshake test (#208)

This test checks the integrity of the communication link between the two processors on the Announcement circuit pack.

WARNING:
Failure of this test indicates that the Speech Processor is insane and ***results in the loss of all integrated announcements on the circuit pack.***

Table 118: TEST #208 angel-speech processor (SP) handshake test

Error code	Test result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Test failed. Circuit pack cannot be used. **Announcement speech memory is cleared when this test fails. Therefore, when the problem has been resolved, announcements must be rerecorded or downloaded to the circuit pack.** **1** Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack and then run this test again. **2** If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack **even if Step 1 works**. **WARNING:** Replacing the circuit pack results in loss of integrated announcements. See General notes on page 316.
	PASS	The communications link between the two processors on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to ANN-PT (announcement port) on page 316 for a description of the port tests.

Announcement checksum test (#209)

Associated with every recorded announcement is a checksum. In this test, the SP checks a stored global checksum covering all recorded announcements against a calculated one and returns the results to the maintenance system. If the global checksum failed, maintenance requests the SP to check each individual announcement's checksum.

If the test fails, then it returns the total number of defective announcements found. In addition, associated with each failure is an error in the Error Log (Error Type 14). The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by the **display announcement** command.

Table 119: TEST #209 announcement checksum test

Error code	Test result	Description/ Recommendation
0	ABORT	An error code of 0 indicates that the announcement file has been corrupted due to a hardware fault in the TN750 board. Follow step #7 under General notes on page 316 at the beginning of this section.
1023	ABORT	There are no announcements currently recorded on the circuit pack.
1024	ABORT	This abort code is given for the following reasons: **1** An announcement upload or download is in progress. **2** An announcement upload or download is requested when this test is running. **3** A record is in progress. **4** A record request comes in when this test is running. If an announcement upload or download is in progress, a **status data-module <announcement data extension>** command should show that the announcement data port is connected to a NETCON data channel, and the "card-in-use" LED for the memory card is on (to determine the extension of the announcement data module, use the **list data-module** command). See Note (a) at end of table for more information. **1** Wait until the blocking event is finished, and then run this test again. An upload or download could take up to 45 minutes to complete, and a recording session is finished as soon as the station that was making the recording is placed on-hook. **2** If the test continues to abort, and a record or upload/download is not in progress, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.

1 of 2

Table 119: TEST #209 announcement checksum test

Error code	Test result	Description/ Recommendation
0-256	FAIL	Test failed. The error code indicates the total number of defective announcements that were found. When TEST #209 fails with error code 0, the Global Checksum failed on the board, but no individual Checksum failed. **NOTE:** Since the announcements are recorded digitally, it is possible for the Announcement Checksum Test to *fail* but still have all the announcements sound uncorrupted. When an individual announcement fails the Checksum Test, always listen to the announcement first before taking any action (an announcement can be played back by dialing the announcement extension associated with the announcement number). If the announcement sounds corrupted, then rerecord it or delete it. **1** Look in the Error Log to determine the number of the first defective announcement. Play back the announcement. If the announcement sounds defective, rerecord it or delete it. If the error code was greater than one (indicating that there is more than one defective announcement), run this test again and repeat this step. **2** If after deleting and rerecording all defective announcements, the checksum test still fails, reset the circuit pack using the **reset board PCSS** command and run this test again. **3** If the test still continues to fail, reseat the circuit pack and restore all announcements with an appropriate time estimate (for example, 40 minutes.) Then rerecord the lost announcements (that is, those recorded since the last save operation) and run this test again. **4** If the test still continues to fail, replace the circuit pack, and run this test again. **WARNING:** Replacing the circuit pack results in loss of integrated announcements. See General notes on page 316 near the beginning of this Maintenance procedure.
	PASS	All recorded announcements checksum correctly, indicating that the speech main memory is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to ANN-PT (announcement port) on page 316 Maintenance documentation for a description of the port tests.

2 of 2

Notes:

a The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement do not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yield the following abort codes:
   - Ports 1 AND 9 abort Test #206 with code 1024
   - Ports 1 AND 9 abort Test #205 with code 2000
   - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

   ```
   Error encountered, can't complete request
   ```

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- Reset circuit pack using the **reset board PCSS** command
- Release circuit pack using the **release board PCSS** command

140AY loop around test (#210)

This test checks the integrity of the record channel on the Announcement circuit pack (Announcement Port 1). The main function of the 140AY device is to accept Pulse Code Modulation (PCM)/Adaptive Differential Pulse Code Modulation (ADPCM) samples and compress/expand the samples using ADPCM. This test connects a Tone Generator to one port (Announcement Port 1, the recording port), and a Tone Detector to another port (Announcement Port 9). A tone is generated by the Tone Generator on the first port and looped through the 140AY device to the second port. The Tone Detector then responds with a tone present/absent message. The 140AY Loop Around Test is repeated at three different speech compression rates.

Since this test involves sending a tone through two different ports, the Playback Speech Memory Array (PSMA) Test (#206) is run on the two ports first to make sure that they are working properly. See ANN-PT (announcement port) on page 316 for a description of this test.

Table 120: TEST #210 140AY loop around test

Error code	Test result	Description/ Recommendation
1-3	ABORT	Response to the test request was not received within the allowable time period. The error code indicates at which speech compression rate the test aborted (one being the first rate tested, three being the last). **1** Retry the command at 1-minute intervals a maximum of 5 times.
10	ABORT	The PSMA Test (#206) failed on Announcement Port 1.
90	ABORT	The PSMA Test (#206) failed on Announcement Port 9. **1** Refer to ANN-PT (announcement port) on page 316 Maintenance documentation, Test #206.
1000	ABORT	System resources required to run this test are not available. This test needs Announcement Ports 1 and 9 to run. One of the ports may be in use on a valid call. **1** Retry the command at 1-minute intervals a maximum of 5 times. **2** If the test continues to abort and Ports 1 and 9 are not in use, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM Bus) on page 1832 Maintenance documentation to diagnose any active TDM-BUS errors. **1** If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. **1** Look for TTR-LEV errors in the Error Log. If present, refer to the TTR-LEV (TTR Level) on page 1946. **2** Look for TONE-PT errors in the Error Log. If present, refer to the TONE-PT (Tone Generator) on page 1927. **3** If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.
1007	ABORT	The Announcement circuit pack thinks that Port 1 or Port 9 is busy. **1** Retry the command at 1-minute intervals a maximum of 5 times. **2** If the test continues to abort, follow the Announcement Port maintenance procedures for Ports 1 and 9.

1 of 2

Table 120: TEST #210 140AY loop around test

Error code	Test result	Description/ Recommendation
1024	ABORT	Announcement circuit pack blocked the test because an announcement download is in progress. If an announcement download is in progress, a **status data-module <announcement data extension>** command should show that the announcement data port is connected to a NETCON data channel, and the "card-in-use" LED for the memory card should be on (to determine the extension of the announcement data module, use the **list data-module** command). See Note (a) at end of table for more information. **1** Wait until download is finished (can take up to 45 minutes), and then run the test again. **2** If the test continues to abort and there is no download in progress, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this error type. **1** Retry the command at 1-minute intervals a maximum of 5 times.
2007	ABORT	The Announcement circuit pack thinks that Port 1 or Port 9 is busy. **1** Retry the command at 1-minute intervals a maximum of 5 times. **2** If the test continues to abort, follow the Announcement Port maintenance procedures for Ports 1 and 9.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals a maximum of 5 times.
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.
1-3	FAIL	Test failed. The error code indicates at which speech compression rate the test actually failed (one being the first rate tested, three being the last). **1** Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test still fails, replace the circuit pack (see Warning) and run this test again. **2** If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** Replacing the circuit pack results in loss of integrated announcements. See General notes on page 316 on page -92.
	PASS	The record channel on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to ANN-PT (announcement port) on page 316 on page -108 for a description of the port tests.

2 of 2

Notes:

a The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
   - Ports 1 AND 9 abort Test #206 with code 1024
   - Ports 1 AND 9 abort Test #205 with code 2000
   - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

   ```
   Error encountered, can't complete request
   ```

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- Reset circuit pack using the **reset board PCSS** command
- Release circuit pack using the **release board PCSS** command

Super frame match inquiry test (#211)

The super frame is a means by which the SP synchronizes with the 140AY device on the Announcement circuit pack. If the super frame is not synchronized, the SP is not able to properly process record/playback requests. Both the SP and the hardware generate a super frame pulse. When these two pulses are out of synch, the SP sets a flag to indicate the mismatch. When this test is run, the state of this flag is returned.

Table 121: TEST #211 super frame match inquiry

Error code	Test result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.

1 of 2

Table 121: TEST #211 super frame match inquiry *Continued*

Error code	Test result	Description/ Recommendation
	FAIL	Test failed. Announcement playbacks should sound corrupted. **1** Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). **2** If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** Replacing the circuit pack results in loss of integrated announcements. See General notes on page 316 near the beginning of this Maintenance procedure.
	PASS	The SP can properly process record/playback requests. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to ANN-PT (announcement port) on page 316 for a description of the port tests.

Clock match inquiry test (#212)

This test is supported to determine the state of the clock generation circuitry on the Announcement circuit pack. This circuitry is used for controlling various pieces of the hardware, like the 140AY device. It is also used to synchronize the Announcement circuit pack with the clock that is on the backplane.

Table 122: TEST #212 clock match inquiry test

Error code	Test result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.

Table 122: TEST #212 clock match inquiry test

Error code	Test result	Description/ Recommendation
	FAIL	Test failed. Announcements recorded or played back while the clock circuitry is not functioning properly sound distorted. The ANN-BD may be defective or the Active Tone-Clock circuit pack (TONE-BD) may be marginal and is causing this test to fail. **1** Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, proceed to Step 2 or 3 as applicable. **WARNING:** Replacing the circuit pack results in loss of integrated announcements. See General notes on page 316 near the beginning of this Maintenance procedure.
	FAIL *(cont'd.)*	**2** Replace the ANN-BD. Rerun the test. If the test continues to fail, replace the Tone-Clock circuit pack. **WARNING:** Replacing the TONE-BD causes a COLD 2 reset. See Replacing the IPSI or Tone-Clock Circuit Pack on page 1911. Replacing the ANN-BD results in loss of integrated announcements. See General notes on page 316 near the beginning of this Maintenance procedure. **3** If there are recurring alarms on this circuit pack caused by this test failing, replace the ANN-BD even if the previous steps were successful.
	PASS	Announcement record/playbacks should have clear sound quality. User-reported troubles on this circuit pack should be investigated using other circuit packs and port tests. Refer to ANN-PT (announcement port) on page 316 for a description of the port tests.

2 of 2

ANN-PT (announcement port)

S8100 only

MO name (in alarm log)	Alarm level	Initial command to run[1]	Full name of MO
ANN-PT	MINOR	**test port *location* l**	Announcement Port
ANN-PT	WRN	**test port *location* l**	Announcement Port

1 For information on specifying a location, see Command Syntax on page 179.

The TN750 Announcement circuit pack is a service circuit pack that provides an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (that is, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. If there are any errors associated with the circuit pack, refer to ANN-BD (announcement circuit pack) on page 299.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack, and communicates with the switch via the control channel on the TDM Bus. The second processor, or SP, controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

General notes

Here are a few **very important** general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, **especially if the circuit pack needs to be replaced.**

1. The TN750/B Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power.* For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always better to try to reset the circuit pack via the **reset board PCSS** command first and, if that does not work, then try to reseat it. **Announcements are preserved through a software reset, but they are lost when the circuit pack is reseated.**
2. **If a customer has announcements on the Announcement circuit pack, then announcements must be saved on the system tape to ensure that they are not lost.** This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the pack is in proper working order (see Note).

   NOTE:
   Unlike translations, announcements are NEVER automatically saved to the memory card.

3. The **save announcements** command replaces the announcement file on the card with the Announcement circuit pack speech memory. Care must be taken not to mistakenly enter this command, thereby destroying a valid file on tape.

4 The **restore announcements** command replaces the Announcement circuit pack speech memory with the announcement file on the card. Care must be taken not to mistakenly enter this command, thereby destroying valid speech memory (especially if the card does not have a valid announcement file on it).

5 Whenever the Announcement circuit pack is replaced, announcements must always be re-recorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the circuit pack.

6 If announcement speech memory is corrupted, **announcements should not be saved**, that is, if the Announcement Checksum Test (#209) fails or if the speech sounds corrupted on playback. This can ruin a good announcement file and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file, then announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).

7 Although Announcement Port 5 and Data Line Circuit Port 17 on the Announcement circuit pack are logically two separate ports, they are physically the same port. Therefore, if one of the ports is in use, the other one will be busy. Also, if Announcement Port 5 is out-of-service, the Data Line Circuit Port is taken out-of-service. However, if the Data Line Circuit Port is out-of-service, the Announcement Port remains in-service.

Announcement administration

A brief description of the integrated announcement administration is given here to aid in the troubleshooting of the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to *Administrator's Guide for Avaya™ Communication Manager, 555-233-506*.

Announcement session

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate FAC (administered as Announcement access code on the FACs form). Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press station keypad digit 2. To delete an announcement, press station keypad digit 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

Uploading/Downloading announcements

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the memory card with the **save announcements** command. Similarly, integrated announcements can be downloaded to the Announcement circuit pack with the **restore announcements** command. Both of these commands require a free data module of NETCON type to be administered, a data module of

announcement type (on the Announcement circuit pack) to be administered, and a memory card. These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads/downloads take between 30 and 45 minutes.

The system **automatically** tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

- An announcement is recorded within 10 minutes of circuit pack insertion.
- An announcement download is invoked sooner with the administration terminal **restore announcements** command.
- There is no announcement and/or NETCON data module administered.
- Either the announcement data module is busy or all the administered NETCON data modules are busy.
- There is no memory card in the system.
- The memory card in the system does not have a valid announcement file saved on it.

> **NOTE:**
> Unlike translations, there is no provision in the system for automatically saving announcements to the memory card.

Announcement Board Locked Condition

The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the announcement ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and will attempt to use the ports.

If the circuit pack is locked into this state, the following symptoms will be observed:

1. When attempting to record an announcement, users will hear the proper record tone, but the announcement will not record (they will not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state will yield the following abort codes:
   - Ports 1 AND 9 abort Test 206 with code 1024.
   - Ports 1 AND 9 abort Test 205 with code 2000.
   - Board-level Tests 209 and 210 abort with code 1024.
3. The **save/restore announcements** command will time out with:

   ```
   Error encountered, can't complete request
   ```

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board *UUCSS*** (this command drops every call in progress on the Announcement circuit pack).
- Reset circuit pack using the **reset board *UUCSS*** command.
- Release board using the **release board *UUCSS*** command.

Hardware error log entries and test to clear values

Table 123: Announcement port error log entries

Error type	Aux data	Associated test	Alarm level	On/Off board	Test to clear value
0[1]	0	Any	Any	Any	test port PCSSpp sh r 1
1		Playback Speech Memory Array (PSMA) Test (#206)	MINOR	ON	test port PCSSpp sh r 3
18	0	The port was busied out	WARNING	OFF	release port PCSSpp
130 (a)		None	WARNING	ON	test port PCSSpp sh
257		Channel Administration Memory Array (CAMA) Test (#205)	MINOR	ON	test port PCSSpp l r 3
	17667	In-line error			
513		140AY Channel Sanity Inquiry Test (#222)	MINOR	ON	test port PCSSpp sh r 3
	17684	In-line error			
769 (b)		None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

b This error is logged and the port is alarmed when an alarm is raised on the Announcement circuit pack because of a faulty condition with a common circuit pack resource. Any one of the following alarmed errors on the Announcement circuit pack causes this error to be logged against the Announcement Port: 1793, 2049, 2305, 2561. Follow the ANN-BD (announcement circuit pack) Maintenance documentation to resolve these alarms. When the corresponding circuit pack alarm is cleared, this alarm clears.

System technician-demanded tests: descriptions and error codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Channel Administration Memory Array (CAMA) Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 124: Announcement port system technician-demanded tests

Order of investigation	Short test sequence	Long test sequence	D/ND[1]
Channel administration memory array (cama) test (#205)		X	ND
Playback speech memory array (PSMA) test (#206)	X	X	ND
140AY channel sanity inquiry test (#222)	X	X	ND

1 D = Destructive; ND = Nondestructive

Channel administration memory array (cama) test (#205)

This test is a memory device that stores information used to control the 140AY device. The Angel asynchronously feeds the CAMA with the control information. During the CAMA test, the Angel writes patterns into the CAMA, reads them back, and verifies that they match. If the patterns do not match, the test fails. This test is run periodically by the switch maintenance and by the Announcement circuit pack in the background.

Table 125: TEST #205 channel administration memory array (CAMA) test

Error code	Test result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. **1** Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. See Note (a) at end of table for more information.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Test failed. Announcements played back on this port may sound corrupted. **1** Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). **2** If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** Replacing the circuit pack results in loss of integrated announcements. Refer to General notes on page 316.

1 of 2

Table 125: TEST #205 channel administration memory array (CAMA) test

Error code	Test result	Description/ Recommendation
	PASS	This test verifies that the Angel processor can properly set up this port for playbacks. User-reported troubles on this circuit pack should be investigated using other port and circuit pack tests. (Refer to ANN-BD (announcement circuit pack) on page 299 for a description of the circuit pack tests.)

2 of 2

Notes:

a The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
   - Ports 1 AND 9 abort Test #206 with code 1024
   - Ports 1 AND 9 abort Test #205 with code 2000
   - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

   Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- Reset circuit pack using the **reset board PCSS** command
- Release circuit pack using the **release board PCSS** command

Playback speech memory array (PSMA) test (#206)

The PSMA test checks the integrity of a playback channel's interface to the speech memory and the TDM Bus. The SP has an internal buffer that contains a specific 256-byte sequence. During this test, the byte sequence is "played" through the 140AY device onto the TDM Bus. A General Purpose Tone Detector is used to confirm that the proper sequence was played. **This test is very important.** It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence.

The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

Table 126: TEST #206 playback speech memory array (PSMA) test

Error code	Test result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. **1** Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM Bus) on page 1832 to diagnose any active TDM-BUS errors. **1** If system has no TDM-BUS errors and is not handling heavy traffic, repeat the test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. **1** Look for TTR-LEV errors in the Error Log. If present, refer to TTR-LEV (TTR Level) on page 1946. **2** Look for TONE-PT errors in the Error Log. If present, refer to TONE-PT (Tone Generator) on page 1927. **3** If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.
1024	ABORT	Announcement circuit pack blocked the test because an announcement download is in progress. If an announcement download is in progress, a **status data-module <announcement data extension>** command should show that the announcement data port is connected to a NETCON data channel, and the memory card should be active. (To determine the extension of the announcement data module, use the **list data-module** command.) See Note (a) at end of table for more information. **1** Wait until download is finished (could take a maximum of 45 minutes), and then run the test again. **2** If the test continues to abort and there is no download in progress, escalate the problem.

1 of 2

Table 126: TEST #206 playback speech memory array (PSMA) test

Error code	Test result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.
1 to 254	FAIL	Test failed. The error code indicates the number of byte count errors found by the Tone Detector. **1** Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). **2** If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** Replacing the circuit pack results in loss of integrated announcements. Refer to General notes on page 316.
255	FAIL	Test failed. The Announcement Port and the Tone Detector never synchronized. Check for active GPTD-PT errors, and refer to GPTD-PT (General-Purpose Tone Detector Port) on page 1046 to diagnose them first. **1** If there are no active GPTD-PT errors, reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). **2** If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** Replacing the circuit pack results in loss of integrated announcements. Refer to General notes on page 316.
	PASS	This port can cleanly play announcements. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to ANN-BD (announcement circuit pack) on page 299 for a description of the circuit pack tests.

2 of 2

Notes:

a The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
   - Ports 1 and 9 abort Test #206 with code 1024
   - Ports 1 and 9 abort Test #205 with code 2000
   - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

   Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- Reset circuit pack using the **reset board PCSS** command
- Release circuit pack using the **release board PCSS** command

140AY channel sanity inquiry test (#222)

The Angel keeps a sanity status bit for each of the 16 channels on the 140AY device. This test queries the Angel to determine the status for a particular channel. If a channel is insane, that implies that announcements cannot be played back on that channel.

Table 127: TEST #222 140AY channel sanity inquiry test

Error code	Test result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Test failed. Announcements cannot be played back over this port. **1** Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). **2** If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** Replacing the circuit pack results in loss of integrated announcements. Refer to General notes on page 316.
	PASS	Announcements can be played back over this port. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to the ANN-BD (announcement circuit pack) on page 299 for a description of the circuit pack tests.

ANNOUNCE (announce)

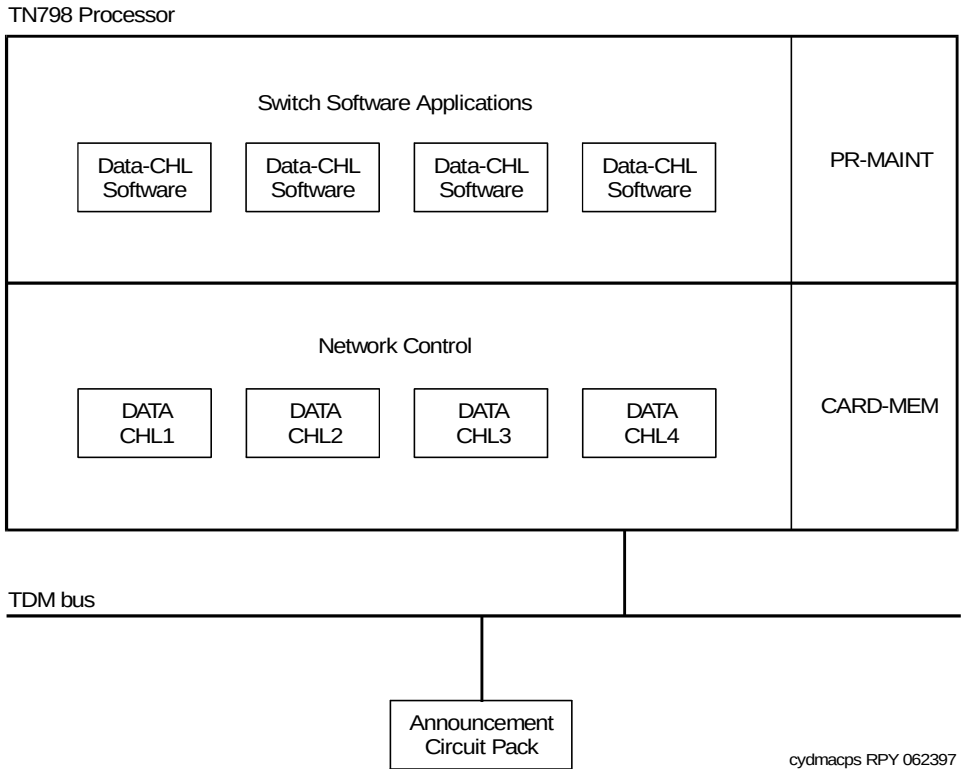
S8100 only

MO name (in alarm log)	Alarm level	Initial command to run	Full name of MO
ANNOUNCE	none	none	ANNOUNCEMENT

The ANNOUNCE MO logs an error in the hardware error log if the system fails to restore announcements from the memory card at boot time.

Figure 22, Connection of announcement circuit pack to the system, on page 326 shows the connection of the Announcement Circuit Pack to the system. To save or restore announcements, an ANNOUNCEMENT Data Extension must be administered, and at least one DATA-CHL (Network Control Data Channel) must be in the in-service/idle state.

Figure 22: Connection of announcement circuit pack to the system



Hardware error log entries

Table 128: ANNOUNCE error log entries

Error type	Aux data	Associated test	Alarm level	On/Off board	Test to clear value
1(a)(d)	any	None			
257(d)	any	None			
513(b)(d)	0	None			
769(d)	0	None			
1025(d)	any	None			

Notes:

a Error occurred while saving announcements. (See Table 129, Aux data error codes and recommended repair procedures, on page 327 in the next section for an explanation of Aux Data and for recommended repair actions.)

b User pressed cancel while announcements were being saved.

c Error occurred while restoring announcements. (See Table 129, Aux data error codes and recommended repair procedures, on page 327 in the next section for an explanation of Aux Data and for recommended repair actions.)

d The port field for this error contained the active PE complex when the error occurred.

Aux data error codes and recommended repair procedures

Table 129: Aux data error codes and recommended repair procedures

Aux data	Description/ Recommendation
9000 through 9031	CARD-MEM errors Check and resolve CARD-MEM errors and alarms.
32001	Internal system error. **1** Check other ANNOUNCE errors and take corrective action. If there are no other ANNOUNCE errors, do the following: **2** Retry the command at 2-minute intervals a maximum of 3 times. **3** If the **save/restore announcements** command fails, escalate the problem.
32002	Announcement circuit pack is in use. **1** Retry the command at 2-minute intervals a maximum of three times. **2** If the **save/restore announcements** command fails, escalate the problem.

1 of 3

Table 129: Aux data error codes and recommended repair procedures

Aux data	Description/ Recommendation
32003	Announcement port is in use. **1** Wait for all Announcement ports to become available. **2** Enter the **save/restore announcements** command.
32004	There are no announcements recorded on the Announcement Circuit Pack. The **save announcements** command is not allowed to prevent the destroying of the announcement file on tape [286 systems] or on the memory card [386 systems].
32005	Integrated announcement circuit pack is not present. The Announcement Circuit Pack is not inserted, or it is defective. **1** Enter the **list config** command to check for the presence of the circuit pack in the system. **2** If the Announcement Circuit Pack is present, use the **test board PCSS** command to check the status of the Announcement Circuit Pack.
32006	Announcement Data Module not available. **1** Use the **status** command to check the status of the Announcement Data Module.
32007	Announcement Data Module out of service. **1** Use the **status** command to check the status of the Announcement Data Module.
32008	Announcement data is being saved or loaded. **1** Retry the command at 2-minute intervals a maximum of three times. **2** If the **save/restore announcements** command fails, escalate the problem.
32009	Required DATA-CHL is not administered or out of service. (A DATA-CHL is required to save or restore announcements.) **1** Add a DATA-CHL if none is administered. **2** If a DATA-CHL is administered, use the **status** command to check the status of all DATA-CHLs. At least one DATA-CHL should be in the in-service/idle state.
32010 32013	DATA-CHL is not administered, or it is unavailable. (A DATA-CHL is required to save or restore announcements.) **1** Add a DATA-CHL if none is administered. **2** If a DATA-CHL is administered, use the **status** command to check the status of all DATA-CHLs. At least one DATA-CHL should be in the in-service/idle state.
32012	Required Announcement Data Module is not administered. **1** Add an Announcement Data Module and repeat the command.

2 of 3

Table 129: Aux data error codes and recommended repair procedures

Aux data	Description/ Recommendation
32015	Time of day not set. **1** Set the time of day, and reenter the **save/restore announcements** command.
32016	Internal system errors. Check for any other ANNOUNCE errors and take corrective action.If there are no other announcements errors, do the following: **1** Retry the command at 2-minute intervals a maximum of three times. **2** If the **save/restore announcements** command fails, escalate the problem.

3 of 3

ASAI-ADJ (ASAI Adjunct)

S8700 / S8500 / S8100

Refer to BRI-SET, BRI-DAT, Various Adjuncts on page 520 of this chapter.

ASAI-BD (Multi-Application Platform Board)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ASAI-BD	MINOR	**test board *location***	ASAI-BD
ASAI-BD	WARNING	**test board *location***	ASAI-BD

1 For information on specifying a location, see Command Syntax on page 179.

Maintenance testing of the common circuit pack is handled by on-board firmware and server-controlled tests. Maintenance software queries the firmware for error and alarm information, status, and test results. Firmware automatically reports error conditions that result in server-controlled testing.

For MAPD board insertion, the switch makes an additional board query if any of the following circuit packs are inserted:

Circuit Pack	Vintage
TN754	49
TN556	49, 80 or greater
TN800	any

For any of the previous initial board uplinks, the switch queries the board for administration data as well as reporting the switch software release and the system type.

For the native mode, the response to the board query downlink messages consists of several CCMS uplink messages that identify the true board code, vintage, suffix, emulation type, and number of reserved slots needed.

NOTE:
Refer to LAN-BD Maintenance documentation for circuit pack level errors. See also ASAI-PT on page 341 and ASAI-EPT on page 333 for related line information. See the following exceptions listed below:

- Hyperactivity: Currently, the common circuit pack is considered "hyperactive" if the Service Dispatcher receives 200 uplink messages from the circuit pack in a 10-second period. Since MAPD has 32 ports, the hyperactivity limit increases to 500 uplink messages per 10 seconds. The switch issues an alarm when the limit reaches 400; when it reaches 500 up-link messages in 10 seconds, the board is taken out of service.
- LED use: The LED Control message 038x requests the Angel to drive the red, amber, and green LEDs on the face plate of a typical port board on or off. Only the MAPD's red LED is controlled by this message. Yellow and green change requests the MAPD receives from the switch drive LCD behavior rather than LED behavior. The system continues to send

the same LED control messages to the MAPD that the system currently sends to every other port board. The MAPD handles proper interpretation of these messages. You should note that the PC on the MAPD and the switch itself control the LEDs and the LCD on the MAPD.

- Port Administration: In Administration Without Hardware (AWOH), the switch allows administration of up to 8 ports in any of the first 12 ports. If the port type later reported by the board does not match the existing type, the switch assumes it to be a MAPD board with a different configuration and rejects the board.

ASAI-EPT

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ASAI-EPT	MAJOR[1]	**test station *extension***	ASAI-Adjunct

1 The alarm level for ASAI adjuncts is administered using the **set options** command. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI adjunct in the system.

The maintenance strategy for this endpoint MO is built on maintenance facilities offered in the Avaya ISDN-BRI protocol and in the ASAI adjuncts. Currently there are no facilities in the protocol that provide for maintenance of set data features.

The TN800 is a PC-based platform that allows interaction of multiple applications with Communication Manager at any time. Communication Manager (native mode) supports emulation of three types of port MOs on this board. The type of ports to be emulated is defined by the applications running on the TN800.

NOTE:
If the TN800 is emulating BRI, the software/firmware supports up to 12 ports, but only 8 of the 12 ports can be administered at any one time.

Error Log Entries and Test to Clear Values

Table 130: ASAI-EPT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level ASAI-EPT	On/ Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test ASAI-ADJ**
2 (a)	2-102	None			
257 (b)	Any	BRI Layer 3 query	MAJOR WARNING[2]	OFF	**test station** *ext* **r 2** **test data-module** *ext* **r 2**
351 (c)	0	none	WARNING	OFF	**busyout** and **release station**
513 (d)	0	None			
769 (e)	0	None	MAJOR	OFF	
2561 (f)	0	None			
2562-2566 (g)	0	None			
2567 (h)	0	None			
2568 (i)	0	None			

1 of 2

Table 130: ASAI-EPT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level ASAI-EPT	On/ Off Board	Test to Clear Value
3329 (j)	Any	Signaling Link status (#626)	MAJOR WARNING†	OFF	
3584-3839 (k)	Any **S8100** : 0,1	None			
3841 (l) 4095	Any **S8100** : 0	None			

2 of 2

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Major alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

a Errors of this type indicate violations of the ISDN-BRI signaling protocol. Timers associated with certain layer-3 messages have expired before a required response was received. In the following table, the aux data column indicates which timer has just expired.

Aux Data	Timer Type
2	First T303 (SETUP timer)
3	Second T303 (SETUP timer)
4	T305 (DISConnect timer)
5	First T308 (RELease timer)
6	Second T308 (RELease timer)
10	T316 (RESTart timer)
12	T309 (Layer-2 Failure timer)
16	TM100 (Management Information message Timer 1)
17	TM200 (Management Information message Timer 2)
102	TASAI (ASAI Routing Timer)

The switch sent a message to an endpoint that did not respond in the allotted time. This may be due to failure of the point-to-point signaling link or because of a problem in the ASAI adjunct. To repair:

- Execute the **test station *extension*** command and perform the associated repair procedures for those tests.

b An endpoint is not responding to the service state query message sent to the adjunct or to the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or to the adjunct.

When this error occurs for an ASAI adjunct, the Aux Data field indicates the state of the ASAI link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

Aux Data	ASAI Link State	Error
102	13-restarting	No response to RESTART message
104	13-restarting	Invalid response to RESTART message
152	13-restarted	No response to layer-3 query
154	13-restarted	Invalid response to layer-3 query
202	13-established	No response to layer-3 query
204	13-established	Invalid response to layer-3 query

See status bri-port in Maintenance Commands Reference (555-245-101) for an explanation of the ASAI link states.

For ASAI or Avaya adjuncts, the switch queries the adjunct every two minutes. The Layer 3 Query test is not executed for ASAI or Avaya adjuncts through a command issued from the management terminal. While alarmed for this error, the switch takes the associated port out-of-service for five seconds every 15 minutes. This action attempts to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or Avaya adjunct, the service technician should:

1. Execute the **test station *extension*** command and perform the associated repair procedures for those tests.
2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.

c This error and associated warning alarm are logged against an ASAI endpoint when the adjunct has asked the switch to suspend maintenance on the ASAI endpoint. Busying out and releasing the ASAI station clears this alarm.

d This error occurs when the endpoint sends more messages than the switch can handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.

e This error occurs when an ASAI endpoint's associated signaling link has too much traffic related to link establishment. This occurs if the signaling link is alternating between assigned and established states. If this problem persists, replace the endpoint.

f This error occurs when the ASAI-EPT message is not transmitted because the PKT-CTRL (Packet Control circuit pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI adjunct. Resolve the problem by following the repair procedures for the PKT-CTRL. If these attempts fail, re-engineering the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

g The ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow-controlled. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI adjunct. Resolve the problem by following the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

h This version of ASAI is not supported. Check the software version that is running on the ASAI adjunct.

i The adjunct identification is invalid. Check the vendor ID or software running on the ASAI adjunct.

j This occurs when the point-to-point signaling link to the endpoint goes down, except when the link goes down because either a system technician has busied out the PKT-CTRL or the PKT-BUS, or they have failed. This error raises an alarm against the endpoint or adjunct. Execute the **test station *extension* short** command and note the results of the Signaling Link Status Test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is re-established to the endpoint or adjunct.

k The switch software logs certain ASAI cause values. The cause value is determined from the following formulas:

— If the error type is greater than 3712, then the ASAI cause value is equal to the error type minus 3712. The switch sent this value to the adjunct.

— If the error type is less than 3712, then the ASAI cause value is equal to the error type minus 3584. The adjunct sent this value to the switch.

Table 131, ASAI Cause Values, on page 336 contains a description of the various ASAI cause values and recommended system technician actions associated with the cause value.

l The switch software logs certain ASAI cause values. The cause value is determined from the following formula:

— If the error type is greater than 3968, then the ASAI cause value is equal to the error type minus 3968. The switch sent this value to the endpoint.

— If the error type is less than 3968, then the ASAI cause code is equal to the error type minus 3840. The endpoint sent this value to the switch.

Table 131: ASAI Cause Values

Code	Explanation	Recommendation
0	Unrecognized ASAI Protocol Operation.	Requested ASAI protocol is not implemented by switch or adjunct. `Aux Data` field of error log entry contains protocol identifier for unrecognized operation. **1** Consult switch and adjunct documentation to determine which set of operations is supported by switch and the adjunct. Turning off adjunct operations not implemented by the switch may resolve the problem.
34	No circuit or channel available	A resource on the switch is unavailable for a call. For BRI endpoints, this cause value is not logged. For ASAI, this condition means that there are no available trunks for an outgoing call request. **1** Verify that the adjunct is administered to support the trunk capabilities of the switch. **2** Investigate trunk-group status by issuing the **status trunk** command from the SAT or by requesting trunk-group queries from the adjunct. **3** Perform trunk diagnostic procedures outlined in this manual.

1 of 3

Table 131: ASAI Cause Values

Code	Explanation	Recommendation
40	Resources not available.	No available internal resources to service switch or adjunct request. Exceeds system transaction capacity for adjunct or switch. **1** May require re-engineering of adjunct services.
50	Requested facility not subscribed	Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct. For BRI endpoints: **1** Verify the switch administration of endpoint using **display station** or **display data-module**. **2** If step 1 does not resolve the problem, refer to the endpoint's service manual and verify administration on the endpoint. For ASAI adjuncts: **1** Display the Customer Optional Features screen (administration screen) on the switch to determine which ASAI capabilities are turned on in the switch. **2** Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administered capabilities, then re-administer the switch and/or the adjunct to establish a consistent set of desired capabilities on both the switch and the adjunct.
58	Bearer capability not currently available	Requested bearer capability is implemented, but not administered. No B channel is administered. See code 50 above.
63	Service or option not available	Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resource. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct. **1** Verify that no overlapping administration of switch resources (for example, requesting notifications on a single domain by multiple adjuncts attempting to control a single call) exists across any adjunct connected to the switch. If an overlap exists, then re-administer the adjuncts to ensure that each adjunct is associated with a unique set of switch resources.
65	Bearer service not implemented	Requested service not implemented in switch or endpoint.
69	Requested facility not implemented	Requested service not supported in switch or endpoint. **1** Consult switch and endpoint documentation to determine service support.

2 of 3

Table 131: ASAI Cause Values

Code	Explanation	Recommendation
79	Service or option not implemented	Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct. **1** Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Re-administration of the switch-administered capabilities (see Customer Optional Feature screen) or those of the adjunct may be necessary to correct the problem.
81	Invalid CRV	An invalid CRV was sent by the adjunct. **1** This may indicate a CRV inconsistency between the switch and the adjunct. See the CallVisor protocol reference manual.
87	Internal switch audit	There is an inconsistency in switch data records. **1** There is no action needed, since the switch has corrected the data inconsistency.

3 of 3

System Technician-Demanded Tests: Descriptions and Error Codes

When inspecting errors in the system, always investigate errors associated with the circuit pack and port first. Clearing these error codes first may also clear errors generated against the endpoint. When every circuit pack and port error has been cleared, but errors still exist against the endpoint, investigate errors in the table below. By clearing error codes associated with the Signaling Link Status test, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Signaling Link Status test (#626)	X	X	ND

1 D = Destructive; ND = Nondestructive

BRI Layer 3 Query Test (#629)

This test is not used by the ASAI-ADJ MO. For information about this test, see BRI-SET, BRI-DAT, Various Adjuncts on page 520.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is “bound” to an endpoint and fails if the link is “not bound.”

The definition of the term “bound” for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of “bound” for ASAI type of endpoint is:

- ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):

  For endpoints of this type, the signaling link is “bound” when the link is connected at Layer 2 (L2 established).

Table 132: Test #626 Signaling Link Status Test

Error Code	Test Result	Description / Recommendation
1139	ABORT	The PN’s packet bus is out-of-service. **1** Follow the repair procedures for the packet bus. **2** After completing step 1, execute **test port *location* long** and review the results of the BRI Port Local LAN Looparound test (#618) to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. **1** Refer to PKT-CTRL maintenance documentation.
S8100: 1144	ABORT	The PPN Packet Bus is out-of-service. **1** Follow the repair procedures for the Packet Bus in the PPN. **2** Execute the **test port *location* long** command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.
S8700 S8500: 1187	ABORT	The circuit pack, port, or station may have been busied out. **1** Look in the Error Log for Error Type 18 (busied out) for ASAI-BD, ASAI-PT, or ASAI-EPT. **2** If this Error Type is present for ASAI-EPT only, use **release station** and run the test again. **3** If this Error Type is present for ASAI-PT and ASAI-EPT, use **release port** and run the test again. **4** If this Error Type is present for ASAI-BD, ASAI-PT, and ASAI-EPT, use **release board** and run the test again.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1113	FAIL	The signaling link is not “bound” to the adjunct. For ASAI adjuncts this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified by administration, the link is only “unbound” from the endpoint when it is disconnected. **1** Execute **status bri-port *location*** and see BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port) on page 499.
	PASS	The signaling link is connected at Layer 2 and “bound” to the ASAI adjunct.

ASAI-IP (ASAI Adjunct IP Link)

S8100 only

For information on error codes and testing, see ADJ-IP/ASAI-IP (ASAI Adjunct IP Link) on page 190.

MO name (in alarm log)	Alarm level	Initial command to run	Full name of MO
ASAI-IP	MAJOR	**test cti-link *n***	ASAI IP link

ASAI-PT

S8700 / S8500 / S8100

MO's Name (in Alarm Log	Alarm Level	Initial Command to Run[1]	Full Name of MO
ASAI-PT	MAJOR[2,3]	**test port *location* l**	ASAI ISDN BRI port
ASAI-PT	WARNING	**test port *location* l**	ASAI ISDN BRI port

1 For information on specifying a location, see Command Syntax on page 179.

2 The alarm level for ASAI adjunct ports may be administered using the **set options** command. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI adjunct port in the system.

3 All alarming for an ASAI adjunct and off-board alarming for an ASAI port is disabled if the ASAI adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI adjunct. Check the Hardware Error and Alarm Logs to see if the adjunct has disabled alarming.

Unless otherwise stated, every maintenance action contained in this section applies to ASAI-PT and ISDN-BRI ports connected to ASAI adjuncts. This port type is administered as an ASAI-BD on the TN800 circuit pack.

The TN800 circuit pack is a PC-based platform that allows interaction of multiple applications with Avaya™ Communication Manager. Communication Manager software (native mode) supports emulation of three types of port MOs on this board. The type of ports to be emulated are defined by the applications running on the TN800. The TN800 can support up to 32 ports (time slots) at a time.

The TN800 connects to the switch through a single slot in the backplane, however its width is not limited to one slot. The number of slots occupied by the TN800 is supplied by the board during its insertion. The TN800 (Release 5 and higher) is three slots wide. The blank (reserve) slots are to the left of the functional slot.

In non-native mode the TN800 is recognized as TN556, TN2181, TN754, or TN746 based on the switch software and the application running on the TN800. In non-native mode only one type of port MO runs at any time, and the port type depends on the application running on the TN800. If the TN800 fails diagnostics in non-native mode, the system's alarm and error logs would show a failure for the board type the TN800 is emulating.

Error Log Entries and Test to Clear Values

Table 133: ASAI-PT Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level ASAI-PORT	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
1 (a)	(a)	Level 1 Status inquiry (#621)	MAJOR[2]	OFF	**test port** *UUCSSpp* **sh r 2**
513 (b)	0	none	(b)	ON	
1537 (c)	46210	CRC Error counter (#623)	MAJOR[2]	OFF	
3841 (d)	46208	None			
3844 (e)	46223	None			
3845 (f	46211	None			
3846 (g)	TEI	None			

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Major and Minor alarms may be downgraded to warning alarms based on the value used in the **set options** command.

Notes:

a This error occurs when the Level 1 Status inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. The `Aux Data` field contains one of the following values:

Blank	This indicates that the Level 1 Status inquiry failed.
32773	This is a message from the ASAI-Line circuit pack indicating Level 1 has been deactivated.

Refer to the repair procedures for Test #621.

b The circuit pack is having problems transmitting data to the packet bus, thus affecting the conveyance of signaling information over the D channel. This error occurs when the packet bus transmit FIFO buffer overflows. This condition probably indicates a hardware problem as well. The ASAI-PORT alarm level is MAJOR with aux data 0. Use troubleshooting procedures for both on-board hardware problems and potential off-board packet-bus problems.

c The port received an invalid frame over the D channel. When the cyclical redundancy check (CRC) errors exceed 5 within 15 minutes, the port is taken out of service for 5 seconds. If 5 more CRC errors are received within 15 minutes of the first set of 5 errors, the port is taken out of service for one minute. If 5 more CRC errors are received within 15 minutes of the last 5, the port is taken out of service for 15 minutes.

This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source, or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

- Check the wiring to the endpoints or the adjunct.
- If the problem persists, replace the endpoints or adjuncts.

d This error occurs when a Layer 1 Transmission error is detected for the port. Run the long test sequence, and note the results of the Layer 1 Transmission Error Counter test (#624).

e This error occurs when the circuit pack detects an overflow of its receive buffers. Run the long test sequence, and note the results of the Receive FIFO Overflow Counter test (#625).

f This error occurs when the BRI Port Local LAN Looparound test (#618) fails. Run the long test sequence, and note the results of Test #618.

g The TEI (Terminal Endpoint Identifier) administered for the ASAI endpoint most likely does not match the TEI administered in the ASAI adjunct. Check the switch administration of the TEI against that of the adjunct, and make sure that both are using the same TEI.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *ASAI Port Local LAN Looparound* test (#618), you may also clear errors generated from other tests in the testing sequence.

Table 134: System Technician-Demanded Tests: ASAI-PT

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
ASAI Port Local LAN Looparound test (#618)		X	D
Level 1 Status Inquiry test (#621)	X	X	ND
CRC Error Counter test (#623)		X	ND
Layer 1 Transmission Error Counter test (#624)		X	ND
Receive FIFO Overflow Error Counter test (#625)		X	ND
Clear Error Counters (#270)	X	X	ND

1 D = Destructive, ND = Nondestructive

BRI Port Local LAN Loop-Around Test (#618)

This test is **destructive**.

This test verifies the connectivity of a BRI port across the LAN Bus and executes only if the port is out-of-service. The test aborts if calls associated with the port are in-progress. Failures of this test indicate either on-board faults associated with the ASAI-PT hardware on the circuit pack or problems with the LAN Bus, which is used to form connectivity between the switch and the ASAI-PT.

The dotted lines in Figure 23, BRI Port Local LAN Loop-Around Path, on page 344 show how a loop-around test is performed across the packet bus for the D channel.

Figure 23: BRI Port Local LAN Loop-Around Path

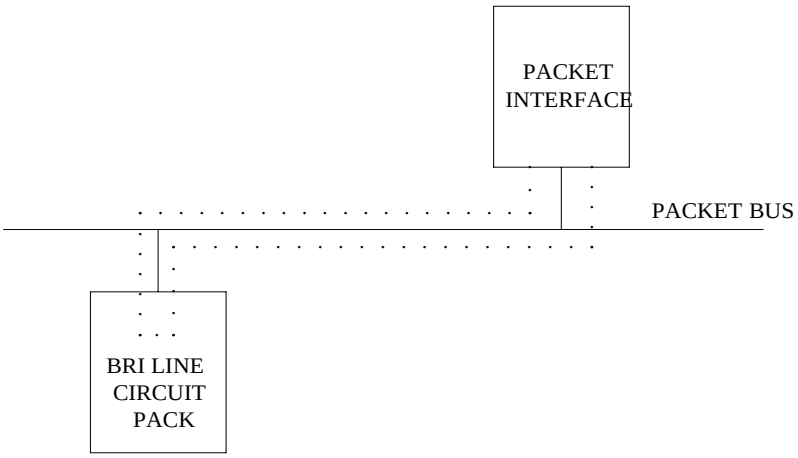


Table 135: Test #618 BRI Port Local LAN Looparound

Error Code	Test Result	Description / Recommendation
1015	ABORT	The port is not in the out-of-service state. **1** Display the Port Status screen using **status bri-port *location*** to determine which stations or adjuncts are on this port. **2** Use the extension shown on this screen in **status station** to determine whether the station or adjunct is active. **3** If the port is active, wait until it is idle, and use **busyout port *location*** to place it in the out-of-service state and repeat this test. **WARNING:** Since the "busyout" command is destructive, using this command prior to the port being idle causes every transaction associated with the ASAI on the port to be torn down. Note that 3rd-party calls established by an ASAI adjunct remain connected even though the port is taken out-of-service.
1139	ABORT	The PN's packet bus is out-of-service. **1** Follow the repair procedures for the packet bus. **2** After completing step 1, execute **test port long *location*** and review the results of the BRI Port Local LAN Looparound test to verify the repair.

1 of 2

Table 135: Test #618 BRI Port Local LAN Looparound

Error Code	Test Result	Description / Recommendation
1141	ABORT	The PKT-CTRL is out-of-service. **1** Follow the repair procedures for the PKT-CTRL. **2** Issue the **test port long *location*** command and review the results of the BRI Port Local LAN Looparound test to verify the repair.
S8100: 1144	ABORT	The PPN Packet Bus is out-of-service. **1** Follow the repair procedures for the Packet Bus. **2** Issue the **test port long *location*** command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	The loop-around test has failed. **1** If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the board are idle. Reset the circuit pack by issuing the **busyout board *location*** and the **reset board *UUCSS*** commands. **2** If the test fails again, execute **test pkt *P*** on the management terminal. If this fails, follow the failure procedures the in PKT-BUS section. **3** If the tests executed in step 2 pass, the problem is local to the BRI board. Replace the circuit pack.
	PASS	The BRI Port Local LAN Looparound test has passed.

2 of 2

Level 1 Status Inquiry Test (#621)

This test determines the state of the transmission facility of a BRI port at the Level 1 (L1) or physical layer. L1 can be in one of two possible states: Activated or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI adjunct administered on this port. This test passes if the state of L1 is activated. This test also passes if software has taken this port out of service.

The Deactivated state indicates a problem with the ASAI circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ASAI port is placed in the out-of-service state, Level 1 is also put into the deactivated state. This could be due either to the system detecting a fault with the port or in response to a **busyout port *location*** request.

Table 136: Test #621 Level 1 Status Inquiry

Error Code	Test Result	Description / Recommendation
1187	ABORT	The board, port, or station may have been busied-out by a technician. **1** Look in the Error Log for Error Type 18 (port busied out) for this port and ASAI-BD (board busied out). If this error type is present for ASAI-PT only, then release the port using **release port *location*** and run the test again. If the error is present for both ASAI-BD and ASAI-PT, then release the board with **release port *location*** and run the test again. **NOTE:** When you release a port, you release every port associated with it. If certain ports still need to be busied out, use **busyout port *location*** to busy them out. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to 5 times, reset the circuit pack using **busyout board *location*** and **reset board *location***. **2** If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
3	FAIL	Received a status of Level 1 Deactivated; the port is out of service. **1** Issue the **status bri-port *location*** command to verify that the service state of the port is out-of-service. If the port is not out of service, escalate the problem, or else proceed to step 2. **2** If the port has been placed out-of-service using the **busyout port *location*** command, try releasing the port by executing the **release port *location*** command. Then issue the **test port long *location*** command, and review the results of Level 1 Status Inquiry test. If this test is still failing, proceed to step 3. **3** After executing the **test port long *location*** command, review the results of every test. Follow the repair procedures for any tests that fail. Verify repair of the problem by executing the **test port *location*** command and by determining that the Level 1 Status test passes. **4** If the test continues to fail for this reason, escalate the problem.
	PASS	This test indicates that Level 1 is activated, or that software has taken the port out of service.

CRC Error Counter Test (#623)

This test reads and clears the BRI port's CRC error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it receives a frame from the endpoint or adjunct with a bad CRC over the D channel. The test passes if the value of the counter is 0 (the error is cleared). If the counter is not 0, the test will fail and the value of the counter is displayed in the `Error Code` field. A CRC error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source (for example, electrical motors or generators), or no termination (open circuit). It usually does not indicate a problem with the BRI circuit pack. This test is used for verifying the repair of the problem.

Table 137: Test #623 CRC Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to 5 times, reset the circuit pack using **busyout board *location*** and **reset board *location***. **2** If the test aborts again, replace the circuit pack. **CAUTION:** Do not leave the circuit pack busied out.
2012	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The BRI circuit pack is still detecting CRC errors. The `Error Code` field contains the value of the counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, review the results of other tests in the long test sequence. Pay particular attention to the results of the Level 1 Status Inquiry test. Follow the repair procedures for any of the executed tests if they fail; otherwise, proceed to step 3. **3** If the tests for the endpoints or adjunct pass and the CRC error counter test continues to fail, check the wiring to the endpoints or adjunct. If the wiring appears to be OK, escalate the problem.

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port's Layer 1 Transmission error counter maintained on the ASAI circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY® Communications System Generic 1 and Generic 3i Wiring,*

555-204-111. It does not indicate a problem with the TN800 circuit pack. This test is useful for verifying the repair of the problem.

Table 138: Test #624 Layer 1 Transmission Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to 5 times, reset the circuit pack using **busyout board *location*** and **reset board *location***. **2** If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate necessary system resources to run test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The TN800 circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, review the results of other tests in the long test sequence. Note the results of the Level 1 Status Inquiry test. Follow the repair procedures for any of the executed tests if they fail. Otherwise, go to the next step. **3** Replace the circuit pack.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Receive FIFO Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO error counter maintained on the TN800 circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from a packet bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port or if hardware fault is causing the receive buffers not to be emptied properly. This test is useful for verifying the repair of the problem.

Table 139: Test #625 Receive FIFO Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to 5 times, reset the circuit pack using **busyout board *location*** and **reset board *location***. **2** If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate necessary system resources to run test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The TN800 circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, review the results of other tests in the long test sequence. Note the results of the Level 1 Status Inquiry test. Follow repair procedures for any of the tests that fail. Otherwise, go to the next step. **3** If the tests for the endpoints or adjunct pass and the Layer 1 Transmission Error Counter test continues to fail, check the wiring to the endpoints or adjunct.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Clear Error Counters Test (#270)

There are various error counters associated with each ASAI-PT. This test clears those counters and triggers the auditing of layer-3 reinitialization. This test is used only to send messages to the ASAI-PT and should not abort nor fail. ASAI uses a fixed TEI value of 1.

Table 140: Test #270 Clear Error Counters

Error Code	Test Result	Description / Recommendation
Any	ABORT	This test should never abort.
Any	FAIL	This test should never fail. **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	The message to clear the error counters of the ASAI-PT has been sent.

ASAI-RES/E-DIG-RES (TN800 reserve slot)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ASAI-RES	NONE	NONE	TN800 ASAI reserve slot
E-DIG-RES	NONE	NONE	TN800 DIG reserve slot

There are no tests associated with these MOs. Both the **test board** and **busyout board** commands abort when either is attempted on a reserved slot. An error message indicates the slot is associated with the circuit pack that the TN800 is emulating, but the requested operation is not valid.

The TN800 MAPD (Multi-Application Platform) circuit pack connects to the switch through a single slot in the backplane. The number of slots occupied by the MAPD pack is supplied by the board when inserted. The TN800 in R5EM is three slots wide. The TN800 requires 2 reserve slots to its left. The reserve (blank) slots are to left of the functional slot and are place holders on the switch, and do not have any interaction with the switch.

Each instance of these MOs represents a reserve slot associated with respective circuit pack mode in which the MAPD is working.

ATM-BCH (ATM B-Channel Trunk)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ATM-BCH[2]	MAJOR[3]	**test port *location* l**	ATM B-Channel Trunk
ATM-BCH	MINOR	**test port *location* l**	ATM B-Channel Trunk
ATM-BCH	WARNING	**test port *location* sh**	ATM B-Channel Trunk

1 For information on specifying a location, see Command Syntax on page 179.

2 For additional repair information, see also ATM-DCH (ATM D-Channel Port) on page 364, ATM-SGRP (ATM Signaling Group) on page 429 and PKT-BUS (Packet Bus) on page 1406.

3 A MAJOR alarm on a trunk means that alarms on these trunks are not downgraded by the **set options** command, and at least 75% of the trunks in this trunk group are alarmed.

This MO explains how you test and repair TN230x ATM Interface circuit packs (TN2305 and TN2306) that have ATM B-channel trunks administered for ATM Circuit Emulation Service (CES).

For maintenance instructions for TN230x circuit packs that are administered as Expansion Interfaces for ATM network connectivity, see ATM-INTF (TN2305/6) on page 407.

ATM Circuit Emulation Service

Under ATM Circuit Emulation Service, you simulate ISDN-PRI circuits by assigning ATM ports to *signaling groups*. Each signaling group represents a PRI circuit, and the ports in the group represent the D channel and B channels of that circuit. B channels must also be assigned to ISDN-PRI trunk groups. TN230x circuit packs support up to 248 ports per circuit pack.

Signaling Group Components

B (bearer) channels (ATM-BCH) transmit digitized voice or data, while a separate D channel (ATM-DCH) handles call-control signaling. One D channel handles signaling for a group of B channels that combine to form a signaling group (ATM-SGRP).

B-Channel Service States

The ISDN specification defines two service state categories for B channels as listed in Table 141, ATM ISDN service states, on page 352.

Table 141: ATM ISDN service states

Category	Description		
Service states			
In-Service (INS)	B channel is in normal operating state	Active	A call is connected over the B channel.
		Idle	There is no call on the B channel.
Out-of-Service/Far-End (OOS/FE)	The switch has not successfully negotiated B-channel connection as of yet. Calls cannot be placed or received. When you first administer a B channel, the switch initializes the B channel to this state while it tries to negotiate a connection to the far end. If the request times out with no response from the far end, the switch leaves the B channel in the OOS/FE state.		
Out-of-Service/Near-End (OOS/NE)	The NPE Crosstalk test has failed, or the trunk is busied out. Calls cannot be placed or received.		
Maintenance/Far-End (MTC/FE)	A request has timed out with no response from the far end after signaling is in place and B channels are in service. Calls can be received but not placed, and stable calls are unaffected.		
Maintenance/Near-End (MTC/NE)	The signaling channel (ISDN-LNK) has been busied out, possibly after a **test trunk *grp#/mbr#* long** command. Calls cannot be placed or received, but stable calls are unaffected.		
Pending states[1]			
Pending-in-Service	The near end is waiting for a response to a transition-to-service request.		
Pending-Maintenance	The near end is waiting for a transition-to-maintenance-service request (US and other country-protocol-1 systems).		

1 The switch is waiting for a reply from the far end. Pending service states remain in effect until the near end receives a response or times out.

B-Channel Alarms

The Maintenance/Far-End and Out-Of-Service/Far-End states generate warning alarms displayed with **status trunk *grp#/mbr#***.

Table 142: ATM-BCH alarms by service state

Service state	Alarm[1]	Possible cause	Possible solution
Out-of-Service/NE	Warning	Trunk busied out	Release the port (**release trunk *grp#/mbr#***).
	Minor	NPE Crosstalk test (#6) failed	Replace ATM circuit pack.
	None	ATM circuit pack lost signal or there is a circuit pack problem.	Install circuit pack or cable. Check circuit pack using procedures in ATM-BCH. Check far-end switch status.
Out-of-Service/FE	Warning	Unadministered far end	Administer the corresponding trunk on the far-end switch.
	Warning	Far-end busied out	Check the status of the far-end switch.
Pending/In-Service Pending/Maint	None	Maintenance message timed out waiting for reply	Wait 2 minutes after the pending state clears, and check the service state.
Maint/NE	None	ISDN test call in progress (**test trunk long**)	Wait for the test to finish and recheck.
	None	System link busied out	Check link status. Run **release link *link#***.
Maint/FE	Warning	Signaling channel down for over 90 sec.	See ATM-SGRP (ATM Signaling Group) on page 429 or ATM-DCH (ATM D-Channel Port) on page 364.
	Warning	Repeated lack of response to messages sent to the far end	Wait. Maintenance software resends messages periodically. Or run **test trunk *grp#/mb#*** or **test signaling-grp *grp#***.
	Warning	The far-end trunk is being tested.	Check status of the far-end switch. Wait for testing to finish.
In-Service	None	Normal operating state	

1 ATM-BCH alarms; alarms against other MOs may also be present.

Error Log Entries and Test to Clear Values

Table 143: ATM-BCH Error Log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSppp*
1(a)	Any	None			**test port** *UUCSSppp*
18	0	**busyout trunk** ***grp/mbr***			**release trunk** *grp/mbr*
129 (b)		None	WARNING	OFF	**test port** *UUCSSppp*
130 (c)					**test port** *UUCSSppp*
257(d)	Any	Service State Audit test (#256)			**test port** *UUCSSppp*
513(e)	Any	None	WARNING	OFF	**test port** *UUCSSppp*
769(f)	Any	Service State Audit test (#256)			**test port** *UUCSSppp*
1793(g)	Any	None			**test port** *UUCSSppp*
3073(h)	Any	Service State Audit test (#256)			**test port** *UUCSSppp*
3585(i)	Any	None			none
3841(j)	Any	None	WARNING	OFF	none

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

Notes:

a Error Type 1: the two ends of the ATM trunk do not agree on the ISDN call state. Possible causes:

- Received a DISConnect or RELease COMplete message with cause value 52 (outgoing calls barred)
- Received a DISConnect or RELease COMplete message with cause value 54 (incoming calls barred)
- Outgoing call renegotiated by the far end to another B channel in the absence of SETUP message glare
- Near end attempted a call on a B channel that the far end has marked OOS

When running the short test sequence, pay close attention to the results of the Call State Audit test (#257).

b Error Type 129: the far-end switch changed its ISDN service state to either out-of-service or maintenance. This may be a temporary condition because the far end is testing that trunk or a hardware problem with the trunk. Outgoing calls may not be allowed over that trunk.

1 Investigate the trunk's status (**status trunk** ***grp#/mbr#***).

c Error Type 130: the circuit pack has been removed or has been insane for more than 11 minutes.

1 Reinsert or replace the circuit pack to clear the error.

d Error Type 257: SETUP received for a B channel that is in an invalid service state. Service states may be incompatible at the two ends of the trunk. A normal call was received while the B channel was MTC/FE, MTC/NE, OOS/FE, or OOS/NE or a test call was received while the B channel was OOS/FE or OOS/NE.

e Error Type 513: RELease COMplete message received with cause value 82 (nonexistent channel). The B channel may not be administered at the far end. The trunk has been placed in the OOS/FE state.

f Error Type 769: inconsistent SERVice or SERVice ACKnowledge message. Possible causes:

- SERVice or SERVice ACKnowledge message received containing a change status that is more available than the previously-transmitted SERVice message.
- Unsolicited SERVice ACKnowledge message received containing a change status that does not match the current B-channel state.

ISDN-PRI service-state negotiation rules have been violated and may indicate that a pending service-state audit is failing. The system:

- cancels the maintenance timer
- increments the Service State Audit counter
- attempts a Service State Audit

When running the short test sequence, pay close attention to the results of the Service State Audit test (#256).

g Error Type 1793: TN230x circuit pack has failed. The maintenance system

- places the trunk in the OOS/NE state
- sends a SERvice message to the far end (if possible) containing a change status of OOS for the B channel
- returns the trunk to service when the ATM trunk circuit pack reports the failure cleared

h Error Type 3073: Service State Audit attempt failed. See Service State Audit Test (#256) on page 357. Calls can be received but not placed until the test passes and the trunk state returns to In-Service.

1 Check the trunk's status (**status trunk *grp#/mbr#***).

i Error Type 3585: ISDN RESTART message received. Active calls have been dropped.

The following Aux Data values (Error Type 3585 only) below represent the trunk's ISDN call state at the time Error 3585 occurred. This information can be useful if users report dropped calls on the ISDN-PRI trunks.

Aux Data	Description
0	An idle trunk received a restart.
10	An ISDN RESTART from the far end has unexpectedly cleared a call in the ACTIVE state (call stable, parties talking).
4 7 8 260 263	An ISDN RESTART from the far end has unexpectedly cleared a RINGING call.

Aux Data	Description
1 3 6 9 265	An ISDN RESTART from the far end has unexpectedly cleared a call before the call entered the RINGING state.
11 12 19 531 267 268	An ISDN RESTART from the far end has unexpectedly cleared a call that was already in the process of clearing. If this condition occurs frequently, the far end may be trying to clear trunks that appear to be in the “hung” state.

j Error Type 3841: the far end rejected an ATM CES trunk selected by the near end 10 times. The ATM CES trunk may not be administered on the far end.

1. Get the physical name of the ATM trunk by noting the decimal number in the `Aux Data` field.
2. Check administration for the named trunk on the far end.
3. If problems persist, then busyout the ATM trunk to take it out of the hunt group.

The WARNING alarm retires automatically whenever a called endpoint answers an outgoing or incoming call that uses the alarmed trunk.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate problems in the order presented in the table below. When you clear one of the error codes associated with a given test, you clear errors generated by other tests in the testing sequence. If you clear errors out of order, you can lose important information.

Table 144: System Technician-Demanded Tests: ATM-BCH

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Signaling Link State Check test (#255)	X	X	ND
Service State Audit test (#256)	X	X	ND
Call State Audit test (#257)	X	X	ND
ISDN Test Call test (#258)		X	ND

1 D = Destructive, ND = Nondestructive

Signaling Link State Audit Test (#255)

This nondestructive test checks the status of the TN230x ATM-CES Interface circuit pack and the ATM D-channel (ATM-DCH) trunk, which are both important elements to the health of the ATM-BCH trunk.

Table 145: Test #255 Signaling Link State Audit Test

Error Code	Test Result	Description / Recommendation
None	ABORT	Internal system error
0	ABORT	
1114	ABORT	Signaling link in transitional state **1** Retry the command up to 5 times at 1-minute intervals.
1018	ABORT	Maintenance disabled **1** Enable maintenance. Enter **y** in the `Maintenance Tests` field on the ***change trunk-group*** screen.
4	FAIL	Signaling channel problem **1** Look for errors or alarms against ATM-SGRP (ATM Signaling Group) on page 429 and ATM-DCH (ATM D-Channel Port) on page 364.
8	FAIL	TN230x circuit pack failed **1** See ATM-INTF (TN2305/6) on page 407.
	PASS	Signaling link OK.

Service State Audit Test (#256)

This test checks the service state of the trunk.

Country protocol 1

If the interface uses country protocol 1 (includes USA), the service-state audit executes in every trunk service state. It queries the service state on the far end and waits 2 minutes for a reply. If the first request times out, the service-state audit asks again. If the request times out again, it logs error 3073 and resends the request every 15 minutes. It places in-service trunks in the MAINTENANCE/FAR-END state (outgoing calls blocked, incoming calls accepted). Incoming calls trigger an immediate service-state audit without waiting for the end of a 15-minute cycle.

Any other country protocol

If the interface uses some other country protocol, the service-state audit executes only on trunks that are in the OUT-OF-SERVICE/FAR-END state. It asks the far-end switch to bring the trunk back into the IN-SERVICE state and waits 2 minutes for a reply. If the first request times out, the service-state audit asks again. If the request times out again, it leaves the trunk in the OUT-OF-SERVICE/FAR-END state and tries again in 1 hour.

NOTE:
PASS for this test only means that a message to the far end was successfully sent.

To check the service state of the ATM-BCH trunk, run **status trunk *grp#/mbr#***.

Table 146: Test #256 Service State Audit Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	Needed resources not available, port on a call or initializing **1** Run **status trunk *grp#/mbr#***. **1** Check the results of Test #255.
1018	ABORT	Maintenance disabled **1** Enable maintenance by entering **y** in the `Maintenance Tests` field on the ***change trunk-group*** screen.
1113	ABORT	Signaling link failed **1** Run **status trunk *grp#/mbr#***. **2** Check the results of Test #255. **3** See ATM-SGRP (ATM Signaling Group) on page 429.
1114	ABORT	Signaling link in transitional state **1** Retry the command up to 5 times at 1-minute intervals.
1116	ABORT	Trunk not in Out-of-Service/Far-end state and country protocol other than 1
1117	ABORT	Service-state audit message outstanding **1** Wait 2 minutes, then try again.
2100	ABORT	Could not allocate needed resources **1** Retry the command up to 5 times at 1-minute intervals.
1113	FAIL	Signaling link failed **1** See ATM-SGRP (ATM Signaling Group) on page 429 and 'ISDN-PLK (ISDN-PRI Signaling Link Port) on page 1121.

1 of 2

Table 146: Test #256 Service State Audit Test

Error Code	Test Result	Description / Recommendation
	FAIL	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
	PASS	**1** Wait 4 minutes, then check the Error Log for any new Error Type 3073. • If there are none, both sides of the ISDN connection agree on the service state. The negotiation succeeded. • If there is a new 3073 error, then the negotiation failed (the request timed out).

2 of 2

Call State Audit Test (#257)

This test audits the internal call state by asking the far-end switch for the ISDN call state. The test is particularly useful when you are trying to clear a hung call. If the internal call state on the near end differs from that on the far end, the call is torn down.

The ISDN specification allows up to 2 minutes for a reply. If a reply is not received within the 2 minute window, the test logs a protocol time-out violation against the associated signaling channel (ATM-DCH, Error Type 1).

NOTE:
PASS simply means that an appropriate message was composed and sent to the far-end switch.

Table 147: Test #257 Call State Audit Test

Error Code	Test Result	Description / Recommendation
1018	ABORT	Maintenance disabled **1** Enable maintenance by entering **y** in the `Maintenance Tests` field on the ***change trunk-group*** screen.
1019	ABORT	Audit already in progress **1** Wait 2 minutes, and try again.
1113	ABORT	Signaling link failed **1** Check the results of Test #255 (Signaling Link State check).
1114	ABORT	Signaling link in transitional state **1** Retry the command up to 5 times at 1-minute intervals.
1116	ABORT	Trunk out-of-service **1** Check the trunk service state (**status trunk *grp#/mbr#***).

1 of 2

Table 147: Test #257 Call State Audit Test *Continued*

Error Code	Test Result	Description / Recommendation
2100	ABORT	Could not allocate needed resources **1** Retry the command up to 5 times at 1-minute intervals.
	FAIL	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
	PASS	**1** Wait 4 minutes, then check the Error Log for call-state mismatches. If a call state mismatch is found, the call is torn down.

2 of 2

ISDN Test Call Test (#258)

This nondestructive test performs a far-end loop-around test over an ATM-BCH trunk if:

- The trunk is IN-SERVICE, MAINTENANCE/NEAR-END, or OUT-OF-SERVICE/NEAR-END.
- No calls are active on the trunk.
- The system uses country protocol 1 (including US), or the far end has loop-around capability.

The test sets up a call to a far-end switch over the ATM-BCH trunk. Then the digital port on a TN711D Maintenance/Test circuit pack sends a bit pattern to the far end and back. If the received pattern matches that sent, the test passes. If there are differences, it fails.

Synchronous Test Calls

You can initiate a synchronous outgoing test call (including a test call for ISDN-PRI trunks) with these commands:

- **test trunk *grp#/mbr#* long [*repeat#*]**
- **test board *location* long [*repeat#*]**
- **test port *location* long [*repeat#*]**

Table 148: Test #258 ISDN Test Call

Error Code	Test Result	Description / Recommendation
4	ABORT	Signaling channel problem **1** Look for errors or alarms against ATM-SGRP (ATM Signaling Group) on page 429 and ATM-DCH (ATM D-Channel Port) on page 364.
8	ABORT	TN230x circuit-pack problem **1** See ATM-INTF (TN2305/6) on page 407.
1004	ABORT	B channel is active. **1** See if a call is active. Run **status trunk *grp#/mbr#*** command. **2** If the service state is In-Service/Idle, retry the test.

1 of 4

Table 148: Test #258 ISDN Test Call

Error Code	Test Result	Description / Recommendation
1005	ABORT	Bad configuration (for example, no Maintenance/Test circuit pack) **1** Make sure that the Maintenance/Test circuit pack is inserted. **2** Repeat the test.
1018	ABORT	Test call disabled **1** Set the Maintenance field on the Trunk Group screen to **y**.
1020	ABORT	TN230x circuit-pack problem **1** See ATM-INTF (TN2305/6) on page 407.
1024	ABORT	Maintenance/Test digital port active **1** Wait until amber and green LEDs on the Maintenance/Test circuit pack are OFF. **2** Rerun the test. **3** If the problem persists, see M/T-DIG (Maintenance/Test Digital Port) on page 1341.
1113	ABORT	Signaling link failed **1** Check the results of Test #255 (Signaling Link State Check test).
1116	ABORT	Switch could not change the service state **1** See if calls are active. Run **status trunk *grp#/mbr#***. **2** If a call is active, proceed as for Error Code 1119. If not, check the Error and Alarm Logs and see ATM-TRK (Circuit Emulation Service Circuit Pack) on page 445.
1117	ABORT	ISDN service message outstanding **1** Wait 2 minutes. Then try again.
1118	ABORT	Far-end not administered **1** Check the administration of the far end of the ATM trunk. Run **status trunk *grp#/mbr#***. **2** Try the test again.
1119	ABORT	Test call aborted, normal call attempted **1** Wait for the call to finish normally, or drop it by running **busyout trunk *grp#/mbr#***. **2** When the trunk is idle, retry the test.
1120	ABORT	Trunk OUT-OF-SERVICE/FAR-END **1** Try to change the service state via Test #256 (Service State Audit test). **2** Try the test again.
1122	ABORT	No test-line number for the far-end switch **1** Check the Trunk Group screen.

2 of 4

Table 148: Test #258 ISDN Test Call

Error Code	Test Result	Description / Recommendation
1123	ABORT	No Feature Access Code administration for this Facility test **1** Check the Dial Plan and Feature Administration forms.
2000, 2012, None	ABORT	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
2035	ABORT	Call timed out **1** Wait 1 minute, and try again.
2036–2037	ABORT	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
2038–2039	ABORT	Problem reading test data **1** Wait 1 minute, and then try again. **2** If the test aborts again, there is a serious internal problem.
2040	ABORT	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
2041	ABORT	Call timed out **1** Wait 1 minute, and try again.
2066	ABORT	Could not establish test call **1** Retry the command up to 5 times at 1-minute intervals.
2067	ABORT	Call timed out **1** Wait 1 minute, and try again.
2074	ABORT	Bit and Block Error query failed **1** Retry the command up to 5 times at 1-minute intervals. **2** If the test continues to abort, there may be a serious internal problem in the Maintenance/Test Digital port. See M/T-DIG (Maintenance/Test Digital Port) on page 1341.
2075	ABORT	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2201–2205	ABORT	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
2206	ABORT	Could not allocate needed resources **1** Retry the command at 1-minute intervals up to 5 times.

3 of 4

Table 148: Test #258 ISDN Test Call

Error Code	Test Result	Description / Recommendation
2208	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
2209–2210	ABORT	Could not allocate needed resources **1** Follow recommendations for ABORT code 2100.
2211	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times.
2212	ABORT	Call terminated by unexpected disconnect **1** Wait 1 minute and then try again.
2213	ABORT	Call timed out **1** Wait 1 minute, and try again.
2214	ABORT	Call terminated by unexpected disconnect **1** Wait 1 minute and then try again.
2215–2219	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
2220	ABORT	Call terminated prematurely **1** Wait 1 minute, and try again.
2221–2226	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
2227	ABORT	Could not allocate needed resources **1** Retry the command at 1-minute intervals up to 5 times.
2042	FAIL	Test data corrupt
	PASS	Test pattern intact. If the synchronous test call was performed (long test sequence), the communications path is operating properly.

4 of 4

ATM-DCH (ATM D-Channel Port)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ATM-DCH[2]	MINOR	**test port *locationpp* l**	ATM D-Channel
ATM-DCH	WARNING	**test port *locationpp* sh**	ATM D-Channel

1 For information on specifying a location, see Command Syntax on page 179. In specifying a location, ***pp*** is administered as a port in the range of 9 through 32.

2 For additional related information, see ATM-TRK (Circuit Emulation Service Circuit Pack) on page 445.

NOTE:
TN230x circuit packs are not interchangeable. Always replace an ATM circuit pack with the same type.

This MO (ATM-DCH) uses the existing ISDN-PLK or D-channel maintenance strategy with modifications. The ATM circuit pack can be administered for up to 8 Circuit Emulation Service (CES) or signaling groups, each with its own D channel, as opposed to one D channel for an entire DS1 circuit pack.

NOTE:
Due to the dual personalities and the number of D channels that the ATM board can possess, the in-line errors and signaling port LAN loopback test has been moved to the MO ATM-TRK (Circuit Emulation Service Circuit Pack) on page 445. When an in-line error is sent due to packet-bus errors, the ATM circuit pack MO receives the error, not ATM-DCH.

The D-channel ISDN-PRI interface is emulated for ATM-CES and uses out-of-band signaling to transmit control messages between two endpoints. User information or bearer channels (B channels) carry digitized voice and digital data and are assigned to DS1 ISDN trunks or PRI endpoints. Call-control signaling for the B channels is combined and carried over the separate ISDN-PRI Signaling Link port D channel.

Problems with ATM-DCH affects every associated B channel, since call-control signaling cannot reach the far-end switch or terminal adapter. Stable calls can remain operational, but no new calls can be made. In turn, ATM-DCH depends on the:

- TN230X ATM Trunk circuit pack where it resides
- Packet bus that provides the link to the processor

When working ATM-DCH alarms or errors, also investigate

- ATM-TRK (Circuit Emulation Service Circuit Pack) on page 445
- PKT-BUS (Packet Bus) on page 1406

Hardware Error Log Entries and Test to Clear Values

Table 149: ATM D-channel Error Log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp*[2]
18 (a)	0	busyout port UUCSSpp	WARNING	OFF	**release port** *UUCSSpp*
130 (b)		None	WARNING	ON	**test port** *UUCSSpp*
1793 (c)		Signaling Link Board check (#643)			**test board** *UUCSS* **l**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 pp is for ports 9–32.

Notes:

a Error Type 18: D channel busied out; no calls possible over this D channel.

b Error Type 130: circuit pack removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

c Error Type 1793: ATM Trunk circuit pack failed the Signaling Link Board check (#643). Resolve any ATM-TRK errors in the Error Log.

System Technician-Demanded Tests: Descriptions and Error Codes

The command to test the ATM-DCH MO is **test port *locationpp***, where ***pp*** is for ports 9-32.

Table 150: System Technician-Demanded Tests: ATM-DCH

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Signaling Link Board check (#643)	X	X	ND

1 D = Destructive, ND = Nondestructive

Signaling Link Board Check (#643)

This nondestructive test checks the health of the ATM TN230X trunk circuit pack's hardware. The test runs on a periodic or scheduled basis, during initialization testing, and upon demand.

NOTE:
The board-level maintenance is handled independently of the ATM-CES signaling link maintenance, raising the possibility of inconsistent states.

Table 151: Test #643 Signaling Link Board Check

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error Retry the command at 1-minute intervals up to 5 times.
8	FAIL	The TN230X circuit pack is not in-service. Check the Error Log for ATM-TRK errors and resolve any using ATM-TRK (Circuit Emulation Service Circuit Pack) on page 445.
	PASS	The ATM TN230X circuit pack is in-service.

ATM-EI (Expansion Interface Circuit Pack)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ATM-EI	MAJOR	**test board *location***	ATM Expansion Interface circuit pack
ATM-EI	MINOR	**test board *location***	ATM Expansion Interface circuit pack
ATM-EI	WARNING	**test board *location***	ATM Expansion Interface circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

This MO covers the ATM circuit pack administered as an Expansion Interface (ATM-EI) for ATM Port-Network Connectivity (ATM PNC). The ATM-EI provides PNC between a S8700 Multi-Connect server and every PN through the ATM switch.

The circuit packs listed in Table 152, ATM-EI circuit packs for S8700 Multi-Connect, on page 367 are ATM-EI boards *if they are administered to support ATM Port Network Connectivity (ATM PNC) for S8700 Multi-Connect*.

Table 152: ATM-EI circuit packs for S8700 Multi-Connect

Circuit pack	Fiber	Echo cancellation
TN2305	Multimode	Y
TN2306	Single mode	Y

NOTE:
TN230x circuit packs are not interchangeable. Always replace an ATM circuit pack with the same type.

NOTE:
ATM switch maintenance is not covered in this section. When S8700 Multi-Connect system maintenance software suspects the ATM switch connections, it raises appropriate Communication Manager alarms.
To clear any ATM switch faults, refer to the particular ATM switch's documentation.

LEDs

The ATM Interface circuit pack has three LEDs:

- Red indicates some alarm condition.
- Green indicates maintenance testing in progress.
- Amber provides useful visual information regarding the operating mode of the ATM-EI and possible error conditions.

The possible LED states are in Table 153, ATM Interface LED codes, on page 368.

Table 153: ATM Interface LED codes

LED	LED Status	Condition
Red	Steady on	Board is not healthy
	Never on	Normal conditions
Red and Green	Red LED solid on Green LED 200 msec on; 200 msec off	Board is in the processes of booting
Green	Steady on[1]	Maintenance is running tests on the board
	100 msec on - 100 msec off	No links to the board
Amber	100 msec on -100 msec off	Fiber Loss of Signal (LOS), LOF, MS_RDI, MS_AIS, LCD, HP_RDI, HP_AIS, LOP, PSC
Amber	500 msec on; 500 msec off	Signal to the ATM switch is down
Amber	2 sec on; 0.2 sec off	ATM-EI is Expansion Archangel (EAA)
Amber	Never on	ATM-EI standby

1 The green LED flashes between tests.

ATM-EI-Related Commands

The following commands can be helpful in resolving ATM-EI problems:

add atm pnc
busyout/release atm pnc
busyout/release board
change atm pnc (pnc duplication)
display atm pnc
list atm oam-statistics
list atm pnc
list measurements atm
remove atm pnc
reset board
status atm pnc
status cabinet
status port-network
test board

Replacing an ATM-EI Circuit Pack

Standard Reliability

1. Enter **busyout atm pnc #** (this is service-affecting) at the SAT.
2. Replace the ATM PNC circuit pack, and reconnect the fiber.
3. Enter **release atm pnc**.
4. Wait 2½ minutes for board insertion.
5. Enter **list sys-link** to verify that the links are up.
6. Enter **test board UUCSS,** and verify that every test passes.

Duplex or High Reliability

There is 1 ATM-EI circuit pack in each PN.

1. Enter **busyout atm pnc #** at the SAT.

   NOTE:
   If the ATM-EI is in a PN, this is service-affecting.

2. Replace the circuit pack.
3. Enter **release atm pnc**.
4. Wait 2½ minutes for board insertion.
5. Enter **list sys-link** to verify that the links are up.
6. Enter **test board *location***, and verify that every test passes.

Critical Reliability

There are 2 ATM-EI circuit packs in each PN.

1. Enter **status pnc** at the SAT. If the board is on the active side, enter **reset pnc interchange** to switch the active ATM-EI board to the standby side.
2. Enter **busyout pnc-standby.**
3. Enter **busyout atm pnc # a-pnc** or **b-pnc**.
4. Replace the circuit pack.
5. Enter **release atm pnc #.**
6. Enter **release pnc-standby.**
7. Wait 2½ minutes for board insertion.
8. Enter **test board *location***, and verify that every test passes.

Basic ATM PNC Administration

> **NOTE:**
> This section contains basic administration information only. Refer to *ATM Installation, Upgrades, and Administration using Avaya™ Communication Manager, 555-233-124,* for more detailed information.

ATM PNC connections involve administering

- 1 ATM-EI board in each PN (standard, duplex, or high reliability)
- 2 ATM-EI boards in each PN (critical reliability)

Adding ATM PNC Connections

Standard, Duplex or High Reliability

1. If the ATM-EI circuit pack is absent or if the circuit pack is present but in a PN, use the **change circuit-pack** command to add circuit pack translations.
2. Enter **add atm pnc *n*** (connection number), and administer the circuit pack's location and its ATM address.

Critical Reliability

1. Enter **change system-parameters duplication**, and change the `Enable Operation of PNC Duplication field` to **n.**
2. If the ATM-EI circuit pack is absent or is present but in a PN that does not yet have PNC connectivity to it, use the **change circuit-pack** command to add circuit pack translation for the missing circuit pack.
3. Enter **add atm pnc *n*** (connection number), and administer the circuit pack location and ATM address.
4. Enter **change system-parameters duplication**, and change the `Enable Operation of PNC Duplication` field to **y.**

Removing ATM PNC Connections

Standard, Duplex or High Reliability

> **NOTE:**
> These systems are *not* equipped with PNC duplication.

1. Enter **busyout atm pnc *n*** (connection number).
2. Enter **remove atm pnc *n*** (connection number).

Critical Reliability

1. Enter **status pnc**, and ensure that the A-PNC is active.

   If not, request a PNC interchange using the **reset pnc interchange** command.
2. Enter **busyout pnc-standby.**
3. Enter **change system-parameters duplication**, and change the `Enable Operation of PNC Duplication` field to **n.**

4 Enter **busyout atm pnc *n*** (PN's number)**.**

5 Enter **remove atm pnc *n*** (PN's number) to remove both ATM-EI boards, or enter **change atm pnc** to remove the B-side ATM-EI board.

6 Enter **change system-parameters duplication**, and change the `Enable Operation of PNC Duplication` field to **y**.

Changing Circuit Pack Location or ATM Address

Standard, Duplex or High Reliability

NOTE:
These systems are *not* equipped with PNC duplication.

1 Remove the ATM PNC connection (see Removing ATM PNC Connections above).

2 Add an ATM PNC connection (see Adding ATM PNC Connections above).

A-side ATM-EI—Critical Reliability

1 Remove the ATM PNC connection (see Removing ATM PNC Connections above).

2 Add an ATM PNC connection (see Adding ATM PNC Connections above).

B-side ATM-EI—Critical Reliability

1 Enter **status pnc**, and ensure that the A-PNC is active.

If not, request a pnc interchange using the **reset pnc interchange** command.

2 Enter **busyout pnc-standby.**

3 Enter **list config carrier**, and verify that an ATM circuit pack is assigned for the new location. If not, add the ATM circuit pack's translations.

4 Enter **busyout atm pnc *n*** (connection number) **b-pnc**.

5 Enter **change atm pnc *n*** (connection number) and change circuit pack location for the B side.

6 Enter **release pnc-standby.**

Changing ATM Address of Standby ATM PNC EI — Critical Reliability

1 Enter **busy pnc-standby.**

2 Enter **change atm pnc *n*** (connection number), and change the ATM address for the standby side.

3 Enter **release pnc-standby.**

Error Log Entries and Test to Clear Values

Table 154: ATM-EI Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value

3843 (w)		None			
3999 (x)	Any	None			
Any	32767[2]	None			

2 of 2

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Aux Data 32767 for any error log entry indicates that an alarmed ATM-EI was busied out and then released. When this occurs, existing service-affecting alarms must be preserved. Typically, every alarm is resolved when the ATM-EI is released. Therefore, the Alarm and Error Logs must be repopulated with the alarms present at time of busyout. This Aux Data indicates that existing Error Type and Error Log time stamps are no longer valid because they were lost when the circuit pack was released.

Notes:

a **Error Type 2** — The on-board DUART chip failed. This results in communication failure between the PN's Maintenance board and the ATM-EI board. The Maintenance board should have a red LED lit, because the link to the ATM-EI is down in this PN.

1 Reset the board with the **reset board *location*** command.

2 If the board does not recover, replace the board.

b **Error Type 18** — The ATM-EI circuit pack has been busied out.

1 Release the circuit pack (**release board *location***).

c **Error Type 23** — An ATM-EI circuit pack has been administered with the **add atm pnc *n*** command, but the circuit pack has not been inserted into the system.

1 Insert an ATM-EI circuit pack at this location.

d **Error Type 125** — A wrong circuit pack is located in the slot where the ATM-EI circuit pack is logically administered.

1 Either remove the wrong circuit pack and insert the ATM-EI circuit pack or remove the ATM-EI administration (see Basic ATM PNC Administration on page 370).

2 Remove the ATM-INTF administration and re-administer the slot (**change circuit-pack**) to match the circuit-pack that is physically present in this slot.

e **Error Type 131** — An ATM-EI circuit pack has been removed from the slot for 5 minutes.

1 Insert the ATM-EI circuit pack into its administered slot.

2 Another way to resolve or prevent this alarm is to remove the ATM-EI administration (see Basic ATM PNC Administration on page 370), then remove the ATM-INTF administration (**change circuit-pack**).

It is possible that the ATM-EI could be held in reset by the PN's Maintenance board and is not inserted in the system.

1 Try issuing the **test maint *P* long** command on the maintenance board in the same PN.

f **Error Type 257** — Expansion Interface Control Channel test (#316) failed (board cannot communicate on the TDM bus control channel). Follow the suggested test procedures.

Error Type 258 — The archangel is out of sequence (Aux Data indicates angel number).

Error type 259 — The expansion archangel link (EAL) to the active ATM-EI board is down. See SYS-LINK (System Links) on page 1782.

g **Error Type 513** — The ATM Crosstalk test failed. The board is either writing to or reading from a TDM time slot that is not allocated to the board.

1 Test the board (**test board *location***), and follow the test procedures suggested for this test. In random tests of a single DSP during low or high traffic, the same DSP can be tested more than once.

h **Error Types 769 and 770** — are board-degraded alarm errors that result when the ATM switch is sending corrupted cells or excessive AAL/LAPD retransmissions (off-board ATM cell corruption errors). These errors indicate the detection of a problem in handling ATM cells that are received from the fiber interface.

Aux Data:

Error Type	Aux Data	Description
769	34	Excessive AAL-5 retransmission requests
769	35	Excessive LAPD retransmission requests
770	25	Uncorrectable ATM cell headers – threshold
771	26	VPI, VCI pair unknown

The problem is most likely *not* on the ATM-EI circuit pack reporting the errors, but it could be due to one or more of the following reasons:

- The fiber is not snugly connected to either the board or the ATM switch.
- The PN's packet bus is corrupting the cells. See PKT-BUS (Packet Bus) on page 1406 (Aux Data 35 only).
- The fiber between the ATM switch and the ATM-EI is too long (greater than 2 km for multimode fiber). Use loopback to see if the fiber is corrupting the cells.
- Some other ATM-EI board is not receiving the cells properly.
- The intervening ATM switch is dropping the ATM cells due to a shortage of bandwidth, or the S8700 Multi-Connect system is using more than the subscribed bandwidth.

Error Type 771 — The ATM switch is sending cells with unknown VPI and VCI address (wrong connection).

1 Ensure that the ATM-EI board address on the ATM switch matches the ATM-EI (ATM) address on the S8700 Multi-Connect side.

i **Error Types 1024-1151** — These errors represent problems detected by the ATM-EI board in response to SETUP and ADDPARTY requests from software.

- The Error Types and descriptions are in Table 155, ATM Error Types 1024 - 1151, on page 375.
- Aux Data values represent PN and angel numbers and are in Table 156, Error Type 1024-1151 Aux Data values (XXYYY) converted to slot number, on page 377.

Table 155: ATM Error Types 1024 - 1151

Error Type	Description	General problem
1024	Next node unreachable	ATM protocol stack on ATM-EI circuit pack
1056	DTL Transit not my node ID	

1 of 2

Table 155: ATM Error Types 1024 - 1151

Error Type	Description	General problem
1088 or 1104	ATM-EI circuit pack received a request with an invalid connection identifier.	Firmware-detected problems on the ATM-EI circuit pack. Note: Error Types 1088–1103 are reported by the board that is originating the connection. Error Types 1104–1119 are reported by the board that is terminating the connection. In most cases, when the terminating board reports one of these errors, the originating board also reports an ATM-NTWK error for the same event (usually with Error Type 21).
1089 or 1105	ATM-EI circuit pack received a request with a reference to an unknown VC token.	
1090 or 1106	ATM-EI circuit pack did not have enough resources (memory) for the requested operation.	
1091 or 1107	Internal failure in the local protocol stack. This can occur when the connection to the ATM switch failed, perhaps because the: • ATM switch rebooted • fiber between the ATM switch and the ATM-EI circuit pack disconnected	
1092 or 1108	ATM-EI circuit pack received a request for which the referenced VC was in the wrong call state.	
1093 or 1109	ATM-EI circuit pack received a request for which the VPI/VCI pair was invalid or out of range.	
1094 or 1110	ATM-EI circuit pack received a request to add a party to an existing VC. The add party request failed, and a retry was not possible.	
1095 or 1111	ATM-EI circuit pack in link recovery after the lower ATM layer (Q.SAAL portion of the protocol stack) failed. This can occur when the connection to the ATM switch failed, perhaps because the: • ATM switch rebooted • fiber between the ATM switch and the ATM-EI circuit pack disconnected	
1096 or 1112	ATM-EI circuit pack received an error from the local protocol stack for which no more detailed cause was specified.	
1102	ATM-EI circuit pack asked to create more connections that it was capable of creating.	
1103	ATM-EI circuit pack detected an illegal message from software. Check the Error Log for CONN-M proc errors for more information.	
1113		Problems detected by the board terminating the connection

2 of 2

1 Test the ATM-EI circuit pack (**test board *location***) and investigate further based on each test's results. If every test passes, the error was a transient problem.

Aux Data values: For Setup and Add Party connection request failure type, the port-network and the angel number of the destination ATM-EI circuit pack are logged Aux Data values in the form XXYYY, where

- port-network number = XX
- angel number = YYY

Aux Data values for WSP Setup (XX = WSP number, YYY = location code).

Since you need to know the slot number also, Table 156, Error Type 1024-1151 Aux Data values (XXYYY) converted to slot number, on page 377 converts the Aux Data to slot numbers.

Table 156: Error Type 1024-1151 Aux Data values (XXYYY) converted to slot number

2 of 2

j **Error type 1153** — The ATM connection audit found some discrepancy in the firmware's VC token numbers and live VCs. The problem is rectified in firmware and no action is needed.

k **Error Type 1281** — The loss of high-level signal indicating operational problems of equipment located outside of the circuit pack and the fiber connected to the board. Aux Data values are listed in Table 157, Error type 1281 Aux Data and repair procedures, on page 378.

Table 157: Error type 1281 Aux Data and repair procedures

Aux Data	Alarm Description	Repair procedure
15	SYSCLOCK failed	The board is not locked to the TDM backplane clock signal. This is probably due to a Tone-Clock problem. Check for TDM-BUS or TONE-BD errors in the Error Log. If no other problems are present, reset the circuit pack (**reset board *location***)
16	Loss of Signal: LOS	The fiber is not connected properly to the ATM-EI board or ATM switch (or to the multiplexer section [MUX] if present).It is possible that the board transceivers are not functioning properly. Run **test board *location*** command. If Test #1259 fails, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. If it does the problem is off-board. If the amber LED continues to flash, replace the circuit pack.
17	Loss of Frame: LOF	The fiber signal cannot obtain or maintain STM-1/OC-3 framing. Try to move the fiber on the ATM switch side to a different port. This could require administration on the ATM switch. If the problem persists, reset the circuit pack (**reset board *location***).

1 of 3

Table 157: Error type 1281 Aux Data and repair procedures

Aux Data	Alarm Description	Repair procedure
18	Multiplexer Section Alarm Indication Signal: MS_AIS	There is a major problem on the far end (between multiplexer section [MUX] and the switch) that prohibits the circuit pack from sending a valid signal. See if the ports at the MUX and/or the ATM switch are connected snugly. Run **test board *location*** command If Test #1259 fails with Error Code 18, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. If it does, the problem is off-board. If the amber LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.
19	Multiplexer Section Remote Defect Indicator: MS_RDI	The far end is detecting a major problem with the signal that this board is transmitting. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-EI board) is the same as the ATM-EI circuit pack's cable interface. Run **test board *location*** command. If Test #1259 fails with Error Code 19, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. If it does the problem is off-board. If the amber LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.
20	Loss of pointer: LOP	ATM framer chip is unable to access the payload part of the signal. Reset the board (**reset board *location***). If the error persists replace the board.
21	Path Signal Error (PSL) (STM1/SONET)	The incoming signal payload is not set up for transmission of ATM data. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-EI board) is the same as the ATM-EI circuit pack's cable interface.

2 of 3

Table 157: Error type 1281 Aux Data and repair procedures

Aux Data	Alarm Description	Repair procedure
22	High-level Path Alarm Indication Signal: HP_AIS	The payload is invalid. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-EI board) is the same as the ATM-EI circuit pack's cable interface. Run **test board *location***. If Test #1259 fails with Error Code 22, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. If it does the problem is off-board. If the amber LED continues to flash, replace the circuit pack.
23	High-level path Remote defect Indicator: HP_RDI	The far end is detecting a major problem with the signal that this board is transmitting. The transmitted payload is invalid. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-EI board) is the same as the ATM-EI circuit pack's cable interface. Run **test board *location*** command; if the Test #1259 fails with Error Code 23, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. If it does the problem is off-board. If the amber LED continues to flash, replace the circuit pack.
24	Loss of cell delineation (LCD)	On board ATM framer chip is not able to frame cells based on the cell header. Reset the board (**reset board *location***). If the error persists, replace the board.
27	SIGCON_DOWN ATM switch high level signal.	The board cannot communicate with the ATM switch. Busyout the board (**busyout board *location***). Test the board (**test board long *location***). If Test #1260 fails, replace the board. If Test #1260 passes, make sure the ATM address on both the S8700 Multi-Connect and the ATM switch sides are the same for this board. If the address is the same, change the port on the ATM switch side. This could require administration on the ATM switch. If the error is resolved, the problem is on the ATM switch port.

3 of 3

- **Error Type 1537** — LAN bus time out. The circuit pack is transmitting a packet larger than 1,024 bytes. Replace the circuit pack.

m **Error Type 1538** — A hyperactive ATM-EI circuit pack is generating an abnormal amount of control messages to the processor. When this error is generated, the system automatically resets the ATM-EI.

Duplicated PNC?	Then:
Y	service to the PN is disrupted
N	the system switches to the standby PNC

1. Enter the **reset board *location*** command for this ATM-EI circuit pack.
2. If the same error persists, replace the ATM-EI circuit pack.

n **Error Type 1793** — LANHO transmit FIFO overflow error (the transmit FIFO RAM buffers on the circuit pack overflowed). This most likely indicates a hardware problem on the circuit pack, because the speed of the LAN/packet bus is much higher than the speed of the link connected to the port.

1. Test this ATM-EI circuit pack (**test board *location***).
2. If Test #598 fails again, replace the ATM-EI circuit pack.

o **Error Types 2049 and 2050** — The ATM-EI is out of lock with the backplane system clock.

1. Test this ATM-EI circuit pack (**test board *location***).
2. If Test #304 fails, follow the repair procedures suggested for this test.

p **Error Type 2305** — Too many parity errors on data received from the LAN/packet bus (could be due to packet-bus problems).

1. Test the ATM-EI circuit pack (**test board *location***).
2. If Test #598 fails, follow the repair procedures suggested for this test.
3. If the test passes, look for and resolve any PKT-BUS (packet bus) alarms/errors.
4. If there are no PKT-BUS errors and the problem persists, escalate the problem.

Error Type 2309 — The packet-interface chip (LANHO) is malfunctioning.

1. Test the ATM-EI circuit pack (**test board *location***).
2. If Test #598 fails, follow the repair procedures suggested for this test.

q **Error Type 2561** — ATM-EI 2-way transmission failure (circuit pack is having problems creating connections to other PNs in the system).

1. Test the ATM-EI circuit pack (**test board *location***).
2. Follow the repair procedures suggested for Test #241.

r **Error Types 2817 and 2818** — A DSP test failure detected along the circuit path of the ATM-EI circuit pack.

Error Type	Description	Aux Data indicates
2817	DSP test failure	The Aux Data field contains the following information about the failed DSPs: X is the number of talker DSPs Y is the number of listener DSPs Z is the number of echo-cancelling DSPs
2818	One or more DSPs failed	DSP number that has failed

1. Test the ATM-EI circuit pack (**test board *location***).
2. Follow the repair procedures suggested for Test #1258.

s **Error Type 3329** — The on-board LANHO chip is insane, possibly due to a problem in packet-bus arbitration, the transmission line frame, or the circuit pack itself. The circuit pack cannot talk to the packet bus.

If the packet bus is alarmed:

1. Resolve any PKT-BUS errors. The probability of this error being related to a packet-bus problem increases with the number of other circuit packs using the bus that are also showing this error.

If the packet bus is *not* alarmed:

1. Reset the circuit pack (**reset board *location***).
2. If the problem persists, replace the ATM-EI circuit pack.

If the system has a duplicated PNC, and the in-line error received is from an active ATM-EI, the system switches to the standby PNC.

CAUTION:
If the system does not have duplicated PNC, services to the PN could be disrupted.

t **Error Types 3585 and 3586** — (Major board alarm) A failure of critical components involved in the operation of the circuit pack, and the switch can no longer recognize the circuit pack. If the system has a duplicated PNC and the in-line error received is from an active ATM-EI, the system switches to standby PNC.

CAUTION:
If the system does not have duplicated PNC, services to the PN could be disrupted.

Error Type 3585

Aux Data (Error Type 3585 only):

Aux Data	Description
1	ATM framer failure
2	NCE failed (only from ATM-EIs in PN)
4	TDM_PLD_FAILED
5	DSP_ALL FAILED
6	Receive Network Processor (RNP) failure
7	Transmit Network Processor (TNP) failure
8	MEMORY read/write failure

1 If the system has duplicated PNC:

a Test the ATM-EI (**test board *location* l**).

b If Error 3585 is detected again, or if the board is not recognized anymore, replace the ATM-EI circuit pack.

2 If the system does *not* have duplicated PNC and the circuit pack is in a PN:

a Replace the ATM-EI circuit pack.

Error Type 3586 — Framer Looparound test (#1260) failed.

Aux Data (Error Code 3586 only):

Aux Data	Description
2	Packet path failed
3	Circuit path failed
4	TDM loop cannot be created
5	Packet loop cannot be created

1 If Error Type 3586 is detected again, replace the circuit pack.

u **Error Type 3841** — The board received a message from the switch that it does not recognize, and the board responded with an inconsistent down link error message. This error does not affect service, and no action is required.

v **Error type 3842** — The circuit pack received data from the packet bus faster than it could distribute the data to its endpoint. This circuit pack should be able to recover by itself, and no action is necessary.

w **Error type 3843** — The firmware on the circuit pack is reporting a resource that is low. This error does not affect service and no action is required.

x **Error Type 3999** — The circuit pack sent a large number of control channel messages to the switch within a short period of time.

If	Then
Error Type 1538 is also present	Circuit pack is taken out of service
Error Type 1538 is absent	Circuit pack is *not* taken out of service, but has generated 50% of the messages necessary to be considered hyperactive. This can be normal during heavy traffic. If the error is logged during light traffic, it can indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in Table 158, System Technician-Demanded Tests: ATM-EI, on page 384 when inspecting the errors in the system. For example, by clearing error codes associated with the *Expansion Interface 2-Way Transmission* test (#241), you can also clear errors generated from other tests in the testing sequence.

Table 158: System Technician-Demanded Tests: ATM-EI

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Expansion Interface 2-Way Transmission test (#241)	X	X		ND
ATM Board Framer Looparound test (#1260)		X		D
Expansion Interface Lock Query test (#304)	X	X		ND
ATM Board Error Query test (#1259)	X	X		ND
ATM Expansion Interface Reset (#1256)			X	D
ATM board DSP test(#1293) for TN2305 and TN2306 circuit packs.	X	X		ND
ATM Cross Talk test(#1298) for TN2305 and TN2306 circuit packs		X		ND

1 D = Destructive, ND = Nondestructive

NOTE:
To get a better indication of a problem's location, test both ATM-EI circuit packs on the associated fiber link, whether the circuit packs are both ATM-EI circuit packs or not.

Expansion Interface 2-Way Transmission Test (#241)

This test is nondestructive and applies to every ATM-EI, both active and standby. It is run as part of craft short and long testing, periodic, scheduled, initialization, and error analysis testing**.** The test sets up a connection between a Tone-Clock in one cabinet and a Tone Detector in a separate cabinet and transmits a digital test count between the PNs. The ATM-EIs used to set up this connection are chosen by maintenance, not call processing. After the connection is checked for dial-tone, the connection is torn down and re-established in the opposite direction.

For this test, the second ATM-EI can reside in any PN outside the tested ATM-EI's PN. Therefore, if the test should fail in either direction, the test is repeated with a different PN, if available. This aids the fault isolation procedure.

The test results indicate if the test failed in one or both directions. The test aborts if the ATM-EIs do not exist on both ends (for example, the EIs are not administered correctly). If the test passes, the TDM and ATM framer interfaces of both ATM-EIs are functioning properly. If the test fails, a series of tests are run on the board. Figure 24, Expansion Interface 2-Way Transmit Test #241 PN X and PN Y represent any of 44 possible PNs., on page 385 shows a schematic of this test.

Figure 24: Expansion Interface 2-Way Transmit Test #241 PN X and PN Y represent any of 44 possible PNs.

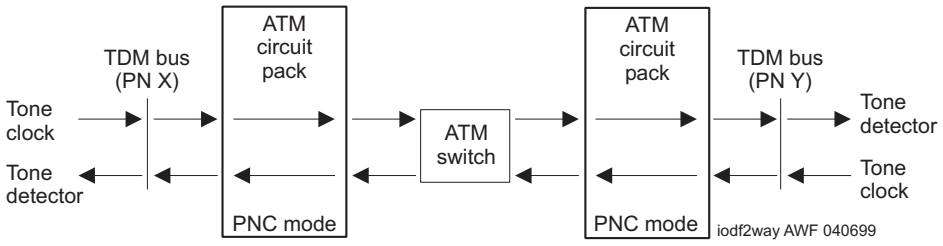

Table 159: Expansion Interface 2-Way Transmission Test (#241)

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system could be under heavy traffic conditions or it can have time slots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.

1 of 6

Table 159: Expansion Interface 2-Way Transmission Test (#241)

Error Code	Test Result	Description / Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Verify that at least one Tone Detector resides in this PN. (Even without a TTR-LEV error, the tested circuit pack's PN could be missing a Tone Detector.) If missing, the test always aborts for this circuit pack, without harming the system. **NOTE:** A TN2182 Tone-Clock circuit pack in a PN must be of vintage B or newer. If an earlier vintage resides in a PN, this test always aborts with this abort code. **3** Resolve any TONE-PT errors. **4** If neither condition exists, retry the command at 1-minute intervals up to 3 times.
1033	ABORT	The test cannot run because either the ATM-EI board is not administered, or there were no other PNs administered that had its ATM-EI board in-service. **1** Ensure that the board is administered as ATM PNC Expansion Interface circuit pack. **2** If the board is administered as ATM-EI circuit pack, then there has been some change in the ability of the ATM-EI circuit pack in the other PNs to communicate with the ATM-EI on the other end of its connection. **3** Using **status port *x*** (the port-network number where the board is administered), see if both ACL and EAL are up to this board. If not, see the service procedure for SYS-LINK. **4** Check the Error Log for Error Type 1281 with Aux Data 27 (board cannot talk to the ATM switch). See Figure 157, Error type 1281 Aux Data and repair procedures, on page 378 for repair procedures. **5** If present, check both the ATM switch and the Communication Manager translations for consistent ATM addresses. Reset the board, and see if the problem resolves. **6** Repeat Test #241. If it continues to abort with this abort code, replace the board.

2 of 6

Table 159: Expansion Interface 2-Way Transmission Test (#241)

Error Code	Test Result	Description / Recommendation
1394	ABORT	**1** See Table 10, Error type 1281 Aux Data and repair procedures, on page 204 (Error Type 1281) with Aux Data 27 (board cannot talk to the ATM switch), and if present, check both the ATM switch and the Communication Manager translations for consistent ATM addresses. **2** Reset the board and see if the problem resolves. **3** Repeat the test.
1395	ABORT	This test cannot run on an ATM-EI circuit pack if it is part of the B-side PNC and Duplicated PNC is not enabled. **1** If this test needs to run on this ATM-EI circuit pack, enable PNC with the **change system-parameters duplication** command. **2** Prevent the system from doing a PNC interchange by executing the **set PNC lock** command. **3** Repeat this test.
1413	ABORT	This test requires the use of a Tone-Clock circuit in each of the PNs used in this test. This abort code indicates that a Tone-Clock circuit is absent from one of the PNs. **1** Verify that an IPSI or Tone-Clock circuit pack resides in the same PN as the ATM PNC Expansion Interface circuit pack under test. **2** In ATM PNC configurations, make sure that there is at least one other PN besides the PN where the ATM-EI circuit pack under test resides that contains a Tone-Clock circuit.
1414	ABORT	The active Tone-Clock circuit in one of the PNs being used for the test has a MAJOR or MINOR alarm logged against it. **1** Enter **display alarms** and resolve any TONE-BD and TONE-PT alarms.
1956	ABORT	ACL to the board is not up. See ACL status with the **list sys-link** command and follow the repair procedures for SYS-LINK.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	FAIL	The test tone was not detected correctly in either direction. **1** Test the active Tone-Clocks in the PNs for which the ATM-EI circuit pack under test provides a link. This determines if the dial tone is supplied.

3 of 6

Table 159: Expansion Interface 2-Way Transmission Test (#241)

Error Code	Test Result	Description / Recommendation
10MM	FAIL	The failure codes only apply to a system equipped with an ATM Switch. The letters "MM" refer to the distant or far-end PN, and "NN" to the near-end ATM-EI under test. The test tone was detected correctly in forward direction (data sent from the PN where the circuit pack under test resides and detected correctly in port network MM), but not the opposite direction. **1** Test the active Tone-Clocks on the "***MM***" PN and the PN where the ATM-EI under test resides (**test tone-clock *location***). This determines if a dial tone is supplied. **2** Ensure that the ATM address of the ATM-EI circuit pack under test matches the ATM address on the ATM switch for the port to which this circuit pack is connected. Refer to *ATM Installation, Upgrades, and Administration using Avaya™ Communication Manager, 555-233-124,* for the procedure to check the ATM port address on the ATM switch. **3** Run Test #241 on the active ATM-EI in port network ***MM***. If this test fails with Error Code 10NN or 30NN, go back to step 2. **4** If the address was the same, replace the active ATM-EI circuit pack on port network ***MM***. **5** If this test fails with Error Code 20NN or 40NN, replace ATM-EI circuit pack that had the initial problem.
20MM	FAIL	The failure codes only apply to a system equipped with an ATM Switch. The letters "***MM***" refer to the distant or far-end PN, and "***NN***" to the near-end ATM-EI under test. **1** The test tone was detected correctly in reverse direction (data sent from port network ***MM*** was detected correctly in the PN where the circuit pack under test resides, but not the opposite direction). **2** Test the active Tone-Clock on the "***MM***" PN and the PN where the ATM-EI under test resides (**test tone-clock *location***). This determines if dial tone is supplied. **3** Ensure that the ATM address of the active ATM-EI circuit pack under test matches the ATM address on the ATM switch for the port to which this circuit pack is connected. Refer to *ATM Installation, Upgrades, and Administration using Avaya™ Communication Manager, 555-233-124,* for the procedure to check the ATM port address on the ATM switch. **4** Run Test #241 on the active ATM-EI in port network ***MM***. If this test fails with Error Code 20NN or 40NN, go back to step 2. If the address was the same, replace the active ATM-EI circuit pack on port network ***MM***. If this test fails with Error Code 10NN or 30NN, replace ATM-EI circuit pack with the initial problem.

4 of 6

Table 159: Expansion Interface 2-Way Transmission Test (#241)

Error Code	Test Result	Description / Recommendation
30MM	FAIL	The failure codes only apply to a system equipped with an ATM Switch. The letters "***MM***" refer to the distant or far-end PN, and "***NN***" to the near-end ATM-EI under test. The test failed for the first connection from the ATM-EI board under test to another PN, and the test tone was detected correctly in the forward direction (data sent from the PN where the circuit pack under test resides was detected correctly in port network MM, but not the opposite direction). **1** Test the active Tone-Clock on the "MM" PN and the PN where the ATM-EI under test resides (**test tone-clock *location***). This determines if dial tone is supplied. **2** Ensure that the ATM address of the ATM-EI circuit pack under test matches the ATM address on the ATM switch for the port to which this circuit pack is connected. Refer to for the procedure to check the ATM port address on the ATM switch. **3** Run Test #241 on the active ATM-EI in port network MM. If this test fails with Error Code 10NN or 30NN, go back to step 2. If the address was the same, replace the active ATM-EI circuit pack on port network MM. If this test fails with Error Code 20NN or 40NN, replace ATM-EI circuit pack with the initial problem.
40MM	FAIL	Failure code only applies to a system equipped with an ATM Switch. The letters "***MM***" refer to the distant or far-end PN, and "***NN***" to the near-end ATM-EI under test. The test failed for the first connection from the ATM-EI board under test to another PN, and the test tone was detected correctly in the reverse direction (data sent from port network ***MM*** was detected correctly in the PN where the circuit pack under test resides), but not the opposite direction. **1** Test for the Active Tone-Clocks on port network ***MM*** and the PN where the ATM-EI under test resides. This determines if dial tone is supplied. **2** Ensure that the ATM address of the active ATM-EI circuit pack in port network ***MM*** matches the ATM address on the ATM switch for the port to which this circuit pack is connected. Refer to *ATM Installation, Upgrades, and Administration using Avaya™ Communication Manager, 555-233-124,* for the procedure to check the ATM port address on the ATM switch. **3** Run Test #241 on the active ATM-EI in port network ***MM***. If this test fails with Error Code 20NN or 40NN, go back to step 2. If the address was the same, replace the active ATM-EI circuit pack on port network ***MM***. If this test fails with Error Code 10NN or 30NN, replace ATM-EI circuit pack with the initial problem.

5 of 6

Table 159: Expansion Interface 2-Way Transmission Test (#241)

Error Code	Test Result	Description / Recommendation
	PASS	Tone successfully transmitted in both directions. Both ATM-EI boards and their lightwave transceivers are functioning properly.
0	NO BOARD	No board was detected by the test. **1** Resolve either wrong board (Error 125) or no board (Error 131) issues. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the **reset board *location*** command. **3** Run the test again. If it fails, the ID chip on board could be bad. Replace the board and retest.

6 of 6

Expansion Interface Lock Query Test (#304)

This test is nondestructive and is used to query the ATM and EI circuit packs (both active and standby) for its status concerning lock to the backplane system clock. It is run as part of periodic, scheduled, initialization, and error analysis testing. When an in-line, “out-of-lock” report comes in, this test is run to check the circuit pack’s status. The ATM-EI responds with “in lock” or “out of lock.” If the response is “in lock,” the test passes; if the response is “out of lock,” the test fails.

Table 160: Test #304 Expansion Interface Lock Query Test (#304)

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

1 of 2

Table 160: Test #304 Expansion Interface Lock Query Test (#304)

Error Code	Test Result	Description / Recommendation
	FAIL	A PN's **unduplicated** ATM-EI circuit pack responded incorrectly, or a PN's **active** ATM-EI circuit pack could not communicate with the PN's circuit packs. **1** If the PN's active ATM-EI circuit pack is failing and duplicated PNC is enabled: **g** Enter **reset PNC interchange** to switch to the standby PNC. **h** Repeat the short test sequence. **i** If test continues to fail, enter **reset board *location*** to reset the ATM-EI circuit pack. **2** If the PN's unduplicated ATM-EI circuit pack is failing: **j** Enter **display errors** and **display alarms**, and follow the associated repair procedures for TDM-CLK, TONE-BD, or SYNC alarms/errors. **k** Repeat the short test sequence. **l** If test continues to fail, replace the circuit pack or transceiver.
	PASS	Communication from software to the ATM-EI circuit pack is functioning correctly.
0	NO BOARD	No board was detected by the test. **1** Check the error log for wrong board (error 125) or no board (error 131). Resolve either of these issues. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (error 1538). If hyperactive, use **reset board *location***. **3** Run the test again. If it fails, the NCE chip on board could be bad. Replace the board and retest.

2 of 2

Expansion Interface Control Channel Test (#316)

This test is **non**destructive. If an ATM-EI circuit pack is an *active* ATM-EI in the PN (amber LED on long/off short), the Expansion Interface Control Channel test checks to see if the ATM-EI circuit pack can communicate with other circuit packs in the PN using the PN's TDM bus.

If the circuit pack is a *standby* ATM-EI (amber LED off), this test queries the ATM PNC Expansion Interface circuit pack for information about its type and vintage.

Table 161: Expansion Interface Control Channel Test #316

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	FAIL	A PN's **unduplicated** ATM-EI circuit pack responded incorrectly, or a PN's **active** ATM-EI circuit pack could not communicate with the PN's circuit packs. **1** If the PN's active ATM-EI circuit pack is failing and duplicated PNC is enabled: **m** Enter **reset PNC interchange** to switch to the standby PNC. **n** Repeat the short test sequence. **o** If test continues to fail, enter **reset board *location*** to reset the ATM-EI circuit pack. **2** If the PN's unduplicated ATM-EI circuit pack is failing: **p** Enter **display errors** and **display alarms**, and follow the associated repair procedures for TDM-CLK, TONE-BD, or SYNC alarms/errors. **q** Repeat the short test sequence. **r** If test continues to fail, replace the circuit pack or transceiver.
	PASS	The ATM-EI circuit pack did respond correctly to test. Communication from software to the ATM-EI circuit pack is functioning. **1** Refer to other ATM-EI circuit pack tests if the link is not functioning correctly.
0	NO BOARD	No board was detected by the test. **1** Resolve any wrong board (Error 125) or no board (Error 131) issues. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use **reset board *location***. **3** Run the test again. If it fails, the NCE chip on board could be bad. Replace the board and retest.

Packet Interface Test (#598)

This test is nondestructive and attempts to send a data packet from the TN1655 Packet Interface circuit pack through any ATM PNC Expansion Interface circuit packs. The path the data packet takes depends on the location of the ATM PNC Expansion Interface circuit pack being tested and whether the system has duplicated port-network connectivity.

The Packet Interface Looparound test checks the packet-bus interface circuitry on this board. The on-board LANHO chip sends a data stream to the bus, retrieves it back, and checks for its consistency. If the data is consistent, the test passes; otherwise, it fails. The test aborts if the specified PN's packet bus has an active minor alarm or is out of service. This test runs as a part of initialization, periodic or scheduled error analysis, and demand-test sequences. Figure 25, Packet Interface Test (#598), on page 393 shows a schematic of the test.

Figure 25: Packet Interface Test (#598)

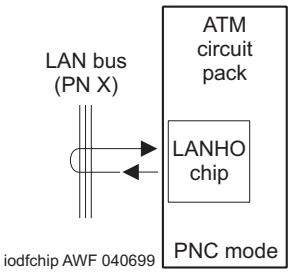

Table 162: Packet Interface Test (#598)

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 3 retries. **2** If the test fails repeatedly, attempt to reset the circuit pack. **3** If the test continues to fail, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
ANY	FAIL	The transmitted data packet was not received correctly by the Packet Interface circuit pack. The failure can be in the ATM-EI under test, the DS1C-BD circuit packs, or the intervening Center Stage components. **1** Retry the command at 1-minute intervals up to five times. **2** If the test continues to fail, replace the circuit pack.
	PASS	The Packet Interface test passed.

ATM Board Error Query Test (#1259)

This test is nondestructive. The ATM circuit pack firmware maintains counters for some of the on- and off-board errors. The maintenance software queries the board for its health information to do error analysis. These alarms have assigned priority: if a higher priority alarm occurs, the remaining alarms are not reported to the software (through the inline errors), avoiding unnecessary up-link, in-line error message traffic. This is run as a part of a craft demand test sequence periodic testing, initialization, and error analysis.

Table 163: ATM Board Error Query Test (#1259)

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
XXYY	FAIL	On-board hardware or off-board signaling errors on the board. XX indicates the on-board hardware error, and YY indicates the off-board errors on the as shown in Table 164, XXYY Error Codes for Test #1259 (ATM Board Error Query Test), on page 394. **1** Resolve any errors in error logs.
	PASS	No service effecting errors or alarms were detected on the circuit pack.
0	NO BOARD	No board was detected by the test. **1** Check the Error Log for wrong board (Error Type 125) or no board (Error Type 131). Resolve either of these issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error Type 1538). If hyperactive, use **reset board *location***. **3** Run the test again. If it fails, the NCE chip on board could be bad. Replace the board and retest.

Table 164: XXYY Error Codes for Test #1259 (ATM Board Error Query Test)

XX Aux Data	Description
1	ATM framer chip failed
2	NCE chip failed
3	LANHO critical error
4	TDM Prog. logic device failed
5	Every on-board DSP failed
6	Receive network processor failed
7	Transmit network processor failed
8	Memory read failed
9	Dual UART chip failed
10	LANHO receive parity error
11	LANHO FIFO overflow error
12	LAN Bus timeout

1 of 2

Table 164: XXYY Error Codes for Test #1259 (ATM Board Error Query Test)

XX Aux Data	Description
13	LANHO Xmit FIFO overflow
14	One or more on-board DSPs failed
YY Aux Data	Description
15	Backplane clock failed
16	Loss of signal
17	Loss of frame
18	Multiplexer Section Alarm indication signal error
19	Multiplexer Section remote defect indicator error
20	Loss of pointer
21	Path signal level mismatch
22	High level path alarm indication signal
23	High level path remote defect indicator
24	Loss of cell delineation
25	Uncorrectable headers sent by the ATM switch
26	Too many cells with invalid Virtual Path Indicator (VPI)/Virtual Circuit Indicator (VCI) combination
27	The signaling link between the board and the ATM switch is down.
28	Board to the ATM switch connection is down
34	Excessive AAL-5 (ATM signaling protocol) retransmission requests
35	Excessive LAPD retransmission requests
37	ATM CLP (cell loss priority) bit – see MO ATM-NTWK (ATM Network Error) on page 410
38	ATM congestion indicator – see MO ATM-NTWK (ATM Network Error) on page 410)
39	ATM cell underrun – see MO ATM-NTWK (ATM Network Error) on page 410
40	ATM cell overrun – see MO ATM-NTWK (ATM Network Error) on page 410
41	Lost ATM cells – see MO ATM-NTWK (ATM Network Error) on page 410

2 of 2

ATM Board Framer Loop-Around Test (#1260)

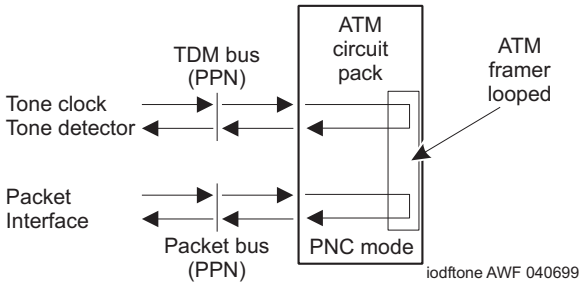
This test is **destructive**.

> **NOTE:**
> This test can be run on the standby PNC only if the board is busied out.

This test places the ATM circuit pack in ATM framer loop-around mode. Once the board receives this message, it creates a dummy virtual circuit that originates and ends on the same board, without leaving the board. This test verifies both the TDM path and the Packet Path. If the TDM test path passes, then the packet path is tested. Definitions of each test path are:

- ***The circuit (TDM) path***: one of the Tone Generators sends a bit pattern through a TDM bus time slot to the ATM framer. The pattern is converted into ATM cells and looped back to the ATM-EI board, which converts the cell back into the bit pattern and puts it on a pre-determined time slot. A Tone Detector tests for the bit pattern and reports the test result. This test verifies that a large portion of the ATM-EIs circuit paths are functioning correctly. Figure 26, ATM Board Framer Loop-Around Test (#1260), on page 396 shows a diagram of the test.

Figure 26: ATM Board Framer Loop-Around Test (#1260)



- ***Packet path***: the Packet Interface circuit pack sends packet data to the ATM framer interface, where it is mapped into ATM cells and then looped around internally. The cells are converted back to packet data after it has been looped. This portion of the test verifies correct operation of the ATM-EI's packet-bus interface and a large portion of the ATM-EI's packet paths. Figure 27, ATM Board Framer Loop-Around Test (#1260) (non-EAA, Packet Path), on page 397 shows the packet switched signal path for the ATM circuit pack.
- This test verifies the operation of a large portion of the ATM-EI circuit and packet paths, but does not verify the optical portion of the lightwave transceiver. If this test passes, the ATM-EI circuit pack is functioning correctly, but faults can exist in the lightwave transceiver. If the test fails, the fault can be on the board. After the test results are reported, the ATM framer is taken out of loopback.

> **NOTE:**
> This test can be run on active or standby ATM-EIs, but it is *not* allowed if an ATM-EI is the Expansion Archangel.

Figure 27: ATM Board Framer Loop-Around Test (#1260) (non-EAA, Packet Path)

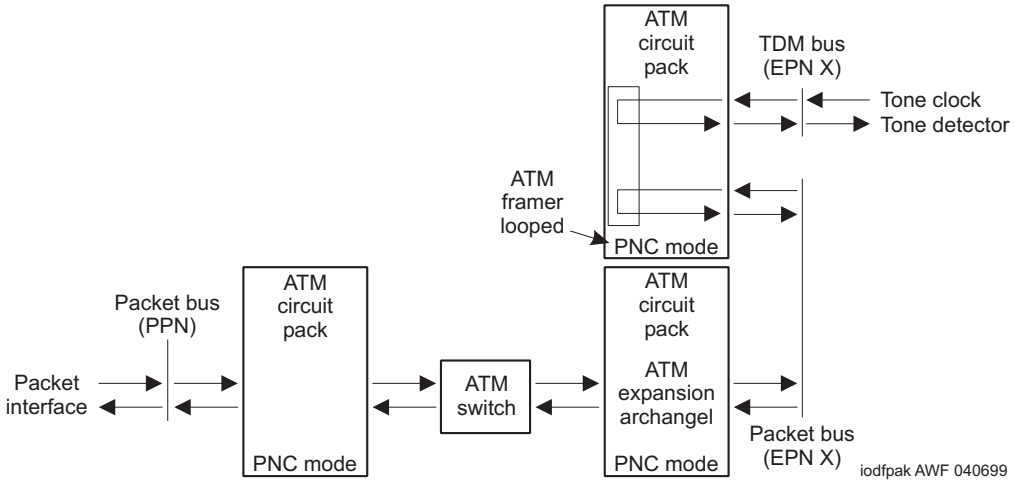


Table 165: ATM Board Framer Loop-Around Test (#1260)

Error Code	Test Result	Description / Recommendation
1002	ABORT	The system could not allocate timeslots for the test. The system could be under heavy traffic conditions or it could have timeslots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **2** Verify that at least one Tone Detector resides in this PN. (Even without a TTR-LEV error, the tested circuit pack's PN could be missing a Tone Detector.) If missing, the test always aborts for this circuit pack, without harming the system. **NOTE:** A TN2182 Tone-Clock circuit pack must be of vintage B or newer. If an earlier vintage circuit pack resides in a PN, this test always aborts with this abort code. **3** Resolve any TONE-PT errors. **4** If neither condition exists, retry the command at 1-minute intervals up to 3 times.
1015	ABORT	The ATM-EI circuit pack has not been busied out. **1** Busyout the ATM-Expansion Interface circuit pack, then repeat **test board *location* long** .

1 of 4

Table 165: ATM Board Framer Loop-Around Test (#1260)

Error Code	Test Result	Description / Recommendation
1031	ABORT	If the ATM Expansion Interface circuit pack is in a PN and is on the active PNC, this test cannot be executed. **1** If PNC Duplication is enabled, attempt to make the standby PNC active using **reset pnc interchange**. **2** If the PNC Interchange is successful, rerun the test.
1033	ABORT	The ATM-EI circuit pack is absent. **1** Use **list atm pnc** to verify that switch recognizes the circuit pack. **2** Retry the command.
1139	ABORT	The packet bus in the PN where this ATM-EI board resides has a major alarm against it. This test needs to use the alarmed PN's packet bus. **1** Resolve any PKT-BUS problems. **2** Retry the command.
1141	ABORT	The Packet Interface circuit pack is out of service. **1** Resolve any PKT-INTF problems.
1394	ABORT	The ATM-EI board is out of service and the test cannot be run. This condition is due to a change in the ATM-EI board's ability to communicate with the ATM switch. **1** Run Test #241. If it does not pass, see repair procedures for Expansion Interface 2-Way Transmission Test (#241).
1395	ABORT	This test cannot be run on an ATM-EI circuit pack if it is part of the B-side PNC and duplicated PNC is not enabled. **1** If this test needs to run on this ATM-EI circuit pack, enable PNC duplication with the **change system-parameters duplication** command. **2** Prevent the system from doing a PNC interchange by executing the **set PNC lock** command. **3** Repeat this test.
1407	ABORT	This test cannot be run on an ATM-EI board that is on the active PNC because it cannot be busied out. This error code indicates that PNC duplication is enabled. **1** Attempt to perform a PNC interchange with the **reset pnc interchange** command. **2** If the PNC interchange is successful, busyout the original ATM-Expansion Interface circuit pack with the **busyout board *location*** (address of the original ATM-EI board) command. **3** Retry the command.
2000	ABORT	Response to the test was not received in the allowable time period. **1** Retry the command at 1-minute intervals up to 3 times.

2 of 4

Table 165: ATM Board Framer Loop-Around Test (#1260)

Error Code	Test Result	Description / Recommendation
2060	ABORT	The link on the packet bus being used to perform the test has failed. **1** Retry the command at 1-minute intervals up to 3 times. **2** If the test continues to abort, resolve any PKT-INTF errors.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 3 times.
1	FAIL	The test did not detect the test tone through the loop-around connection. **NOTE:** The packet portion of this test was not run since the circuit portion failed. **1** Test the active Tone-Clock (**test tone-clock *location***) in the PN that contains the defective ATM-EI circuit pack to verify that dial tone is being supplied. **2** If the Tone-Clock is healthy, test the ATM-EI circuit pack (**test board *location* long**). **3** If this test continues to fail, replace the ATM-EI circuit pack or transceiver. **4** Test the new ATM-EI circuit pack (**test board *location* long**).
2	FAIL	The test tone was transmitted and detected correctly, but the correct data packet was not detected by the Packet Interface circuit pack. **1** Test the Packet Interface circuit pack to verify that it is functioning properly. If any tests fail, investigate those tests and repair the Packet Interface circuit pack. **2** If the Packet Interface circuit pack is OK, resolve any DS1C-BD alarms or errors (if so equipped). **3** Test the ATM-EI circuit pack (**test board *location* long**). **4** If this test continues to fail, replace the ATM-EI board. **5** Test the new ATM-EI circuit pack (**test board *location* long**).
3	FAIL	The test tone was transmitted correctly, but the returned tone was distorted. **1** If the Tone-Clock is healthy, test the ATM-EI circuit pack (**test board *location* long**). **2** If this test continues to fail, replace the ATM-EI circuit pack. **3** Test the new ATM-EI circuit pack (**test board *location* long**).

3 of 4

Table 165: ATM Board Framer Loop-Around Test (#1260)

Error Code	Test Result	Description / Recommendation
4	FAIL	Unable to create loop for TDM path for this test. **1** Retry the command at 1-minute intervals up to 3 times. **2** If this test continues to fail, replace the ATM-EI circuit pack. **3** Test the new ATM-EI circuit pack (**test board *location* long**).
5	FAIL	Unable to create loop for packet path for this test. **1** Retry the command at 1-minute intervals up to 3 times. **2** If this test continues to fail, replace the ATM-EI circuit pack. **3** Test the new ATM-EI circuit pack (**test board *location* long**).
6	FAIL	A previously-established loop around was not released. **1** Issue the **reset board *location*** command. **2** Retry the command at 1-minute intervals up to 3 times. **3** If this test continues to fail, replace the ATM-EI circuit pack. **4** Test the new ATM-EI circuit pack (**test board *location* long*).***
	PASS	The ATM-EI board is functioning properly, however this test does not verify that the optical portion of the lightwave transceiver is functioning.
0	NO BOARD	No board was detected by the test. **1** Resolve either wrong board (Error 125) or no board (Error 131) issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the **reset board *location*** command. **3** Run the test again. If it fails, the NCE chip on board could be bad. Replace the board and retest.

4 of 4

ATM Board Time Of Day Update (#1261)

This test is **non**destructive. The ATM circuit pack requires a reference time to do SDH/SONET performance monitoring. This test updates the system time to the board and synchronizes the board with the S8700 Multi-Connect system's clock during initialization, scheduled maintenance, and craft long test.

Table 166: ATM Board Time Of Day Update (#1261)

Error Code	Test Result	Description / Recommendation
2031	FAIL	The attempt to send the message to the ATM-EI circuit pack was not successful.
2500	FAIL	Did not send the time-of-day information to the board. **1** Retry the command at 1-minute intervals up to 3 times.
	PASS	The ATM-EI circuit pack is successfully updated with system time. **1** If **status port-network** still indicates that this link is down, it is possible that one or both of the ATM-EI circuit packs have been busied out. **2** If the link still does not come up, reset one or both ATM-EI circuit packs on the link.
0	NO BOARD	No board detected. **1** Resolve either wrong board (Error 125) or no board (Error 131) issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use **reset board *location***. **3** Run the test again. If it fails, the circuit pack's NCE chip could be bad. Replace the pack and retest.

ATM Board Reset (#1256)

This test is **destructive**.

If the ATM-EI board is a standby in a PN, the reset is done through the SAKI reset interface. If the ATM-EI is an Expansion Archangel (active ATM-EI board in the PN) and if the EAL is present, a special message is sent to the board over the EAL.

Table 167: ATM Board Reset (#1256)

Error Code	Test Result	Description / Recommendation
1386	ABORT	No Active EAL to the board. This error applies only if the board under test is in a PN. Check the error logs for SYS-LINK (System Links) errors against the PN where the ATM-EI resides, and take appropriate diagnostic action for the SYS-LINK.
1015	ABORT	This test cannot be run because the ATM-EI circuit pack has not been busied out. **4** Busyout the ATM circuit pack, then repeat **test board *location* long**.
1407	ABORT	**1** Perform a PNC Interchange **2** Try to reset the board again.

1 of 2

Table 167: ATM Board Reset (#1256)

Error Code	Test Result	Description / Recommendation
None	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort escalate the problem.
2000	ABORT	Did not receive the SANITY response in the given time. **1** Wait for 5 minutes and see if board is visible to the system by using **list config all**. **2** If the board is visible, run the test again. If same abort code results, escalate the problem. **3** If the board is not visible to the system with **list configuration all**, reseat the board. **4** If the board is still not recognized by the system, replace the board.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2500	ABORT	Internal system error **1** Try to reset the board again.
1	FAIL	The circuit pack failed to reset.
2	FAIL	The circuit pack failed to restart. **1** Execute command again. **2** If the problem persists, replace the circuit pack.
	PASS	The ATM-EI circuit pack is successfully reset. **1** If **status port-network** still indicates that this link is down, it is possible that one or both of the ATM-EI circuit packs are busied out. **2** If the links do not come up after reset, review the error logs and take appropriate diagnostic action.

2 of 2

ATM Cross Talk Test (#1298)

This test is nondestructive. The ATM board Cross Talk test verifies that the selected TDM bus time slot never crosses over to time slots reserved for other connections. The test also checks for cross connections, where the board talks to time slots other than those specified. Since this test uses many system resources (TDM time slots, Tone Generator, Tone Detector, and others), it runs as a part of demand test only.

This test fails if either the TDM programmable logic and/or the interface to the DSP is not operating properly. Failure of these components can result in 1-way or noisy connections. Refer to Figure 28, ATM Cross Talk Test #1298 schematic, on page 403 for a schematic of this test.

NOTE:
Note: This test takes approximately 12 minutes and applies only to TN2305 and TN2306 circuit packs.

Figure 28: ATM Cross Talk Test #1298 schematic

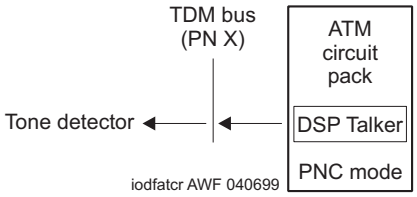

Table 168: ATM Crosstalk Test (#1298)

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system could be under heavy traffic conditions or it could have time slots out-of-service due to TDM-Bus errors. Refer to TDM-BUS to diagnose these errors. **1** If the system has no TDM-Bus errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. **1** Resolve any TTR-LEV errors in the Error Log. **2** Resolve any TONE-PT errors in the Error Log. **3** If neither condition exists, retry the test at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1962	ABORT	Every TALKER DSP is busy (an unlikely event). **1** Retry the command at 1-minute intervals up to 3 times.
2302	ABORT	Inconsistent uplink message from the ATM-EI board. This is a very unlikely event. **1** Retry the command at 1-minute intervals up to 3 times.
2752	ABORT	The circuit pack in this location is not a TN230X.

1 of 2

Table 168: ATM Crosstalk Test (#1298)

Error Code	Test Result	Description / Recommendation
1–8, None	FAIL	The board is writing to unauthorized TDM time slots. The error code indicates the number of faulted TALKER DSPs. **1** Retry the command up to 3 times. **2** If the failure persists, replace the circuit pack.
1–8	PASS	The board is not talking to unauthorized time slots on the TDM Bus. The error code indicates the number of TALKER DSPs that were tested.

2 of 2

ATM Board DSP Test (#1293)

This test is **non**destructive and is designed to test the board's interface to the TDM bus and the functions of all 24 on-board DSPs (Digital Signal Processors). There are three functional types of DSPs:

- talkers – put data on the TDM bus
- listeners – take data off the TDM bus
- echo cancelers – as implied

Listener and echo cancelers are tightly coupled because firmware allocates *sets* of DSPs. Since there are a total of 24 DSPs on the board, there can be up to 8 triplets allocated.

If the test fails for every DSP, a MAJOR alarm is raised against the board. If the test fails for one or more DSPs, a MINOR alarm is raised. If a DSP is busy, the test for that particular DSP is considered passed. The test aborts if the system resources (for example, the TDM time slots, Tone Generator, and others) are not available.

This test applies to TN2305 and TN2306 ATM-EIs, both active and standby, and is run as part of craft short and long testing, periodic, scheduled, initialization, and error analysis testing. Refer to Figure 29, ATM Board DSP Test (#1293), on page 404 for a diagram of this loop-around test.

Figure 29: ATM Board DSP Test (#1293)

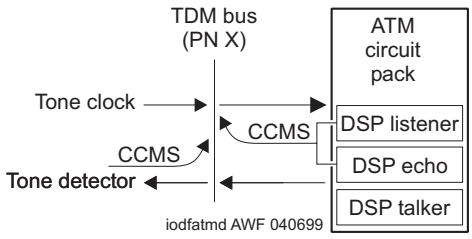

Table 169: ATM Board DSP Test (#1293)

Error Code	Test Result	Description / Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system could be under heavy traffic conditions or it could have time slots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Verify that at least one Tone Detector resides in this PN. (Even without a TTR-LEV error, the tested circuit pack's PN could be missing a Tone Detector.) If missing, the test always aborts for this circuit pack, without harming the system. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 3 times.
1962	ABORT	Every DSPs is busy (an unlikely event). **1** Retry the command at 1-minute intervals up to 3 times.
2000	ABORT	Response to the test was not received within the allowable time period for some of the DSPs. **1** If the board is in standby, reset the board and run the test again. **2** Look into the Error Log for Error Type 1218 (bad DSP). If Error Type 1218 is not logged against this board, run the DSP test again and see if the error persists.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2302	ABORT	Inconsistent uplink message from the ATM-EI board (an unlikely event). **1** Retry the command at 1-minute intervals up to 3 times.
2500	ABORT	Internal system error
2752	ABORT	The circuit pack in this location is not a TN230X.

1 of 2

Table 169: ATM Board DSP Test (#1293)

Error Code	Test Result	Description / Recommendation
XYZ	FAIL	A device on the circuit pack is failing. There is at least one bad DSP on the board. Values are as follows: • The X value indicates the number of talker DSPs • Y indicates the number of listener DSPs • Z indicates the number of Echo Canceler DSPs that have failed the test. **1** Run the tests for the active Tone-Clock in the PN that contains the indicted ATM-EI circuit pack to verify that dial-tone is supplied. **2** If the Tone-Clock is healthy, repeat the short test on the ATM-EI board. **3** If this test continues to fail, replace the ATM-EI circuit pack.
XYZ	PASS	The test passed for some or all DSPs depending on XYZ values. XYZ indicates the number of talker, listener and echo-canceler DSPs for which the test passed, respectively. In the DSPs that passed the test, the test tone was correctly detected by the DSP Listener and by tone-detector for the DSP Talkers on both buses, and the Echo Canceler DSPs are working properly.
0	NO BOARD	No board was detected by the test. **1** Check the Error Log for wrong board (Error Type 125) or no board (Error Type 131). Resolve either of these issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error Type 1538). If hyperactive, use the **reset board *UUCSS*** command. **3** Run the test again. If it fails, the circuit pack could be bad. Replace the circuit pack and retest.

2 of 2

ATM-INTF (TN2305/6)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ATM-INTF	WARNING	**test board *location***[1]	ATM interface board

1 For information on specifying a ***location***, see Command Syntax on page 179

The system recognizes a TN2305/6 as an ATM interface board (ATM-INTF) unless it has an assigned personality (**add atm pnc** or **add atm trunk**). ATM-INTF does not have an associated maintenance strategy, although the:

- list config and change circuit-pack commands reveal the board
- **test board** command runs an on-demand Control Channel test
- **reset board** command resets the board

The following circuit packs are ATM-EI boards if they are administered to provide ATM port-network connectivity (ATM PNC).

Table 170: ATM-EI circuit packs for ATM PNC

Circuit Pack	Fiber	Echo Cancellation	Release
TN2305	Multimode	Yes	7.1
TN2306	Single-mode	Yes	7.1

NOTE:
Always replace an ATM-EI circuit pack with the same type.

Error Log Entries and Test-to-Clear Values

Table 171: ATM-INTF Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test-to-Clear Value
23 (a)	0	None	Warning	Off	
125 (b)		None	Minor	On	
217 (c)	0	None	Warning	Off	

Error Log Entry Notes:

a Error Type 23: The ATM expansion interface circuit pack is administered through a **change circuit-pack** command, but has not been inserted into the system. Insert the circuit pack.

b Error Type 125: A wrong circuit pack is located in the slot where this circuit pack is logically administered. To resolve this problem either remove the wrong circuit pack or insert the logically-administered circuit pack.

c Error Type 217: The ATM circuit pack is physically present but has not been given a personality. Remove the circuit pack or administer it using the **add atm pnc** command or the **add atm trunk** command.

System Technical Demanded Tests: Descriptions and Error Codes

Test failure is not logged in the error log.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Control Channel Loop Around test (#52)	X	X	ND

1 D = Destructive, ND = Nondestructive

Control Channel Loop-Around Test

This test queries the circuit pack for its circuit-pack code and vintage, and verifies its records.

Table 172: Test #52: Control Channel Loop-Around

Error Code	Test Result	Description / Recommendation
2000	ABORT	The response to the test request was not received within the allowable time period.
2100	ABORT	The system resources required to this test are not available.
2500	ABORT	Internal system error — Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 172: Test #52: Control Channel Loop-Around

Error Code	Test Result	Description / Recommendation
	FAIL	The circuit pack failed to return the circuit pack code or vintage. **1** Retry the command up to 5 times. **2** If the problem continues, reset the circuit pack. **3** Retry the command up to 5 times.
	PASS	Communication with this circuit pack is successful.
Any	NO BOARD	This is normal if the test is being executed when: **1** The board is not physically in the system. **2** The system is booting. Otherwise, there is some inconsistency in the date stored in the system. **1** Verify that the board is physically in the system. **2** Verify that the system is not in the process of booting. **3** Retry the command at 1-minute intervals up to 5 times.

2 of 2

ATM-NTWK (ATM Network Error)

S8700 MC only

MO's Name (in Alarm Log)	Physical Name (in Error Logs)[1]	Alarm Level	Full Name of MO
ATM-NTWK	ATUUP	WARNING	ATM Network Error
ATM-NTWK	UUCSS	WARNING	ATM Network Error

1 *AT* indicates it is an ATM switch-related address, *UU* is the connection number. The connection number can be converted into a board location by the command **display atm pnc *UU***, which shows the translations for the board that reported the ATM network error. *P* indicates if the ATM-EI board (reporting the ATM network error) is on the PNC's A side or the B side. If the system is simplex, only A is valid.

In an ATM PNC configuration, a proprietary Center Stage Switch (CSS) is replaced by an ATM network. Since CSS nodes are replaced by the ATM network in the ATM PNC configuration, SNI boards are no longer needed. In place of the SNI boards, ATM Expansion Interface (EI) or ATM Circuit Emulation Service (CES) boards are connected to an ATM switch port over a fiber-optic cable. The ports on the ATM switch are under control of its maintenance software. Refer to *ATM Installation, Upgrades, and Administration using Avaya™ Communication Manager, 555-233-124,* for more information.

An error against this MO indicates a problem in the ATM network (including the ATM switch) that is affecting service quality. These error events are either:

- Reported by the ATM network to an ATM EI or ATM CES board
- Detected by either the ATM EI or ATM CES board itself

Since these errors are ***not*** related to the ATM EI or ATM CES board, they are not reported against the ATM-EI or ATM-TRK MO. However, some of these errors invoke alarms that require action by the system's maintenance software, while other log-only errors require no action.

Error Codes and Aux Data values

The Cause Code/Error Type information is shown in Table 173, Error codes and Aux data values ATM-NTWK, on page 410. These are the possible errors that can be logged against the ATM-NTWK MO.

If the ATM-NTWK MO receives more than 6 errors, the most recent are discarded.

Table 173: Error codes and Aux data values ATM-NTWK

Cause Code/ Error Type	Aux Data	Cause Codes Description
NORMAL EVENTS		
0	(a)	Network unreachable
1	(a)	Unallocated (unassigned) number. This cause indicates that the called party cannot be reached because, although the number is in a valid format, it is not currently assigned (allocated).

Table 173: Error codes and Aux data values ATM-NTWK

Cause Code/ Error Type	Aux Data	Cause Codes Description
2	(a)	No route to specified transit network. This cause indicates that the equipment sending this cause has received a request to route the call through a particular network that it does not recognize, either because the transit network does not exist or because that particular transit network does not serve the equipment that is sending this cause. This cause is supported on a network-dependent basis.
3	(a)	No route to destination. This cause indicates that the called party cannot be reached because the network through which the call has been routed does not serve the destination desired. This cause is supported on a network-dependent basis.
10	(a)	VPCI/VCI unacceptable. This cause indicates that the virtual channel most recently identified is not acceptable to the sending entity for use in this call.
16	(a)	Normal call clearing. This cause indicates that the call is being cleared because one of the users involved in the call has requested that the call be cleared. Under normal situations, the source of this cause is not the network.
17	(a)	User busy. This cause indicates that the called party is unable to accept another call because the user busy condition has been encountered. This cause value can be generated by the called user or by the network.
18	(a)	No user responding. This cause is used when a called party does not respond to a call establishment message with a connect indication within the prescribed period of time allocated.
21	(a)	Call rejected. This cause indicates that the equipment sending this cause does not wish to accept this call, although it could have accepted the call because the equipment sending this cause is neither busy nor incompatible. **NOTE:** If the call was rejected by the far-end ATM-EI or ATM-CES board, there could also be additional information about this rejection in an ATM-EI error log entry. Look for an ATM-EI or error with an Error Type between 1104 and 1119 inclusive, with approximately the same time stamp as this error.
22	(a)	Number changed. This cause is returned to a calling party when the called party's number indicated by the calling user is no longer assigned. The new called party's number can optionally be included in the diagnostic field. If a network does not support this capability, cause number 1 "*unassigned (unallocated) number*" is used.
23	(a)	User rejects every call with CLIR (calling line identification restriction). This cause is returned by the called party when the call is offered without calling party's number information and the called party requires this information.

2 of 6

Table 173: Error codes and Aux data values ATM-NTWK

Cause Code/ Error Type	Aux Data	Cause Codes Description
27	(a)	Destination out of order. This cause indicates that a user-indicated destination cannot be reached because a signaling message could not be delivered to the remote user over the destination's interface (for example, a physical-layer or SAAL failure at the remote user, or remote user's equipment is off line).
28	(a)	Invalid number format (address incomplete). This cause indicates that the called user cannot be reached because the called party's number is not in a valid format or has insufficient digits.
30	(a)	Response to STATUS ENQUIRY. This cause is included in the STATUS message when the reason for generating the STATUS message was the prior receipt of a STATUS ENQUIRY message.
31	(a)	Normal, unspecified. When no more specific cause values apply, this cause reports a normal event.
32	(a)	DTL transit not-my-node ID
RESOURCE UNAVAILABLE		
35	(a)	Requested VPCI/VCI not available. This cause indicates that the requested VPCI/VCI is not available. This can be caused by mismatched VCI ranges on different ATM switches.
36	(a)	VPCI/VCI assignment failure
37	(a)	User Cell Rate not available
38	(a)	Network out of order. This cause indicates that the network is not functioning correctly and that the condition is likely to last a relatively long time. (Immediately retrying the call is unlikely to succeed.)
41	(a)	Temporary failure. This cause indicates that the network is not functioning correctly, but the condition is unlikely to last long. (Immediately retrying the call is likely to succeed.)
43	(a)	Access information discarded. This cause indicates that the network could not deliver access information to the remote user as requested (that is, ATM adaptation-layer parameters, Broadband low-layer information, Broadband high-layer information, or sub-address as indicated in the diagnostic).
45	(a)	No VPCI/VCI available. This cause indicates that no appropriate VPCI/VCI is currently available to handle the call.
47	(a)	Resource unavailable, unspecified. When no more specific cause values apply, this cause reports a resource-unavailable event.
SERVICE OR OPTION UNAVAILABLE		
49	(a)	Quality of Service unavailable. This cause reports that the requested Quality of Service cannot be provided.
51	(a)	User cell rate not available. This cause reports that the requested ATM Traffic Descriptor is unobtainable.

3 of 6

Table 173: Error codes and Aux data values ATM-NTWK

Cause Code/ Error Type	Aux Data	Cause Codes Description
57	(a)	Bearer capability not authorized. This cause indicates that a user-requested bearer capability is implemented by the cause-sending equipment, but the user is not authorized to use the capability.
58	(a)	Bearer capability not currently available. This cause indicates that the user-requested bearer capability is implemented by the cause-sending equipment, but the capability is currently unavailable.
63	(a)	Service or option not available, unspecified. When no more specific cause values apply, this cause reports an unavailable service or option event.
65	(a)	Bearer capability not implemented. This cause indicates that its sending equipment does not support the bearer capability requested.
73	(a)	Unsupported combination of traffic parameters. This cause indicates that the combination of traffic parameters contained in the ATM traffic descriptor information element (IE) is not supported.
78	(a)	AAL parameters cannot be supported.
INVALID MESSAGES		
81	(a)	Invalid call reference value. This cause indicates that its sending equipment received a message with a call reference that is currently inactive on the user-network interface.
82	(a)	Identified channel does not exist. This cause indicates that its sending equipment received a request to use a channel not activated for the call's interface.
88	(a)	Incompatible destination. This cause indicates that its sending equipment received a request to establish a call with either Broadband low-layer information, Broadband high-layer information, or other compatibility attributes that cannot be accommodated.
89	(a)	Invalid endpoint reference value. This cause indicates that its sending equipment has received a message with an endpoint reference that is currently idle on the user-network interface.
91	(a)	Invalid transit network selection. This cause indicates that a transit network identification was received in an incorrect format.
92	(a)	Too many pending add-party requests. This cause indicates a temporary condition when the calling party sends an add-party message, but the network rejects the message due to full queues.
93	(a)	AAL parameters cannot be supported. This cause indicates that its sending equipment received a request to establish a call with ATM adaptation-layer parameters that cannot be accommodated.
PROTOCOL ERROR		
96	(a)	Mandatory information element (IE) is missing. This cause indicates its sending equipment has received a message with a missing IE.

Table 173: Error codes and Aux data values ATM-NTWK

Cause Code/ Error Type	Aux Data	Cause Codes Description
97	(a)	Message type either non-existent or not implemented. This cause indicates that its sending equipment received a message with an unrecognized type — either because the type is undefined, or defined but not implemented by the cause-sending equipment.
99	(a)	Information element (IE) either non-existent or not implemented. This cause indicates that its sending equipment received a message with an unrecognized IE — either because the IE's identifier(s) are undefined, or defined but not implemented by the cause-sending equipment. This cause indicates that its sending equipment discarded the IE. However, the equipment could still process the message since this IE was not required.
100	(a)	Invalid contents in information element (IE). This cause indicates that its sending equipment received and implemented an IE. However, one or more of the IE's fields are coded in a way that the cause-sending equipment has not implemented.
101	(a)	Message not compatible with call state. This cause indicates receipt of a message that is incompatible with the call state.
102	(a)	Recovery on timer expiration. This cause indicates that a timer's expiration initiated an error-handling procedure.
104	(a)	Incorrect message length
111	(a)	Protocol error, unspecified. When no more specific cause values apply, this cause reports a protocol-error event.
257 to 300 (b)	(b)	ATM Impaired Paths **1** Examine the error log (**display errors**), atm setup-events log (**list measurements atm svc-setup**), and atm pnc-latency (**list measurements atm latency**) screens to help diagnose the problem — although the switch could be operating normally. In this case, you should consider raising the Activation threshold and/or increasing the Timeout value on the ATM-RELATED System Parameters screen. (**change system atm**). You can use the **list measurements atm svc-setup** command to provide information about errors associated with connection numbers. **2** After entering the above command, note the time stamps shown in the ***list measurements atm setup-events*** screen. Execute the above command periodically and note the time stamps. If the time stamps have changed for a particular From Conn-To Conn pair, this indicates there are still setup failures/delays for that connection. **3** After verifying that every associated ATM endpoint is operating correctly, and if errors are still occurring, contact your local service provider.
301 (c)	ANY	System wide ATM Impaired Paths. See the suggestions listed above to trouble shoot these errors.

5 of 6

Table 173: Error codes and Aux data values ATM-NTWK

Cause Code/ Error Type	Aux Data	Cause Codes Description
769 (d)		ATM CLP (Cell Loss Priority) Bit Errors
1025 (e)		ATM Congestion Bit Errors
1281 (f)		ATM Cell Underrun Errors
1537 (g)		ATM Cell Overrun Errors
1793 (h)		ATM Lost Cells

6 of 6

Notes:

a Aux Data values for Setup and Add Party (XX = port network, YYY = location code).

Aux Data values for WSP Setup (XX = WSP number, YYY = location code).

Table 174, Location codes from Aux Data values, on page 415 is a list of UNI 3.1 location codes:

Table 174: Location codes from Aux Data values

Setup (Location Code)	Add Party (Location Code)	WSP Setup (location Code)	Location Code Meaning
0	500	800	User
1	501	801	Private network serving the local user
2	502	802	Public network serving the local user
3	503	803	Transit network
4	504	804	Public network serving the remote user
5	505	805	Private network serving the remote user
7	507	807	International network
10	510	810	Network beyond interworking point

b **Error Types 257 to 300** — These error type numbers are used to determine the destination PNC connection number of an ATM Network connection that is experiencing an impaired path. The connection number is obtained by subtracting 256 from the number that is shown in the Error Type field. See the following example:

ERROR TYPE field = 263
Subtract = 256
PNC destination connection # = 7

The AUX DATA field contains the originating and destination PN number (XXYY). Where XX = the originating PN #, and YY = the destination PN # for example:

1 AUX DATA = 302
3 = orig
2 = dest

2 Example AUX DATA = 1510
15 = orig
10 = dest

c **Error Type 301** — indicates that there is a system wide impaired path network problem.

NOTE:
Under certain circumstances network errors can be against the ATM EI board.

d **Error Type 769** — ATM CLP (Cell Loss Priority) Bit Errors

The ATM cell header has a bit called the cell loss priority (CLP) bit. The bit indicates one of two states: the cell is eligible for discarding, or it is not. In an ATM configuration, every cell is transmitted into the ATM network with the CLP bit set to 0 indicating that these cells are NOT eligible for discarding. Should the system ever receive a cell from the ATM network with the CLP bit set to 1 (discard eligible), an entity in the ATM network modified the bit during transit. Generally, an ATM network switch sets the CLP bit to 1 (discard eligible) only if the cell fails to conform to the cell rate specified in the traffic contract for the VC. However, Communication Manager cell emissions conform with the VC traffic contract. Therefore, the presence of a non-conforming cell implies that something else in the ATM network switch is setting the CLP bit in some cells, the ATM switch can also be policing out (discarding) cells which do not conform to the traffic contract. This error can occur together with other errors such as:

"Excessive AAL-5 CRC errors" or
"Excessive LAP-D retransmissions"

These errors affect SVCs with Variable Bit Rate (VBRnt) traffic contracts. VBR SVCs transport system links such as EAL, PACL, and PRI links. Again, this indicates problems with cell transmissions in the ATM network.

If cell discard is happening generically in the ATM network, other symptoms can affect the Constant Bit Rate (CBR) SVCs including audible artifacts in talk paths, failure of modems over voice lines, and "Cell Underruns" - see note (f).

e **Error Type 1025** — ATM Congestion Bit Errors

The ATM cell header has a bit called the congestion bit. In Communication Manager ATM, every cell is transmitted into the ATM network with the congestion bit set to 0 (congestion not experienced). Should the system ever receive a cell from the ATM network with the congestion bit set to 1 (congestion experienced), an entity in the ATM network modified the bit during transit. It simply indicates that the ATM network is experiencing heavy traffic.

During periods of congestion, the ATM network can choose to discard cells even though those cells conform to their traffic contracts. Should the ATM network discard cells, errors such as the following can occur:

"Excessive AAL-5 CRC errors"
"Excessive LAP-D retransmissions".

These errors affect SVCs with Variable Bit Rate (VBRnt) traffic contracts. VBR SVCs transport system links such as EAL, PACL, and PRI links. Symptoms that can affect the Constant Bit Rate (CBR) SVCs include audible artifacts in talk paths, failure of modems over voice lines, and "cell Underruns" – see note (f).

f **Error Type 1281** — ATM Cell Underruns

Communication Manager ATM monitors for cell underrun conditions on SVCs with Constant Bit Rate (CBR) traffic contracts or on ATM CES trunks. In either case, cells are expected to arrive at a fixed rate. If cells arrive below that rate, an underrun condition exists. The most likely cause of cell underruns is a problem with cell transmission through the ATM network.

Possible symptoms include audible artifacts in talk paths and failure of modems over voice lines. If cell loss is happening generically in the ATM network, other symptoms like “excessive AAL-5 CRC errors” or “excessive LAP-D retransmissions” are possible on SVCs with Variable Bit Rate (VBRnt) traffic contracts. The VBR SVCs transport system links such as EAL, PACL, and PRI links.

Another ATM board within the system originally generated the arriving cells at the specified traffic contract rate. In order to have arrived at a lower rate, these cells were either slowed during transmission or possibly discarded by the ATM network. This indicates problems with cell transmission in the ATM network. Consult the ATM network vendor. Ask about cell delay variation, cell discard, and traffic policing.

Cell underruns often happen in conjunction with cell overruns. If both occur, it further indicts the ATM network.

g **Error Type 1537** — ATM Cell Overruns

Communication Manager ATM monitors for cell overrun conditions on SVCs with Constant Bit Rate (CBR) traffic contracts or on ATM CES trunks. In either case, cells are expected to arrive at a fixed rate. If cells arrive above that rate, an overrun condition exists. The most likely cause of cell overruns is a problem with cell transmission through the ATM network.

Both cell underruns and overruns are typical symptoms of cell transmission problems like cell jitter or delay. The ATM board attempts to compensate somewhat by buffering cells. However, if the ATM network transmission delays are high, the board could conclude that it has seen a cell overrun because it has exhausted all of its buffer space.

If cell underruns or both cell underruns and overruns occur, indict the ATM network. Consult the ATM vendor. Ask about cell delay variation, cell discard, and traffic policing.

Another much less likely cause of cell overruns is that an ATM board is generating cells above the traffic contract rate. Suppose, a board somehow generates cells too quickly. The ATM network likely reacts by at least setting the CLP bit in the cells that exceed the traffic contract (see note (d) for ATM CLP errors). The ATM network can also discard the excess cells.

If only cell overruns occur, locate the ATM board generating those cells. Execute **test board long**. If the board passes, then the ATM network remains the likely cause of transmission problems. Consult the ATM network vendor. Ask about cell delay variation, cell discard, and traffic policing.

h **Error Type 1793** — ATM lost cells:

The ATM board receiving the CBR cell stream is detecting out-of-sequence AAL1 sequence numbers, above the defined threshold. This normally indicates that the ATM network has lost the missing cells. In this case, “lost” could mean that the cells were, for example, policed out, lost to congestion, or misdirected to another endpoint.

The likely user-visible symptoms of lost cells are missing talk paths or poor voice quality.

The “lost cells” error can help you diagnose cell underrun problems. When cell underruns are accompanied by lost cells errors, the lost cells could have caused the underruns. But if you have cell under runs without lost cells, it could indicate that the underruns were due to network jitter instead. It is also possible that network jitter can cause both cell underruns and lost cells, if the jitter is so severe it causes the cells to violate their traffic contract.

When accompanied by congestion or CLP errors, the congestion or CLP can be causing the lost cells.

When accompanied by cell overrun errors, the cell overruns can be causing the TN2305 to discard cells, which in turn can show up as lost cells.

Lost cells without other errors can indicate that cells are being corrupted, especially the AAL1 sequence number.

In any case, consult your ATM network vendor about possible causes. Look for jitter (cell delay variation), cell discard, and traffic policing.

ATM PNC-DUP (ATM PNC Duplication)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
PNC-DUP	NA	**status pnc**	PNC duplication

The PNC-DUP MO tracks the health of the active and standby PNCs, controls planned and spontaneous interchanges, and manages related functions such as double call refresh and unrefresh, antithrashing, and so on. The main responsibility of PNC-DUP is to recover the system to full service in the event of a fault. In the event of multiple faults, PNC-DUP does its best to maximize service continuity.

NOTE:
ATM PNC-DUP behaves differently when the system is running the ATM PNC feature. While not a separate MO, this discussion explains the unique behavior of PNC-DUP under the ATM PNC feature.

In critical-reliability systems, the following components comprising the port-network connectivity (PNC), are duplicated:

- ATM-Expansion Interface (ATM-EI) circuit packs in port networks (PNs)
- Fiber-optic cables connecting the above circuit packs to the ATM Switch Interface Modules
- ATM Switch

Although not part of the PNC, Tone-Clock circuit packs are also duplicated in each PN. ATM PNC systems can have up to 64 PNs.

PNC duplication architecture utilizes an active/standby duplication scheme in which one complete set of PNC components supports call processing, while the duplicate PNC is held in reserve. All calls on the active PNC are simultaneously set up, or shadowed, on the standby PNC in order for it to be capable of instantly assuming active status when necessary, allowing for interchanges without service disruption (in the case of single faults).

PNC duplication does not introduce any additional types of hardware or hardware faults, and there are no tests associated with the PNC-DUP MO. Instead, its error log entries contain useful information about the occurrence and causes of interchanges in order to facilitate diagnosis of problems, which can then be addressed by using the documentation for the individual MO involved.

PNC-DUP Related Commands

The following commands and their output forms are fully described in Chapter 1, "Maintenance SAT Commands" in Maintenance Commands Reference (555-245-101).

status pnc	Displays information about both PNCs' operational status, including state of health, alarms, busyouts and locks, and so on.
reset pnc interchange	Used to initiate a demand PNC interchange. If the standby is healthy (all-zero state-of-health indexes), there is no effect on service. Otherwise, calls may be dropped.
set pnc	Used to lock or unlock the active PNC, preventing interchanges. It does not interfere with double call setup.
busyout pnc	Removes the standby PNC from service. See also the following section on busyout of PNC components.

Busyouts and PNC-DUP

Busyout pnc puts the standby PNC in the busyout state. In this condition:

- Double call set up is turned off.
- The standby PNC is unrefreshed; existing duplicate call connections are removed.
- PNC interchanges are prevented.

Upon release, interchanges are re-enabled and a global refresh of double call setup on the standby is performed.

When PNC duplication is in effect:

- An active PNC component cannot be busied-out.
- A standby PNC component can only be busied-out when the standby PNC is first busied-out.
- The standby PNC cannot be released unless all standby PNC components are released.

Enabling and Removing PNC Duplication

To Enable PNC Duplication

To enable PNC duplication, perform the following sequence of steps:

1. Enable administration of PNC-DUP on the ***change system-parameters customer-options*** screen.
2. Fully administer duplicate ATM PNC connectivity. Verify by **list atm pnc**. Or for IP duplication, go to step three.
3. Fully administer IPSI duplication (**ipserver-interface duplication**). Verify by using **list ipserver-interface**.
4. Activate PNC-DUP through the ***change system-parameters duplication*** screen. This is not allowed if any component of either PNC (A or B) is busied out.

5 The system must insert all connectivity-related components for both standby and active PNC, a process that takes up to 5 minutes, depending upon circuit pack insertion. The process finishes when the first terminal login prompt appears.

6 The PNC-DUP initialization anti-thrashing timer must expire (this occurs 5 minutes after completion of board insertion, PNC interchange, or system reset of level 2 or higher).

To Disable PNC Duplication

To disable PNC duplication perform the following sequence of steps:

1 Verify that the A-PNC is active. A forced interchange may be required. See **reset pnc**.

2 Busyout the standby PNC (B-PNC).

3 Turn off the system parameter for PNC-DUP through **change system-parameters duplication**.

4 Remove the B-PNC connectivity by removing the Board Locations on the ***change fiber*** screen for ATM PNC.

5 Remove the B-PNC circuit packs (ATM-EI boards). Use **change circuit-pack *location***.

6 Disable administration of PNC duplication on the ***change system-parameters customer-options*** screen by changing the `PNC Duplication` field to **n**.

Notes:

- Alterations to PNC that involve only the *addition* of connectivity can be done with PNC-DUP operational.
- Alterations requiring the *removal* of connectivity must be done with PNC-DUP removed.
- PNC-DUP must be removed and translations should be saved before making any hardware changes.

Steady State LEDs

The LEDs of PNC components in a stable duplicated system should appear as follows:

- For an ***active*** ATM EI (functioning as Archangel) in a PN ***without*** IPSIs, its amber LED's flash pattern is 2 seconds on/200 ms off.
- For a ***standby*** ATM EI in a PN without IPSIs, it's amber LED is off.
- For an ***active*** ATM EI in a PN ***with*** IPSIs, its amber LED is on steady.
- For an ***standby*** ATM EI in a PN with IPSIs, its amber LED is off.

PNC State of Health

PNC-DUP software monitors the health of the two PNCs as determined by their state-of-health (SOH) vectors, and initiates an interchange when the health of the active falls below that of the standby (unless prevented from doing so by a PNC lock, busyout, or antithrashing mechanism). Potentially service-disrupting faults that occur in a PNC's components are reported to PNC-DUP and incorporated in the affected PNC's state of health. The SOHs of both PNCs are displayed on the **status pnc** screen, as shown in Figure 30, Status PNC screen with standby PNC fully In-Service, on page 422.

Figure 30: Status PNC screen with standby PNC fully In-Service

   Warning Alarms: 0                  Warning Alarms: 0
```

PNC State-of-Health Indexes

The Inter-PN Index screen the state-of-health vector is used to track and compare the states of health of both PNCs. The fields making up the indexes are 2-digit numbers separated by periods (.), with each field representing a different class of faults. The fault class fields are arranged in order of decreasing importance from left to right. In other words, each field in the index supersedes the following fields in determining which PNC is healthiest. A fault class drives an interchange only when all of the higher priority fault classes are equal. A zero entry indicates no faults present for that class. Increasing numbers indicate increasingly higher numbers of faults present in that class.

The Inter-PN Index contains four fields (XX.XX.XX.XX). The Inter-PN Index reports faults in connectivity between PNs.

- The meaning of each fault class field is given in Table 175, PNC State-of-Health Fault Classes, on page 423.
- A zero entry indicates that there are no faults reported.
- Higher numbers indicate increasing number of faults.
- All zeros indicate a perfect state of health.
- Unless the PNCs are locked, the active PNC's state of health should always be equal to or better than the standby's. Otherwise, the system performs a spontaneous interchange.

After a PNC-related alarm is cleared, the system performs a partial refresh of the standby PNC. The corresponding fault class field is not updated to reflect the improved state of health until the refresh is done. The state-of-health indexes do not agree with the current alarm status during this period.

Table 175: PNC State-of-Health Fault Classes

Fault Class	Priority	Description	MOs
FC_EAL	1	Number of PNs with EALs down	EXP-PN
FC_PACL	2	Number of PNs with LINL, RINL, or EI-SNI neighbor link faults	EXP-PN
FC_BFD	3	Number of PNs with BFDL (Bearer Fault Detection Link) faults	SYS-LINK
FC_HW	4	Number of PNs affected by hardware faults in a link having an EI as an endpoint. Use **list atm pnc** to see endpoint designations.	ATM-EI

Resolving Poor State of Health

When both PNCs do not have an all-zero SOH (perfect health), use the following steps to identify and repair the problem.

1. Look for PNC component alarms (major or minor) for the PNC side without an all-zero SOH. The standby PNC should be repaired first.
2. Busy-out the standby PNC.
3. Follow the appropriate diagnostic and repair procedures for the alarmed PNC components just as with a simplex PNC. Both the alarm and error logs should be examined to isolate the fault.
4. Verify that the related PNC's SOH is restored to all zeros.
5. Release the standby PNC.

Refresh and Unrefresh of the Standby PNC

In a fully-functional PNC with healthy standby and active sides, the standby PNC has a complete set of call connections corresponding to those in the active PNC. If, however, the standby PNC's state of health degrades, a selective unrefresh of those connections that utilize the faulted component(s) is performed. If the standby PNC's health improves, a selective refresh of connections on the affected route is performed so that call setup is consistent between the active PNC and the healthy parts of the standby PNC.

The `Standby Refreshed?` field on the **status pnc** screen does *not* refer to the selective type of refresh. It refers only to a global refresh that is performed when:

- The system is initialized and PNC duplication is enabled.
- There has been a spontaneous PNC interchange.
- The standby PNC has been released from busy-out.
- A system reset of level 2 or higher has taken place.

The `Refreshed` field may display `yes` when in fact the standby is partially unrefreshed. An interchange into an incompletely refreshed standby results in dropped calls. This can happen when a more severe fault occurs on the active PNC or when **reset pnc interchange** is used with the override option.

PNC Interchanges

PNC spontaneous interchanges occur when PNC duplication software determines that the standby PNC's state of health (SOH) surpasses the active PNC's.

- PNC-DUP executes a spontaneous interchange in response to a message from a PNC component MO indicating that either a fault has occurred on the active PNC or a fault has been resolved on the standby PNC.
- The PNC SOH is compared to the standby PNC, and an interchange occurs if the standby PNC's state of health surpasses the active PNC's.
- A corresponding Major or Minor alarm is logged by the reporting MO, stimulating an alarm report.

When the resolution of a fault on the standby renders it more healthy than a simultaneously-faulted active PNC, the error message indicates the type and location of the *improved* component.

Once the interchange completes, the failed component is on the standby PNC. A demand interchange can be requested in the presence or absence of standby PNC faults. The following sequence of actions can be observed during a fault-free interchange:

1. The ATM-Expansion Interfaces currently acting as archangels in the PNs are deactivated as indicated by the amber LEDs going from flashing to on solid.
2. The ATM-EIs in IPSI-connected PNs are interchanged, indicated by the new standby ATM-EI amber LED off and the new active ATM-EI amber LED on steady.
3. One by one, the ATM-EIs in non-IPSI-connected PNs are interchanged as indicated by new standby ATM-EI amber LED turning off and the new active ATM-EI amber LED flashing (2 seconds on / 200 milliseconds off). At this point, the interchange is functionally complete.

Certain conditions may interfere with the normal execution of the interchange:

1. In a faulted spontaneous interchange, it is possible the PN(s) directly affected by the fault will be the last to interchange.
2. A user directly affected by the single fault instigating a PNC interchange can experience a momentary voice path outage during the switch.
3. If faults exist on both the standby and active PNC, it is possible to have some PNs go out of service while others are returned to service.

In any multifault situation, rely on **status pnc** to determine which is the active PNC.

PNC duplication informs Timing Synchronization maintenance when a PNC interchange has been completed and indicates which PNC is active. This causes Synchronization to audit and ensure that the primary source for synchronization of Tone-Clocks in each PN is supplied by a path associated with the active PNC.

Antithrashing and PNC Interchanges

Following a spontaneous PNC interchange, subsequent PNC interchanges are prevented for 5 minutes. This condition is indicated by **y** in the `Interchange Disabled?` field of the **status pnc** screen. After 5 minutes, the antithrashing timer expires, interchange decisions are re-enabled, and the field displays **n**.

NOTE:
Should a catastrophic failure occur on the active PNC during the period when the `Interchange Disabled?` *field is set to "yes," there will be no spontaneous PNC interchange.*

Demand PNC interchanges also invoke anti-thrashing, but only for a period of 30 seconds. During antithrashing mode, demand interchanges are also prevented unless the override option is specified.

CAUTION:
Use of this option may cause a service disruption.

Repairs on the Standby PNC Components

CAUTION:
If there is a TDM-CLK alarm, system timing may be routed through part of the standby PNC, and circuit switched data may be affected by the following repair procedures. This can happen, for example, when a slave tone/clock circuit pack experiences a loss of signal and switches to receive timing from the standby ATM-EI. In this case TDM-CLK 2305 error is logged, and the clock problem should be addressed first, if possible.

To repair PNC components in a duplicated PNC proceed as follows:

1. Most repairs involve fixing a single fault on the standby PNC. Use **set pnc lock** or **busy-out pnc** to prevent an interchange into the PNC being repaired.
2. If a faulty component exists on the active PNC, this also means that the standby PNC is more severely faulted. Normally, the *standby* PNC is repaired first, since it is the most severely impaired.

   To repair the active PNC (standby is already repaired), issue the **set pnc unlock** command, which generates a spontaneous interchange. In a PNC demand interchange with **reset pnc interchange** use the ***override-and-lock*** qualifier for the active PNC. The ***override-and-lock*** option ensures that no subsequent interchange can occur during the repair of the standby PNC. A demand interchange may not be necessary if the following conditions drive a spontaneous interchange:

   - The anti-thrashing period from the last interchange has expired.
   - The global refresh from releasing the standby PNC has completed.
   - The standby PNC's state of health surpasses the active PNC's.

   At this point, the faulty component is on the standby PNC, and the PNCs are locked in their current active/standby state.
3. Busyout the PNC with the **busyout pnc** command.
4. Use fault isolation and component testing procedures for the individual PNC components, just as for a simplex PNC. Replacement of components does disrupt operation of the active PNC.

5 Once the failed component is replaced, use the **status pnc** command to check the health standby PNC component.

6 When confident that the problem has been resolved, as indicated by an all-zero state of health, unlock (**set pnc unlock**) and release (**release pnc**) the PNC. Note that no further PNC interchange is required since you can test the standby PNC as thoroughly as the active.

Interactions: Server Resets and PNC Interchanges

- A system reset of level 1 (warm), 2 (cold2) or 4 (reboot) does not change which PNC is active. If a PNC interchange was in progress when the reset took place, the PNC interchange continued until completion.
- If a **reset system 1** (warm) takes place during a PNC interchange, the reset is escalated to level 2 (cold2).

Fault Isolation Using Duplicated PNC

In some cases, PNC duplication can aid in the fault isolation procedure. PNC interchanges can be used to help isolate the faulty hardware. Two examples demonstrating this technique follow:

1 There is a fault that can occur in either an IPSI-connected PN's ATM-EI or the PKT-INT which cannot be readily attributed to one board or the other. If the packet bus transceivers on either the PKT-INT or ATM-EI fail, the two boards cannot communicate, but it will not be clear which board is at fault. In this case, a planned interchange of the PNC can be used to indicate which of the two boards. If the interchange:

   — Cures the problem, the ATM-EI was at fault

   — Does not cure the problem, the PKT-INT is suspect (provided there are no PKT-BUS faults)

2 A similar relationship exists for the PN Archangel (EAA - the active ATM-EI) and certain TDM-bus problems. If the EAA is unable to communicate with a port board over the TDM bus, either the EAA has a fault, the port board has a fault, or there is a problem with the TDM bus itself. If TDM bus maintenance tests find no problems with the bus, then it is either the port board or the EAA. It may be simpler to replace the port board than to request a PNC interchange. However, if it is not clear which port board may be at fault or maintenance is being performed remotely, verify that the EAA is not at fault by executing a PNC interchange. If the interchange solves the problem, then the EAA is faulty. If the problem persists after the interchange, but TDM bus maintenance finds no problem, then the port board is faulty.

Error Log Entries

Whenever a PNC interchange takes place, an error is logged against PNC-DUP with a code that conveys information about the cause of the interchange and which PNC became active. There are no alarms associated with PNC-DUP errors, but there should be an alarm against the PNC component that caused the interchange. There are no PNC-DUP test sequences, but **status pnc** provides information regarding the status of the PNCs. The information in Table 92, Test #35 Battery Feed Test, on page 239 and Table 177, Error Log Encode Field Decoding, on page 427 can help to identify which areas of the Alarm Log to investigate to find the source of the problem.

Table 176: Error Code descriptions and Aux Data correlations

Error Code	Description	Aux Data[1]
00000	Error in generating error code	None
1cxpp	Spontaneous Interchange in response to a constraint for A-PNC	Active PNC
2cxpp	Spontaneous Interchange in response to a constraint for B-PNC	Active PNC
51000	Spontaneous Interchange at expiration of SOH validation timer	Active PNC
52000	Spontaneous Interchange upon PNC UNLOCK	Active PNC
53000	Spontaneous Interchange at completion of Global Refresh	Active PNC
60801	PNC Demand Interchange	Active PNC
60800	PNC Demand Interchange with override	Active PNC

1 The Aux Data indicates which PNC became active after the PNC interchange: “0” denotes PNC-A; “1” denotes PNC-B.

Table 177: Error Log Encode Field Decoding

Field	Variable Name	Values	Description
c	Alarm Type	0 1	Alarm retired MAJOR or MINOR alarm on any PNC component
x	Fault class; see description for contributing MOs	0	EAL (Expansion Archangel Link - EXP-PN) carries CCMS messages
		1	PACL (ATM-EI) carries ATM signaling commands from Call Processing to the remote ATM-EI circuit packs
		2	PNC hardware (providing connectivity of PN-to-PN or -ATM-EI)
		5	BFDL (bearer fault detection link) solely for the purpose of detecting bearer faults
pp	Port-network number	0–63	0–2 for constraint class (this is an internal number; add 1 for external port number)

Error Log Entries and Test to Clear Values

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
18	None	**busy PNC-DUP**	WARNING	ON	**release pnc-dup**

NOTE:
The **list config port-network** command shows the cabinet number associated with a PN.

ATM-SGRP (ATM Signaling Group)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ATM-SGRP	MINOR	**test sig-group *grp#***	ATM-CES Signaling Group
ATM-SGRP	WARNING	**test sig-group *grp#***	ATM-CES Signaling Group

1 ***grp#*** is the signaling group number (1–166); the test sequence can be either short or long.

This ATM-SGRP MO applies when ATM signaling groups have been administered on an ATM circuit pack as ATM trunks.

Table 178, R7 ATM-SGR circuit packs, on page 429 outlines the differences between ATM interface circuit packs:

Table 178: R7 ATM-SGR circuit packs

Circuit pack	Channel types	Interface	Fiber	Echo cancellation
TN2305	B and D channels	24- or 32-channel	Multimode	Y
TN2306	B and D channels	24- or 32-channel	Single-mode	Y

The TN2305 and TN2306 ATM Interface circuit boards are referred to as TN230X for the remainder of this MO.

An ATM Signaling Group is a collection of B channels for which a given ISDN-PRI signaling-channel port (ATM D channel) carries signaling information. ATM B channels (ATM-BCH) carry voice or data and are assigned to ISDN trunks. For more information see ATM-TRK (Circuit Emulation Service Circuit Pack) on page 445.

The operation of the entire ATM signaling group depends on several other entities:

- ATM-DCH signaling-channel port
- TN230X Interface circuit pack where a D channel resides
- System link to the processor via the packet bus

When there are problems with ATM-SGRP (ATM signaling group), also investigate:

- ATM-DCH (ATM D-Channel Port)
- ATM-BCH (ATM B-Channel Trunk)
- SYS-LINK (System Links)
- PKT-BUS (Packet Bus)

Error Log Entries and Test to Clear Values

Table 179: ATM-SGRP Signaling Group Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/ Off Board	Test to Clear Value
0	0	Any	Any		**test sig-group *grp#***
1 (a)	Any	None			
18 (b)		MO busied out			
257 (c)	Any	None			**test sig-group *grp#***
769 (d)	Any	Primary Signaling Link Hardware check (#636)			**test sig-group *grp#***
1281 (e)	Any	Secondary Signaling Link Hardware check (#639)			**test sig-group *grp#***
1793 (f)	Any	Layer 2 Status test (#647)	WARNING	OFF	**test sig-group *grp#***
2305 (g)	Any	Remote Layer 3 Query test (#637)	MINOR	OFF	**test sig-group *grp#***
3585 (h)	Port number	None			
3840 - 3928 (i)	Port number	None			

Notes

a Error Type 1: switch sent a message to the far-end switch or terminal adapter, and the far end did not respond in the allotted time. Possible causes include link failure and congestion or outage at the far end. The Aux Data field contains layer-3 protocol information used by internal counters.

If no other symptoms are present, no action is required. If layer-3 communication is down:

a Check for alarms and errors against link components

b Check out other errors against ATM-SGRP, ATM-TRK, and other hardware components on the link.

There is no test to clear these errors. The error counter is decremented by 1 every 15 minutes.

b Error Type 18: the ATM circuit pack has been busied out (either **busyout atm sig-grp** or **busyout board *locaation***).

1 Release the ATM signaling group (**release atm sig-grp**) or the circuit pack (**release board *UUCSS***).

c Error Type 257: the primary signaling channel connection has been lost for more than 90 seconds.

- The associated B channels are placed in the ISDN Maintenance/Far-End state.
- The B channels are not usable for outgoing calls, although incoming calls can be accepted.
- The switch automatically attempts to recover the signaling link.

1 Pay particular attention to the results of Test #636 (Primary Signaling Link Hardware Check) in the test sequence.

- When the link does recover, the B channels are negotiated back to the In-Service state and their alarms are retired.

2 When this error occurs, the state of the Signaling Group is changed to out-of-service (verify using the **status sig-group** command).

d Error Type 769: signaling link hardware error.
Service-affecting failures of the hardware used to transport the D channel are reported to the ATM CES Signaling Group MO. Maintenance logs this error, places the D channel into the OOS state, and raises a board-level alarm. The D channel is returned to service, and the alarm is retired once the hardware failure condition clears.

e Error Type 1281: Degraded PVC alarms indicate that a particular Permanent Virtual Circuit, or signaling group, has encountered sufficient errors to exceed firmware thresholds. Operations can continue but at a lower level of reliability or performance. Firmware filters these alarms so that only one is reported active at a given time. The following in-line error is considered a Degraded PVC alarm:

- Excessive AAL – The AAL layer is experiencing an excessive number of errors in trying to reconstruct Service Data Units (SDUs). Possible causes:
  - Problem with the ATM switch
  - Noisy communication paths on opposite side of ATM switch
  - Unhealthy sending node
  - Congestion at the ATM switch

f Error Type 1793: Layer 2 Query test for the primary signaling channel failed.

- Excessive AAL – The AAL layer is experiencing an excessive number of errors in trying to reconstruct Service Data Unit (SDUs). Possible causes:
  - Problem with the ATM switch
  - Noisy communication paths on opposite side of ATM switch
  - Unhealthy sending node
  - Congestion at the ATM switch

g Error Type 2305: The Remote Layer 3 Query test (#637) failed. A specific message was sent to the far-end switch, and it did not respond within the allotted time.

1 Investigate elements of the ATM D channel(s) (ATM-DCH) for both this switch and the far-end switch.

If Test #637 fails twice in a row, the B channels are alarmed and made unavailable for outgoing calls (although incoming calls are still accepted). When Test #637 succeeds and the far-end switch starts responding properly, the ATM trunk (B channels) are placed back into normal operation and their alarms retired.

h Error Type 3585: A SERV or SERV ACK ISDN D-channel message has been received by a non-US-type interface (country option other than `1` on the DS1 administration screen). However, these messages are used only for duplex NFAS signaling, which is supported by country protocol 1.

Thus, there may be a mismatch in administration between the local and far-end switches.

1 Consult with the customer's network provider to determine whether the D channel is set up correctly on the far-end switch.

i Error Type 3840-3928: These error types are used to report certain error messages received by the ATM-SGRP Signaling Group for one of its associated B channels. The Aux Data field is the port number of the B channel from which the message was received.

The error code generated equals 3840+*x*, where *x* is a Cause Value defined by the ISDN PRI Specification. Note that there is no Test to Clear Value for these error types; selected ISDN cause values are placed in the log when they are received, but no direct action or alarming is performed solely in response to receiving them. They provide added data that may prove useful when tracking down obscure networking and routing problems. Table 180, Descriptions and repair recommendations (Error Types 3840-3928), on page 432 provides more information about this range of Error Codes:

Table 180: Descriptions and repair recommendations (Error Types 3840-3928)

Error Code	Description	Recommendation
3842	A request has been made to use a transit network or common carrier that cannot be accessed.	From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. **1** Check every routing pattern containing this trunk group for validity of interexchange carriers requested (IXC field).
3846	The far-end switch has indicated that the B channel (trunk) is not acceptable for use in the call for which it was requested.	This could indicate • an administration problem (for example, the local switch and the far-end switch have different B channels administered) • a normal race condition (for example, the local switch has requested use of a B channel that the far-end switch had just reserved for use on another call). **1** From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. **2** Issue **status trunk** for the indicated trunk. **3** Refer to Table 141, ATM ISDN service states, on page 352 for recovery suggestions.
3858	Similar to Error Type 1. The switch sent an ISDN message to the far-end switch or terminal adapter that did not respond in the allotted time.	**1** Check for alarms and errors against link components **2** Check out other errors against ATM-SGRP (ATM Signaling Group), ATM-TRK (Circuit Emulation Service Circuit Pack), and other hardware components on the link.
3878	The far-end switch has indicated that the network is not functioning correctly and that the condition may last a relatively long period of time (for example, immediately re-attempting the call may not be successful).	**1** From the circuit pack and port number (in the Aux Data field, determine the trunk group against which the error was reported. **2** Consult with the network provider to determine the nature and expected duration of the out of service condition. **3** Consider modifying every routing pattern containing this trunk group, to route calls around the network that is out of service.

1 of 3

Table 180: Descriptions and repair recommendations (Error Types 3840-3928)

Error Code	Description	Recommendation
3890	A request to use a network service (for example, SDN) has been denied. Administration somewhere in the network has indicated that the requested service has not been subscribed to or purchased for this trunk.	This could indicate • a local administration problem • a mismatch between the local administration and that of the network provider. **1** From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. **2** Display the trunk group screen. If the trunk group is Call-by-Call (the `Service Type` field is `cbc`), check every routing pattern screen containing this trunk group to see if the Service/Feature fields contain the correct network services purchased for this trunk. If the trunk group is not Call-by-Call, check that the `Service Type` field contains the single network service purchased for this trunk. **3** If local administration appears correct, consult with the customer and/or the network provider to determine the services that the customer has subscribed to for this trunk group.
3892	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	**1** If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.
3894	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	**1** Eliminate any transitory state mismatch problems (**test port *location*** for the trunk port shown in the Aux Data field). Test #256 (Service State Audit) is the important test in the sequence. **2** If Test #256 passes yet the customer continues to complain of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.
3905	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	**1** If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.

2 of 3

Table 180: Descriptions and repair recommendations (Error Types 3840-3928)

Error Code	Description	Recommendation
3906	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	**1** If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate to the problem and provide the next tier with this Error Log information.
3909	A request to use a network service has been made, but the network has rejected the request because the requested service is not implemented.	**1** Follow the recommendations listed above for Error Type 3890.
3928	A call was denied because of a basic incompatibility between the type of call and either the facilities selected by the routing pattern or the called user itself.	This error might be helpful as a clue if the customer complains of receiving unexpected intercept tone after accessing ISDN trunks or PRI endpoints. **1** Determine the trunk group from the circuit pack and port number (in the aux data field) **2** check the BCC fields of the pertinent routing patterns. **3** Also, investigate whether or not the calling and called endpoints are compatible (for example, some ISDN switches may not allow a voice station to call a data extension).

3 of 3

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the *Primary Signaling Link Hardware* check (#636), you may also clear errors generated from other tests in the testing sequence.

Table 181: System Technician-Demanded Tests: ATM-SGRP

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Primary Signaling Link Hardware check (#636)	X	X	ND
Layer 2 Status test (#647)	X	X	ND
Remote Layer 3 Query test (#1291)	X	X	ND

1 D = Destructive, ND = Nondestructive

Primary Signaling Link Hardware Check (#636)

The ATM-SGRP Signaling Group D-channel port depends on the health of the TN230X interface circuit pack on which it resides. This test fails if there are problems with either the ATM-DCH (D-channel port) MO or the TN230X circuit pack. Investigate the ATM TN230X circuit pack (ATM-TRK) anytime there are problems with the ATM D-channel port (ATM-DCH).

Table 182: Primary Signaling Link Hardware Check (#636)

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error Retry the command at 1-minute intervals up to 5 times.
8	FAIL	There is a problem with the ATM TN230X circuit pack or the ATM signaling channel (D channel), preventing any ISDN trunk calls until the problem is resolved. **1** Consult the procedures for the TN230X circuit pack (ATM-TRK) and the ATM D channel (ATM-DCH).
	PASS	The basic physical connectivity of the D channel is intact and functional. **1** Try this test repeatedly to ensure the link is up and to uncover any transitory problems.

Layer 2 Status Test (#647)

The Layer 2 Status test checks the layer-2 status of the ATM-SRG signaling channel (D channel). This test fails when:

- there is a hardware failure
- there is a facility problem
- the D channels are not administered correctly

The Signaling Link Hardware Check (Test #637) and the Remote Layer 3 Query test (#1291) detects most problems caused by hardware failures or incorrect administration.

Table 183: Test #647 Layer 2 Status Query Test

Error Code	Test Result	Description / Recommendation
1132	ABORT	Internal system error. The port location for the D channel is not known. This condition should not be possible since an administered ATM circuit pack must be specified when a Signaling Group is administered: **1** Retry the command at 1-minute intervals up to five times.

1 of 2

Table 183: Test #647 Layer 2 Status Query Test

Error Code	Test Result	Description / Recommendation
1134	ABORT	Internal system error. The associated ATM circuit pack is not administered. This condition should not be possible, since an administered ATM circuit pack must be specified when administering a Signaling Group. **1** Retry the command at 1-minute intervals up to three times.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to five times.
1	FAIL	Layer 2 of the signaling channel is down. **1** Examine the results of the Signaling test (#636), and follow recommendations provided there. **2** If Test #636 (Primary Signaling Link Hardware Check) passes, the Layer 2 Query test may still fail if the signaling channel at the far end has not been administered correctly or if the signaling channel has been busied out. **3** Verify that the far-end signaling channel (D channel) has been administered correctly. **4** Verify that the ATM-DCH port used for the D channel has not been busied out at the far end.
3	FAIL	The D channel is down. **1** Examine the results of the Primary Signaling Link Hardware Check (#636) and follow recommendations provided there. **2** If Test #636 (Primary Signaling Link Hardware Check) passes, the Layer 2 Query test may still fail if the signaling channel at the far end has not been administered correctly or if the signaling channel has been busied out. **3** Verify that the far-end signaling channel (D channel) has been administered correctly. **4** Verify that the far-end ATM-DCH ports used for the Primary and Secondary D channels have not been busied out.
	PASS	The Primary signaling channel is up.

2 of 2

Remote Layer 3 Query (#1291)

This test queries the far-end switch or terminal adapter to determine whether the signaling connection is functioning properly at Layer 3. It selects a B channel in the in-service or maintenance service state and sends an ISDN layer-3 SERVice message, which requires a response from the far end (similar to performing Test #256 on an ISDN trunk). The test is not performed if there are no B channels in an appropriate ISDN service state (for example, when none are administered or they are all out of service).

NOTE:
The service state can be displayed by using the **status trunk *trunk-group/trunk-member*** or **status pri-endpoint** command.

As is the case with Test #256 for an ISDN trunk, a PASS only indicates that a message was composed and sent to the far-end switch or terminal adapter. The ISDN PRI Specification allows up to 2 minutes for a response. Check the Error Log for ATM-SGRP errors of type 2305 for evidence of a Remote Layer 3 Query failure.

Test #636 checks the health of the D channels and ATM Interface circuit packs. This test goes one step further by checking the communication path from the processor, through the TDM/packet bus and ATM Interface circuit pack, and on to the far-end switch or terminal adapter. A special ISDN message is sent to the far-end switch or terminal adapter that must respond within a specified amount of time. This test is designed to ensure that the communication path between the switch and the far end is up and operational, and that the two endpoints can properly exchange ISDN control messages.

Table 184: Test #1291 Remote Layer 3 Query

Error Code	Test Result	Description / Recommendation
1006	ABORT	There are no associated B channels in an ISDN “in-service” or “maintenance” service state. This is a NORMAL ABORT. **1** Administer or release an ISDN trunk or PRI endpoint before retrying the test. For an ATM trunk, use **status trunk *grp#/mbr#*** to verify the ISDN trunk state. **2** Retry this test when at least one B channel is in the “in-service” or “maintenance” states.
1113	ABORT	The signaling channel is down. Therefore, no messages can be sent to the far-end switch or terminal adapter. **1** Examine the results of Test #636, and follow recommendations provided there.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2500, none	ABORT	Internal system error or administration problem **1** Determine whether any B channels are administered. **2** If there are none, then this is a normal ABORT, since this test cannot run unless at least one B channel is administered. **3** If at least one B channel is administered, there is an internal system error. Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 184: Test #1291 Remote Layer 3 Query

Error Code	Test Result	Description / Recommendation
	FAIL	Internal system error **1** See description of ABORT with Error Code 2500.
	PASS	A message was sent to the far-end switch or terminal adapter. The ISDN PRI specification allows up to 2 minutes for a reply. **1** Check the Error Log for ATM-SGRP errors of type 2305 for evidence of a Remote Layer 3 Query failure. **2** If no new errors were logged since this test was run, then this switch and the far-end switch can exchange call control messages. **3** If there is still a problem with a particular ATM trunk, busyout the trunk and run the long test sequence, paying particular attention to the results of Test #258 (ISDN test call).

2 of 2

ATM-SYNC (ATM Synchronization)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ATM-SYNC	MINOR	**display errors**	ATM Synchronization
ATM-SYNC	WARNING	**test synchronization**	ATM Synchronization

This section discusses intra-switch synchronization maintenance and the hardware and software components that provide a common reference frequency for reliable digital communications among the G3r system, the ATM switch, and other PBXs, Central Offices (COs) or customer-premises equipment (CPE). Circuit packs involved in synchronization include:

NOTE:
TN768 or TN780 Tone-Clock circuit packs are not compatible with ATM EIs.

- TN2312 IPSI circuit pack's Tone-Clock circuit
- TN2182 Tone-Clock
- TN722, TN464, and TN767 DS1 Interfaces (all suffixes)
- TN2305/6 ATM Expansion Interface (multimode fiber)

Synchronization is achieved between the S8700 Media Server Multi-Connect IPSI and the port networks (PNs) through the ATM port-network connectivity (ATM PNC) between the networks. Depending on the network's synchronization plan and the status of synchronization sources, the system timing reference may be:

- The clock circuit pack on the ATM switch
- A DS1 or UDS1 interface circuit pack-tapped T1 input signal connected to the ATM switch clock circuit
- An OC-3 interface circuit pack on the ATM switch

Stratum 4 synchronization extracts timing information directly from

- A DS1 or UDS1 reference
- An OC3 reference
- The ATM switch clock

For further information about synchronization including network synchronization, refer to *AT&T Network and Data Connectivity , 555-025-201*.

Stratum 4 Synchronization

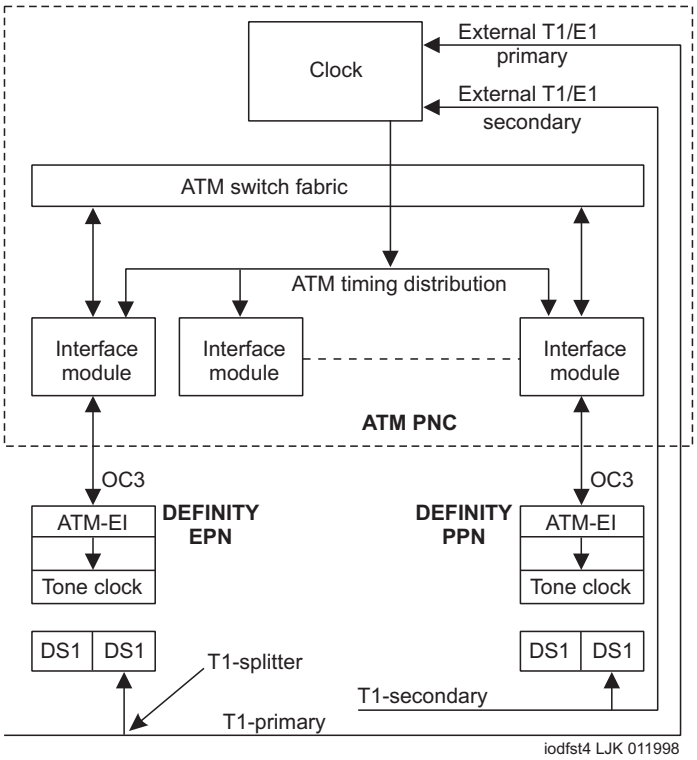
Systems may have primary and secondary synchronization references (DS1/UDS1 interface circuit packs or ATM-Switch) when using Stratum 4 synchronization.

If the primary synchronization reference in Figure 31, Stratum-4 Synchronization with Unduplicated ATM PNC, on page 440 is providing a valid timing signal, then the flow of system synchronization would travel from the DS1 interface circuit pack in the PN to the ATM switch. The primary DS1 interface circuit pack provides a timing signal for the ATM switch clock circuitry. This synchronization source is then distributed to all of its OC3 Interface Modules. Each ATM Expansion Interface circuit pack uses the received data stream from the ATM switch to generate a timing signal. The Tone-Clock circuits in the PNs use this signal to generate timing for every circuit pack in their respective PNs. All PNs, in the above mentioned scenario are designated the *slave* PNs. The ATM switch is the *master* that contains the system synchronization source. If the primary synchronization reference does not provide a valid timing signal, ATM synchronization maintenance infers a switch to the secondary reference.

If the primary synchronization reference is not providing a valid timing signal, the system automatically switches to the secondary synchronization reference. If the primary synchronization reference is invalid, and if the secondary reference does not provide a valid timing signal or is not administered as a synchronization reference, the switch infers that the local oscillator of the ATM switch provides the system timing source. If the system is using the local oscillator of the ATM switch as the system timing source because the primary and secondary references are providing invalid timing signals, when either the primary or secondary reference becomes valid again, the system switches back to the primary or secondary source. When both the primary and secondary source become valid, the system switches to the primary source, since the primary source is always preferred over the secondary source when both sources are equally healthy.

Figure 31, Stratum-4 Synchronization with Unduplicated ATM PNC, on page 440 depicts a simplex ATM PNC with T1/OC3 synchronization reference into the ATM switch.

Figure 31: Stratum-4 Synchronization with Unduplicated ATM PNC



NOTE:
The TN722 DS1 Interface circuit pack does not provide a synchronization reference as reliably as the TN767 or TN464C circuit packs. Therefore, administer the TN767 or TN464C circuit packs as the primary or secondary sources.

Stratum-3 Synchronization

Stratum-3 synchronization is not supported in S8700 Multi-Connect with ATM PNC.

Synchronization Troubleshooting

A significant part of the Synchronization Recovery Strategy for a S8700 Multi-Connect with ATM PNC resides in the ATM switch's clock hardware, firmware, and software. S8700 Multi-Connect monitors synchronization performance and alarms any faulty components. See SYNC (Port-Network Synchronization) on page 1751.

ATM-SYNC Commands

Use the following commands to help troubleshoot ATM-SYNC problems:

change synchronization	Allows primary and secondary references to be administered for the Stratum 4 option, or `ATM-Switch`, indicating that the synchronization references are input directly to the ATM switch
status synchronization	Shows the current inferred synchronization reference
status synchronization	Shows the administered primary and secondary synchronization references
list timing-source	Displays all DS1 and UDS1 locations that are allowed to be administered as primary or secondary references with the **change synchronization** command
disable/enable synchronization-switch	Prevents or allows switching to another synchronization source
test synchronization	Tests the administered synchronization source

Error Log Entries and Test to Clear Values

Table 185: Synchronization Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test synchronization**
1 (a) (g)		None	WARNING/ MINOR	OFF	None
257 (b) (g)		None	WARNING/ MINOR	OFF	None
513 (c) (g)		None	WARNING/ MAJOR	OFF	None
1537 (d)[2]		None	WARNING	OFF	None
1793 (e)[2]	0-50	None	NONE	OFF	None
2049 (f)[2]	0	None	WARNING	OFF	None

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 It may take up to 1 hour for these alarms to clear via the "leaky bucket" strategy.

Notes:

a Error Type 1: problem with the primary DS1 reference. It is cleared when the primary reference is restored. The following steps should give an indication of the source of the problem:

1 Check if the primary DS1 interface circuit pack is inserted in the carrier with the **list configuration board *location*** command.

2 Verify that the administered primary reference matches the DS1 reference from the network synchronization plan.

3 Test the primary DS1 interface circuit pack with the **test board *location* long** command. Check the Error Log for DS1-BD or UDS1-BD errors and see DS1-BD (DS1 Interface Circuit Pack) on page 760 or 'UDS1-BD (UDS1 Interface Circuit Pack) on page 1950 to resolve any errors associated with the primary DS1 (DS1 or UDS1) interface circuit pack. If the only errors against DS1-BD or UDS1-BD are slip errors, then follow the procedures described in the troubleshooting section above. If no errors are listed in the Error Log for the primary DS1 interface circuit pack, continue with the following steps.

4 Test the active Tone-Clock circuit in the master PN with the **test tone-clock *location* long** command. Check the Error Log for TDM-CLK errors and verify that TDM Bus Clock Test #148 (TDM Bus Clock Circuit Status Inquiry test) passes successfully. If Test #148 fails with an Error Code 2 through 32, see TDM-CLK (TDM Bus Clock) on page 1847 to resolve the problem.

b Error Type 257: problem with the secondary DS1 reference. It is cleared when the secondary reference is restored. Refer to note (a) to resolve this error substituting **secondary** for **primary** in the preceding resolution steps.

c Error Type 513: the ATM switch clock is inferred to be providing the timing source for the system. The primary and secondary (if administered) are not providing a valid timing signal. Investigate errors 1 and 257 to resolve this error.

d Error Type 1537: over half of the DS1s that are administered with slip detection enabled through the `Slip Detection?` field set to **y** are experiencing slips.

e Error Type 1793: inferred excessive switching of system synchronization references has occurred. When this error occurs, it is inferred that the ATM switch clock has become the synchronization reference for the system.

1. Check for timing loops and resolve any loops that exist.
2. Test the active Tone-Clock circuit in the master PN with the **test tone-clock *location* long** command.

   Check the Error Log for TDM-CLK errors, and verify that TDM Bus Clock Circuit Status Inquiry test (#148) passes successfully.

   If Test #148 fails with an Error Code 2–32, see TDM-CLK (TDM Bus Clock) on page 1847 to resolve the problem. If not, continue with the following steps.
3. *For Duplicated Tone-Clock circuit packs in the master PN:* Switch Tone-Clock circuit packs on the master PN with the **set tone-clock *location*** command.

   For Simplex Tone-Clock circuit packs in the master PN: replace the primary and secondary (if administered) DS1 Interface circuit packs.
4. Investigate any other SYNC errors.

f Error Type 2049: the ATM Expansion Interface circuit packs have errors that affect synchronization. Test the ATM Expansion Interface circuit pack with the **test board *location*** command.

This error is cleared by a “leaky bucket” strategy and takes up to one hour to clear (leak away) the error counter once it is cleared.

g Error Types 1, 257, and 513: noise on the DS1 line can cause transient alarms on synchronization. Therefore, when a synchronization problem occurs on Error Types 1, 257, or 513, a WARNING alarm is first raised for 15 to 20 minutes before the alarm is upgraded to a MINOR or MAJOR alarm.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented below when inspecting errors in the system.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Test Synchronization test (#417)	X	X	ND

1 D = Destructive, ND = Non-destructive

Test Synchronization Test (#417)

This test updates all the Synchronization Maintenance component circuit packs with the correct information regarding their role in providing synchronization for the system. All the Tone-Clock, ATM Expansion Interface, DS1 Interface, and UDS1 Interface circuit packs in the system are updated through this test. This test either passes or aborts.

Table 186: Test #417 Test Synchronization Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 3 times.
1115	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error
	PASS	The synchronization maintenance component circuit pack parameters have been successfully updated. The system should be synchronized after successful execution of this test. **1** If synchronization problems still exist, refer to the Error Log to obtain information regarding the source of the problem.

ATM-TRK (Circuit Emulation Service Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
ATM-TRK	MAJOR	**test board *location***	ATM TRUNK (ATM Circuit Emulation Service)
ATM-TRK	MINOR	**test board *location***	ATM TRUNK (ATM Circuit Emulation Service)
ATM-TRK	WARNING	**test board *location***	ATM TRUNK (ATM Circuit Emulation Service)

1 For information on specifying a location, see Command Syntax on page 179.

This MO explains how you test and repair TN230x ATM Interface circuit packs (TN2305 and TN2306) that have been administered as virtual ISDN-PRI trunks for ATM Circuit Emulation Service (CES). The maintenance instructions for TN230x circuit packs that have been administered as Expansion Interfaces for WAN connectivity are in the ATM-INTF (TN2305/6) MO.

Description

The TN2305 and TN2306 (Table 187, R7 ATM-TRK circuit packs, on page 445) are dual-purpose ATM circuit packs that can be administered as either personality:

- ATM Circuit Emulation Service or virtual ISDN-PRI signaling trunks
- Expansion Interfaces (ATM-EIs) for port-network connectivity (ATM PNC) between the PNs

Either circuit pack "personality" requires SONET OC-3 or SDH STM-1 fiber cable connections between the circuit pack and the ATM switch. As a trunk board, it supports direct connection between ATM CES circuit packs without an intervening ATM switch.

Table 187: R7 ATM-TRK circuit packs

Circuit pack	Channel types	Interface	Fiber	Echo cancellation
TN2305	B and D channels	24 or 32 channel	Multimode	Y
TN2306	B and D channels	24 or 32 channel	Single-mode	Y

NOTE:
TN230x circuit packs are not interchangeable.

ATM Circuit Emulation Service

Under ATM Circuit Emulation Service (CES), you simulate ISDN-PRI circuits by assigning ports to *signaling groups*. Each signaling group represents a PRI circuit, and the ports in the group represent the D channel and B channels of that circuit. TN230x circuit packs support up to 248 ports per circuit pack.

Virtual D channels

Non-facility associated signaling is not supported under ATM-CES, so you must reserve one port in each signaling group for use as a D channel (channel 24 when emulating a T-1 ISDN facility, channel 16 when emulating an E-1 facility). The D channel can be any physical port from 9 to 32.

Virtual circuits

The TN230x can support a varied number of virtual circuits, depending on the switch and the administration of the circuit pack. Table 188, Circuit and channel capacities, for each DEFINITY model, on page 446 lists the possibilities for various DEFINITY ECS models.

Table 188: Circuit and channel capacities, for each DEFINITY model

Model	Ports	Emulated circuits (signaling groups)	Channels/ circuit	Virtual D channels	Virtual B channels
csi	248	1 to 8	24 (T1), 31 (E1)	1–8	6–240
si	248	1 to 8	24 (T1), 31 (E1)	1–8	6–240
r	248	1 to 8	24 (T1), 31 (E1)	1–8	6–240

Virtual trunk groups

You cannot bundle physical DS1 ISDN-PRI circuits and virtual ATM-CES circuits into the same trunk groups. Virtual circuits can only be assigned to all-virtual, all-ATM trunk groups. Table 189, ATM CES capacities by DEFINITY model, on page 446 lists the possible trunk-group capacities.

Table 189: ATM CES capacities by DEFINITY model

Model	Ports per trunk group (max)	Trunk groups per switch (max)	Trunks per switch (max)
csi	99	99	400
si	99	99	400
r	255	666	400

Table 190, Ports available for trunking, for each ISDN facility type, on page 447 shows the ATM CES capacities for both T1 and E1 circuits.

Table 190: Ports available for trunking, for each ISDN facility type

Type	Channels per signaling group (trunk)	Max. signaling groups (trunks) per circuit pack	Max. available ports	Reserved ports	Total ports
T1:	24	8	192	ports 1-8	256
E1:	31	8	248	ports 1-8	256

LEDs

The ATM circuit pack LEDs give you a visual indication of the condition of the TN230x circuit pack (Table 191, ATM-TRK LED interpretation, on page 447).

Table 191: ATM-TRK LED interpretation

LEDs	Condition	LED status
Red	Error (alarm logged)	On
Red and Green	Booting (LEDs being tested)	Blinking (on 200 ms, off 200 ms)
Green	Test/maintenance in progress	On
Amber	Fiber Loss of Signal (LOS), LOF, MS_RDI, MS_AIS, LCD, HP_RDI, HP_AIS, LOP, PSC	Blinking fast (100 ms on, 100 ms off)
Amber	Signal to ATM switch down	Blinking slowly (500 ms on, 500 ms off)
Amber	One or more CES signaling groups administered	On
Amber	CES signaling group not administered or not reporting to firmware	Off

ATM-TRK-related commands

Table 192, ATM CES troubleshooting commands, on page 448 lists some commands that can be useful in troubleshooting ATM errors and alarms.

Table 192: ATM CES troubleshooting commands

Command	Description
display circuit-packs *cabinet*	Shows the circuit packs in the cabinet, identifying ATM trunk as well as ATM-EI boards. "ATM Interface" boards have not been administered as CES or PNC.
display atm ports *UUCSSppp*	Shows the 256 ports on the ATM board with the corresponding signaling and trunk group.
list configuration atm	Lists the ATM boards, identifying equipment location, board code, type, and vintage.
list configuration trunks	Lists boards identifying assigned ports. While the ATM board is listed, the 256 ports are not.
busyout/release atm signaling-group	Busyout or release of an ATM signaling group within a trunk group.
status atm signaling-group	Show current status of an ATM signaling group.
status trunk-group	Shows status of the trunk group (ATM signaling groups are part of trunk groups).

Error Log Entries and Test to Clear Values

Table 193: ATM-TRK Error Log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any		**test board** *UUCSS*

2 of 2

Notes:

a **Error Type 1:** the ATM-TRK circuit pack does not appear to be in its assigned slot.

1 Make sure that the ATM-TRK circuit pack is installed correctly seated in the slot administered for the ATM trunk.

b **Error Type 18:** the ATM circuit pack is busied out.

1 Run **release board *UUCSS***.

c **Error Type 23:** an ATM trunk is administered, but the corresponding ATM-TRK circuit pack does not appear to be physically installed.

1 Make sure the ATM-TRK circuit pack is installed and correctly seated in the slot.

d **Error Type 125:** an ATM trunk is administered but a non-ATM-TRK circuit pack is installed in the corresponding slot. You have two options:

- Replace the incorrect circuit pack with an ATM-TRK circuit pack.
- Or re-administer the slot for the circuit pack that is physically present, locate the slot where the ATM-TRK circuit pack is actually installed, and re-administer the ATM trunk.

e **Error Type 257:** Control Channel Loop test (#52) failed. The circuit pack is not properly connected with the control channel on the TDM bus.

1 Take the corrective action specified by Test #52.

f **Error Type 513:** ATM Crosstalk test (#1298) failed. The board is writing to or reading from a TDM time slot that is not allocated to the board, or the Digital Signal Processor (DSP) selected for this test has malfunctioned.

1 Run **test board *UUCSS***.

2 Take the corrective action specified for Test #1298.

g **Error Type 769, 770:** the ATM switch is requesting too many LAPD retransmissions (off-board ATM cell corruption errors).

Error Type	Aux Data	Description
769	35	Excessive LAPD retransmission requests
770	25	Uncorrectable ATM cell headers – threshold

1 Check the connections between the fiber cable, the ATM-TRK circuit pack, and the ATM switch.

2 See PKT-BUS (Packet Bus) on page 1406 for test and corrective procedures.

3 Determine what type of fiber is installed between the ATM-TRK circuit pack and the ATM switch.

If	Then
There is multimode fiber	Check the length of the fiber. If the cable is longer than 2 km, it may be causing errors.
There is single-mode fiber or the length of the multimode fiber is less than 2 km	The source of the errors can lie in the ATM facility, the ATM-TRK circuit pack, or the far-end circuit pack.

4 Perform ATM loopback tests on the near-end ATM-TRK circuit pack and on the far-end circuit pack or ATM switch.

If	Then
The ATM-TRK circuit pack fails the loopback test.	The problem is in the ATM-TRK circuit pack. Replace the circuit pack.
The far-end circuit pack or ATM switch fails the loopback test.	The problem is in the far-end circuit pack or ATM switch. Consult the circuit-pack or ATM switch documentation for advice.
The equipment at each end of the ATM span passes the loopback test	The problem is somewhere in the ATM span. Lack of bandwidth can be forcing an intermediate ATM switch to drop cells.

5 Check capacity and peak bandwidth consumption for the ATM span.

If	Then
The capacity of the span is inadequate, or bandwidth consumption is too high.	Reduce traffic on the system to ensure that it is using no more that its subscribed bandwidth.

h **Error Type 771:** the ATM switch is sending cells with unknown Virtual Path-Identifier (VPI) and Virtual Channel-Identifier (VCI) addresses.

1 Make sure that the ATM-TRK circuit-pack address is administered identically on the ATM switch and the S8700 Multi-Connect system.

i **Error Type 1281:** Board major signals error (loss of high-level signal). The far end has detected a major problem in transmissions originating from the ATM-TRK circuit pack. The possible Aux Data values for this software counter are listed in Table 194, Error type 1281 Aux Data and repair procedures, on page 451.

Table 194: Error type 1281 Aux Data and repair procedures

Aux Data	Alarm Description	Repair procedure
15	SYSCLOCK failed	The board is not locked to the TDM backplane clock signal. This is probably due to a Tone-Clock problem. **1** Check for TDM-BUS or TONE-BD errors in the Error Log. **2** If no other problems are present, reset the circuit pack (**reset board *UUCSS***)
16	Loss of Signal: LOS	The fiber is not connected properly to the ATM-TRK board or ATM switch (or to the multiplexer section [MUX] if present).It is possible that the board transceivers are not functioning properly. **1** Run **test board *UUCSS***. **2** If Test #1259 fails with Error Code 16, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. If it does the problem is off-board. **3** If the amber LED continues to flash, replace the circuit pack.
17	Loss of Frame: LOF	The fiber signal cannot obtain or maintain STM-1/OC-3 framing. **1** Try to more the fiber on the ATM switch side to a different port. **2** If the problem persists, reset the circuit pack (**reset board *UUCSS***).

1 of 4

Table 194: Error type 1281 Aux Data and repair procedures*Continued*

Aux Data	Alarm Description	Repair procedure
18	Multiplexer Section Alarm Indication Signal: MS_AIS	There is a major problem on the far end (between multiplexer section [MUX] and the switch) that prohibits the circuit pack from sending a valid signal. **1** See if the ports at the MUX and/or the ATM switch are connected snugly. **2** Run **test board *UUCSS***. **3** If Test #1259 fails with Error Code 18, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. **4** If it does the problem is off-board. **5** If the amber LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.
19	Multiplexer Section Remote Defect Indicator: MS_RDI	The far end is detecting a major problem with the signal that this board is transmitting. **1** Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface **2** Run **test board *UUCSS*** command. **3** If Test #1259 fails with Error Code 19, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. **4** If it does the problem is off-board. **5** If the amber LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.
20	Loss of pointer: LOP	ATM framer chip is unable to access the payload part of the signal. **1** Reset the board (**reset board *UUCSS***). **2** If the error persists replace the board.
21	Path Signal Error (PSL) (STM1/SONET)	The incoming signal payload is not set up for transmission of ATM data. **1** Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface.

2 of 4

Table 194: Error type 1281 Aux Data and repair procedures*Continued*

Aux Data	Alarm Description	Repair procedure
22	High-level Path Alarm Indication Signal: HP_AIS	The payload is invalid. **1** Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface. **2** Run **test board *UUCSS***. **3** If Test #1259 fails with Error Code 22, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. **4** If it does the problem is off-board. **5** If the amber LED continues to flash, replace the circuit pack.
23	High-level path Remote defect Indicator: HP_RDI	The far end is detecting a major problem with the signal that this board is transmitting. The transmitted payload is invalid. **1** Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface. **2** Run **test board *UUCSS*** command; if Test #1259 fails with Error Code 23, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. **3** If it does the problem is off-board. **4** If the amber LED continues to flash, replace the circuit pack.

Table 194: Error type 1281 Aux Data and repair procedures*Continued*

Aux Data	Alarm Description	Repair procedure
24	Loss of cell delineation (LCD)	On board ATM framer chip is not able to frame cells based on the cell header. **1** Reset the board (**reset board *UUCSS***). **2** If the error persists, replace the board.
27	SIGCON_DOWN ATM switch high level signal.	The board cannot communicate with the ATM switch. **1** Busyout the board (**busyout board *UUCSS***). **2** Test the board (**test board long *UUCSS***). **3** If Test #1260 fails, replace the board. **4** If Test #1260 passes, make sure the ATM address on both the S8700 Multi-Connect and the ATM switch sides are the same for this board. **5** If the address is the same, change the port on the ATM switch side. **6** If the error is resolved, the problem is on the ATM switch port.

4 of 4

j **Error Type 1537:** LANHO bus timeout. The circuit pack is transmitting too many bytes on the LAN bus for a single frame. This can be due to:

- an on-board fault.
- a faulty data received on one of the circuit pack's external ports.

If the error occurs three times in 10 minutes, the board is isolated from the packet bus, and the board is alarmed. To clear the alarm:

1 Restore this circuit pack to the packet bus with this command sequence:

a busyout board *UUCSS*

b reset board *UUCSS*

c test board *UUCSS* long

d release board *UUCSS*

2 If the problem persists and there are no PKT-BUS or port alarms, replace the circuit pack.

k **Error Type 1538:** The ATM-TRK circuit pack is hyperactive (sending an abnormal number of control messages to the processor). Use the following command sequence for this ATM-TRK circuit pack:

1 busyout board *UUCSS*

2 reset board *UUCSS*

3 test board *UUCSS* long

4 release board *UUCSS*

5 If this error persists, replace the circuit pack.

l Error Type 1794: LANHO transmit FIFO overflow. The circuit pack's transmit buffers have overflowed.

1 Run **test board *UUCSS* r 5**.

If	Then
Test #598 fails	Replace the circuit pack.

m **Error Type 2049:** ACL Link Failure (link is down). The ATM Control Link (ACL) has failed, communication has been interrupted between the server and the ATM-TRK circuit packs on the system, and signaling-group parameters are not communicated across the packet bus.

1 Check the 'PKT-BUS (Packet Bus) on page 1406 and 'SYS-LINK (System Links) on page 1782 MOs, and follow the repair procedures indicated.

2 Run **test board *UUCSS*** against the ATM-TRK circuit pack.

If	Then
Test 598 fails.	Follow the repair procedures suggested for that test.

n **Error Type 2306:** too many parity errors in data received from the LAN/packet bus.

1 Run **test board UUCSS**.

If	Then
Test 598 fails.	Follow the repair procedures suggested for that test.
Test 598 passes	See PKT-BUS (Packet Bus) and perform the specified repair.
There are no errors against the packet bus MO	This can be a transient condition. Do nothing now, but escalate if the error occurs repeatedly.

o **Error Type 2561:** Packet Interface Loop Around test (#598) failure. The ATM-TRK circuit pack has failed, the packet bus has a minor alarm active, or the packet bus is out of service.

1 Run **test board UUCSS**.

If	Then
Test 598 fails	Follow the repair procedures suggested for that test.
Test 598 passes	See PKT-BUS (Packet Bus) and perform the specified repair.
There are no errors against the packet bus MO	This can be a transient condition. Do nothing now, but escalate if the error occurs repeatedly.

p **Error Type 2817, 2818:** DSP failure detected along the circuit path.

1 Run **test board UUCSS**.

2 Follow the repair procedures suggested for Test #1293.

Error Type	Description
2818	One or more DSPs failed. The Aux Data field contains the ID number of DSP that failed
2817	DSP test failure. The Aux Data field contains the following information about the failed DSPs: X is the number of talker DSPs Y is the number of listener DSPs Z is the number of echo-cancelling DSPs

q **Error Type 3330:** LANHO critical error. The circuit pack reports that the on-board LANHO chip is insane (possibly due to a problem in packet-bus arbitration, in the transmission line frame, or in the circuit pack itself). The circuit pack cannot talk to the packet bus.

1 Check for PKT-BUS alarms.

If	Then
There is a packet-bus alarm	There is probably a packet-bus problem, particularly if other circuit packs on the packet bus report the same error. See PKT-BUS (Packet Bus) and Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in Maintenance Procedures (555-245-103) for repair procedures.
There are no packet-bus alarms	Run the following command sequence: **1** busyout board *UUCSS* **2** reset board *UUCSS* **3** test board *UUCSS* long **4** release board *UUCSS*
The problem persists	Replace the ATM-TRK circuit pack.

r **Error Type 3585:** Major board alarm; failure of critical components involved in the operation of the circuit pack. The circuit pack has failed, and the switch can no longer recognize it.

Aux Data	Description
1	ATM framer chip failure
2	NCE failed
4	TDM PLD failed
5	Every DSP on the circuit pack has failed.
6	RNP (Receive Network Processor) failed
7	TNP (Transmit Network Processor) failed
8	MEMORY read/write failure
9	DUART failure

1 Run **test board UUCSS long**.

If	Then
Test #1259 fails with Error Code XXYY and XX is an AUX value in the preceding table	Replace the ATM-TRK circuit pack.
The system does not recognize the circuit pack	Replace the ATM-TRK circuit pack.

s **Error Type 3841:** the ATM-TRK circuit pack received an unrecognized message from the switch and responded with an inconsistent down-link error message.

1 Do nothing. This error does not affect service.

t **Error Type 3842:** LANHO Receive FIFO Overflow error; the packet bus is delivering data to the ATM-TRK circuit pack faster than the circuit pack can distribute it to the endpoint.

1 Do nothing. The circuit pack can recover by itself.

u **Error Type 3843:** The firmware on the circuit pack is reporting a resource that is to low. This error does not affect the service and no action is required.

- **Error Type 3999:** circuit pack sent a large number of control channel messages to the switch within a short period of time.

If	Then
Error Type 1538 is also present	Circuit pack is taken out of service.
Error Type 1538 is absent	Circuit pack is not taken out of service, but has generated 50% of the messages necessary to be considered hyperactive. • This can be normal during heavy traffic. • If the error is logged during light traffic, it can indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and error codes

Always investigate problems in the order presented. When you clear one of the error codes associated with a given test, you clear errors generated by other tests in the testing sequence. If you clear errors out of order, you can lose important information.

Table 195: System Technician-Demanded Tests: ATM-TRK

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
ATM Board Time Of Day Update (#1261)		X		ND
Connection Audit test (#50)		X		ND
Control Channel Loop test (#52)		X		ND
Packet Interface Loop Around test (#598)	X	X		ND
ATM DSP test (#1293)	X	X		ND
ATM Board Framer Looparound test (#1260)		X		D
ATM Board Error Query test (#1259)	X	X		ND
ATM Cross Talk test (#1298)		X		ND
ATM Board Reset (#1256)			X	D

1 D = Destructive, ND = Nondestructive

Connection Audit Test (#50)

Nondestructive (in a sane switch environment).

The Connection Audit test updates TDM time slots. It sends network-update Control Channel Message Set (CCMS) messages that tell the ATM-TRK circuit pack to listen to, talk to, or disconnect particular time slots.

The test passes if software successfully sends the downlink network-update messages. It aborts otherwise.

CAUTION:
Though normally nondestructive, this test could unintentionally tear down an active call if the connection-manager software's tables are corrupt.

Table 196: Test #50 Connection Audit Test

Error Code	Test Result	Description / Recommendation
None, 2100	ABORT	System resources required for this test are not available. Retry the command up to 5 times at 1-minute intervals.
1019	ABORT	The test aborted because a test was already running on the port. Retry the command up to 5 times at 1-minute intervals.
	FAIL	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
	PASS	The circuit pack has been updated with its translation.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Check the board translations. **2** If the ATM-TRK circuit pack is not administered, run **add atm trunk *UUCSS***. **3** If the ATM-TRK circuit pack is administered correctly, check the error log. **4** If ATM-TRK circuit pack is hyperactive, shut down, and reseat the circuit pack to force re-initialization. **5** If the ATM-TRK circuit pack is correctly inserted, run **busyout board**. **6** Run **reset board**. **7** Run **release board**. **8** Run **test board long** to re-establish the linkage between the internal ID and the port.

Control Channel Loop Test (#52)

The nondestructive Control Channel Loop test is part of the maintenance subsystem's Common Port Board Testing feature. The Common Port Board test sends board vintage queries to a port circuit pack and checks the responses. CCMS downlink notifications tell the circuit pack which TDM Bus (A or B) carries the control channel and which carries the touch tones.

The test passes if the port circuit pack responds. The test aborts if the circuit pack does not respond. The test fails otherwise.

Table 197: Control Channel Test #52

Error Code	Test Result	Description / Recommendation
2000	ABORT	Test request timed out.
2100	ABORT	Could not allocate needed system resources.
2500	ABORT	Internal system error **1** Retry the command up to 3 times at 1-minute intervals.
	FAIL	The ATM circuit pack responded incorrectly. **1** Retry the command up to 3 times at 1-minute intervals. **2** If the test continues to fail, reset the ATM-TRK circuit pack (**reset board *UUCSS***). **3** If test continues to fail, replace the circuit pack or transceiver.
	PASS	The ATM-TRK circuit pack is communicating correctly with the software.
0	NO BOARD	Circuit pack not detected. **1** Check the error log for Error 125 (wrong board) or Error 131 (no board), and correct any errors found. **2** Make sure that the ATM-TRK circuit pack is properly translated and inserted. **3** Check for Error 1538 (hyperactivity). If hyperactive, run **reset board *UUCSS***. **4** Run the test again. If it fails, replace the ATM-TRK circuit pack, and retest.

Packet Interface Loop Around Test (#598)

This nondestructive test checks the ATM-TRK circuit pack's packet-bus interface. The LANHO chip sends data through the bus and back to itself. If the data received is consistent with the data sent, the test passes. The test does not run if the specified PN's packet bus has a minor alarm or is out of service.

Table 198: Packet Interface Loop Around Test (#598)

Error Code	Test Result	Description / Recommendation
S8100: 1144	ABORT	The packet bus in the PPN has a major alarm against it. **1** Run **display alarms** and **display errors**. **2** Perform the PKT-BUS repair procedures associated with the alarms. **3** Retry the command.
2000	ABORT	Test request timed out. **1** Retry the command up to 3 times at 1-minute intervals. **2** If the test fails repeatedly, run **reset board *UUCSS***. **3** If the test continues to fail, replace the ATM-TRK circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate needed system resources. **1** Retry the command up to 5 times at 1-minute intervals.
ANY	FAIL	Data packet not received correctly by the ATM Interface circuit pack. **1** Retry the command up to 5 times at 1-minute intervals. **2** If the test continues to fail, replace the ATM-TRK circuit pack.
	PASS	The Packet Interface test passed.

ATM Board Reset (#1256)

This test is **destructive**.

This test checks the sanity of the angel processor using the Sanity and Control Interface (SAKI) test (Common Port Board test, #53). It resets the circuit pack if the SAKI test fails and runs the test again.The ATM Board Reset test passes if SAKI can successfully reset and retest the board.

Before running the SAKI test, you must:

- Move synchronization off the ATM-TRK circuit pack
- Busyout the ATM-TRK circuit pack

The test aborts if the ATM-TRK circuit pack is supplying synchronization.

Table 199: ATM Board Reset (#1256)

Error Code	Test Result	Description / Recommendation
1005	ABORT	Wrong circuit pack configuration to run this test. The ATM CES Trunk Interface circuit pack provides timing for the system and cannot be reset without major system disruptions. **1** Set synchronization to another ATM CES trunk circuit pack or to the Tone-Clock circuit pack and test again.
1015	ABORT	Test cannot be run because the ATM-TRK circuit pack has not been busied out. **1** Busyout out the circuit pack (**busyout board *UUCSS***). **2** Repeat the test (**test board *UUCSS* long**).
None	ABORT	Could not allocate the required system resources **1** Retry the command up to 5 times at 1-minute intervals. **2** If the test continues to abort escalate the problem.
2000	ABORT	Sanity test timed out. **1** Wait 5 minutes. Then see if ATM-TRK circuit pack is visible to the system by running **list configuration all**. **2** If the ATM-TRK circuit pack is visible (**list configuration all**), run the test again, and escalate if the problem recurs. **3** If the ATM-TRK circuit pack is not visible to the system (**list configuration all**), re-seat the ATM-TRK circuit pack, and retest. **4** If the ATM-TRK circuit pack is still not recognized by the system, replace the board.
2100	ABORT	Could not allocate required system resources **1** Retry the command up to 5 times at 1-minute intervals.
2500	ABORT	Internal system error **1** Try to reset the circuit pack (**reset board *UUCSS***).
1	FAIL	The circuit pack failed to reset
2	FAIL	The circuit pack failed to restart. **1** Retry command. **2** If the problem persists, replace the ATM-TRK circuit pack.

1 of 2

Table 199: ATM Board Reset (#1256)

Error Code	Test Result	Description / Recommendation
	PASS	The ATM-TRK circuit pack is successfully reset.
0	NO BOARD	No board detected. **1** Check the error log for Error 125 (wrong board) or Error 131 (no board), and perform the appropriate repair, if needed. **2** Ensure that the board is properly translated and inserted. **3** Check for Error 1538 (hyperactivity). If hyperactive, run **reset board *UUCSS***. **4** Run the test again. If it fails, replace the ATM-TRK circuit pack, and retest.

2 of 2

ATM Board Error Query Test (#1259)

This **non**destructive ATM Error Query test retrieves the most severe, active, on- and off-board problem from the ATM-TRK circuit pack's firmware and increments error counts in the Error Log.

The test passes if there are no errors and fails otherwise. A passing test clears the software counters; a failure increments the counter associated with the problem that caused the failure and clears the others.

Table 200: ATM Board Error Query Test (#1259)

Error Code	Test Result	Description / Recommendation
2000	ABORT	Test request timed out.
2031	ABORT	SCD failure. Unable to sent down-link message.
2100	ABORT	Could not allocate needed system resources.
2500	ABORT	Internal system error **1** Retry the command up to 3 times at 1-minute intervals.
XXYY	FAIL	On-board error XX (Table 201, Aux Data XX for ATM Board Error Query Test (#1259), on page 464) and/or off-board error YY (Table 202, Aux Data YY for ATM Board Error Query Test (#1259), on page 465). **1** Examine the error logs and repair any errors found.

1 of 2

Table 200: ATM Board Error Query Test (#1259)

Error Code	Test Result	Description / Recommendation
	PASS	The ATM circuit pack has passed this test. No service effecting errors/alarms have been detected on board.
0	NO BOARD	ATM-TRK circuit pack not found **1** Check the error log, and correct Error 125 (wrong board) or Error 131 (no board), if found. **2** Make sure that the board is properly translated and inserted. **3** Check for hyperactivity (Error 1538). Run **reset board *UUCSS*** if hyperactive. **4** Run the test again. If it fails, replace the board, and retest.

2 of 2

Aux Data XX

Table 201: Aux Data XX for ATM Board Error Query Test (#1259)

If XX=	Then
1	ATM framer chip failed
2	NCE chip failed
3	LANHO critical error
4	TDM Programmable Logic Device failed
5	Every on-board DSP failed
6	Receive Network Processor failed
7	Transmit Network Processor failed
8	Memory read failed
9	Dual UART chip failed
10	LANHO receive parity error
11	LANHO FIFO overflow error
12	LAN bus time out
13	LANHO Xmit FIFO overflow error
14	One or more on-board DSPs failed

Aux Data YY

Table 202: Aux Data YY for ATM Board Error Query Test (#1259)

If YY=	Then
15	Back plane clock failed
16	Loss of signal
17	Loss of frame
18	MS alarm indication signal error
19	MS remote defect indicator error
20	Loss of pointer
21	Path signal level mismatch
22	High-level path alarm indication signal
23	High-level path remote defect indicator
24	Loss of cell delineation
25	Uncorrectable headers sent by the ATM switch
26	Too many cells with invalid VPI/VCI combination
27	The signaling link between the board and the ATM switch is down.
34	Excessive AAL-5 retransmission requests - per VC
35	Excessive LAPD retransmission requests - per VC
37	ATM CLP (cell loss priority) bit – see MO ATM-NTWK (ATM Network Error)
38	ATM congestion indicator – see MO ATM-NTWK (ATM Network Error)
39	ATM cell underrun – see MO ATM-NTWK (ATM Network Error)
40	ATM cell overrun – see MO ATM-NTWK (ATM Network Error)
41	Lost ATM cells – see MO ATM-NTWK (ATM Network Error)

ATM Board Framer Loop-Around Test (#1260)

This test is **destructive**.

This test verifies the board's circuit (Time Division Multiplexing) and packet paths using an on-board, dummy virtual circuit. Before running the test, you must:

- busyout the ATM-TRK circuit pack (**busyout board *UUCSS***) and
- switch synchronization (**change synchronization**) from the ATM-TRK circuit pack

If the ATM-TRK circuit pack is supplying synchronization, the test aborts.

The test sends a digital counter from one of the Tone Generators via one of the TDM bus time slots. The ATM framer interface converts this digital counter to ATM cells and loops them back internally. The ATM-TRK circuit pack converts the cells back to a digital counter and sends it to the tone receiver for

verification. If the circuit pack passes the circuit check, the software checks the packet path by sending a packet from the packet-interface circuit pack to the ATM-TRK circuit pack via the ATM protocol stack.

Table 203: ATM Board Framer Loop-Around Test (#1260)

Error Code	Test Result	Description / Recommendation
1002	ABORT	Time slots could not be allocated. Traffic could be heavy or time slots could be out-of-service. **1** Run **display errors**, and perform repairs associated with TDM-BUS errors. **2** Retry the command up to 3 times at 1-minute intervals.
1003	ABORT	Tone receiver could not be allocated. **1** Run **display errors**, and perform the repairs associated with TTR-LEV and TONE-PT errors. The test cannot run unless there is at least one Tone Detector available in the PN that holds the ATM-TRK circuit pack. **2** Retry the command up to 3 times at 1-minute intervals.
1015	ABORT	ATM-TRK circuit pack not busied out **1** Busyout the ATM circuit pack. **2** Rerun the command.
1033	ABORT	ATM-TRK circuit pack not found **1** See if the switch can see the circuit pack. Run **status trunk group**. **2** Retry the command.
1139	ABORT	Major alarm on the PN's (**S8100**: EPN) packet bus **1** Run **display alarms**, and perform the repairs associated with PKT-BUS errors. **2** Run **display errors**, and perform the repairs associated with PKT-BUS errors. **3** Retry the command.
1141	ABORT	Packet-interface circuit pack out of service **1** See PKT-INT (Packet Interface).
S8100: 1144	ABORT	Major alarm on the PPN packet bus **1** Run **display alarms**, and perform the repairs associated with PKT-BUS. **2** Run **display errors**, and perform the repairs associated with PKT-BUS. **3** Retry the command.
1394	ABORT	ATM-TRK circuit pack out of service **1** Run ATM Board Reset Test #1256.
2000	ABORT	Request timed out. **1** Retry the command up to 3 times at 1-minute intervals.

Table 203: ATM Board Framer Loop-Around Test (#1260)

Error Code	Test Result	Description / Recommendation
2060	ABORT	Packet-bus link has failed. **1** Retry the command up to 3 times at 1-minute intervals. **2** If the test continues to abort, run **display errors**, and perform the repairs associated with PKT-INT errors.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error **1** Retry the command up to 3 times at 1-minute intervals.
1	FAIL	Test tone not detected over the loop around; packet-path test aborted. **1** Test the active Tone-Clock in the PN, and verify that a tone is reaching the ATM-TRK circuit pack. If not, correct the condition. **2** Run **test board *UUCSS* long**. **3** If the test continues to fail, replace the ATM-TRK circuit pack or transceiver. **4** Rerun **test board UUCSS long.**
2	FAIL	TN1655 Packet Interface circuit pack could not detect the correct data packet. **1** Test the TN1655 Packet Interface circuit pack to verify that it is functioning properly. If not, correct the condition. **2** Run **display errors**, and perform the repairs associated with DS1C-BD errors, if applicable. **3** Run **display alarms**, and perform the repairs associated with DS1C-BD alarms, if applicable. **4** Run **test board *UUCSS* long**. **5** If this test continues to fail, replace the ATM-TRK circuit pack. **6** Run **test board *UUCSS* long**.
3	FAIL	Distorted tone returned **1** Test the active Tone-Clock in the PN, and verify that a tone is reaching the ATM-TRK circuit pack. If not, correct the condition. **2** Run **test board *UUCSS* long**. **3** If the test continues to fail, replace the ATM-TRK circuit pack. **4** Run **test board *UUCSS* long**.
4	FAIL	Unable to create TDM-path loop. **1** Retry the command up to 3 times at 1-minute intervals. **2** If this test continues to fail, replace the ATM-TRK circuit pack. **3** Run **test board *UUCSS* long**.

2 of 3

Table 203: ATM Board Framer Loop-Around Test (#1260)

Error Code	Test Result	Description / Recommendation
5	FAIL	Unable to create packet-path loop. **1** Retry the command up to 3 times at 1-minute intervals. **2** If this test continues to fail, replace the ATM-TRK circuit pack. **3** Rerun **test board *UUCSS* long**.
6	FAIL	A previously established loop around was not released. **1** Run **reset board *UUCSS***. **2** Retry the command up to 3 times at 1-minute intervals. **3** If this test continues to fail, replace the ATM-TRK circuit pack. **4** Rerun **test board *UUCSS* long**.
	PASS	The non-optical parts of the ATM-TRK circuit pack are functioning properly.
0	NO BOARD	ATM-TRK circuit pack not found **1** Check the error log for Error 125 (wrong board) or Error 131 (no board), and correct as necessary. **2** Check that the board is properly translated and inserted. **3** Check for Error 1538 (hyperactivity), and run **reset board *UUCSS*** if necessary. **4** Rerun **test board *UUCSS* long**. **5** If the test fails, replace the board, and rerun **test board *UUCSS* long**.

3 of 3

ATM Board Time Of Day Update (#1261)

The nondestructive ATM-TOD-UPD test updates the system time used by the ATM-TRK circuit pack for SDH/SONET performance monitoring and synchronizes the ATM-TRK circuit pack with the S8700 Multi-Connect system's clock. This test is run during initialization, scheduled maintenance, and craft long test.

Table 204: ATM Board Time Of Day Update (#1261)

Error Code	Test Result	Description / Recommendation
2031	FAIL	The attempt to send the message to the ATM-TRK circuit pack was not successful.
2500	FAIL	Internal system error. Did not send the time-of-day information to the board. **1** Retry the command up to 3 times at 1-minute intervals. **2** If the test aborts with the same error code, escalate the problem.

1 of 2

Table 204: ATM Board Time Of Day Update (#1261)

Error Code	Test Result	Description / Recommendation
	PASS	The ATM-TRK circuit pack is successfully updated with system time. **1** If **status port-network** still indicates that this link is down, it is possible that one or both of the ATM-TRK circuit packs have been busied out. **2** If the link still does not come up, reset one or both ATM-TRK circuit packs on the link.
0	NO BOARD	No board detected. **1** Check the error log for wrong board (Error 125) or no board (Error 131). Resolve either of these issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use **reset board *UUCSS***. **1** Run the test again. If it fails, the board could be bad. Replace the board and retest.

2 of 2

ATM Board DSP Test (#1293)

This test is **non**destructive.

There are three kinds of digital signal processors (DSPs): talkers, listeners, and echo cancelers.Talkers put data on the TDM bus, listeners take data off the TDM bus, and echo cancelers filter out echoes of the main transmission. Firmware allocates DSPs in sets of three (one of each type), up to a maximum of 8 sets. This has three parts, one for each type of DSP. If the test fails for every DSP, a MAJOR alarm is raised. If the test fails for one or more DSPs, a MINOR alarm is raised. If a DSP is busy, the test passes for that DSP. The test aborts if system resources are not available. Each part of the test returns the number of DSPs that passed or failed. This test run during initialization, error analysis testing, periodic, scheduled, and craft short and long testing.

Table 205: ATM Board DSP Test (#1293)

Error Code	Test Result	Description / Recommendation
1002	ABORT	Could not allocate time slots. Traffic could be heavy or time slots could be out-of-service. **1** Run **display errors**, and follow associated repair procedures for TDM-BUS. **2** Retry the command up to 3 times at 1-minute intervals.

1 of 3

Table 205: ATM Board DSP Test (#1293)

Error Code	Test Result	Description / Recommendation
1003	ABORT	Could not allocate a Tone Detector. Too few Tone Detectors present or Tone Detectors out-of-service. **1** Run **display errors**, and follow the repair procedures associated with any TTR-LEV (TTR Level) errors that appear. **2** Verify that there is at least one Tone Detector in the PN that holds the ATM-TRK circuit pack. **3** Resolve any TONE-PT (Tone Generator) errors listed in the Error Log. **4** Retry the command up to 3 times at 1-minute intervals.
1962	ABORT	Every DSPs is busy. This is a very unlikely event. **1** Retry the command up to 3 times at 1-minute intervals.
2000	ABORT	Test timed out. **1** If the ATM-TRK circuit pack is in standby, reset the board and run the test again after the ATM-TRK circuit pack is inserted. **2** Examine the Error Log for Error 1218 (bad DSP). **3** Run the test again.
2100	ABORT	Could not allocate required system resources.
2302	ABORT	Inconsistent uplink message from the ATM-TRK circuit pack.
2500	ABORT	Internal system error **1** Retry the command up to 5 times at 1-minute intervals.
2752	ABORT	Circuit pack not a TN2305A/2306A.
XYZ	FAIL	There is at least one bad DSP on the board. The ***X*** value indicates the number of bad talker DSPs, ***Y*** indicates the number of bad listener DSPs and ***Z*** indicates the number of bad echo canceler DSPs. **1** Test the Active Tone-Clock in the PN that contains the ATM-TRK circuit pack for dial-tone. Repair as needed. **2** Repeat the short test on the ATM-TRK circuit pack. **3** If the test continues to fail, check for service-affecting MINOR alarms. If a MINOR alarm is raised for Error Type 2817 or 1818, replace the circuit pack. **4** If a WARNING alarm is raised, this is a non-service-affecting error, and the circuit pack can still process calls.
XY8	PASS	The test passed for some or all DSPs. XY8 indicates the number of talker, listener, and echo-canceler DSPs for which the test passed (the rest of the DSPs were skipped). The ***X*** value indicates the number of good talker DSPs, ***Y*** indicates the number of good listener DSPs, and ***Z*** indicates the number of good echo canceler DSPs.

2 of 3

Table 205: ATM Board DSP Test (#1293)

Error Code	Test Result	Description / Recommendation
0	NO BOARD	No board detected. **1** Check the Error Log for wrong board Error 125 (wrong board) or Error 131 (no board). Replace or insert the circuit pack if necessary. **2** Check that the board is properly translated and inserted. **3** If Error 1538 (hyperactivity) is listed in the Error Log, and run **reset board *UUCSS***. **4** Run the test again, and, if it fails, replace the ATM-TRK circuit pack. **5** Retest.

3 of 3

ATM Cross Talk Test (#1298)

This nondestructive ATM Cross Talk test makes sure that TDM time slots are correctly allocated to connections. It is useful for diagnosing one-way or noisy connections. The test fails if the TDM programmable logic and/or the interface to the DSP is not operating properly. The test can take more than 10 minutes.

Table 206: ATM Crosstalk Test (#1298)

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate required system resources. **1** Retry the command up to 5 times at 1-minute intervals.
1002	ABORT	Could not allocate time slots. Traffic could be heavy or time slots could be out-of-service. **1** Identify and correct TDM-bus errors (if any) using the procedures in the TDM-BUS (TDM Bus) MO. **2** Repeat the test up to 5 times at 1-minute intervals.
1003	ABORT	Could not allocate a tone receiver. Too few Tone Detectors installed or Tone Detectors out-of-service. **1** Identify and correct any TTR-LEV (TTR Level) errors listed in the Error Log. **2** Resolve any TONE-PT (Tone Generator) errors listed in the Error Log. **3** Retry the test up to 5 times at 1-minute intervals a maximum.
1962	ABORT	Every TALKER DSP is busy.
2000	ABORT	Test timed out.
2100	ABORT	Could not allocate required system resources **1** Retry the command 5 times at 1-minute intervals.

1 of 2

Table 206: ATM Crosstalk Test (#1298)

Error Code	Test Result	Description / Recommendation
2302	ABORT	Inconsistent uplink message from the ATM-TRK circuit pack. **1** Retry the command up to 3 times at 1-minute intervals.
2752	ABORT	The circuit pack in this location is not a TN2305A/2306A.
1–8, None	FAIL	ATM-TRK circuit pack writing on unauthorized TDM time slots. The error code indicates the number of TALKER DSPs that are at fault. These DSPs cannot be used again until this test of the ATM DSP test (#1293) tells the circuit pack to use them again. **1** Retry the command up to 3 times at 1-minute intervals. **2** If the failure persists, replace the circuit pack.
1-8	PASS	ATM-TRK circuit pack not talking to un-authorized time slots on the TDM bus. The error code indicates the number of TALKER DSPs tested.

2 of 2

ATM-WSP (ATM WAN Spare Processor)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ATM-WSP	MAJOR	**status atm wsp**	ATM WAN Spare Processor
ATM-WSP	MINOR	**status atm wsp**	ATM WAN Spare Processor
ATM-WSP	WARNING	**display atm wsp (1-15)**	ATM WAN Spare Processor

S8700 Multi-Connect systems with multiple PNs connected via ATM PNC have the option of installing up to 15 ATM WAN Spare Processor (WSP) units. Each WSP has the ability to function as the S8700 Multi-Connect server, if the main server is not functional or is not connected to one or more of the other PNs.

ATM WSP is available in S8700 Multi-Connect standard loads. A WSP is capable of running an entire S8700 Multi-Connect system (just as the main server can), or whatever PNs with which it can establish links while the ATM network is impaired. WSPs continually monitor a path to the main server to determine whether it is on-line. In the event of a main server failure, an automatic switch-over to WSP control is neither instantaneous nor call-preserving. Likewise, restoring the system to normal operation (under control of the main server) requires manual intervention, and is neither instantaneous nor call preserving.

Each WSP attempts to establish connections (links) to every other WSP and to the main server. These links are re-established once a minute. If a link cannot be re-established, its status is flagged as "down."

A WSP or main server is considered "down" if:

1 For standard reliability, links cannot be established on the A-PNC.

1 For a duplex- or high-reliability system and for standard reliability on the other WSPs, links cannot be established:

— to both A-PNCs of the main server

— on the A-PNC between other WSPs

2 For a critical-reliability system, links cannot be established on both the A- and B-PNCs.

A WSP becomes active (initiates a fail-over) when every link to a higher-priority WSP and the main server has been in a "down" state for an administered amount of time (as specified in the WSP Activation Timer field of the System-Parameters Maintenance screen).

When a WSP becomes active, a major alarm is raised against this MO (ATM-WSP). If it is later determined that the WSP should not be active, or the system is rebooted at a COLD-2 or more severe level, the WSP is returned to a standby state and the alarm retired. This alarm is never activated for the main server.

Operations of the ATM WAN Spare Processors

The WSP has the following operational features:

- The WSP feature is activated/deactivated via license file. You can verify that ATM WSP is enabled by checking the value of the ATM WAN Spare Processor field on the system-parameters customer-options screen.
- Fail-over occurs when the connections with the main server and every higher-priority WSP is lost (for an administrable period of time between 5 and 99 minutes; default = 5 minutes). When the administered threshold is exceeded, the highest-priority standby WSP becomes active. Once the standby WSP becomes active, it takes over control of one or more PNs. Restoration to the normal configuration must be manual.
- A WSP in the standby mode is not intended to be a DCS node. Although DCS could potentially play a role in an effective back-up or re-route strategy, no provision has been made to support DCS connections between parts of a failed switch. A WSP in the active mode can have the DCS functionality of the server.
- The main server makes no attempt to do maintenance on the WSPs.
- A WSP can perform maintenance on itself, and monitor WAN connectivity.
- A WSP is not recognized by the system's hardware or software as a PN when not active, and functions in place of the main server when active. Up to seven WSPs can reside in an ATM PNC configuration. The number of PNs in an S8700 Multi-Connect configuration is not limited by the number of WSPs used (i.e., the number of WSPs used is not subtracted from the total number of PNs to determine the number of PNs that can the system can support).
- Every WSP could potentially take over the entire S8700 Multi-Connect system.
- Links are established between the main server and each WSP, and from every WSP to every other WSP. These links are monitored by the WSPs, as well as by the main server, so that each processor is able to observe and report status.
- Each WSP is assigned a unique priority. WSPs become active if they cannot establish communications both with the main server and with a higher-priority WSP.
- An active WSP attempts to establish EAL connectivity to the PNs.
- Contention for support of PNs is addressed by prioritization, and also by the fact that the PNs accept an EAL connection to only the main server or one WSP at a time.

NOTE:
Each WSP reports its alarms to INADS as an individual system processor. The INADS database correlates WSPs together as part of a larger network.

Error Log Entries and Test to Clear Values

Table 207: ATM-WSP Error Log Entries

Error Type	Aux Data	Associated Test[1]	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any		
18 (a)		MO busied out			**release atm wsp**
257 (b)		Active WSP (#1401)	MAJOR	OFF	**reset system 2**

1 of 2

Table 207: ATM-WSP Error Log Entries

Error Type	Aux Data	Associated Test[1]	Alarm Level	On/Off Board	Test to Clear Value
513 (c)		WSP Link Status (#1400)	MINOR	OFF	
769 (d)	WSP #	WSP Priority Error	MINOR	OFF	
1025 (e)		WSP Error	WARNING	OFF	

2 of 2

1 There are **no** system technician-demanded Tests associated with this MO. The tests listed in this column are tests run by system software.

Notes:

a **Error Type 18** — indicates that the ATM WSP has been busied out with the **busyout atm wsp** command. To resolve this error, check for any other errors that would require that the WSP be made maintenance busy. Clear every related alarm. After every related alarm is clear, or if there are no other alarms, release the ATM circuit pack using the **release atm wsp** command.

b **Error Type: 257** — indicates that the WSP has become active. When a WSP takes over, the error becomes active, and causes an alarm condition. This error is not applicable for the main server. Use the following procedures to return the system to normal operation:

1. Run **status atm wsp** on the active WSP to verify that the main server or a higher-priority WSP that you want to be in control is "up.**"**
2. If the main server or the higher-priority WSP is "up," then run **reset system 2.** The active WSP should relinquish control.
3. Wait a few minutes, and run **list sys-link** on the main server or higher-priority WSP to verify that the EAL and ACL system links are "up."

c **Error Type: 513** — indicates a down ATM WSP link status from this WSP to the main server or a higher-priority WSP. If any of the links are considered down, this alarm is logged. When every link probed by this WSP is "up," the alarm should be cleared.

Remember that more than one link can be down. To get a system-wide view of the status of the network run **status atm wsp**.

Aux Data Values are in the form of XYY where

- X is the PNC: 0 = A-PNC, 1 = B-PNC
- YY is the WSP number

Examples:

- An Aux Data of 15 indicates that the B-PNC link to WSP 5 is down.
- An Aux Data of 3 indicates that the A-PNC link to WSP 3 is down.

d **Error Type: 769** — indicates that there are inconsistent translations with regard to WSP's priority. Each WSP keeps a list of every other WSP's priority levels. Inconsistent priorities can exist that result in a WSP receiving an unexpected probe. This causes an alarm to be raised.

Follow the procedures listed below to correct any inconsistency in WSP priorities:

1. Obtain a list of WSP priorities from the system administrator.
2. Use the **display error** command to find the WSP number with the incorrect priority (the Aux Data of the error).

3 Use the **status atm wsp** command to determine whether any administered priorities are incorrect. Pay close attention to WSP X and the local WSP.

4 If any are incorrect, use the **change atm wsp *n*** command to administer the correct priority, where **n** is the appropriate WSP number. If the priorities for WSP X and the local WSP are both correct, then there is an error in priority administered on WSP X.

5 On WSP X, use the **status atm wsp** command to determine whether the priority of WSP X, the local WSP, and the priority of the WSP with the alarm are correct. At least one should be incorrect.

6 Use the **change atm wsp *n*** command to administer the correct WSP priority, where **n** is the appropriate WSP number.

e **Error Type: 1025** — indicates that there is a WSP error. The Aux Data determine the WSP number and error code.

Aux Data Values are in the form of XXYY where

- XX is the WSP number that probed this WSP
- YY is the error code (Table 208, Error type 1025 - Aux Data error codes for YY, on page 476)

Table 208: Error type 1025 - Aux Data error codes for YY

YY	Meaning
1	The probing WSP (XX value in Aux Data) contains an ATM address in its message that does not match the translation for that ATM address on this WSP.

Example: This is WSP 1. An Aux Data of 201 indicates that WSP 2 probed this WSP, and it has a different address in the probe message than WSP 1 has for WSP 2.

1 On WSP X, use **display atm wsp *X*** to determine its address.

2 On this WSP, use **change atm wsp *X*** to change the address of WSP X, if they do not match.

3 If the addresses do match, then the ATM switch has a different address administered for WSP X, even though each WSP is consistent.

System Technician-Demanded Tests: Descriptions and Error Codes

There are **no** system technician-demanded tests associated with this MO.

ATT-ADJ (AvayaAdjunct), ATTE-AJ (Ethernet Avaya Adjunct)

S8700 / S8500 / S8100

See BRI-SET, BRI-DAT, Various Adjuncts on page 520.

AUDIX-BD (AUDIX Circuit Pack)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
AUDIX-BD	MINOR	**test board *location* sh**	AUDIX circuit pack
AUDIX-BD	WARNING	**test board *location* sh**	AUDIX circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

The AUDIX-BD MO represents a TN566/TN2169 EMBEDDED AUDIX circuit pack combination. For circuit-pack-level problems, see 'XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

EMBEDDED AUDIX consists of a combination of two circuit packs that occupy five slots on a port carrier. The tests described in this manual apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*

AUDIX-PT (AUDIX Port)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
AUDIX-PT	MINOR	**test port *location* l**	AUDIX port
AUDIX-PT	WARNING	**test port *location* sh**	AUDIX port

1 For information on specifying a location, see Command Syntax on page 179.

The AUDIX-PT MO represents a port on a TN566/TN2169 EMBEDDED AUDIX circuit pack operating in digital-port (DP) mode. For circuit-pack-level problems (AUDIX-BD), see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

AUX-BD (Auxiliary Trunk Circuit Pack)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
AUX-BD	MINOR	**test board *location* sh**	Auxiliary Trunk circuit pack
AUX-BD	WARNING	**test board *location* sh**	Auxiliary Trunk circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 maintenance information for circuit pack-level errors. See also AUX-TRK (Auxiliary Trunk) on page 481 for related trunk information.

AUX-TRK (Auxiliary Trunk)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
AUX-TRK	MAJOR[2]	**test port *location* l**	Auxiliary Trunk
AUX-TRK	MINOR	**test port *location* l**	Auxiliary Trunk
AUX-TRK	WARNING	**test port *location* sh**	Auxiliary Trunk

1 For information on specifying a location, see Command Syntax on page 179.

2 A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75% of the trunks in this trunk group are alarmed.

The TN763B/C/D and TN417 Auxiliary Trunk circuit packs are used to provide ports for the following features: Music-On-Hold, loudspeaker paging (voice and coded chimes), dictation, automated wake-up with AUDICHRON. Recorder/Announcer, and recorded announcements. TN763C circuit packs support Mu-law companding. TN417 circuit packs support A-law companding. TN763D can support either companding mode and defaults to mu-law on initialization. Companding modes are administered on the ***location-parameters*** screen.

Use the following commands to administer the features:

Command	Administration
change system-parameters features	Music-On-Hold
change paging loudspeaker	loudspeaker paging
add trunk-group [Customer-Provided Equipment (CPE)]	loudspeaker paging
change paging loudspeaker	system-provided paging
add trunk-group	access to otherwise-provided (CPE) paging
change paging code-calling-ids	translation for code chiming
add trunk-group (CPE)	Recorded announcement and dictation
change system-parameters hospitality	Automatic wake-up (ses all four ports on a TN763B Auxiliary Trunk circuit pack)

Music-On-Hold provides audible feedback to a held, parked, or otherwise split-away party indicating that the call is still connected. The feedback can be customer-provided music, a recorded message, or other audible indication. Since the Music-On-Hold port is always busy, some of its port tests always abort.

The Loudspeaker Paging feature provides voice and/or code calling chime paging. If multiple paging zones are provided at a customer's premises, the Loudspeaker Paging feature gives a user the option of paging to a particular zone or to every zone. If a zone is active for one page, it cannot be used at the same time for another.

An Auxiliary Trunk circuit pack contains four ports and uses DTMF signaling. A different hardware interface between the switch and the auxiliary equipment is used for the four types of signaling that the auxiliary trunk circuit pack supports.

The interface used for the Communication Manager loudspeaker paging consists of the following three pairs:

- The Tip-Ring (T-R) pair used for voice transmission.
- The S (S-S1) pair that carries answer supervision and/or make busy information.
- The SZ (SZ-SZ1) pair that provides the external equipment with a seizure indication.

The interface used for recorded announcement, dictation, and other loudspeaker paging consists of the following two pairs:

- The Tip-Ring (T-R) pair used for voice transmission.
- The S (S-S1) pair that carries answer supervision and/or make busy information.

The interface used for Music-On-Hold consists of one pair:

- The Tip-Ring (T-R) pair used for voice transmission.

The interface, used for automatic wake-up using an Audichron recorder/announcer unit, consists of the following two pairs:

- The Tip-Ring (T-R) pair used for voice transmission.
- The S (S-S1) pair that carries the synchronization signal.

Error Log Entries and Test to Clear Values

Table 209: Auxiliary Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/ Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
1(a)	57481	None			
1(b)	57782				
15(c)	Any	Audit Update test (#36)			
18	0	**busyout port** *UUCSSpp*	WARNING	OFF	**release port** *UUCSSpp*
130(d)		None	WARNING	ON	**test trunk** *grp/mbr* **sh**
769(b)	57482	None			
257		Hybrid/Conference	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 3**

Table 209: Auxiliary Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/ Off Board	Test to Clear Value
		Circuit test (#33)			
513		NPE Crosstalk test (#6)	MINOR WARNING [2]	ON	**test port** *UUCSSpp* **l r 3**
1025		Diagnostic test —Auxiliary Trunk test (#114)	WARNING	ON	**test port** *UUCSSpp* **sh r 3**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Major or Minor alarms may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a Error Type 1 with Aux Data 57481 indicates a port fault. Use an empty port if one is available until the circuit pack can be replaced.

b Error Type 1 or 769 with Aux Data 57482 indicates a fault on signaling lead, which is an off-board error. This error should only occur with loudspeaker paging. If the trunk is being used for another application, check that the administration is correct. Otherwise, check the wiring to the external equipment connected to the Auxiliary Trunk and check the external equipment.

c This is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors.

d Indicates the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reseat or replace the circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the *Looparound and Conference* test (#33), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Looparound and Conference test (#33)		X	ND
NPE Crosstalk test (#6)		X	ND
Diagnostic test (#114)	X	X	ND
Audit Update test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 210: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times
1000	ABORT	System resources required to run test are not available. The port may be busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. **1** Resolve TTR-LEV errors. **2** Resolve TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use the **display port *UUCSSpp*** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 210: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
2020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. **1** Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The Network Processing Element (NPE) of the tested port was found to be transmitting in error. This will cause noisy and unreliable connections. This problem may be caused by defective Tone Detectors. **1** Test every Tone-Clock circuit pack, and resolve any errors on these circuit packs before any action is taken on the auxiliary trunk circuit pack. Then, repeat the test. **2** If the test fails again, replace the auxiliary trunk circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and examining station, trunk, or external wiring.

2 of 2

Looparound and Conference Test (#33)

This test checks the reflective loop around and conference capabilities of an auxiliary trunk port circuit. The test uses 404-Hz, 1004-Hz, and 2804-Hz tones. Each tone is separately transmitted through the loop and checked. All of these tests are performed on-board.

Table 211: Test #33 Looparound and Conference Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 211: Test #33 Looparound and Conference Test

Error Code	Test Result	Description / Recommendation
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *UUCSSpp*** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
7	FAIL	The conference capabilities of the port failed. **1** If no service problems exist on the port, continue to use the port until the circuit pack can be replaced.
129	FAIL	The reflective 404-Hz tone test failed, no transmission was detected to or from the port. The problem may be off-board.
131	FAIL	The reflective 1004-Hz tone test failed. No transmission was detected to or from the port. The problem may be off-board.
133	FAIL	The reflective 2804-Hz tone test failed. No transmission was detected to or from the port. The problem may be off-board. **1** To make sure the problem is on-board, disconnect the port from the auxiliary equipment and retry test. **2** If the test fails, replace the circuit pack. Otherwise, if the test passed after disconnecting the port from the auxiliary equipment, the problem is off-board. Check the wiring and connections to the auxiliary equipment and retry the test after reconnecting the port to the auxiliary equipment. If the test fails, check the auxiliary equipment. See the preceding procedure for a failure with Error Code 7. **NOTE:** If the Looparound and Conference test fails for every port on a circuit pack, a -5 Volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, the 631DB AC power unit or the 676B power unit may be defective. The system may contain either a TN736 or a TN752 power unit circuit pack OR a 631DB power unit, *but not both types of power units.* To investigate power problems, see CARR-POW (Carrier Power Supply) on page 578.
	PASS	Looparound and Conference test is successful. This port is functioning properly.

2 of 2

Audit Update Test (#36)

This test will send updates of the auxiliary trunk port translation for every port on the Auxiliary Trunk circuit pack that has been translated. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack. No response message is expected from the circuit pack once it receives translation updates. The port translation data includes:

- Trunk type
- DTMF time slot
- Termination R/RC
- Gain, high/low
- End-to-end signaling, tone, and pause duration
- Trunk state, idle/active/unavailable
- Companding mode (A-law or mu-law)

Table 212: Test #36 Audit Update Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1006	ABORT	Port is in out-of-service state as a result of being busied out. This audit cannot be run. **1** Retry the command once the port is in service (**release port *UUCSSpp*** command has been run).
2100	ABORT	Could not allocate the necessary system resources to run this test.
	FAIL	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	This test passed. Translation information was successfully updated on the circuit pack.

Diagnostic Test—Auxiliary Trunk Test (#114)

The system software sends a message to the on-board microprocessor to operate a relay in the port circuit. If ground is detected, the test passes.

Table 213: Test #114 Diagnostic Test—Auxiliary Trunk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port *UUCSSpp*** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle. **2** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	This test failed to detect ground. **1** Try the test once more. **2** If the test fails again, replace the circuit pack.
	PASS	This test passed. Ground was detected.

AXA12-BD/ADX8D-BD/AXD12-BD (AUDIX Circuit Packs)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
AXA12-BD	MINOR	**test board *location*[1] sh**	AUDIX circuit pack
AXA12-BD	WARNING	**test board *location* sh**	AUDIX circuit pack
ADX8D-BD	MINOR	**test board *location* sh**	AUDIX circuit pack
ADX8D-BD	WARNING	**test board *location* sh**	AUDIX circuit pack
AXD12-BD	MINOR	**test board *location* sh**	AUDIX circuit pack
AXD12-BD	WARNING	**test board *location* sh**	AUDIX circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

The TN568 is an EMBEDDED AUDIX circuit pack that occupies 2 slots in a port carrier. The tests below apply only to switch-side maintenance, which tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy of its own that is described in EMBEDDED AUDIX System Maintenance, 585-300-110.

AXA12-BD:

TN568 EMBEDDED AUDIX circuit packs (sometimes called Embedded AUDIX) operating in control-link mode appear to the system as TN746 Analog Line circuit packs with vintage greater than 50. For circuit-pack-level problems, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086. The maintenance strategy for ports on the TN568 operating in control-link mode is described in ADXCL-PT.

ADX8D-BD:

TN568 EMBEDDED AUDIX circuit packs operating in 8-port digital mode appear to the system as TN754 Digital Line circuit packs with vintage greater than 50. For circuit-pack-level problems, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086. The maintenance strategy for ports on the TN568 operating in 8-port digital mode is described in ADXDP-PT.

ADX12-BD:

The ADX12-BD MO represents a TN568 EMBEDDED AUDIX circuit pack operating in 12-port digital (DP) mode. TN568 EMBEDDED AUDIX circuit packs operating in 12-port digital mode appear to the system as TN2181 Digital Line circuit packs with vintage greater than 50. For circuit-pack-level problems, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086. Port-level problems are covered by ADX12D-PT.

AXA12-RS/ADX8D-RS/AXD12-RS (AUDIX Reserve Slots)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
AXA12-RS	NONE	NONE	TN568 12-port analog reserve slot
ADX8D-RS	NONE	NONE	TN568 8-port digital reserve slot
AXD12-RS	NONE	NONE	TN568 12-port digital reserve slot

There are no tests associated with these MOs. Both the **test board** and **busyout board** commands abort when either is attempted on a reserved slot. An error message indicates that the slot is associated with the circuit pack that the TN568 is emulating, but the requested operation is not valid. If there are errors logged against these MOs, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

The TN568 circuit pack connects to the switch through a single slot in the backplane; however, the number of slots physically occupied by the circuit pack is supplied by the board when inserted. The TN568 is 2 slots wide: the functional slot and a reserve slot. The reserve (blank) slot to the left of the functional slot is a place holder on the switch and has no interaction with the switch.

These MOs are place holders for the extra slot needed for the EMBEDDED AUDIX board. Each instance of these MOs represents a reserve slot associated with the respective circuit pack mode in which the TN568 (EMBEDDED AUDIX) is working. They are used for EMBEDDED AUDIX and emulation of respective port types.

BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
BRI-BD	MAJOR	**test board *location* l**	ISDN-BRI Line circuit pack
BRI-BD	MINOR	**test board *location* l**	ISDN-BRI Line circuit pack
BRI-BD	WARNING	**test board *location* sh**	ISDN-BRI Line circuit pack
LGATE-BD	MAJOR	**test board *location* l**	DEFINITY LAN Gateway
LGATE-BD	MINOR	**test board *location* l**	DEFINITY LAN Gateway
LGATE-BD	WARNING – (See Caution)	**test board *location* sh**	DEFINITY LAN Gateway

1 For information on specifying a location, see Command Syntax on page 179.

CAUTION:

A detailed flowchart for isolating and resolving Packet Bus faults is included in Isolating and repairing packet-bus faults in *Maintenance Procedures (555-245-103)*. This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to see Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**). See also PKT-BUS (Packet Bus) on page 1406 for repair procedures.

This section relates to the TN556 ISDN BRI, TN2198 ISDN BRIU, TN2208 Ethernet, (LGATE)-Ethernet Multifunction (MFB) boards.

The TN2208 LGATE MFB provides the system with the interface to Adjunct-Switch Application Interface (ASAI) and Avaya adjuncts (for example, CONVERSANT® Voice System). This circuit pack contains 12 ports for line circuit interface (although only 8 are usable by the switch), each of which operates with two B channels and 1 D channel. In this context, the term "ISDN-BRI port" is used to refer to ports on the TN2208 MFB circuit pack that are connected to ASAI or Avaya adjuncts. The TN2208 LGATE MFB is handled by the switch software as if it is an ISDN-BRI compatible board, and every maintenance action referring to ASAI and Avaya adjunct links in this section applies.

The TN556, TN2198, and TN2208 ISDN-BRI Lines are packet port circuit packs that provides access to ISDN-BRI endpoints. The ISDN-BRI Line circuit packs supports 12 ports, each of which provides access to ISDN stations. Voice and circuit-switched data from the ISDN stations are carried on the Time Division Multiplex (TDM) Bus. Signaling is carried over the packet bus.

LEDS

The ISDN-BRI Line circuit pack performs extensive initialization tests and lights both the red and green LEDS during the initialization testing. See Chapter 2, "LEDs", for more details on circuit pack status LEDs.

Hardware Error Log Entries and Test to Clear Values

Table 214: BRI-BD Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test board** *UUCSS* **sh r 1**
1(a)	Any	None	MINOR	ON	
18(b)	0	**busyout board** *UUCSS*	WARNING	OFF	**release board** *UUCSS*
23(c)	0	None	WARNING	OFF	
257(d)	65535	Control Channel Loop test (#52)	MINOR	ON	**test board** *UUCSS* **r 20**
513(e)	4352 to 4357				
769(f)	4358

Table 214: BRI-BD Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3843 (m)	46097				
3999 (n)	Any	None			

2 of 2

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

Notes:

a Error 1 indicates the circuit pack totally stopped functioning or it was physically removed from the system.

NOTE:
The alarm is logged approximately 11 minutes after the circuit pack has been removed and/or SAKI Sanity test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, then follow the instructions for "Red (alarm)" in Circuit pack LEDs on page 27.

b This circuit pack has been busied out via the **busyout board *UUCSS*** command.

c Port(s) has (have) been administered on this circuit pack but the circuit pack is not physically present.

d This error indicates transient communication problems between the switch and this circuit pack. Execute the **test board *UUCSS*** command and see Control Channel Loop-Around Test (#52) on page 1973 for the repair procedures.

e An on-board hardware failure has been detected by the circuit pack.

The reported aux data values correspond to the following detected errors:

4352	External RAM error
4353	Internal RAM error
4355	ROM Checksum error
4357	Instruction set error

Reset the circuit pack by executing **busyout board *UUCSS*** and **reset board *UUCSS***. When it is reset, the circuit pack executes a set of tests to detect the presence of any of the above faults. The detection of one of these errors during initialization causes the circuit pack to lock-up and appear insane to the system. See the repair procedure in footnote (a) for error type 1.

f This error is reported by the circuit pack when it detects a program logic error. While no action is required, this error may lead to errors of other types being reported against this circuit pack.

g This error is reported by the circuit pack when it cannot update NPE memory and read it back. This error type can be ignored, but may lead to errors of other types being reported against this circuit pack.

h A critical hardware failure has been detected on the circuit pack. Reset the circuit pack via **busyout board *UUCSS*** and **reset board *UUCSS***. If the Circuit Pack Restart test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via **test board *UUCSS* long clear**. If the Circuit Pack Restart test (#594) fails, replace the circuit pack.

The reported error types correspond to the following detected errors:

1293	On-board auxiliary processor insane
1294	Internal memory access error

i These error types are reported when the following errors are detected:

1537	Frame overrun at packet-bus interface. This condition may be caused by an on-board fault or by faulty data received on one of the circuit pack's external ports. If any of the ports on this circuit pack are alarmed, refer to the repair procedures for those MOs.
1538	Circuit packet is hyperactive; that is, it is flooding the switch with messages sent over the control channel. The circuit pack is taken out-of-service when a threshold number of these errors is reported to the switch. Clear the alarm via the following commands: **busyout board *UUCSS***, **reset board *UUCSS***, **test board *UUCSS* long clear**, **release board *UUCSS***. If the error recurs within 10 minutes, then replace the circuit pack.

j These errors indicate that the circuit pack is having problems transmitting data to the packet bus.

1793	Parity errors are detected when transmitting data to the packet bus.
1794	Overflow of packet-bus transmit buffers has occurred.
1795	Circuit pack cannot find end of frame when transmitting to packet bus. Clear the alarm via the following commands: **busyout board *UUCSS***, **reset board *UUCSS***, **test board *UUCSS* long clear**, **release board *UUCSS***. If the error recurs within 10 minutes, then replace the circuit pack.
2306	This error occurs when the circuit pack detects an error in a received frame from the packet bus. These errors are most likely caused by a packet-bus problem, but may be due to a circuit pack fault. An invalid Link Access Procedure Data (LAPD) frame error occurs if the frame contains a bad cyclical redundancy check (CRC), is greater than the maximum length, or violates the link level protocol. When bus parity errors are reported, the LANBIC Receive Parity Error Counter test (#595) should be performed to determine whether the condition had cleared. See Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in *Maintenance Procedures (555-245-103)* to determine whether the problem is isolated to this circuit pack or is caused by packet-bus faults.

k A critical failure has been detected in the packet-bus interface of the circuit pack. This failure may be due to either a packet-bus or to an on-board fault. If the packet bus is alarmed, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 and Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in Maintenance Procedures (555-245-103) for recommended repair procedures. The probability of this error being related to packet-bus problems increases with the number of ISDN-BRI circuit packs displaying this error.

If the packet bus is not alarmed, reset the circuit pack via the **busyout board *UUCSS*** and **reset board *UUCSS*** commands. If the Circuit Pack Restart test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via the **test board *UUCSS* long clear** command. If the Circuit Pack Restart test (#594) fails, replace the circuit pack. If the problem persists after complying with the above instructions, then follow normal escalation procedures.

l These errors are not service-affecting. No action is required. These errors are reported by the circuit pack when it receives a bad control channel message from the switch. The auxiliary data identifies the following error events:

4096	Bad major heading
4097	Bad port number
4098	Bad data
4099	Bad sub-qualifier
4100	State inconsistency
4101	Inconsistent downlink message

m This error is not service-affecting. No action is required.

3843	Bad translation RAM detected, but call continues by using another translation location.

n This error indicates that the circuit pack sent a large number of control channel messages to the switch in a short period of time.

3999	If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 absent, then the circuit pack was not taken out-of-service, but has generated 50% of the messages necessary to be considered hyperactive. This may be normal during heavy traffic periods. If traffic is light, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. For example, by clearing error codes associated with the *Control Channel Loop Around* test (#52), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Control Channel Loop-Around test (#52)	X	X	ND
NPE Audit test (#50)		X	ND
LANBIC Receive Parity Error Counter test (#595)		X	ND

1 D = Destructive; ND = Nondestructive

NPE Audit Test (#50)

See the repair procedure described in XXX-BD (Common Port Circuit Pack) as NPE Audit Test (#50) on page 2093.

Control Channel Loop Around Test (#52)

See the repair procedure described in XXX-BD (Common Port Circuit Pack) as Control Channel Loop-Around Test (#52) on page 2096.

SAKI Sanity Test (#53)

Refer to the repair procedure described in XXX-BD (Common Port Circuit Pack) as SAKI Sanity Test (#53) on page 2097.

LANBIC Receive Parity Error Counter Test (#595)

This test is **destructive**.

The test reads and clears the LANBIC Receive Parity Error Counter on the circuit pack. This counter is incremented by the circuit pack when it detects a parity error in data received from the packet bus.

These errors may indicate a circuit-pack problem, packet-bus problem, or a problem with another circuit pack on the bus. This test is useful for verifying the repair of the problem.

Table 215: Test #595 LANBIC Receive Parity Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to five times, reset the circuit pack via the **busyout board *UUCSS*** and **reset board *UUCSS*** commands. **2** If the test aborts again, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2012	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, escalate the problem.
1–10	FAIL	The circuit pack is still detecting errors of this type. The error code indicates the value of the on-board error counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, verify the validity of the packet bus. Run the Packet Bus Maintenance test, **test pkt *P* long**. If any packet-bus tests fail, see PKT-BUS (Packet Bus) on page 1406 for recommended repair procedures. **3** If the Packet Bus test passes, check the validity of the circuit pack. Execute a test that involves data transmission onto the packet bus. For example, the BRI may use the connectivity tests of the port-level MO (BRI-PORT) by executing **test port *UUCSSpp***. Refer to the repair procedures for the executed test if it fails. Otherwise, proceed to the next step. **4** Other circuit packs on the packet bus can cause of the parity error. Use **display errors** to check the Error Log for other circuit packs that are alarmed. If any alarms are present for the other circuit packs, retire those alarms also. Then, rerun the LANBIC Receive Parity Error Counter test (#595) on this circuit pack.
	PASS	No errors detected by circuit pack.

BRI-DAT (ISDN-BRI Data Module)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
BRI-DAT	WARNING[1]	**test data-module**	ISDN-BRI Stand-alone Data Module

1 The alarm level for ASAI or Avaya adjuncts may be administered using the **set options** command. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI adjunct in the system.

Refer to BRI-SET, BRI-DAT, Various Adjuncts on page 520.

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
BRI-PORT	MINOR	**test port *location* l**	ISDN-BRI port
BRI-PORT	WARNING	**test port *location* sh**	ISDN-BRI port
ABRI-PORT	MAJOR[2,3]	**test port *location* l**	ASAI ISDN-BRI port
ABRI-PORT	WARNING[2,3]	**test port *location* l**	ASAI ISDN-BRI port
ATT-PORT	MAJOR [2], [3]	**test port *location* l**	Avaya Adjunct ISDN-BRI port
ATT-PORT	WARNING [2], [3]	**test port *location* l**	Avaya Adjunct ISDN-BRI port
LGATE-PT	MAJOR [2], [3]	**test port *location* l**	Ethernet ASAI port
LGATE-PT	WARNING [2], [3]	**test port *location* l**	Ethernet ASAI port
ATTE-PT	MAJOR [2], [3]	**test port *location* l**	Ethernet Avaya Adjunct port
ATTE-PT	WARNING [2], [3]	**test port *location* l**	Ethernet Avaya Adjunct port

1 For information on specifying a location, see Command Syntax on page 179.

2 The alarm level for ASAI and Avaya adjunct ports may be administered using the **set options** command. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI and Avaya adjunct port in the system.

3 All alarming for an ASAI and Avaya adjunct and OFF-BOARD alarming for an ASAI or Avaya port is disabled if the ASAI or Avaya adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI or Avaya adjunct. The Hardware Error and Alarm Logs should be checked to see if the adjunct has disabled alarming.

NOTE:
Some of the information in this section is reserved for future use.

CAUTION:
The section, Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in Maintenance Procedures (555-245-103), along with the other information presented in the chapter, can help resolve problems involving more than one station or circuit pack.

WARNING:
If a significant packet-bus failure occurs, errors and alarms may not be logged as expected for BRI-PORT/ABRI-POR/ATT-PORT/ LGATE-PT/ ATTE-PT. Conditions under which this occurs are detailed in Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in *Maintenance Procedures (555-245-103)*.

The TN2208 LGATE MFB provides Communication Manager with the interface to Adjunct-Switch Application Interface (ASAI) and Avaya adjuncts (for example, CONVERSANT® Voice System). The circuit pack contains 12 ports of line circuit interface (although only 8 are usable by the switch), each of which operates with two B channels (referred to as B1 and B2 throughout this section) and one D channel. In this context, the term “ISDN-BRI port” is used to refer collectively to ports on the TN2208 circuit pack that are connected to ASAI or Avaya adjuncts.

The TN556 and TN2198 ISDN-BRI Line circuit packs provide the system with the interface to ISDN-BRI endpoints, Adjunct-Switch Application Interface (ASAI) and Avaya adjuncts (for example, CONVERSANT® Voice System). The circuit packs contain 12 ports of line circuit interface, each of which operates with two B channels (referred to as B1 and B2 throughout this section) and one D channel. In this context, the term “ISDN-BRI port” is used to refer collectively to ports on the TN556 an TN2198 circuit packs that are connected to either BRI endpoints, ASAI or Avaya adjuncts.

For BRI endpoints, each B channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B channels are not used on ports connected to ASAI or Avaya adjuncts. The D channel is used for conveying signaling between the switch and a BRI endpoint(s), ASAI or Avaya adjunct. Each ISDN-BRI D channel is connected to the switch processor and the ISDN-BRI port through the packet bus.

ISDN-BRI endpoints are available in various configurations. Every endpoint requires the D channel to convey signaling information to the switch. Only one B channel is required for a voice-only set or a stand-alone data module (BRI-DAT). A voice and data-capable set requires both B channels (one for voice and one for data). Therefore, each TN556 or TN2198 port can support either two voice-only sets, two stand-alone data modules (BRI-DAT), or one voice and data-capable set. Only a single ASAI or Avaya adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

Figure 32, ISDN-BRI Port Interactions, on page 501 illustrates the physical connection (solid line) between an ISDN-BRI port and its associated ISDN-BRI set(s). Each physical connection allows for two B channels and one D channel. Each ISDN-BRI circuit pack can support up to 12 of these *physical* connections to different voice and voice/data sets or ASAI or Avaya adjuncts. On a TN2198 each ISDN-BRI circuit pack can support up to 12 *physical* connections to a NT1 which in turn connects to 2 terminals.

This section covers the maintenance documentation for ISDN-BRI ports. Some of the results of maintenance testing of ISDN-BRI ports may be affected by the health of the ISDN-BRI Line circuit pack (BRI-BD), BRI endpoint (BRI-SET), or ASAI adjunct (ASAI-ADJ/LGATE-AJ/LGATE-AJ) or Avaya adjunct (ATT-ADJ/ATTE-AJ). These interactions should be kept in mind when investigating the cause of ISDN-BRI port problems. For more information about the circuit pack, see:

- BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack) on page 491
- BRI-SET, BRI-DAT, Various Adjuncts on page 520

and its endpoints, see:

- ASAI-ADJ (ASAI Adjunct) on page 330
- ATT-ADJ (AvayaAdjunct), ATTE-AJ (Ethernet Avaya Adjunct) on page 477
- LGATE-AJ on page 1165

3847(o)	0	None				

2 of 2

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Major and Minor alarms on this MO may be downgraded to Warning alarms based on the value used in the set options command.

Notes:

a **Error Type 1** – This error occurs when the Level 1 Status Inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. The aux data field contains one of the following values:

- blank – This indicates that the Level 1 Status Inquiry failed.
- 32773 – This is a message from the BRI-LINE circuit pack indicating Level 1 has been deactivated.

Refer to the repair procedures for Test #621.

b **Error Type 130** – This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.

c **Error Type 257** – This error occurs when the EPF Status Inquiry fails due to an overcurrent condition or when the BRI-LINE circuit pack detects that the EPF is in an over current condition. The aux data field contains one of the following values:

- blank – This indicates that the EPF Status Inquiry failed due to an overcurrent condition.
- 40988 – This indicates that the BRI-LINE circuit pack has detected an overcurrent condition and has turned the EPF off.

Execute the short test sequence, and see the repair procedures for Test #622.

d **Error Type 513** – This error indicates that the circuit pack is having problems transmitting data to the packet bus, thus affecting the conveyance of signaling information over the D channel. With Aux Data 46222, this error occurs when the packet-bus transmit buffers overflow. This condition probably indicates a hardware problem. The BRI-PORT Alarm Level for the error with Aux Data 46222 is "MINOR/WARNING," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJOR/MINOR/WARNING." With Aux Data 0, this error occurs whenever the packet-bus transmit FIFO buffers overflow. This condition can be caused by an on-board hardware problem as well as by problems on the packet bus that disrupt the BRI circuit pack's ability to transmit data onto the packet bus. Use troubleshooting procedures for both on-board hardware problems and potential off-board packet-bus problems. See PKT-BUS (Packet Bus) on page 1406 as well as Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in *Maintenance Procedures (555-245-103)* for more information about troubleshooting the packet bus. The BRI-PORT Alarm Level for the error with Aux Data 0 is "MINOR," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJOR."

e **Error Type 769** – This error occurs when the NPE Crosstalk test (#617) fails. Run the long test sequence, and pay particular attention to the results of Test #617.

f **Error Type 1281** – This error occurs when a port's associated broadcast-signaling links have too much traffic related to link establishment. This could occur if an endpoint on this port is sending link establishment traffic on a port level broadcast link or if there are Level 1 problems on the port. Check the error logs for Level 1 errors. If Level 1 problems exist, follow the repair procedures listed for Test #621. Software will suspend activity to this port for 75 minutes when the port is alarmed due to this error (note that service suspension does not occur if the port is an ABRI-PORT/LGATE-PT/ATTE-PT/ATT-PORT). If this problem persists, replace the endpoint or endpoints associated with this port. If replacing the endpoints does not fix the problem, follow normal escalation procedures.

g **Error Type 1537** – This error occurs when the port receives an invalid frame over the D channel. When CRC errors exceed five within 15 minutes, the port is taken out of service for five seconds. If five more CRC errors are received within 15 minutes of the first set of five errors, the port is taken out of service for one minute. If five more CRC errors are received within 15 minutes of the last five, the port is taken out of service for 15 minutes.

This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source, or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

- Check the wiring to the endpoints or the adjunct.
- If the problem persists, replace the endpoints or adjuncts, or escalate the problem.

h **Error Type 1793** – This error occurs when the BRI Port Local TDM Loop Around test (#619) fails. Run the long test sequence, and pay particular attention to the results of Test #619.

There are no Test to Clear Values for the following error types. The error types are simply provided as additional data that may prove useful while troubleshooting.

i **Error Type 3841** – This error occurs when a Layer 1 Transmission error is detected for the port. Run the long test sequence, and pay particular attention to the results of the Layer 1 Transmission Error Counter test (#624).

j **Error Type 3842** – A BRI port supports up to three Terminal Endpoint Identifiers (TEIs). This error occurs when the switch receives a request for a fourth TEI on a port. Check the number of endpoints administered for this port.

k **Error Type 3843** – This error occurs when an SPID initialization request is made from an endpoint and the switch determines that the SPID value is invalid or is a duplicate of another SPID that is already initialized at Layer 3 on the port. Check the administration of the endpoints.

l **Error Type 3844** – This error occurs when the circuit pack detects an overflow of its receive buffers. Run the long test sequence, and pay particular attention to the results of the Receive FIFO (First In First Out) Overflow Error Counter test (#625).

m **Error Type 3845** – This error occurs when the BRI Port Local LAN Loop Around test (#618) fails. Run the long test sequence, and pay particular attention to the results of Test #618.

n **Error Type 3846** – This error most likely occurs when the Terminal Endpoint Identifier (TEI) administered for the ASAI or Avaya endpoint does not match the TEI administered in the ASAI or Avaya adjunct. Check the switch administration of the TEI against that of the adjunct and make sure that both are using the same TEI.

o **Error Type 3847** – Indicates that sets on the port do not support layer-3 initialization. Consult the Service Set documentation.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. For example, by clearing error codes associated with the *NPE Crosstalk* test (#617), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk test (#617)		X	D
BRI Port Local LAN Loop Around test (#618)		X	D
BRI Port Local TDM Loop Around test (#619)		X	D
Electronic Power Feed Restoral test (#620)	X	X	ND
Level 1 Status Inquiry test (#621)	X	X	ND
Electronic Power Feed Inquiry test (#622)	X	X	ND
CRC Error Counter test (#623)		X	ND
Layer 1 Transmission Error Counter test (#624)		X	ND
Receive FIFO Overflow Error Counter test (#625)		X	ND
Clear Error Counters (#270)	X	X	ND

1 D = Destructive; ND = Nondestructive

NOTE:
The NPE Crosstalk test and the BRI Port Local TDM Loop Around test are not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT.

NPE Crosstalk Test (#617)

This test is **destructive**.

One or more NPEs reside on each circuit pack with a TDM-bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's long test sequence and executes in approximately 20 to 30 seconds. Crosstalk testing is performed on both B channels (B1 and B2) associated with a BRI port. If this test fails on either channel, any endpoint connected to the port is taken out-of-service.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B channels associated with the port are not used by ASAI or Avaya adjuncts.

Table 217: Test #617 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *PCSSpp*** to determine the station extension or trunk group/member number of the port. Use **status bri-port *PCSSpp*** to determine the service state of the port. If the service state indicates that the port is active, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 1, "Maintenance SAT Commands" in Maintenance Commands Reference (555-245-101) for a full description of every possible state.) Wait until the port is idle before retesting. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort, escalate the problem.
1004	ABORT	The port has been seized by a user for a valid call. **1** Use **status station** for the station associated with this port and determine when the port is available for testing. **2** Retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort and the port is idle, escalate the problem.
1005	ABORT	This test is not valid for this type of translation. Ports administered as "ASAI" or "ADJK" cannot run this test, because the B channels associated with the port are not used by ASAI or Avaya Adjunct Links. This is a normal condition.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1, 2	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Error code 1 indicates that the NPE Crosstalk test failed on Channel B1. Error code 2 indicates that the NPE Crosstalk test failed on Channel B1. **1** Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. **1** To verify that this is not an intermittent problem, repeat this test up to 10 times to make sure it continues passing. **2** If complaints still exist, examine the station, connections, and wiring.

BRI Port Local LAN Loop Around Test (#618)

This test is **destructive**.

This test verifies the connectivity of a BRI port across the LAN Bus and executes only if the port is out-of-service. The test aborts if calls associated with the port are in-progress. Failures of this test indicate either on-board faults associated with the BRI-PORT hardware on the circuit pack, or problems with the LAN Bus, which is used to form connectivity between the switch and the BRI-PORT.

The dotted lines in Figure 33, Path of the BRI Port Local LAN Loop Around, on page 507 show how a Loop Around test is performed across the packet bus for the D channel.

Figure 33: Path of the BRI Port Local LAN Loop Around

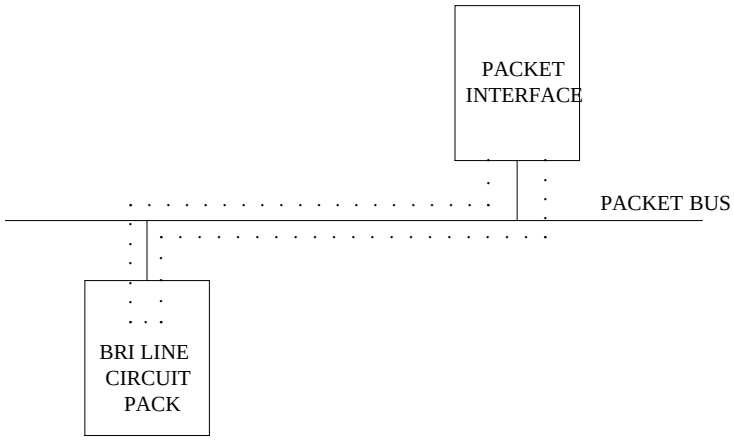

Table 218: Test #618 BRI Port Local LAN Loop Around

Error Code	Test Result	Description / Recommendation
1015	ABORT	The port is not in the out-of-service state. **1** Display the BRI Port Status screen via the **status bri-port *PCSSpp*** command to determine what stations or adjuncts are on this port. **2** Use the extension shown on this screen in **status station** to determine whether the station or adjunct is active. **3** If so, wait until it is idle, and then busyout the port (using the **busyout port *PCSSpp*** command) to place it in the out-of-service state and repeat this test. **WARNING:** Since the "busyout" command is destructive, execution of this command prior to the port being idle causes every call associated with BRI endpoints and every transaction associated with ASAI or Avaya adjuncts on the port to be torn down. Note that 3rd-party calls established by an ASAI or Avaya adjunct remain connected even though the port is taken out-of-service.
1139	ABORT	The PN's packet bus is out-of-service. **1** Follow the repair procedures for the packet bus. **2** After completing step 1, execute the **test port long *PCSSpp*** command, and review the results of the BRI Port Local LAN Loop Around test to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. **1** Follow the repair procedures for the PKT-CTRL. **2** After completing step 1, execute the **test port long *PCSSpp*** command, and review the results of the BRI Port Local LAN Loop Around test to verify the repair.
S8100: 1144	ABORT	The PPN Packet Bus is out-of-service. **1** Follow the repair procedures for the Packet Bus. **2** After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

1 of 2

Table 218: Test #618 BRI Port Local LAN Loop Around

Error Code	Test Result	Description / Recommendation
	FAIL	The Loop Around test has failed. **1** If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the board are idle. Reset the circuit pack by issuing the **busyout board *PCSS*** and the **reset board *PCSS*** commands. **2** If the test fails again, execute **test port-network *pn#***. If this fails, follow failure procedures in PKT-BUS (Packet Bus) on page 1406. **3** If tests executed in step 2 pass, the problem is local to the BRI board. Replace the circuit pack.
	PASS	The BRI Port Local LAN Loop Around test has passed.

2 of 2

BRI Port Local TDM Loop Around Test (#619)

This test is **destructive**.

This test verifies the connectivity of a BRI port across the TDM Bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack.

This Loop Around test runs a series of individual tests on the two B channels (B1 and B2) associated with the port. It is a collection of the following:

- Loop Around test across the TDM Bus for B1.
- Conference Circuit test for B1.
- Loop Around test across the TDM Bus for B2.
- Conference Circuit test for B2.

The tests are run in the above order. If one fails, the remaining tests in the sequence are not executed. An error code is returned at that point.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B channels associated with the port are not used by ASAI or Avaya adjuncts.

The dotted lines in Figure 34, Path of the BRI Port Local TDM Loop Around, on page 510 show how a Loop Around test is performed for the B channels. The figure shows a terminal connected to a BRI line board using a TN556. If a TN2198 is used the terminal would be connected to a NT1, and the NT1 to the BRI board.

Figure 34: Path of the BRI Port Local TDM Loop Around

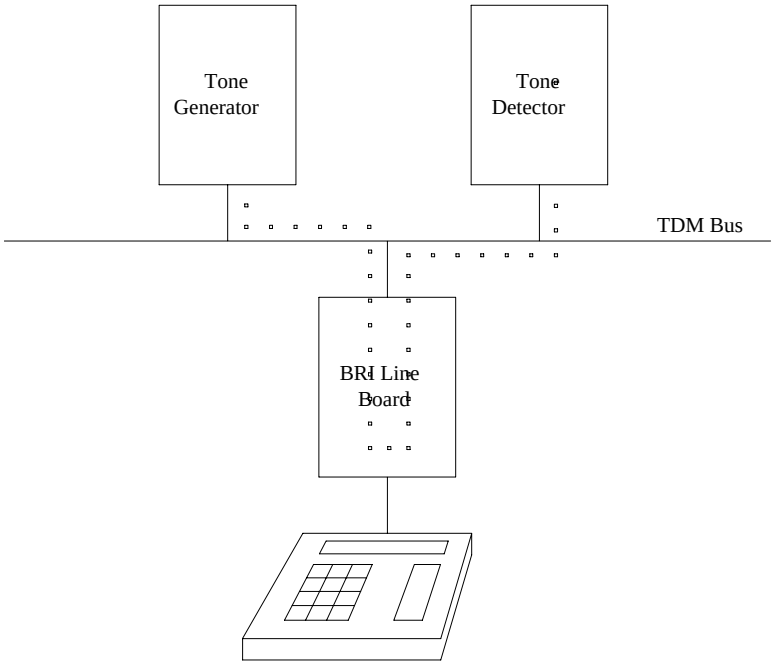

Table 219: Test #619 BRI Port Local TDM Loop Around

Error Code	Test Result	Description / Recommendation
1000	ABORT	The system resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *PCSSpp*** to determine the station extension or trunk group/member number of the port. Use **status bri-port *PCSSpp*** to determine the service state of the port. If the service state indicates that the port is active, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 1, "Maintenance SAT Commands" in Maintenance Commands Reference (555-245-101) for a full description of every possible state.) Wait until the port is idle before retesting. **2** If the port is idle, then retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

1 of 3

Table 219: Test #619 BRI Port Local TDM Loop Around

Error Code	Test Result	Description / Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the test at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
1004	ABORT	The port has been seized by a user for a valid call. Use **status station** for the station associated with this port and determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort and the port is idle, escalate the problem.
1005	ABORT	This test is not valid for this type of translation. Ports administered as "ASAI" or "ADJK" cannot run this test, because the B channels associated with the port are not used by ASAI or Avaya Adjunct Links. This is a normal condition.
2000	ABORT	Response to the test was not received from the BRI-LINE circuit pack within the allowable time period. **1** If this result occurs repeatedly, attempt to reset the circuit pack if the other ports are idle. Reset the circuit pack by issuing the **busyout board *PCSS*** and the **reset board *PCSS*** commands. **2** If this result occurs again, replace the circuit pack.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
2103	ABORT	The system could not make the conference connection for the test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1, 2	FAIL	As stated previously, this test runs a TDM Loop Around test on each B channel. This indicates that the loop around failed on one of the channels. Error Code 1 indicates that the TDM Loop Around test failed on B1. Error Code 2 indicates that the TDM Loop Around test failed on B2.

2 of 3

Table 219: Test #619 BRI Port Local TDM Loop Around

Error Code	Test Result	Description / Recommendation
7, 8	FAIL	As stated previously, this test runs a Conference Circuit test on each B channel. A failure here indicates that one of these conference tests failed; Error Code 7 means that the test failed on B1; Error Code 8 means that the test failed on B2. **1** If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the circuit pack are idle. Reset the circuit pack by issuing the **busyout board *PCSS*** and the **reset board *PCSS*** commands. **2** If the test fails again, replace the circuit pack.
	PASS	The BRI Port Local TDM Loop Around test has passed.

3 of 3

Electronic Power Feed Restoral Test (#620)

This test attempts to restore the Electronic Power Feed (EPF) on an ISDN-BRI port twice. In this test, the processor requests that the EPF be turned on for a given port. An attempt is made to turn on the power unit to the station or adjunct. If no current is being drawn by a station, this probably indicates that the station is not connected. No current being drawn by an adjunct is the normal condition. If an overcurrent condition is sensed (that is, too much current is being drawn), this condition may indicate a short in the wiring to the endpoint or adjunct. Depending on what condition is sensed, a message is returned stating that either the EPF was turned on successfully with no problems or that an overcurrent condition is sensed. This response is reported by the Electronic Power Feed Inquiry (#622), which follows in the testing sequence. EPF Restoral is attempted again by this test five seconds later. This test always passes for the TN2198 because it has no EPF. This test will always abort when run on the TN2208.

Table 220: Test #620 Electronic Power Feed Restoral

Error Code	Test Result	Description / Recommendation
1005	ABORT	This test is not valid for this port type. The TN2208 does not have an electronic power feed, and the test will abort.
2012	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
	PASS	The EPF test passed. The message to turn on the power feed to the station or the adjunct was successfully sent to the port. **1** Although this test should not return a fail result, after running this test, the Error Log should be checked for any entries with error type 257 to examine the real results of this test. **2** An error type of 257 in the Error Log indicates some problem with the power to the station or the adjunct. Check for a short in the wiring, a damaged jack, a defective voice terminal or adjunct, or an incorrect type of terminal.

Level 1 Status Inquiry Test (#621)

This test determines the state of the transmission facility of a BRI port at the physical layer (that is, Level 1). Level 1 can be in one of three possible states: Activated, Pending Activation, or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI or Avaya adjunct administered on this port. This test passes if the state of Level 1 (L1) is Activated. This test also passes if software has taken this port out of service. See the description of the Level 1 "Deactivated State" below for more details.

The Pending Activation state indicates a problem with the endpoints or adjunct, the wiring to the sets or adjunct, or the BRI-LINE circuit pack. When in this state, the Level 1 interface is either not receiving any L1 framing from the endpoint or adjunct (Endpoint Idle), or it is communicating with the endpoint or adjunct but cannot transition to the Activated state (Endpoint Active).

The Deactivated state indicates a problem with the BRI-LINE circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ISDN-BRI port is placed in the out-of-service state, Level 1 is also put into the Deactivated state. This could be due either to the system detecting a fault with the port or to a **busyout port *PCSSpp*** request.

Table 221: Test #621 Level 1 Status Inquiry

Error Code	Test Result	Description / Recommendation
1187	ABORT	The board, port or station may have been busied out by a technician. **1** Look in the Error Log for Error Type 18 (port busied out) for this port and BRI-BD (board busied out). If this error type is present for BRI-PORT only, release the port via **release port *pp*** and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the board via **release port *PCSS*** and run the test again. **NOTE:** When you release a port, you release every port associated with it. If certain ports still need to be busied out, use the **port *PCSSpp*** to busy them out. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to five times, reset the circuit pack via the **busyout board *PCSS*** and **reset board *PCSS*** commands. **2** If the test aborts again, replace the circuit pack.

Table 221: Test #621 Level 1 Status Inquiry

Error Code	Test Result	Description / Recommendation
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, escalate the problem.
1	FAIL	Received a status of Level 1 Pending Activation-Endpoint Idle which indicates a problem with the BRI endpoint or ASAI or Avaya adjunct, the wiring to the endpoint or adjunct, or the ISDN-BRI port. The TN2198, received a status of Level 1 Pending Activation. interface down, which indicates a problem with a connection between the switch and the NT1. **NOTE:** An NT1 is a 2- to 4-wire converter that is used to connect 4-wire Avaya terminals to a 2-wire TN2198 circuit pack. The NT1 also has status lamps to determine the health of the unit. **1** For the TN556, verify that an endpoint is connected to the port. If an endpoint is connected to the port then proceed to step 2. For the TN2198 verify that the connections are good between the switch and the NT1. Verify that the NT1 has power. **2** As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. If a TN2198 is used the set must have been plugged in for at least 15 seconds before it will stabilize. Execute the **test port *PCSSpp*** command, and review the results of the Level 1 Status Inquiry test to verify the repair. If this test is still failing, proceed to step 3. **3** For BRI endpoints, replace the BRI endpoint(s) connected to the port or the NT1 if a TN2198 is used. For ASAI or Avaya adjuncts, follow the recommended repair procedures of the manufacturer for link communication problems. For the NT1, follow the manufacturers repair procedures. Then execute the **test port *PCSSpp*** command and review the results of the Level 1 Status Inquiry test to verify repair. If this test is still failing, proceed to step 4. **4** Escalate the problem to the next tier.

2 of 4

Table 221: Test #621 Level 1 Status Inquiry

Error Code	Test Result	Description / Recommendation
2	FAIL	For the TN556 or TN2208, received a status of Level 1 Pending Activation-Endpoint Active which indicates a problem with the BRI endpoint or ASAI or Avaya adjunct, the wiring to the endpoint or adjunct, or the ISDN-BRI port. For the TN2198, received a status of Level 1 Pending Activation. U interface up S/T interface down, which indicates a problem with the NT1 or the wiring between the NT1 and the BRI endpoint (S/T interface). **1** As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. Execute the **test port *PCSSpp*** command, and review the results of the Level 1 Status Inquiry test to verify the repair. If this test is still failing, proceed to step 2. **2** For BRI endpoints, try replacing the BRI endpoint(s) connected to the port. For ASAI or Avaya adjuncts, follow the recommended repair procedures of the manufacturer for link communication problems. For the NT1, follow the recommended repair procedures of the manufacturer. Then execute the **test port *PCSSpp*** command, and review the results of the Level 1 Status Inquiry test to verify repair. If this test is still failing, proceed to step 3. **3** Escalate the problem to the next tier.
3	FAIL	Received a status of Level 1 Deactivated; the port is out-of-service. **1** Issue the **status bri-port *PCSSpp*** command to verify that the service state of the port is out-of-service. If the service state of the port is not out-of-service, escalate the problem to the next tier. Otherwise, proceed to step 2. **2** If the port has been placed out-of-service via the **busyout port *PCSSpp*** command, try releasing the port by executing the **release port *PCSSpp*** command. Then issue the **test port long *PCSSpp*** command, and review the results of Level 1 Status Inquiry test. If this test is still failing, proceed to step 3. **3** After executing the **test port long *PCSSpp*** command, review the results of every test. Follow the repair procedures for any tests that fail. Verify repair of the problem by executing the **test port *PCSSpp*** command and by determining that the Level 1 Status test passes. If the test continues to fail for this reason, proceed to step 4. **4** Escalate the problem to the next tier.

3 of 4

Table 221: Test #621 Level 1 Status Inquiry

Error Code	Test Result	Description / Recommendation
4	FAIL	For the TN2198 only: Received a status of Level 1 Pending Activation, the NT1 has a loss of power indicating a problem with the NT1. **1** For the NT1 follow the manufacturers recommended repair procedures. **2** Execute the **test port *PCSSpp*** command, and review the results of the Level 1 Status Inquiry test to verify the repair. If the test is still failing proceed to step 3. **3** Escalate the problem to the next tier.
	PASS	This test indicates that Level 1 is activated, or that software has taken the port out of service.

4 of 4

Electronic Power Feed Inquiry (#622)

This test queries the BRI-LINE circuit pack for the status of the Electronic Power Feed (EPF) supplied to a BRI endpoint or an ASAI or Avaya adjunct. If the EPF is on and no overcurrent condition exists, this test passes. All other states are not normal and indicate a problem with the endpoint or adjunct, the wiring to the endpoint or adjunct, or the BRI-LINE circuit pack. This test is not run on the TN2208 circuit pack or the TN2198 and will always return a pass for the TN2198. The TN2208 has no power feeds.

Table 222: Test #622 Electronic Power Feed Inquiry

Error Code	Test Result	Description / Recommendation
1005	ABORT	This test is not valid for this port type. Ports on the TN2208 cannot run this test because this board does not have an electronic power feed.
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to five times, reset the circuit pack via the **busyout board *PCSS*** and **reset board *PCSS*** commands. **2** If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

1 of 2

Table 222: Test #622 Electronic Power Feed Inquiry

Error Code	Test Result	Description / Recommendation
1	FAIL	The BRI-LINE circuit pack reports that it has detected an overcurrent condition and has turned off the EPF. **1** As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. Check the endpoints and replace one or both sets if the sets are drawing too much current. Execute **test port *PCSSpp*** and review the results of the EPF Inquiry test to verify the repair. If this test is still failing, proceed to step 2. **2** Execute **test port *PCSSpp***, and review the results of the Level 1 Status Inquiry test. If this test is also failing, then follow the repair procedure for the Level 1 Status Inquiry test. Otherwise, escalate this problem to the next tier.
	PASS	The Electronic Power Feed Inquiry test reports that the EPF is on.

2 of 2

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port's Layer 1 Transmission error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or the endpoint or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY® Communications System Generic 1 and Generic 3i Wiring, 555-204-111*. It does not indicate a problem with the ISDN-BRI circuit pack. This test is useful for verifying the repair of the problem.

Table 223: Test #624 Layer 1 Transmission Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to five times, reset the circuit pack via **busyout board *PCSS*** and **reset board *PCSS***. **2** If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate necessary system resources to run test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, escalate the problem.

1 of 2

Table 223: Test #624 Layer 1 Transmission Error Counter Test

Error Code	Test Result	Description / Recommendation
value	FAIL	The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, review the results of other tests in the long test sequence. Pay particular attention to the results of the Level 1 Status Inquiry test. Follow repair procedures for any of the executed tests if they fail. Otherwise, go to the next step. **3** If the tests for the endpoints or adjunct pass and the Layer 1 Transmission Error Counter test continues to fail, check the wiring to the endpoints or adjunct. If the wiring appears to be fine, escalate the problem.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

2 of 2

Receive FIFO Overflow Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO Overflow error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is non-zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from the packet bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port OR if a hardware fault is causing the receive buffers not to be emptied properly by the circuit pack. This test is useful for verifying the repair of the problem.

Table 224: Test #625 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. **1** If the test aborts repeatedly up to five times, reset the circuit pack via the **busyout board *PCSS*** and **reset board *PCSS*** commands. **2** If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, escalate the problem.

1 of 2

Table 224: Test #625 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description / Recommendation
value	FAIL	The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, run the long test sequence, and pay particular attention to the Loop Around tests (#618 and #619). See the repair procedures for the executed test if it fails. Otherwise, go to the next step. **3** Replace the circuit pack.
	PASS	The Receive FIFO Overflow error counter was read correctly and has a value of 0.

2 of 2

Clear Error Counters Test (#270)

This test is not an actual test in the strict sense of the word. There are various error counters associated with each BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT. This test clears those counters and triggers the auditing of Terminal Endpoint Identifier (TEI) values and layer-3 reinitialization. This test is used only to send messages to the BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT and, therefore, should neither abort nor fail.

Table 225: Test #270 Clear Error Counters

Error Code	Test Result	Description / Recommendation
Any	ABORT	This test should never abort.
Any	FAIL	This test should never fail. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, escalate the problem.
	PASS	The message to clear the error counters of the BRI-Port/ABRI-Port/ ATT-PORT/LGATE-PT/ATTE-PT has been sent.

BRI-SET, BRI-DAT, Various Adjuncts

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
BRI-SET	WARNING[2]	**test station *extension* l**	ISDN-BRI Set
BRI-DAT	WARNING[2]	**test data-module *extension*** l	ISDN-BRI Data Module
ASAI-ADJ	MAJOR[2]	**test station *extension*** **test data-module *extension***	ASAI-Adjunct
ASAI-ADJ	WARNING[3]	**test data-module *extension***	ASAI-Adjunct
ATT-ADJ	MAJOR[2]	**test station *extension***	Avaya-Adjunct
ATT-ADJ	WARNING[3]	**test station *extension***	Avaya-Adjunct
LGATE-AJ	MAJOR[2]	**test station *extension***	Ethernet ASAI-Adjunct
LGATE-AJ	WARNING[3]	**test station *extension***	Ethernet ASAI-Adjunct
ATTE-AJ	MAJOR[2]	**test station *extension***	Ethernet Avaya-Adjunct
ATTE-AJ	WARNING[3]	**test station *extension***	Ethernet Avaya-Adjunct

1 ***extension*** is the extension number of the station.

2 The alarm level for ASAI and Avaya adjuncts may be administered using the **set options** command. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI and Avaya adjunct in the system.

3 Alarming for an ASAI and Avaya adjuncts is disabled if the adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm are logged against the endpoint. Busying out and releasing the ASAI station or ADJLK station will clear the alarm.

WARNING:

Information for isolating and resolving packet-bus faults is included in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. The flowchart Figure 15, Troubleshooting Packet Bus Problems, along with the other information presented in the chapter, can help resolve problems that involve more than a single station or circuit pack. See also Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in *Maintenance Procedures (555-245-103)*.

WARNING:

If a significant packet-bus failure occurs, errors and alarms may not be logged as expected for BRI-PORT/ABRI-POR/ATT-PORT/ LGATE-PT/ ATTE-PT. Conditions under which this occurs are detailed in the Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in *Maintenance Procedures (555-245-103)*.

The TN2208 ESAI MFB provides the system with an Ethernet interface to Adjunct-Switch Application Interface (ASAI) and Avaya adjuncts (for example, CONVERSANT® Voice System). This circuit pack contains 8 ports of line circuit interface, each of which operates with two B channels (referred to as B1 and B2 throughout this section) and one D channel. In this context, the term ''ISDN-BRI port" is used to refer collectively to ports on the TN2208 MFB circuit pack that is connected to ASAI or Avaya adjuncts.

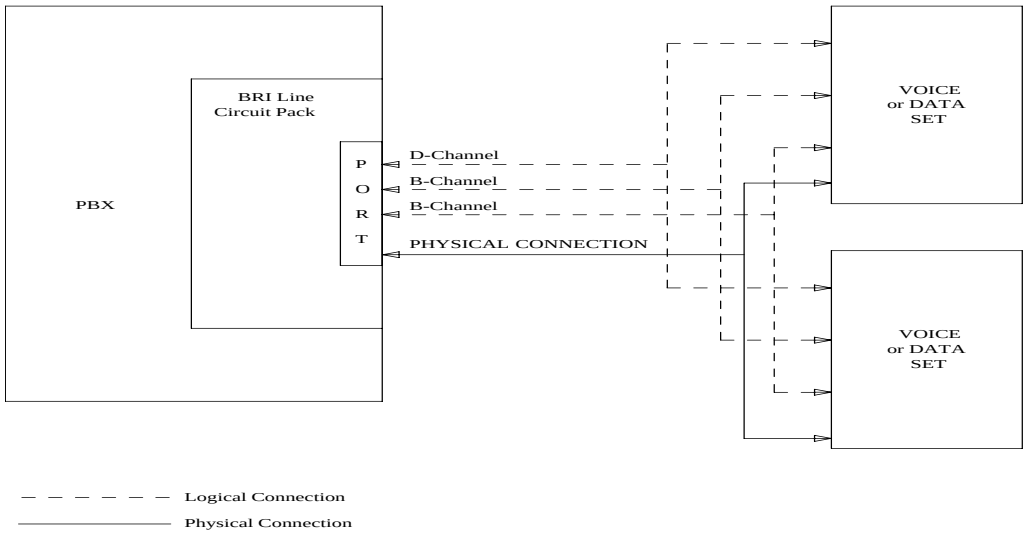
The TN2208 ESAI MFB is handled by switch software as it is an ISDN BRI compatible board and every maintenance action referring to ASAI and Avaya Adjunct Links in this section applies.

In G3iV1.1-286 and G3iV2-386, two types of ISDN-BRI endpoints may be connected to ISDN-BRI (ISDN Basic Rate Interface Line) TN556 and TN2198 circuit packs: ISDN-BRI station endpoints, ASAI (Adjunct-Switch Application Interface) and Avaya adjuncts (for example CONVERSANT® Voice System). These circuit packs contain 12 ports of line circuit interfaces, each of which operates at 192 kilobits per second (kbps) with two B channels and one D channel. For BRI endpoints, each B channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B channels are not used by ASAI or Avaya adjuncts. The D channel is used for conveying signaling between the switch and a BRI endpoint(s) or ASAI or Avaya adjuncts. Each ISDN-BRI D channel is connected to the switch processor and the ISDN-BRI port through the PKT-BUS (packet bus).

ISDN-BRI endpoints come in a number of configurations. Every endpoint requires the D channel to convey signaling information to the switch. A voice-only set requires only one B channel. A voice and data-capable set requires both B channels (one for voice and one for data). Therefore, each TN556 port can support either two voice-only sets or one voice and data-capable set. Only a single ASAI or Avaya adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

Figure 35, ISDN-BRI Set Interactions, on page 521 illustrates the physical connection (solid line) between an ISDN-BRI circuit pack and a voice or voice/data set. Each physical connection allows for two B channels, as stated above, plus one D channel. Each ISDN-BRI circuit pack can support up to 12 of these PHYSICAL connections to different voice and voice/data sets or ASAI and Avaya adjuncts.

Figure 35: ISDN-BRI Set Interactions



This section contains the ISDN-BRI Set, ASAI Adjunct and Avaya Adjunct Maintenance documentation. Some of the results of maintenance testing of the ISDN-BRI Set or the ASAI and Avaya Adjunct may be affected by the health of the ISDN-BRI circuit pack and port. These interactions should be kept in mind when investigating the cause of ISDN-BRI Set problems.

Hardware Error Log Entries and Test to Clear Values

Table 226: BRI-SET/ASAI-ADJ Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level BRI-SET BRI-DAT	Alarm Level ASAI-ADJ ATT-ADJ ATTE-AJ LGATE-AJ	On/ Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	Any	**test station** *ext* **r 2** **test data-module** *ext* **r 2**
2(a)	2-102	None				
18	0	**busyout station** *ext*	WARNING	MAJOR/ WARNING[2]	OFF	**release station** *ext*
130(b)			WARNING		ON	**test port** *PCSS* **sh**
257(c)	Any	BRI Layer 3 Query (#629)	WARNING	MAJOR/ WARNING[2]	OFF	**test station** *ext* **r 2** **test data-module** *ext* **r 2**
351(d)	0	None		WARNING	OFF	**busyout and release station**
513(e)	0	None

3584	0,1	None				
3585-3839 (l)	0	None				
3840-4095 (m) (n)	0	None				

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Major and Minor alarms on this MO may be downgraded to Warning alarms based on the value used in the set options command.

Notes:

a Errors of this type indicate violations of the ISDN-BRI signaling protocol; timers associated with certain layer-3 messages have expired before a required response was received. In the following table, the aux data field indicates what timer has just expired.

Aux Data	Timer Type
2	First T303 (SETUP timer)
3	Second T303 (SETUP timer)
4	T305 (DISConnect timer)
5	First T308 (RELease timer)
6	Second T308 (RELease timer)
10	T316 (RESTart timer)
12	T309 (Layer-2 Failure timer)
16	TM100 (Management Information message Timer 1)
17	TM200 (Management Information message Timer 2)
102	TASAI (ASAI Routing timer)

The switch sent a message to the endpoint that did not respond in the allotted time. This can happen occasionally due to failure of the point-to-point signaling link or because of a problem in the BRI endpoint or ASAI adjunct or Avaya adjunct. Execute **test station *extension* sh** and pay particular attention to the results of the BRI Layer 3 Query test (#629). If this test fails, follow the repair procedure for Test #629.

b This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.

c This error occurs when the endpoint does not respond to the service state query message sent to the adjunct or the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or the adjunct.

For BRI endpoints, the Aux Data field for this error contains "0." When it occurs, execute **test station *extension* sh** and pay particular attention to the results of the BRI Layer 3 Query test (#629). If this test fails, follow the repair procedure for Test #629.

When this error occurs for an ASAI or Avaya adjunct, the Aux Data field indicates the state of the ASAI link or Avaya link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

Aux Data	ASAI Link State	Error
102	13-restarting	No response to RESTART message
104	13-restarting	Invalid response to RESTART message
152	13-restarted	No response to layer-3 query
154	13-restarted	Invalid response to layer-3 query
202	13-established	No response to layer-3 query
204	13-established	Invalid response to layer-3 query

See **status bri-port** in Chapter 1, "Maintenance SAT Commands" in Maintenance Commands Reference (555-245-101) for an explanation of the ASAI link states.

For ASAI or Avaya adjuncts, the switch automatically queries the adjunct every two minutes (and therefore the Layer 3 Query test is not executed for ASAI or Avaya adjuncts via a command issued from the G3MT terminal). While alarmed for this error, the switch momentarily (for five seconds) takes the associated port out-of-service every 15 minutes. This action is taken in an attempt to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or Avaya adjunct, the service technician should:

1. Execute **test station *extension*** and pay particular attention to tests that fail. Perform the associated repair procedures for those tests.
2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.
3. If the above steps do not resolve the problem and the alarm persists, follow normal escalation procedures.

d This error and associated WARNING alarm are logged against an ASAI or Avaya endpoint when the adjunct has asked the switch to suspend Maintenance on the ASAI or Avaya endpoint. Busy out and release the ASAI station or ADJLK station to clear the alarm.

e This error occurs when the endpoint sends more messages than the switch can handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.

f This error occurs when a BRI endpoint's signaling-associated link has too much traffic related to link establishment. This could occur if the signaling link is bouncing between assigned and established states. Software suspends activity to this endpoint for 75 minutes when the endpoint is alarmed due to this problem. Note that service suspension does not occur if the endpoint is an ASAI or Avaya adjunct. If this problem persists, replace the endpoint. If replacing the endpoint does not fix the problem, follow normal escalation procedures.

g This error occurs when the ASAI-ADJ or ATT-ADJ or LGATE-AJ or ATTE-AJ message is not transmitted because the PKT-CTRL (Packet Control circuit pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or Avaya adjunct. Attempt to resolve the problem by following the repair procedures for the PKT-CTRL. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

h This error occurs when the ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow controlled. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or Avaya adjunct. Attempt to resolve the problem by following the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

i This error indicates a layer-2 problem over the D channel between the switch and the endpoint. When this error occurs, an alarm is raised against the station or adjunct. Execute **test station *extension* short** and pay particular attention to the results of the BRI XID test (#628). If this test fails, follow the repair procedure for Test #628.

j This error indicates a problem with the B-channel connection between the switch and the endpoint. When this error occurs, a warning alarm is raised against the endpoint. Execute **test station *extension* long** and pay particular attention to the results of the BRI Remote Loop Back test (#627). If this test fails, follow the repair procedure for Test #627.

k This error occurs whenever the point-to-point signaling link to the endpoint goes down (except when it goes down because either the PKT-CTRL or the PKT-BUS has failed or has been busied out by system technician). When this error occurs, an alarm is raised against the endpoint or adjunct. Execute **test station *extension* short** and pay particular attention to the results of the Signaling Link Status test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is reestablished to the endpoint or adjunct.

l Certain ASAI protocol-specific cause codes are logged by switch software. The cause code can be determined from the following formula:

If the error type is greater than 3712, then the ASAI cause code is equal to the error type minus 3712. This code was sent to the adjunct by the switch.

If the error type is less than 3712, then the ASAI cause code is equal to the error type minus 3584. This code was sent to the switch by the adjunct.

A description of the various ASAI cause values is contained in the Table 227, ASAI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes), on page 525. This table also contains recommended system technician actions associated with the cause value. In addition, the Aux Data field of the Error Log entry contains additional diagnostic information additional diagnostic.

Table 227: ASAI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes)

Error Code	Test Result	Description / Recommendation
0	Unrecognized ASAI Protocol Operation	Requested ASAI protocol operation is not implemented by the switch or adjunct. Aux Data field of Error Log entry contains protocol identifier for unrecognized operation. **1** Consult switch and adjunct documentation to determine which set of operations is supported by the switch and the adjunct. Adjunct administration turning off operations not implemented by the switch may resolve the problem. **2** If step 1 does not resolve the problem, escalate to the next tier.
40	Resources not available	No available internal resources to service switch or adjunct request. System transaction capacity for adjunct or switch is exceeded. **1** Re-engineering of adjunct services my be required. If problem persists, escalate problem to the next tier.

1 of 2

Table 227: ASAI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes)

Error Code	Test Result	Description / Recommendation
63	SERVICE OR OPTION NOT AVAILABLE	Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resources. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct. **1** Verify that no overlapping administration of switch resources (e.g., requesting notifications on a single domain by multiple adjuncts or multiple adjuncts attempting to control a single call) exists across any adjunct connected to the switch. If an overlap exists, then re-administer the adjuncts to guarantee that each adjunct is associated with a unique set of switch resources. **2** If step 1 does not resolve the problem, escalate to the next tier.
79	SERVICE OR OPTION NOT IMPLEMENTED	Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct. **1** Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Re-administration of the switch-administered capabilities (see Customer Optional Feature screen) or those of the adjunct may be necessary to correct the problem. **2** If step 1 does not provide the set of desired services due to deficient implementation, escalate the problem to the next tier.
87	Internal switch audit	There is an inconsistency in switch data records. **1** There is no action needed since the switch has corrected the data inconsistency. **2** If a number of these errors continue to occur, then escalate to next tier.

2 of 2

m Certain ISDN-BRI cause codes are logged by switch software. The cause code can be determined from the following formula:

If the error type is greater than 3968, then the ISDN-BRI cause code is equal to the error type minus 3968. This code was sent to the endpoint by the switch.

If the error type is less than 3968, then the ISDN-BRI cause code is equal to the error type minus 3840. This code was sent to the switch by the endpoint.

A description of the various ISDN-BRI cause values is contained in Table 228, ISDN-BRI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes), on page 527. This table also contains recommended system technician actions associated with the cause value. In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

n Error 3847 indicates that sets on the port do not support level 3 initialization. Consult the Set Service documentation

o For the Error 2567 indicates that the version of ASAI is not supported, check version of the software running on the ASAI or Avaya adjunct.

Table 228: ISDN-BRI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes)

Error Code	Test Result	Description / Recommendation
1	Channel in use	Another station is using requested channel on the BRI-PORT. (Not applicable for ASAI or Avaya adjuncts.) For BRI endpoints: **1** Try to originate a call to or from this port. **2** If the error persists, busyout and release the port. **3** If the problem still persists, replace stations on the port. **4** If the problem still persists, escalate to the next tier.
34	No circuit or channel available	A resource on the switch is unavailable for a call. For BRI endpoints: This cause value is not logged. For ASAI or Avaya Adjuncts: This condition means that there are no available trunks for an outgoing call request. **1** Verify that the adjunct is administered to support the trunk capabilities of the switch. **2** Investigate trunk group status by issuing **status trunk** commands from the SAT or by requesting a trunk group query or queries from the adjunct. **3** Perform trunk diagnostic procedures outlined in this manual. **4** If step 3 does not resolve the problem, escalate to the next tier.
42	Switch Equipment Congestion	Switch takes control to limit received traffic. For BRI endpoints: This cause value is not logged. For ASAI or Avaya Adjuncts: **1** Refer to the CallVisor protocol reference manual. **2** If step 1 does not resolve the problem, escalate to the next tier.

1 of 3

Table 228: ISDN-BRI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes)

Error Code	Test Result	Description / Recommendation
50	Requested Facility Not Subscribed	Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct. For BRI endpoints: **1** Verify the switch administration of endpoint using **display station** or **display data-module**. **2** If step 1 does not resolve the problem, refer to the endpoint's service manual and verify administration on the endpoint. **3** If step 2 does not resolve the problem, escalate to the next tier. For ASAI adjuncts: **1** Display the Customer Optional Features screen (administration screen) on the switch to determine which ASAI capabilities are turned on in the switch. **2** Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administered capabilities, then re-administer the switch and/or the adjunct to establish a consistent set of desired capabilities on both the switch and the adjunct. **3** If step 2 does not resolve the problem, escalate to the next tier. For Avaya adjuncts: **1** Display the Customer Optional Features screen (administration screen) on the switch to determine whether the Avaya adjunct is set enabled on in the switch. **2** If error type 2567 or 2568, verify the Avaya adjunct version, and re-administer if needed. **3** If step 2 does not fix the problem, escalate to the next tier of support
58	Bearer Capability Not Currently Available	Requested bearer capability is implemented, but not administered. No B channel is administered. See recommendation for Error Code 50 above.

2 of 3

Table 228: ISDN-BRI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes)

Error Code	Test Result	Description / Recommendation
65	Bearer Service Not Implemented	Requested service not implemented in switch or endpoint.
69	Requested Facility Not Implemented	Requested service not supported in switch or endpoint. **1** Consult switch and endpoint documentation to determine service support. **2** If step 1 does not resolve the problem, escalate to the next tier.
81	Invalid CRV	An invalid CRV was sent by the adjunct. **1** This may indicate a CRV inconsistency between the switch and the adjunct. Refer to the CallVisor protocol reference manual. **2** If step 1 does not resolve the problem, escalate to the next tier.

3 of 3

p For Error 2568 indicates that the adjunct id is invalid, check the vender id or software running on the Avaya adjunct.

System Technician-Demanded Tests: Descriptions and Error Codes

When inspecting errors in the system and deciding which ones to address, always investigate errors associated with the circuit pack and port first. Clearing these error codes first may also clear errors generated against the endpoint. When every circuit pack and port error has been cleared, and errors still exist against the endpoint, always investigate errors in the order they are presented in the table below. For example, by clearing error codes associated with the *Signaling Link Status* test (#626), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Signaling Link Status test (#626)	X	X	ND
BRI XID test (#628)	X	X	ND
BRI Layer 3 Query (#629)	X(a)	X(a)	ND
BRI Remote Loop Back (#627)		X(a)	ND
BRI Set Audits (#630)	X(a)	X(a)	ND
BRI Vendor ID test (#631)		X(a)	ND
BRI Model/Vintage ID test (#632)		X(a)	ND

1 D = Destructive; ND = Nondestructive

NOTE:
(a) Execute the **test port long *PCSSpp*** command, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is "bound" to an endpoint and fails if the link is "not bound."

The definition of the term "bound" for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of "bound" for each type of endpoint is as follows:

- **BRI endpoints administered for MIM (management information messages) initialization (multipoint):**

  NOTE:
  An MIM is a level 3 message that conveys management and maintenance information between a communications system and a BRI terminal.

  For endpoints of this type, the signaling link is "bound" when the link is connected at Layer 2 and the link has been associated with an endpoint, [that is, the endpoint has completed SPID initialization (L3 established)].

- **ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):**

  For endpoints of this type, the signaling link is "bound" when the link is connected at Layer 2 (L2 established).

For every endpoint type, a signaling link becomes "unbound" when it is disconnected at Layer 2. For BRI endpoints supporting MIM initialization, a signaling link may also become "unbound" if a subsequent attempt to perform SPID initialization on a "bound" link fails (that is, wrong SPID is entered into the endpoint by the user).

Table 229: Test #626 Signaling Link Status Test *1 of 2*

Error Code	Test Result	Description / Recommendation
1139	ABORT	The PN's packet bus is out-of-service. **1** Follow the repair procedures for the packet bus. **2** After completing step 1, use **test port long *PCSSpp***, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. **1** Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. **2** If step 1 does not resolve the problem, escalate to the next tier.
S8100: 1144	ABORT	The PPN Packet Bus is out-of-service. **1** Follow the repair procedures for the Packet Bus in the PPN. **2** After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1187	ABORT	The circuit pack, port or station may have been busied out by a technician. **1** Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. **c** If this error type is present for BRI-SET only, then release the station via **release station.** **d** If this error type is present for BRI-PORT and BRI-SET, then release the port via **release port *PCSSpp*** and run the test again. **e** If the error is present for BRI-BD, BRI-PORT, and BRI-SET, then release the circuit pack via **release port *PCSSpp*** and run the test again. If the error is present for BRI-SET only, then release the circuit pack via **release port *PPCSS*** and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via **release board *PPCSS*** and run the test again. **NOTE:** When you release the circuit pack, you release every port associated with it. If certain ports still need to be busied out, use **busyout port *PCSSpp*** to busy them out. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.

1 of 2

Table 229: Test #626 Signaling Link Status Test *2 of 2*

Error Code	Test Result	Description / Recommendation
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1113	FAIL	The signaling link is not "bound" to the adjunct or endpoint. For BRI endpoints supporting MIM initialization, this error indicates that the endpoint has not been bound to a signaling link (that is, SPID initialization has not been completed). Since the signaling link associated with the endpoint is not identified until SPID initialization completes, this error does not imply that the signaling link is connected or disconnected at Layer 2 nor does it provide the status of TEI assignment for the endpoint. For ASAI adjuncts and BRI endpoints not supporting MIM initialization, this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified via administration, the link is only "unbound" from the endpoint when it is disconnected. **1** Execute **status bri-port *PCSSpp*** and see the associated procedures in BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port) on page 499.
	PASS	The signaling link is connected at Layer 2 and "bound" to the BRI endpoint or ASAI adjunct.

2 of 2

BRI Remote Loop Back Test (#627)

This test checks the integrity of a circuit-switched B-channel connection between the switch and the endpoint.

In this test, the endpoint is put in the "maintenance busy" state to prevent the switch from issuing calls to the endpoint during the test. An application message containing a loop back activate request for the appropriate B channel is sent to the endpoint. The endpoint responds with a loop back activated response. Maintenance then sends data to the endpoint over the B channel under test. Since the B channel is looped back at the endpoint, maintenance should receive the data that it sent. If no data is detected, the test fails. An application message containing a loop-back deactivate request is then sent to the endpoint to discontinue the remote loop-back test. The endpoint responds with an MIM message containing a loop-back deactivate response. Maintenance then releases the endpoint so that it is available to terminate calls.

This test is not executed for ASAI adjuncts because adjuncts do not support MIMs upon which this test is based.

Table 230: Test #627 BRI Remote Loop Back *1 of 3*

Error Code	Test Result	Description / Recommendation
1000	ABORT	Could not seize the endpoint or B channels for test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
1005	ABORT	The endpoint's MIMs Supported field is administered to "no." **1** Use **change station *extension*** to change parameter only if the endpoint documentation reflects support for ISDN-BRI Management and Maintenance Procedures.
1113	ABORT	The signaling link between the switch and the endpoint is down. **1** Use **test port *PCSSpp* long** to clear any errors that prevent establishment of the signaling link. **2** Examine the results of the Signaling Link Status test (#626) that is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626. **3** If the XID test (#628) continues to abort, escalate the problem.
1139	ABORT	The PN's packet bus is out-of-service. **1** Follow the repair procedures for the packet bus. **2** After completing step 1, execute **test port long *PCSSpp***, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. **1** Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. **2** If step 1 does not resolve the problem, escalate to the next tier.
S8100: 1144	ABORT	The PPN Packet Bus is out-of-service. **1** Follow the repair procedures for the Packet Bus in the PPN. **2** After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

1 of 3

Table 230: Test #627 BRI Remote Loop Back *2 of 3*

Error Code	Test Result	Description / Recommendation
1187	ABORT	The circuit pack, port or station may have been busied out by a technician. **1** Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. **f** If this error type is present for BRI-SET only, then release the station via the **release station** **g** If this error type is present for BRI-PORT and BRI-SET, then release the port via **release port *PCSSpp*** command and run the test again. **h** If the error is present for BRI-BD, BRI-PORT, and BRI-SET, then release the circuit pack via the **release port *PCSSpp*** command and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via the **release board *PPCSS*** command and run the test again. If the error is present for BRI-SET only, then release the circuit pack via the **release port *PPCSS*** command and run the test again. **NOTE:** When you release the circuit pack, you release every port associated with it. If certain ports still need to be busied out, use the **busyout port *PCSSpp*** command to busy them out. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
2012	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
2068	ABORT	The endpoint has rejected the switch sent application message. This indicates that the endpoint does not support the ISDN-BRI Management and Maintenance Procedure for Loop Back testing. **1** Use the **change station *extension*** command and change the *MIMs Supported* field to **n**.
2069	ABORT	The endpoint has returned an error response to the application message sent by the switch.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

2 of 3

Table 230: Test #627 BRI Remote Loop Back *3 of 3*

Error Code	Test Result	Description / Recommendation
S8100: 2000	FAIL	No loop back activation or deactivation response is received from the endpoint. **1** Consult the endpoint documentation to determine if ISDN-BRI Management and Maintenance Procedures are supported. If not supported, use **change station extension** command to change the `MIMs Supported?` field to **n**. Use the **busyout station extension** and **release station extension** commands to busyout and release the endpoint to resolve any endpoint alarms resulting from failure of this test. **2** If the endpoint supports these procedures and the test continues to fail, assume the endpoint is defective and replace it.
S8100: 2071	FAIL	No data is detected on Channel B1 during loop back.
S8100: 2072	FAIL	No data is detected on Channel B2 during loop back. **1** Replace the endpoint and repeat test. **2** If test continues to fail, check the wiring between the endpoint and the switch and repeat the test.
S8100:	PASS	The endpoint has responded to the switch activate and deactivate loop back application messages. Data has been detected on the looped back channels.

3 of 3

BRI XID Test (#628)

This test checks the D-channel connection between the server and an endpoint or adjunct.

In this test, a D-channel XID frame is sent to the endpoint or adjunct over the point-to-point signaling link. The test passes if the endpoint or adjunct responds with a layer-2 XID-RESPONSE frame

This test must be administered to not run in the Station Administration screen for ports on a TN2208.

Table 231: Test #628 BRI XID *1 of 2*

Error Code	Test Result	Description / Recommendation
1000	ABORT	The BRI-SET, ASAI-ADJ, ATT-ADJ, LGATE-AJ, ATTE-AJ is busy. The test cannot be executed at this time: **1** Pause momentarily (30 seconds) and re-execute at this time. **2** If this problem persists, escalate this problem. **NOTE:** A BRI-PORT can also be busy. When using this for BRI-PORT/ABRI-PORT tests, the words "BRI-SET, ASAI-ADJ, ATT-ADJ," can be changed to "BRI-PORT, ABRI-PORT, ATT-ADJ."
1005	ABORT	The endpoint is not administered to support XID testing. **1** If the endpoint documentation reflects support XID testing, use **change station *extension*** and change the *XID Testing* field on the screen to **y**.
1113	ABORT	The signaling link between the switch and the endpoint is down. **1** Use **test port *PCSSpp* long** to clear any errors that prevent establishment of the signaling link. **2** Examine the results of the Signaling Link Status test (#626) that is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626. **3** If the XID test (#628) continues to abort, escalate the problem.
1139	ABORT	The PN's packet bus is out-of-service. **1** Follow the repair procedures for the packet bus. **2** After completing step 1, execute **test port long *PCSSpp***, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. **1** Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. **2** If step 1 does not resolve the problem, escalate to the next tier.
S8100: 1144	ABORT	The PPN Packet Bus is out-of-service. **1** Follow the repair procedures for the Packet Bus in the PPN. **2** After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

1 of 2

Table 231: Test #628 BRI XID *2 of 2*

Error Code	Test Result	Description / Recommendation
1187	ABORT	The circuit pack, port or station may have been busied out by a technician. **1** Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. **i** If this error type is present for BRI-SET only, use **release station** to release the station. **j** If this error type is present for BRI-PORT and BRI-SET, use **release port *PCSSpp*** and run the test again. **k** If the error is present for BRI-BD, BRI-PORT, and BRI-SET, use **release port *PCSSpp*** to release the circuit pack, and run the test again. If the error is present for BRI-SET only, use **release port *PCSSpp*** to release the circuit pack, and run the test again. If the error is present for both BRI-BD and BRI-PORT, use **release board *PPCSS*** to release the circuit pack, and run the test again. **NOTE:** When you release the circuit pack, you release every port associated with it. If ports still need to be busied out, use **busyout port *PCSSpp***. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
2000	FAIL	The XID-RESPONSE message was not received from the endpoint. **1** Consult the endpoint's documentation to determine whether layer-2 XID and XID-RESPONSE messages are supported. If the documentation reflects no support for these messages, use **change station *extension*** and change the XID Testing field to **n**. **2** If the endpoint supports these layer-2 messages and the test continues to fail, assume the endpoint is defective and replace it. **3** If the test continues to fail, escalate the problem.
	PASS	The switch can successfully pass messages over the D channel to the BRI endpoint.

2 of 2

BRI Layer 3 Query Test (#629)

This test is used to check the application layer communications between the switch and the endpoint or adjunct.

For BRI endpoints, an application message containing the appropriate endpoint service state is sent by the switch to the endpoint. The endpoint responds with an acknowledgment to the application message.

For ASAI and Avaya adjuncts, this test is not executed from the administration terminal. Rather, a query message is automatically sent by the switch every two minutes. Failure of the switch to receive a response to a query from the adjunct is logged in the Hardware Error Log.

Table 232: Test #629 BRI Layer 3 Query

Error Code	Test Result	Description / Recommendation
1005	ABORT	The endpoint's MIMs Supported? field is administered to "no." **1** Use **change station *extension*** to change the parameter only if the endpoint documentation reflects support for ISDN-BRI Management and Maintenance Procedures.
1113	ABORT	The signaling link between the switch and the endpoint or adjunct is down. **1** Use **test port *PCSSpp* long** to clear any errors that prevent establishment of the signaling link. **2** Examine the results of Test #626 that are executed with the command. If this test aborts or fails, follow the repair procedure for the Signaling Link Status test. **3** Escalate problem if BRI Layer 3 Query test continues to abort.
1139	ABORT	The PN's packet bus is out-of-service. **1** Follow the repair procedures for the packet bus. **2** After completing step 1, execute **test port long *PCSSpp***, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. **1** Consult the repair procedure for PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. **2** If step 1 does not resolve the problem, escalate to the next tier.
S8100: 1144	ABORT	The PPN Packet Bus is out-of-service. **1** Follow the repair procedures for the Packet Bus in the PPN. **2** After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

1 of 3

Table 232: Test #629 BRI Layer 3 Query

Error Code	Test Result	Description / Recommendation
1187	ABORT	The circuit pack, port or station may have been busied out by a technician. **1** Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. **l** If this error type is present for BRI-SET only, then release the station via **release station**. **m** If this error type is present for BRI-PORT and BRI-SET, then release the port via **release port *PCSSpp*** and run the test again. **n** If the error is present for BRI-BD, BRI-PORT, and BRI-SET, then release the circuit pack via **release port *PCSSpp*** and run the test again. If the error is present for BRI-SET only, then release the circuit pack via **release port *PPCSS*** and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via **release board *PPCSS*** and run the test again. **NOTE:** When you release the circuit pack, you release every port associated with it. If certain ports still need to be busied out, use **busyout port *PCSSpp*** to busy them out. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.
2068	ABORT	The endpoint has rejected the switch sent application message. This indicates that the endpoint does not support the ISDN-BRI Management and Maintenance Procedure for Endpoint Service messages. **1** Use **change station *extension*** and change the MIMs Supported field to **n**.
2069	ABORT	The endpoint has returned an error response to the switch sent application message. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

2 of 3

Table 232: Test #629 BRI Layer 3 Query

Error Code	Test Result	Description / Recommendation
2000	FAIL	No response is received from the endpoint or the adjunct. For BRI endpoints: **1** Consult the endpoint's documentation to determine whether ISDN-BRI Management and Maintenance Procedures are supported. If not supported, use **change station *extension*** to change the MIMs Supported field to **n**. Use **busyout station *extension*** and **release station *extension*** to busyout and release the endpoint to resolve any endpoint alarms resulting from failure of this test. **2** If the endpoint supports these procedures and the test continues to fail, assume the endpoint is defective and replace it.
	PASS	The endpoint has successfully responded to the switch's application message.

3 of 3

BRI Set Audits Test (#630)

This is a series of two tests that are classified as audits. The switch sends messages to the BRI endpoint to perform the following tests:

- Ringer Audit – This audit insures that both the switch and the endpoint agree as to the current state of the endpoint's ringer.
- Lamps Audit – This audit insures that both the switch and the endpoint agree as to the current state of the endpoint's lamps.
- Call Activity Audit – This audit insures that the state of calls is consistent between the switch and the endpoint.

This test is not executed for ASAI or Avaya adjunct because adjuncts do not employ ringers or lamps, or establish calls on the B channels associated with the BRI interface.

Table 233: Test #630 BRI Set Audits

Error Code	Test Result	Description / Recommendation
1113	ABORT	The signaling link between the switch and the endpoint is down. **1** Use **test port *PCSSpp* long** to clear any errors that prevent establishment of the signaling link. **2** Examine the results of the Signaling Link Status test (#626) that is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626. **3** If the BRI Set Audits test continues to abort, escalate the problem.

1 of 3

Table 233: Test #630 BRI Set Audits

Error Code	Test Result	Description / Recommendation
1139	ABORT	The PN's packet bus is out-of-service. **1** Follow the repair procedures for the packet bus. **2** After completing step 1, execute **test port long *PCSSpp***, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. **1** Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. **2** If step 1 does not resolve the problem, escalate to the next tier.
S8100: 1144	ABORT	The PPN Packet Bus is out-of-service. **1** Follow the repair procedures for the Packet Bus in the PPN. **2** After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1187	ABORT	The circuit pack, port or station may have been busied out by a technician. **1** Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. **o** If this error type is present for BRI-SET only, then release the station via **release station**. **p** If this error type is present for BRI-PORT and BRI-SET, then release the port via **release port *PCSSpp*** and run the test again. **q** If the error is present for BRI-BD, BRI-PORT, and BRI-SET, use **release port *PCSSpp*** to release the circuit pack, and run the test again. If the error is present for both BRI-BD and BRI-PORT, use **release board *PPCSS*** to release the circuit pack, and run the test again. **NOTE:** When you release the circuit pack, you release every port associated with it. Use **busyout port *PCSSpp*** if ports still need to be busied out. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, escalate the problem.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to abort, escalate the problem.

2 of 3

Table 233: Test #630 BRI Set Audits

Error Code	Test Result	Description / Recommendation
	PASS	The switch has successfully executed the BRI station audits.

3 of 3

SPID Facility Test

This test is used to verify the wiring and operation of the signaling link between the switch and a endpoint or adjunct on a BRI interface. **This test is not executed from the administration terminal, but rather is executed by using a BRI test set equipped with a display.** The test set may replace the BRI set, ASAI or Avaya adjunct under test by plugging it into the same jack or by bridging it onto the wiring at some point between the switch and the endpoint (or adjunct), thereby creating a pseudo-BRI multipoint configuration.

When plugged into the port in this manner, the test set establishes a signaling link connection with the switch and attempts to complete SPID initialization by using the Service SPID administered for the system (see the System Maintenance Administration screen). If the test set displays the correct administered port address for the endpoint or adjunct under test, the test passes (see Table 234, Service SPID Display, on page 543). If after one minute nothing is displayed on the test set, the test fails.

SPID Facility Test

Test Result	Description / Recommendation
FAIL	No response is received from the endpoint. **1** Check the physical wiring between the switch and the endpoint or adjunct. **2** If test continues to fail, escalate to the next tier.

SPID Facility Test

Test Result	Description / Recommendation
FAIL	Display does not match administered port address for the endpoint or adjunct. **1** Change station administration for endpoint or adjunct to match displayed port address. **2** If test continues to fail, escalate the problem.
PASS	Display matches administered port address for the endpoint or adjunct. For BRI endpoints: **1** Verify that the SPID values administered in the switch and the endpoint are consistent. **2** If the SPID values are correct, replace the endpoint. **3** If test continues to fail, escalate the problem. For ASAI adjuncts: **1** Verify that the TEI values administered in the switch and the adjunct are consistent. **2** If the TEI values are correct, consult the recommended repair procedures of the manufacturer for the adjunct. **3** If test continues to fail, escalate the problem.

The abbreviations used in (Service SPID Display) have the following meanings:

UU	Universal cabinet number (1 – 44 for PNs)
C	Carrier (A,B,C,...)
SS	Slot (01, 02,...)
pp	port (01 – 12)
ext	extension one and two (1 – 99999)
SPID	service order profile identifier

CAB-CALM (Customer alarm)

G650

MOs name (in alarm log)	Alarm level	Initial SAT command to run[1]	Full name of MO
CAB-CALM	None	**test customer-alarm *location***	Customer Alarm

1 For information on specifying a ***location***, see Command Syntax on page 179.

The MO CAB-CALM provides control of a relay contact between a pair of leads from the TN2312BP IPSI that can be wired to an external alarming device that is provided by the customer (CPAD). A contact closure is provided between the leads when the alarm exceeds the level specified in the `CPE Alarm Activation Level` field on the ***change system-parameters maintenance*** screen.

The MO CAB-CALM is not associated with any background or demand tests that are used to clear alarms. This MO becomes active when any other MO reaches a predetermined level (none, warning, minor, or major) and generates an alarm. Clear the MO that is generating the alarm to retire the contact closure across the CPAD relay contact.

If you think that there is a problem with the CPAD, you can test it by executing the **test customer-alarm** command that activates the device closing the relay on the TN2312BP IPSI for one minute. You can specify the repeat parameter to close the relay contact for a longer time. The number of repeats that you specify is the number of minutes the external device is activated.

System technician-demanded test: Descriptions and error codes

The **test customer-alarm *location*** (**short|long**) **r#** command causes the TN2312BP IPSI to:

- Close the CPAD relay contact for one minute
- Return to the state determined by the active alarm level specified by the `CPE Alarm Activation Level` field on the ***change system-parameters maintenance*** screen

Order of investigation	Short test sequence	Long test sequence	D/ND[1]
Customer Provided Alarming Device Test (#115)	X	X	ND

1 D = Destructive, ND = Nondestructive

Customer Provided Alarming Device Test (#115)

The CPAD test closes the relay that activates the CPAD for one minute. If more than one minute is necessary to verify the CPAD activation, you can change the **repeat** number on the **test customer-alarm *location*** command to close the relay for up to 99 minutes. For example, specifying **r99** repeats for 99 minutes.

Table 235: Test 115 Customer provided alarming device

Error Code	Test Result	Description / Recommendations
1000	ABORT	This is an internal system error. **1** Repeat the command at one-minute intervals 1 to 3 times.
2000	ABORT	The response to a query was not received in the time allowed. **1** Repeat the command at one-minute intervals 1 to 3 times.
	PASS	(When the command returns a PASS result, the relay contact remains closed for one minute after the command is executed.) The software successfully sent the request to the TN2312BP IPSI circuit pack to turn on the CPAD. You must inspect the CPAD to verify that it is operating. **1** If the CPAD is operating, but a customer complains that the CPAD did not indicate an actual system alarm: **a** Enter **display system-parameters maintenance** to check the administered alarm-activation level **b** Compare administered alarm level with the customer's specifications. If the administered alarm level does not match the customer's specifications, change the alarm level using the **change system-parameters maintenance** screen. **2** If Test 115 passes, but the CPAD is not being activated, check the CPAD connection to the TN2312BP IPSI circuit pack. **3** If the CPAD can be activated but not deactivated, enter **status cabinet** or **status health** command to verify that emergency transfer is not activated in the affected media gateway. Note that you can force emergency transfer to manual OFF using **set emergency-transfer <cabinet>** command. **4** If Emergency Transfer is OFF and the CPAD still cannot be deactivated: **a** Enter **display system-parameters maintenance** to check the administered CPAD alarm levels. **b** Enter **display alarms** to compare CPAD levels against those currently in the system.

CAB-EXFR (emergency transfer)

G650

MOs name (in alarm log)	Alarm level	Initial SAT command to run[1]	Full name of MO
CAB-EXFR	MINOR	**test environment *location* sh**	Emergnncy Transfer
CAB-EXFR	MAJOR	**test environment *location* l**	Emergancy Transfer

1 For information on specifying a ***location***, see Command Syntax on page 179.

The emergency transfer feature connects some central office trunks directly through to analog user stations when the system has a serious problem or experiences a total power failure.

Emergency transfer is activated by the TN2312BP IPSI when:

- The system is booting.
- The cabinet containing the TN2312BP IPSI board is in power failure.
- The TN2312BP IPSI has detected a loss of control connectivity for more than 70 seconds.
- The server has detected a serious problem in the cabinet.
- A request is made from a SAT command to set the state of emergency transfer.

Refer to Figure 119, G650 Cabinet Environmental Hardware Components, on page 1599 for further information.

On, off, and auto in emergency transfer

This is introduced to set the state of emergency transfer (**set emergency-xfr on | off | auto *location***), because a physical switch is not provided on the faceplate of the TN2312BP IPSI circuit pack to control the state of emergency transfer.

The TN2312BP IPSI supplies -48V DC voltage to an emergency transfer panel. This -48V supply keeps relays within the emergency transfer panel operating which, in turn, keep analog stations and CO trunks wired to ports (station and trunk respectively) on the system. When the TN2312BP IPSI is supplying -48V, the state of emergency transfer is off. When a problem is detected and the TN2312BP IPSI stops supplying -48V the state of emergency transfer is on. When the TN2312BP IPSI is in the auto state, it is usually supplying -48V to the emergency transfer panel, but automatically switches to the on state and stops supplying -48V if it detects a problem.

Error log entries and test-to-clear values

Error type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
1 (a)	—	Emergency transfer query test (#1532)	MAJOR	On	**test environment *location***
2 (b)	—	Emergency transfer query test (#1532)	MAJOR	On	**test environment *location***
257 (c)	—	Emergency transfer query tesst (#1532)	WARNING	On	**test environment *location***

Error Notes:

(a) Error Type 1 – Manual on. Run **test environment *location*** and follow the repair steps for Test #1532.

For information on specifying a location, see Command Syntax on page 179.

(b) Error Type 2 – Firmware has activated emergency transfer. This error is not expected. Run **test environment *location*** and follow the repair steps for Test #1532.

(c) Error Type 257 – Manual off. Run **test environment *location*** and follow the repair steps for Test #1532.

System technician-demanded test: Descriptions and error codes

Order of investigation	Short test sequence	Long test sequence	D/ND[1]
Emergency transfer query test (#1532)	X	X	ND

1 D = Destructive, ND = Nondestructive

Emergency Transfer Query test (#1532)

There is only one test associated with the MO CAB-EXFR. The emergency transfer query test queries the maintenance module on the TN2312BP IPSI to determine if the emergency transfer is set in MANUAL-ON or MANUAL-OFF mode. If emergency transfer is set to MANUAL-ON, a major alarm is generated. If emergency transfer is set to MANUAL-OFF, a warning alarm is generated.

Table 236: Test 1532 Emergency transfer query

Error code	Test result	Description and recommendation
1000	ABORT	This is an internal system error. **1** Repeat the command at one-minute intervals 1 to 3 times.
2000	ABORT	The response to a query was not received in the time allowed. **1** Repeat the command at one-minute intervals 1 to 3 times.
1	FAIL	The emergency transfer is set to Manual-Off. **1** Use the **status cabinet *cab*** or **status health *cab*** command to display the status of the emergency transfer select switch: • "on" means that emergency transfer was manually activated by the **set emergency-transfer on** command. • "off" means that emergency transfer was manually deactivated by the **set emergency-transfer off** command. • "auto+" means that the system has a serious alarm that causes Communication Manager to activate emergency transfer. • "auto-" means that emergency transfer is not active and is not being controlled by the **set emergency transfer** command. **2** If "off", issue **set emergency auto *cab*** command to return control of emergency transfer to Communication Manager.
2	FAIL	The emergency transfer is set to Manual-On. **1** Use the **status cabine *cab*** or **status health *cab*** command to display the status of the emergency transfer select switch: • "on" means that emergency transfer was manually activated by the **set emergency-transfer on** command. • "off" means that emergency transfer was manually deactivated by the **set emergency-transfer on** command. • "auto+" means that the system has a serious alarm that causes Communication Manager to activate emergency transfer. • "auto-" means that emergency transfer is not active and is not being controlled by the **set emergency transfer** command. **2** If "on", issue the **set emergency transfer auto *cab*** command to return control of emergency transfer to Communication Manager.
16	FAIL	Embedded software (firmware) has activated emergency transfer. This is an internal error, since Communication Manager should have set the state to "Manual-on", "Manual-off", or "auto" at the time the TN2312BP was initiated. **1** Run **test maintenance *cab*** to see if communications with the TN2312BP are up. **2** Reset the TN2312BP circuit pack with the **reset ipserver** command.

1 of 2

Table 236: Test 1532 Emergency transfer query

Error code	Test result	Description and recommendation
	PASS	System software has control of Emergency Transfer within this cabinet. If Emergency Transfer is currently invoked (the emergency transfer LED is on), the cause could be a major alarm. **1** The following shows the error types that can cause Emergency Transfer. If any of these errors appear in the log, then see TONE-BD (Tone-Clock Circuit) on page 1902, and resolve these error types first: • Error Type 3848, Aux Data 0 • Error Type 2305, Aux Data 0 These errors indicate the loss of one or more clock signals from the reported TN2312BP circuit pack. **a** Examine the Hardware Error Log for errors reported against circuit packs in the same port network, especially TDM-CLK, TONE-BD, and EXP-INTF. Follow the repair or replacement procedures indicated for any such errors found. **b** If the error is not corrected by resolving errors found in step 1, the TN2312BP circuit pack should be replaced. See Replacing the IPSI or Tone-Clock Circuit Pack on page 1911. **2** If none of the previous errors appear in the log, then check the Emergency Transfer hardware.
		2 of 2

CAB-MTCE (Media Gateway Maintenance)

G650

MOs name (in alarm log)	Alarm level	Initial SAT command to run	Full name of MO
CAB-MTCE	MINOR	**test maintenance *location*[1] sh**	Media Gateway Maintenance
CAB-MTCE	MAJOR	**test maintenance *location* l**	Media Gateway Maintenance

1 For information on specifying a ***location***, see Command Syntax on page 179.

Avaya Communication Manager 2.0 introduces the G650 media gateway. The G650 media gateway does not support the traditional maintenance board (TN775D), therefore environmental maintenance is performed by the TN2312BP IPSI circuit pack. The CAB-MTCE MO is used to allow the alarming and logging of environmental maintenance errors for the TN2312BP IPSI in a G650 media gateway. Since the TN2312BP IPSI supports environmental maintenance in the G650 media gateway, trouble with the TN2312BP IPSI may cause environmental maintenance to falsely detect problems. The following environmental MOs may be affected:

- CAB-EXFR (emergency transfer) on page 547
- CAB-CALM (Customer alarm) on page 545
- CAB-PFL (Power Fan Lead) on page 556
- SER-BUS (Serial communication bus) on page 1598
- EXT-DEV (External device alarm) on page 966

When the TN2312BP is used in the SCC1 and MCC1 media gateways the collocated TN775D Maintenance circuit pack performs environmental maintenance.

When the TN2312BP IPSI is used in a G600 or CMC1 media gateway it monitors environment maintenance (power supply and fans) using the AuxSig lead.

Initialization

Initialization Test (#1548) is executed when an IPSI is inserted and the board and media gateway type is determined. When a TN2312AP is inserted in a CMC1, G600, or G650 the Power Fan Lead (AuxSig) environmental maintenance is enabled.

When a TN2312BP IPSI is inserted in either a CMC1 or G600, Communication Manager sends the following messages to the embedded software (firmware) on the board:

- Enable environmental maintenance (Power Fan lead)
- A query to verify that environmental maintenance is enabled

When a TN2312BP IPSI is inserted in a G650, Communication Manager sends the following messages to embedded software (firmware) on the board:

- Enable environmental maintenance
- Enable power supply insertion

- Enable power supply audits
- A query to verify that environmental maintenance is enabled
- A query to verify that power supply insertion is enabled
- A query to verify that power supply audits are enabled

Error log entries and test-to-clear values

Error type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
1 (a)	—	Correct board test (#1546)	MINOR	ON	**test maintenance *location***
257 (b)	—	Sanity test (#1547)	MINOR	ON	**test maintenance *location***
513 (c)	Any	All	NONE	—	—
769 (d)	Any	All	NONE	—	—
1025 (e)	—	Reset test (#1545)	MINOR	ON	**test maintenance *location***
1281 (f)	—	Initialization test (#1548)	MINOR	ON	**reset maintenance *location***

Error Information

a **Error type 1**—When a TN2312AP IPSI is inserted into a CMC1 or G650 Media Gateway a minor alarm is raised. Full environmental maintenance is NOT available. Replace the TN2312AP IPSI with a TN2312BP IPSI. NOTE: A TN2312AP inserted in a G600 media gateway DOES not raise any alarm or error.

b **Error type 257**—This error indicates the inability to communicate with the TN2312BP IPSI board. NOTE: The board must be a TN2312BP IPSI for this test to run.

c **Error type 513**—This error indicates that the op-code for messages received from the TN2312BP was not equal to any known op-code. The unknown op-code is recorded under Aux data.

d **Error type 769**—This error indicates that a message with a valid op-code was received but some other part of the message was indecipherable. The op-code with the error is recorded under Aux data.

e **Error type 1025**—This error indicates that an unsuccessful attempt was made to reset environmental maintenance.

f **Error type 1281**—This error indicates that environmental initialization failed. Run the Reset Environmental Maintenance Test (#1545), which calls the Initialization Test (#1548).

System technician-demanded tests: Descriptions and error codes

Always investigate tests in the order presented in the following table when you inspect errors in the system. When you clear error codes associated with the Correct Board Test (1546), you might also clear errors generated from other tests in the testing sequence.

Order of investigation	Short test sequence	Long test sequence	D/ND[1]
Correct Board Test (#1546)	X	X	ND
Sanity Test (#1547)	X	X	ND
Reset Environmental Maintenance Test (#1545)	—	X	D

1 D = Destructive, ND = Nondestructive

Reset Environmental Maintenance test (#1545)

This test resets the environmental maintenance on the TN2312BP IPSI board.

Table 237: Test #1545 Reset test

Error code	Test result	Description and recommendation
1000	ABORT	There is an internal software problem. **1** Repeat the command at one-minute intervals 1 to 3 times.
1982	ABORT	The board being tested is NOT a TN2312BP IPSI or later. **1** Insert a TN2312BP IPSI circuit pack.
1986	ABORT	The TN2312BP IPSI failed to set emergency transfer to AUTO at initialization. **1** Run **reset maint** command.
2000	ABORT	The response to a query was not received in the time allowed. **1** Run **reset maint** command.
2500	ABORT	An internal operation failed (Possible unknown cabinet type). **1** Repeat the command at one-minute intervals 1 to 3 times.
1	FAIL	The TN2312BP IPSI environmental maintenance initialization failed. **1** Repeat the command at one-minute intervals 1 to 3 times.
2	FAIL	The TN2312BP IPSI failed a sanity test. **1** Run **reset maint** command. **2** If the problem persists, replace the circuit pack.

1 of 2

Table 237: Test #1545 Reset test

Error code	Test result	Description and recommendation
	PASS	Environmental maintenance has been enabled and passes a sanity test.
		2 of 2

Correct Board test (#1546)

The TN2312BP IPSI board is required for the environmental functions to work in the G650 media gateway. This test verifies that the proper IPSI is inserted in the G650.

Table 238: Test #1546 Correct board test

Error code	Test result	Description and recommendation
2500	ABORT	An internal operation failed. **1** Repeat the command at one-minute intervals 1 to 3 times.
1	FAIL	For G650 or CMC1 media gateways: A TN2312AP IPSI has been inserted.
	PASS	For G600 media gateways: Either a TN2312AP or TN2312BP IPSI is present.
	PASS	For CMC1, G600, and G650 media gateways: A TN2312BP IPSI is present.

Sanity test (#1547)

The TN2312BP is queried to determine whether or not it can sustain basic sanity.

Table 239: Test #1547 Sanity test

Error code	Test result	Description and recommendation
1000	ABORT	There is an internal system error. **1** Repeat the command at one-minute intervals 1 to 3 times.
1981	ABORT	The TN2312BP IPSI is busied out. **1** Issue the **release ipserver-interface** command.
1982	ABORT	The board being tested is NOT a TN2312BP IPSI or later. **1** Insert a TN2312BP IPSI circuit pack.
2033	ABORT	There is an internal system error.
2500	ABORT	An internal operation failed (Possible unknown cabinet type). **1** Repeat the command at one-minute intervals 1 to 3 times.
		1 of 2

Table 239: Test #1547 Sanity test

Error code	Test result	Description and recommendation
	PASS	The correct board is present and a valid response was received for a sanity query.
		2 of 2

CAB-PFL (Power Fan Lead)

G650

MOs name (in alarm log)	Alarm level	Initial SAT command to run[1]	Full name of MO
CAB-PFL	MINOR	**test environment *location***	Power Fan Lead
CAB-PFL	MAJOR	**test environment *location***	Power Fan Lead

1 For information on specifying a ***location***, see Command Syntax on page 179.

The CAB-PFL represents the state of a combined power/fan lead. This lead is known as the AuxSig lead. On a G650, the AuxSig output signal is a ground referenced relay contact closure indicating a failure of the 655A power supply outputs, hot spot thermal warning, hot spot thermal shutdown, or failure of the fan assembly in a G650.

Use the AuxSig lead to determine the alarm state of the power supplies and fans if the serial bus or the interface to the serial bus of the TN2312BP IPSI in a G650 fails. If there is a CAB-PFL alarm in a G650 carrier, there should also be a SER-BUS, POW-SUP, CAB-TEMP, or PS-RGEN alarm indicating the source of the failure.

Refer to Figure 119, G650 Cabinet Environmental Hardware Components, on page 1599 for further information.

When the TN2312BP IPSI is on a CMC1 or a G600 carrier, use the CAB-PFL MO to determine the status of the power supply and fans, but the repair procedure should be the same as that for RMC-ENV (Power/Fan Sensors) on page 1593.

NOTE:
Fan/filter replacement procedures for the CMC1 and G600 media gateways are to be found under Variable-speed fans in Chapter 7, Component Replacement in *Maintenance Procedures (555-245-103)*.

Error log entries and test-to-clear values

Error type	Aux data	Associated test	Alarm level[1]	On/Off board	Test-to-clear value
1 (a)	—	Power/Fan lead query test (#1533)	MAJOR/ MINOR	OFF	**test environment *location***

1 The alarm level of CAB-PFL is adjusted to be the same as the highest active alarm level for SER-BUS, POW-SUP, CAB-TEMP, or PS-RGEN, or it will be a MAJOR alarm if no G650 alarms in that category are found.

Error Note:

a **Error type 1—**The AuxSig lead is active. Run **test environment *location*** and follow the repair steps for Test #1533.

System technician-demanded tests: Descriptions and error codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. When you clear error codes associated with the CAB-PFL (1533), you might also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short test sequence	Long test sequence	D/ND[1]
Power/Fan lead query test (1533)	X	X	ND

1 D = Destructive, ND = Nondestructive

Power/Fan lead query test #(1533)

The Power/Fan Query test sends a request for the state of the power/fan lead (AuxSig) to the TN2312BP IPSI board in the G650 with an A carrier address. If the lead is on, the test fails. If the lead is off, the test passes.

Table 240: Test 1533 Power/Fan lead query

Error code	Test result	Description and recommendation
1000	ABORT	This is an internal system error. **1** Repeat the command at one-minute intervals 1 to 3 times.
2000	ABORT	The response to a query was not received in the time allowed. **1** Repeat the command at one-minute intervals 1 to 3 times.
1	FAIL	**G650**: In a G650 carrier, this indicates a failure in any of the following MOs: • SER-BUS • POW-SUP • CAB-TEMP • PS-RGEN Use the diagnostic procedures for those MOs to clear the problem.

1 of 3

Table 240: Test 1533 Power/Fan lead query

Error code	Test result	Description and recommendation
1	FAIL (Cont)	**G600** / **CMC1** only: In a G600 or CMC1, this error code indicates a failure in either: • Power supply • Fan Assembly There is a fan, temperature, power, or voltage problem in one or more of the cabinets. The power supply's LEDs may indicate the problem's source. **1** If none of the fans are running, then: **a** Verify 8- to 14-Volt DC power is available to the fan units by checking the wiring connector. If there is 8- to 14-Volt DC power at the connector, there should be power to the fans. If the fans still do not run, replace the fan assembly. **b** If not, then the power unit's fan output is defective or thermally shut down. Let the power unit cool, and recycle AC input power. If no fan output, replace the power unit. If the fans still do not run, escalate the problem. **2** If only 1 of the fans is not running, replace the fan. **3** If every fan can be started, wait 5 minutes and rerun the test. If the test fails again, proceed to Step 4 or 5 as applicable. **4** If the fans are not at high speed, measure the cabinet's temperature at the air intake and the air exhaust at the top of the cabinet. **a** If the 5- to 60^0-C criteria is met, there is a problem with the fans that is preventing the fans from operating at high speed. Replace the fans. If the fans run at high speed, wait 5 minutes to give the cabinet time to cool down and, rerun the test. If the problem persists, go to step 5. **b** If not, the Processor circuit pack is incorrectly reporting this condition. Look for and resolve every error on these MOs first, then rerun the test. **5** If the fans are running at high speed, check the items on following list. Any one of these could be restricting or redirecting the cabinet's air flow. **a** Verify that nothing other than circuit packs in the carrier slots that could be restricting air flow. **b** Verify that no circuit-pack blanks or carrier faceplates are missing. Install and/or replace them as necessary. **c** Be sure the cabinet's doors are properly closed. The doors must be closed to enable the fans to properly cool the cabinet. Wait 5 minutes to allow the fans to cool the cabinet. Rerun the test. If the test still fails, proceed to Step 6.

2 of 3

Table 240: Test 1533 Power/Fan lead query

Error code	Test result	Description and recommendation
		6 At this point, there should be nothing impeding the air flow, and the fans should be running at high speed. Check the temperatures for the 5- to 60^0-C criteria. **a** If the 5- to 60^0-C criteria exists, a temperature problem exists, and the fans (at high speed) should cool down the switch. Wait 5 minutes, and rerun the test. If the test still fails, the ambient room temperature is probably too high, and the room should be cooled. **b** If not, the fans are defective. Replace the fan assembly, and rerun the test. Failures can occur on the Processor circuit pack that is **not** detected by the respective MO, but that cause many, if not every, environment test to fail. If many environment tests are failing, the suspected circuit pack (depending on the system configuration) should be replaced and the test rerun. **7** There is a problem with the environment of the power system: **8** The power unit for the cabinet may be defective. **a** Verify and, if necessary, replace the power unit. **b** Rerun the test. If the test still fails, escalate.
	PASS	This indicates that the power/fan lead is off and there are no failures in the G650 or G650 stack.
		3 of 3

CAB-TEMP (Cabinet Temperature)

G650

MOs name (in alarm log)	Alarm level	Initial SAT command to run[1]	Full name of MO
CAB-TEMP	MINOR	**test board *location***	Cabinet Temperature
CAB-TEMP	MAJOR	**test board *location***	Cabinet Temperature

1 For information on specifying a ***location***, see Command Syntax on page 179.

The MO CAB-TEMP monitors the G650 and the 655A for the following:

- The power supply
  - — Inlet temperature
  - — Hot spot temperature status
  - — Fan speed
  - — Fan alarm lead
- The G650 carrier exhaust temperature

The serial bus is used by the TN2312BP IPSI to obtain this information from each power supply in a G650 media gateway. There is only one outlet temperature sensor and fan assembly in a G650, so information obtained from dual power supplies (slot 0 and 15) is redundant.

Refer to Figure 119, G650 Cabinet Environmental Hardware Components, on page 1599 for further information.

NOTE:
Fan/filter replacement procedures for the CMC1 and G600 media gateways are to be found under Variable-speed fans in Chapter 7, Component Replacement in *Maintenance Procedures (555-245-103)*.

Error log entries and test-to-clear values

Error type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
1 (a)	—	Power supply temperature test (#1537)	MINOR	OFF	**test enviroment *location*** **test board *location***
257 (b)	—	Power supply temperature test (#1537)	MINOR	ON	**test enviroment *location*** **test board *location***

Error type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
513 (c)	—	Power supply temperature test (#1537)	MINOR/ MAJOR [1]	ON	**test enviroment *location*** **test board *location***
769 (d)	—	Power supply fan test (#1538)	MINOR	ON	**test enviroment *location*** **test board *location***

1 This is a minor alarm if there is a redundant power supply, and a major alarm if there is only one power supply.

Error Notes:

a **Error type 1—**The inlet temperature is over the threshold—120^{o} Fahrenheit (49^{o} Celsius). Run **test board** and check results of Test #1537.

b **Error type 257—**The exhaust temperature is over the threshold—120^{o} Fahrenheit (49^{o} Celsius). Run **test board** and check results of Test #1537.

c **Error type 513—**The hot spot temperature is over the threshold. Run **test board** and check results of Test #1537.

d **Error type 769—**The fan alarm is active. Run **test board** and check results of Test #1537.

System technician-demanded tests: Descriptions and error codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. When you clear error codes associated with the Power Supply Temperature Test(1537), you might also clear errors generated from other tests in the testing sequence.

Order of investigation	Short test sequence	Long test sequence	D/ND[1]
Power supply temperature test (#1537)	X	X	ND
Power supply fan test (#1538)	X	X	ND

1 D = Destructive, ND = Nondestructive

Power supply temperature test (#1537)

The power supply temperature test provides the status of the following temperatures:

- Inlet to the power supply (120F/49C)
- Carrier exhaust (120F49C)
- Power supply hot spot status

Table 241: Test #1537 power supply temperature

Error code	Test result	Description and recommendation
1000	ABORT	There is an internal software error. **1** Repeat the command at one-minute intervals 1 to 3 times.
1035	ABORT	The port network is not available. **1** Use the **status port-network** command to verify that the network is not up. **2** Look for alarms against EXP-PN, EXP-INT, PK-INT, etc. **3** Use diagnostic procedures for those MOs to clear the problem.
2028	ABORT	There is a problem communicating with the environmental maintenance firmware.
2100	ABORT	The system could not allocate resources. **1** Repeat the command at one-minute intervals 1 to 3 times.
2319	ABORT	The EPN is out of range.
2500	ABORT	An internal operation failed. **1** Repeat the command at one-minute intervals 1 to 3 times.
1[1]	FAIL	The inlet temperature is over threshold. **1** Use the **test board** command to check the temperature. **2** If redundant power supplies are present, there may be a problem with the backplane. Verify that each power supply can detect the problem by using the **recycle carrier** command, specifying the slot number of the power supply to be shut down. Refer to the notes and cautions for this command in Maintenance Commands Reference (555-245-101) before executing the **recycle carrier** command. **3** Replace the power supply. **4** If the problem persists, check the backplane for shorts.
2	FAIL	The exhaust temperature is over threshold. **1** Use the **test boardt** command to check the temperature. **2** If redundant power supplies are present, there may be a problem with the backplane. Verify that each power supply can detect the problem by using the **recycle carrier** command, specifying the slot number of the power supply to be shut down. Refer to the notes and cautions for this command in Maintenance Commands Reference (555-245-101) before executing the **recycle carrier** command. **3** Replace the power supply. **4** If the problem persists, check the backplane for shorts.
4	FAIL	There is a hot spot temperature warning.

1 of 2

Table 241: Test #1537 power supply temperature

Error code	Test result	Description and recommendation
8	FAIL	There is a hot spot temperature shutdown.
	PASS	The inlet, exhaust, and hot spot temperatures are within limits.
	NO BOARD	The power supply is administered but not detected. **1** Verify that the power supply is plugged in. **2** Replace the power supply.
		2 of 2

1 The values of these failure codes might be added together. For example, a value of 3 indicates that both the inlet and the exhaust temperatures are over threshold..

Power supply fan test (#1538)

The power supply fan test verifies that the fan alarm lead from the fan assembly is not active.

Table 242: Test #1538 power supply fan

Error code	Test result	Description and recommendation
1000	ABORT	This is an internal software error.
1035	ABORT	The port network is not available.
2028	ABORT	There is a problem communicating with the environmental maintenance firmware.
2100	ABORT	The system could not allocate resources. **1** Repeat the command at one-minute intervals 1 to 3 times.
2319	ABORT	The EPN is out of range.
2500	ABORT	An internal operation failed—Retry the command.
	PASS	The fan alarm lead from the fan assembly is not active.
	NO BOARD	The power supply is administered but not detected. **1** Verify that the power supply is plugged in. **2** Replace the power supply.

CABINET (Cabinet Sensors)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
CABINET	MAJOR	**test environment** ***location***	Cabinet Sensors
CABINET	MINOR	**test environment** ***location***	Cabinet Sensors

1 For information on specifying a location, see Command Syntax on page 179.

NOTE:
This maintenance object covers environmental maintenance for S8700, S8500, and S8100 media servers equipped with CMC1 or G600 carriers. For S8700 or S8500 media servers equipped with G650 carriers, see acnaoa.

S8700 / S8500

NOTE:
The CABINET MO for S8700 and S8500 media servers is valid only for multicarrier cabinets (MCCs). For information about environmental maintenance on single-carrier cabinets (SCCs), see DC-POWER (Single-Carrier Cabinet Environment) on page 679.

The cabinet sensors monitor cabinet temperature and fan rotation. Variable- speed fans are used extensively in S8700 systems.

The Maintenance circuit pack in an MCC PN monitors a temperature sensor (S1) at the top of the cabinet and generates a major alarm if the exit air temperature exceeds 65 degrees Celsius (149 degrees Fahrenheit). Another temperature sensor in the top of the cabinet (S2) also monitors exit air temperature. If it exceeds 70 degrees Celsius (158 degrees Fahrenheit), the power-distribution unit turns off all cabinet power and invokes emergency transfer. Other sensors monitor fan performance.

The repair procedures that follow rely on your ability to distinguish between high and low fan speeds by the sound of the fans. Experience will allow you to distinguish between the high and low pitches generated by high and low speeds. A thermometer is also required for some of the procedures that follow.

In making replacements, observe the following rules:

- New fan assemblies accept *only* variable-speed fans.
- Old fan assemblies accept either variable- or constant-speed fans.
- Replace a fan assembly (carrier) *only* with a fan assembly of the same type (new for new, old for old).

Variable-Speed Fans

A variable-speed fan is identified by the following features:

- A fan and air filter assembly with product code ED-67077-30, Group 4 or greater, labeled on the front of the carrier
- A 5-pin white connector mounted next to each fan on the fan assembly cover plate for speed control and alarm circuitry
- A 2-pin black -48 V power connector to each fan
- A power filter (ED-1E554-30, G1 or G2) located in a metal box mounted behind the fans on the right-hand cable trough as you face the rear of the cabinet
- The AHD1 circuit pack and the two S4 sensors used with older fan assemblies are *absent*.

Alarm leads from each fan are tied together into a single lead that registers a minor alarm against CABINET whenever a fan's speed drops below a preset limit or fails altogether.

NOTE:
The front fans may run at a different speed than the rear fans since they are controlled by different sensors.

NOTE:
Fan/filter replacement procedures for the CMC1 and G600 media gateways are to be found under Variable-speed fans in Chapter 7, Component Replacement in *Maintenance Procedures (555-245-103)*.

CMC1 / G600 / G650

Environment cabinet tests with a TN2312BP IPSI in a CMC1, G600, or G650

Table 243, Environment cabinet tests for carriers with a TN23BP IPSI, on page 566 lists tests that run when you use the **test environment** command on a G650 with a TN2312BP IPSI circuit pack. The table lists the tests in the order that they are performed when you execute the command. This order differs from previous releases. In this release (2.0) the cabinet-wide tests run first, followed by tests on the 655A power supplies in each carrier. This allows you to exit from the test sequence after cabinet-wide tests are performed without waiting for the power supply tests.

When a TN2312BP IPSI is located in a MCC1 or SCC1 media gateway, maintenance is performed by a TN775 maintenance circuit pack. The **test environment** command for a MCC1 or SCC1 media gateway is the same as in previous releases.

Table 243: Environment cabinet tests for carriers with a TN23BP IPSI

Test[1]	CMC	G600	G650	Short Test	Long Test	D/ND[2]	Release 2.0	Release 1.X

1(a) 257 (b) 513 (c) 769 (d) 1025 (e) 1281 (f) 1537 (g) 1793 (h)	Any	Cabinet Temperature or Voltage Query Test (#122)	MAJOR	ON	test environment

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a Error Type: 1 - The Power/Fan Status lead indicates that the power supply of one or more CMC1 cabinets has detected an alarm condition. The condition can be caused by the failure of any fan or the failure of any power supply output. If more than one CMC1 cabinet exists, all of the Power/Fan Status leads are tied together (the fan and power lead is an O-ring of all cabinets' status leads). Since an error condition on a fan or power supply output could be the result of a temporary overload (e.g. during board insertion) or caused by the location of the equipment (e.g. fan blockage), a single event may be an anomaly that eventually clears. However, a repeating condition will cause a major alarm.

b Error Type: 257 - Temperature Sensor 1: Monitors the temperature near the Pentium processor (SPE). Since temperature alarms can be transient, a single event may be an anomaly that eventually clears. However, a repeating condition will cause a major alarm and may indicate a need to replace one or more components (e.g. a Cabinet Fan may be bad, or check to see if the equipment room air conditioning supply/unit is functional).

c Error Type: 513 - Temperature Sensor 2: The temperature sensors are mounted on the TN2314 and monitor the temperature near the disk drive (Windows 2000 C: drive). Since temperature alarms can be transient a single event may be an anomaly that eventually clears. However, a repeating condition will cause a major alarm and may indicate a need to replace one or more components (e.g. a Cabinet Fan may be bad, or check to see if the equipment room air conditioning supply/unit is functional).

NOTE:
An out-of-tolerance voltage condition may be caused by transient conditions (e.g. board insertion or electrical noise). Voltage problems can cause serious damage to the TN2314 or highly unpredictable failure modes. Therefore, a repeating condition will cause a major alarm. The following Error Types 769 through 1793 represents the various system voltages and are listed below:

d Error Type: 769 - Out-Of-Tolerance voltage condition for -48 VDC.

e Error Type: 1025 - Out-Of-Tolerance voltage condition for -5 VDC.

f Error Type: 1281 - Out-Of-Tolerance voltage condition for +5 VDC.

g Error Type: 1537 - Out-Of-Tolerance voltage condition for +12 VDC.

h Error Type: 1793 - Out-Of-Tolerance voltage condition for +3.3 VDC.

System Technician-Demanded Tests: Descriptions and Error Codes

S8700 / S8500

Always investigate tests in the order presented in the table below. By clearing error codes associated with one test, you may also clear errors generated from later tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND*
Battery & Battery Charger Query test (#5)	X	X	ND
AC Power Query test (#78) (See AC-POWER on page 183)	X	X	ND
OLS Query test (carrier **E**) (#127) (See CARR-POW (Carrier Power Supply) on page 578)	X	X	ND
OLS Query test (carrier **D**) (#127) (See CARR-POW (Carrier Power Supply) on page 578)	X	X	ND
OLS Query test (carrier **A**) (#127) (See CARR-POW (Carrier Power Supply) on page 578)	X	X	ND
OLS Query test (carrier **B**) (#127) (See CARR-POW (Carrier Power Supply) on page 578)	X	X	ND
OLS Query test (carrier **C**) (#127) (See CARR-POW (Carrier Power Supply) on page 578)	X	X	ND
Emergency Transfer Query test (#124) (See EMG-XFER (Emergency Transfer) on page 885)	X	X	ND
Cabinet Temperature Query test (#122) (See CABINET (Cabinet Sensors) on page 564)	X	X	ND

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND*
External Alarm Lead Query test (#120) (See EXT-DEV ADMIN? Y (External Device Alarm) on page 972)	X	X	ND
Analog Ring Generator Initial test (#117) See RING-GEN (Analog Ring Generator) on page 1587)	X	X	ND
Analog Ring Generator Query test (#118) (See RING-GEN (Analog Ring Generator) on page 1587)	X	X	ND

S8100

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Cabinet Test (#122)	X	X	ND
Emergency Transfer Query Test (#124) (a)	X	X	ND
External Alarm Lead Query Test (#120) (b)	X	X	ND
Analog Ring Generator Initialization Test (#117)(c)	X	X	ND
Analog Ring Generator Query Test (#118)(d)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a Refer to EMG-XFER (Emergency Transfer) on page 885 for a description of this test.

b Refer to EXT-DEV ADMIN? N (External Device Alarm) on page 969 for a description of this test.

c Refer to RING-GEN (Analog Ring Generator) on page 1587 for a description of this test.

d Refer to RING-GEN (Analog Ring Generator) on page 1587 for a description of this test.

Cabinet Temperature Query Test (#122)

This test queries a PN's Maintenance circuit pack for the status of the temperature and fan sensors in the cabinet.

Table 246: Test #122 Cabinet Temperature Query Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times. **2** **S8700**: If the test continues to abort with error code 2000, check for power problems with the PN's A carrier. **S8700 MC**: Look for and resolve every AC-POWER and CARR-POW alarm in a multicarrier cabinet or DC-POWER alarm in a single-carrier cabinet. **S8700 IP**:Look for and resolve every RMC-ENV alarm. Repeat the test. **3** **S8700 MC**: If the test continues to abort with error code 2000, check for and resolve every MAINT error in a PN. Repeat the test.
2029 **S8700 S8500**: 2319, 2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.

Table 246: Test #122 Cabinet Temperature Query Test

Error Code	Test Result	Description / Recommendation
S8700 S8500: 1	FAIL	**VARIABLE-SPEED FAN ASSEMBLIES:** One or more fans have stopped. *If none of the fans are running:* **1** Resolve every alarm against CARR-POW (Carrier Power Supply) on page 578 (**S8700 IP**: RMC-ENV). **2** Verify that 48 VDC is available to the fan power filter at the J2F local cable connector. The voltage range is -42.5 V to -52.5 V. There should be 48 VDC between the following pin pairs: 2/3, 8/9, 10/11. If -48 VDC is absent, replace the CFY1B current limiter card. **3** If there are 48 VDC at the power filter's input, exactly follow this procedure to verify that there are also 48 VDC at the power filter's output — to avoid damage to the fan alarm circuit. (Note that the J2F/P2F connectors on the power filter must be disconnected whenever connecting or disconnecting the J2/P2 connectors on the fan assembly.) **c** Disconnect connector J2F from P2F on the top of the filter. **d** Disconnect J2 from P2 on the fan assembly. **e** Reconnect J2F to P2F on the filter. (There should be 48 VDC between the following pin pairs on the J2 connector: 2/3, 8/9, 10/11.) **f** If 48 VDC is present, the fans should have power. Make sure every power connector is sound and making good contact. *(Be sure to disconnect the J2F/P2F connector again before reconnecting the J2/P2.)* **g** If not, replace the fan power filter using the previous procedure described. *(Be sure to disconnect the J2F/P2F connector again before reconnecting the J2/P2.)*
S8700 S8500: 1 *(cont'd)*	FAIL *(cont'd)*	*If some of the fans are running and some are not:* **1** Replace the defective fans. If every fan can then be started, wait 5 minutes and rerun the test. If the test fails again, proceed to the next step. **2** Remove all six white 5-pin connectors on the front and back of the fan assembly. This will cause every fan to run at high speed and the alarm to be cleared. **S8700 MC**: If the alarm does not clear, a PN's Maintenance circuit pack is incorrectly reporting the problem. Check for and resolve every error against MAINT, and then rerun the test. **3** One at a time, replace the 5-pin connectors and check to see if the alarm recurs. Replace each fan whose reconnection causes a recurrence of the alarm.

Table 246: Test #122 Cabinet Temperature Query Test

Error Code	Test Result	Description / Recommendation
S8700 S8500: 1 *(cont'd)*	FAIL *(cont'd)*	**NONVARIABLE-SPEEDFAN ASSEMBLIES** (older or upgraded cabinets): The AHD1 circuit pack has reported an air-flow problem. The temperature difference between the air intake and the air exhaust is at least 15^0C (59^0F)) and the absolute temperature at the top of the cabinet is at least 50^0C (122^0F). The fans should be running at high speed. If none of the fans are running then: **1** Look for an resolve every alarm against CARR-POW (**S8700 IP**: RMC-ENV). **2** Verify that 48 VDC is available to the fan wiring harness connector between pin pairs 2/3, 8/9, and 10/11. The tolerable range for this measurement is -42.5 V to -52.5 V. If 48 VDC is present and the fans are not running, replace the AHD1 circuit pack. **3** If the fans still do not run, escalate the problem. **4** If 48 VDC is absent, replace the CFY1B current limiter card. If the fans still do not run, escalate the problem. If some fans are running and some not, replace the defective fans. **5** If every fan can then be started, wait 5 minutes, and rerun the test. If the test fails again, proceed to the next step. **6** If every fan is running but not at high speed, measure the cabinet temperature at the air intake and the air exhaust at the top of the cabinet. **h** If the 15^0-/50^0-C criteria is met, there is a problem with the AHD1 circuit pack or the fans. Replace the AHD1 circuit pack and/or fans. If the fans run at high speed, wait 5 minutes for the cabinet to cool, then retest. If the test fails, escalate the problem. **i** If the 15^0-/50^0-C criteria is not met, then environmental maintenance is incorrectly reporting this condition. Resolve every error (**S8700 MC**: MAINT) and retest. If the test fails, escalate the problem.

3 of 7

Table 246: Test #122 Cabinet Temperature Query Test

Error Code	Test Result	Description / Recommendation
S8700 S8500: 1 *(cont'd)*	FAIL *(cont'd)*	**NONVARIABLE-SPEEDFAN ASSEMBLIES** (continued): If the fans are running at high speed, check the following items, any of which can restrict or redirect airflow within the cabinet. **1** Check both filters. If a filter is dirty or clogged, clean with soapy water or a vacuum. **2** Ensure that there is nothing other than circuit packs in the carrier slots that could be restricting the airflow. **3** Ensure that there are no missing circuit-pack faceplates or blanks. **4** The cabinet door must be closed for proper cooling. **5** Wait 5 minutes for the cabinet to cool and rerun the test. **6** If the test fails, check temperatures for the 15^0-/50^0-C criteria. If the 15^0-/50^0-C criteria is present, then the fans should be running at high speed. **7** Wait 5 minutes, and rerun the test. **8** If the test still fails, then the ambient room temperature is probably too high. Cool the room. **9** If the 15^0-/50^0-C criteria does not exist, one of the following components if defective: • AHD1 circuit pack • fans • S3 sensors • S4 sensors Replace these items one at a time in the order listed, running the test after each replacement. **S8700 MC**: If many environmental tests are failing, it can be a problem that is undetected by maintenance on a PN's Maintenance circuit pack. Replace the circuit pack. Escalate if the problem persists.

4 of 7

Table 246: Test #122 Cabinet Temperature Query Test

Error Code	Test Result	Description / Recommendation
S8100: 1	FAIL	There is a fan, temperature, power or voltage problem in one or more of the cabinets. The LEDs on the power supply may indicate the problem source. Otherwise follow the procedures below for each cabinet: From a LAC bash, type “environment”. Note voltage ranges and temperature of cabinet. **1** If none of the fans are running, then verify 8-14 volt DC power is available to the fan units by checking the wiring connector. • If there is 8-14 volt DC power at the connector, there should be power to the fans. If the fans still do not run, replace the fan assembly. • If there is no 8-14 volt DC power at the connector, then the power unit fan output is defective or thermally shut down. Let the power unit cool and recycle AC input power. If no fan output, replace the power unit. If the fans still do not run, escalate the problem. **2** If only 1 of the fans is not running, replace the fan. **3** If all the fans can be started, wait five minutes and rerun the test. If the test fails again, proceed to Step 4 or 5 as applicable.
S8100: 1	FAIL *(cont’d.)*	**4** If the fans are not at high speed, measure the cabinet temperature at the air intake and the air exhaust at the top of the cabinet. **j** If the 5 - 60^0 C criteria is met, there is a problem with the fans that is preventing the fans from operating at high speed. Replace the fans. If the fans run at high speed, wait 5 minutes to give the cabinet time to cool down and, rerun the test. If the problem persists, go to step 5. **k** If the 5 - 60^0 C criteria is not met, the Processor circuit pack is incorrectly reporting this condition. Look for and resolve all errors on these maintenance objects first, then rerun the test. **5** If the fans are running at the high speed, check the items on list that follows. Any one of the items could be restricting or redirecting the flow of air within the cabinet. **l** Check filter. If the filter is dirty or clogged it should be cleaned or replaced. The filter can either be washed with soap and water or vacuumed. **m** Make sure there is nothing other than circuit packs in the carrier slots that could be restricting the air flow. **n** Make sure there are no missing (blank) circuit pack or carrier faceplates. Install and/or replace them as necessary. **o** Make sure the cabinet doors are properly closed. The doors must be closed for the fans to be able to properly cool the cabinet. Wait five minutes to give the fans a chance to cool the cabinet. Rerun the test. If the tests still fails, proceed to Step 6.

Table 246: Test #122 Cabinet Temperature Query Test

Error Code	Test Result	Description / Recommendation
S8100: 1	FAIL *(cont'd.)*	**6** At this point, there should be nothing impeding the air flow, and the fans should be running at high speed. Check the temperatures for the 5 - 60^0 C criteria. **p** If the 5 - 60^0 C criteria exists, a temperature problem exists, and the fans (at high speed) should cool down the switch. Wait five minutes and rerun the test. If the test still fails, the ambient room temperature is probably too high, and the room should be cooled. **q** If the 5 - 60^0 C criteria does not exist, the fans are defective. Replace the fan assembly and rerun the test. Failures can occur on the Processor circuit pack that **is not** detected by the respective maintenance object, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack (depending on the system configuration) should be replaced and the test rerun.
S8100: 1	FAIL *(cont'd.)*	There is a problem with the environment of the power system: **7** The power unit for the cabinet may be defective. **r** Verify and, if necessary, replace the power unit **s** Rerun the test. If the test still fails, proceed to Step 8.
S8700 S8500: 2	FAIL	A temperature problem due to the S1 sensor detecting a temperature of at least 65^0 C (149^0 F) has been reported. The entire cabinet is in danger of power-down if the temperature reaches 70^0 C (158^0 F). **1** If any of the fans are not running, there should be a FAIL with Error Code 1 present. Follow the procedures for that Error Code, noting the differences for variable- and constant-speed fan assemblies. **2** If the fans are running, check the temperature at the top of the cabinet. **t** If the temperature is at least 65^0 C (149^0 F), the ambient room temperature is too high and the fans cannot cool the system. Unless the room temperature is reduced, the system will shut down soon. **3** If the temperature at the top of the cabinet is less than 65^0 C (149^0 F), either the S1 sensor (**S8700 MC**: or a PN's Maintenance circuit pack) is incorrectly reporting the problem. **u** Resolve any errors against the S1 sensor (**S8700 MC**: or against MAINT), then rerun the test. **v** If there are still errors, replace the S1 sensor and retest. If the test fails, escalate.

Table 246: Test #122 Cabinet Temperature Query Test

Error Code	Test Result	Description / Recommendation
S8700 S8500: 3	FAIL	Fan failures and temperature alarms have been reported. **1** Resolve the fan failure (Error Code 1). This should also resolve the temperature alarm. (With constant-speed fan assemblies, fan failures correspond to air-flow problems.)
	PASS	Temperature measurements and fan performance are satisfactory.

7 of 7

CARR-POW (Carrier Power Supply)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
CARR-POW	MAJOR	**recycle carrier *location***	Carrier Port Power Supply

1 For information on specifying a location, see Command Syntax on page 179.

S8700 Multi-Connect systems support two different cabinet types for PNs. Both cabinet types may be powered by either AC or DC external power source. Environmental maintenance differs according to cabinet type and external power supply.

CAUTION:
Before powering down a cabinet or carrier that contains EMBEDDED AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging the AUDIX software. Instructions for powering down this unit are in the Removing and restoring EMBEDDED AUDIX power in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)* on the circuit pack, and in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.

The CARR-POW MO represents the pair of power supplies that supply +5V, -48V and -5 VDC power to each carrier in a multicarrier cabinet. In AC-powered cabinets, these are called Off Line Switches (OLS); in DC-powered cabinets, they are DC/DC converters.

Cycling Power Supplies

When a port carrier power supply problem is reported by hardware, the system can cycle the power supplies in that carrier. When a carrier is cycled, the power supplies are turned off for 2 seconds and then turned back on. The system cannot cycle the power supplies on any of the following types carriers even if they are duplicated:

- Expansion control carrier
- Switch node carrier
- Single-carrier cabinet

WARNING:
When port carrier power is cycled, all service dependent upon circuit packs in that carrier is disrupted.

Carrier Port Power Supplies — Multicarrier Cabinets

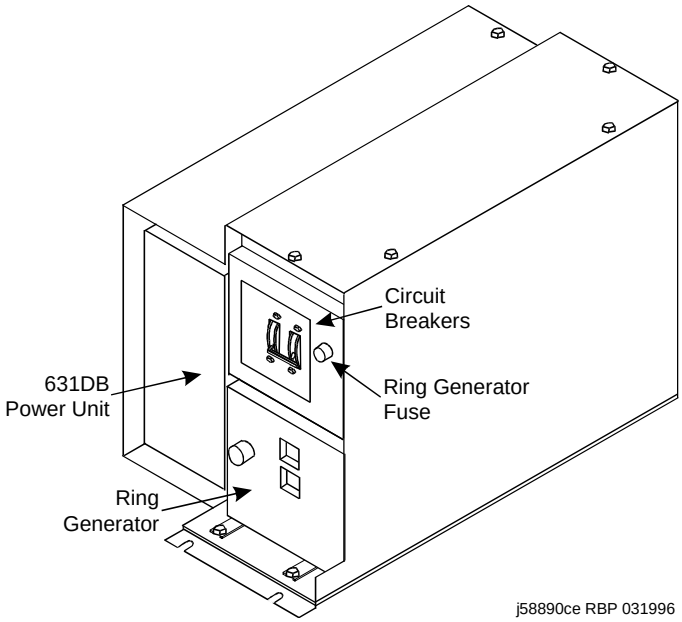
Code	System Power	Output (VDC)	Location
631DA	AC	+5	Left side
631DB	AC	-48/-5	Right side
644A	DC	+5	Left side
645B	DC	-48/-5	Right Side
TN755B		165	Slots 17 and 18
631WA/AR	AC	+5	Left side
631WB/BR	AC	-48	Right side
TN736	AC	-5	Used with 631
TN752	AC	165/-5	WA/WB or AR/AB
649A	AC	-48 at 10 Amps +5 VDC and -5 VDC at 6 Amps	Right side on control and port carriers. Left and right side on switch node carriers.

AC-Powered Cabinets

AC Power-Distribution Unit and Battery Charger (J58890CE-2)

Figure 36, AC Power-Distribution Unit (J58890CE-2) — Front, on page 580 shows an AC power-distribution unit (List 9 or List 10). This unit sits at the bottom of some multicarrier cabinets.

Figure 36: AC Power-Distribution Unit (J58890CE-2) — Front

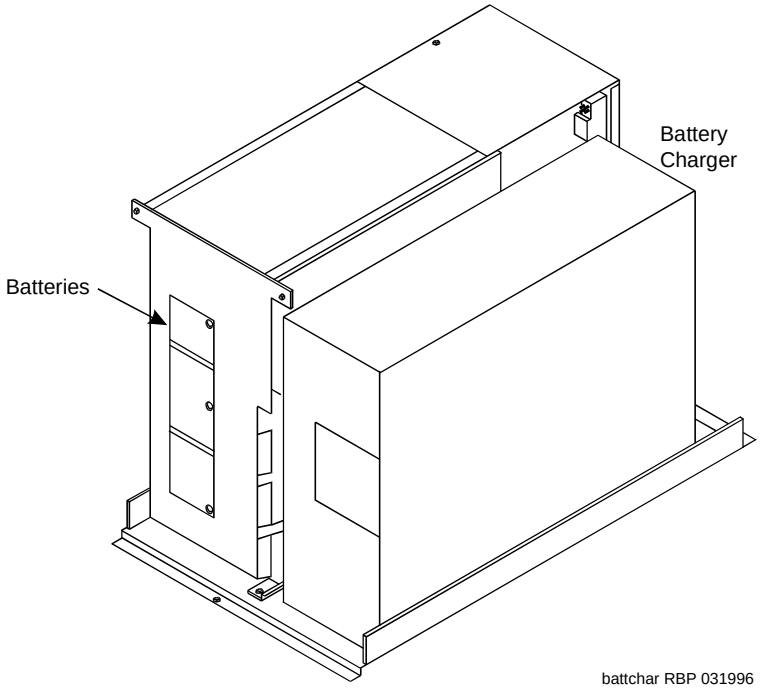


The AC power-distribution unit contains the following components:

- Circuit breaker
- Electromagnetic Interference (EMI) filter
- Ring generator
- AC input fuse
- 20-Amp fuses
- Signal connector
- -48 VDC fan power

The optional battery charger (List 11) sits at the bottom of some multicarrier cabinets. See Figure 37, Battery Charger (Optional Part of J58890CE-2) — Front, on page 581.

Figure 37: Battery Charger (Optional Part of J58890CE-2) — Front

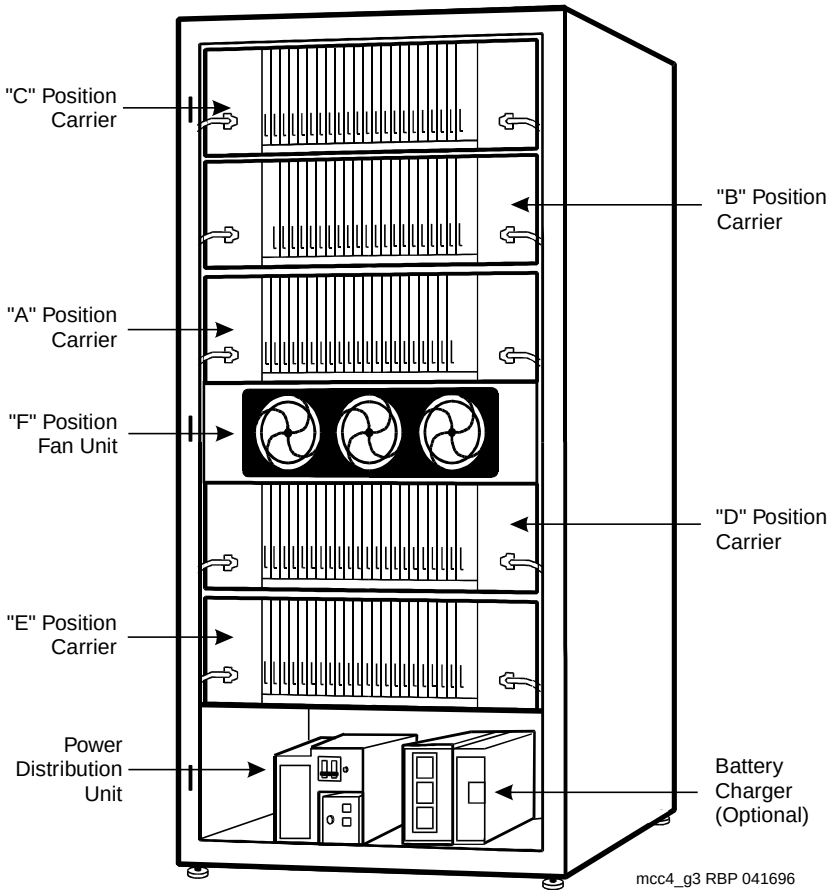


The charger is used only without an uninterruptible power supply (UPS). The charger contains:

- Three 48 VDC batteries for backup power to the cabinet
- A DC power relay to automatically switch the batteries into the power circuit if a main power failure is detected

Figure 38, AC Power Distribution in Multicarrier Cabinets, on page 582 shows AC power distribution in some multicarrier cabinets. The DC power-distribution cables are on both sides of the cabinet. **These cables supply power to each of the carriers**. The optional battery charger is at the right side of the power-distribution unit.

Figure 38: AC Power Distribution in Multicarrier Cabinets



Power Backup

If AC power fails, three 48-V DC batteries power the system for:

- 15 seconds in a PN cabinet
- 10 minutes in the expansion control carrier in the “A” position of a PN cabinet

Uninterruptible Power Supply

An external UPS provides a longer backup time than holdover batteries and can replace the batteries and battery charger. The unit connects from the AC power source to a cabinet’s AC power cord. If AC power fails, the unit supplies its own AC power to the cabinet.

J58890CH-1

In AC-powered cabinets, the power-distribution unit (J58890CH-1), distributes 170 to 264 VAC from a wall outlet to a set of BU3200A Battery Interface Units (BIU). See Figure 39, AC Power-Distribution Unit (J58890CH-1) — Front, on page 583 and Figure 40, Power-Distribution Unit (J58890CH-1), on page 583.

Figure 39: AC Power-Distribution Unit (J58890CH-1) — Front

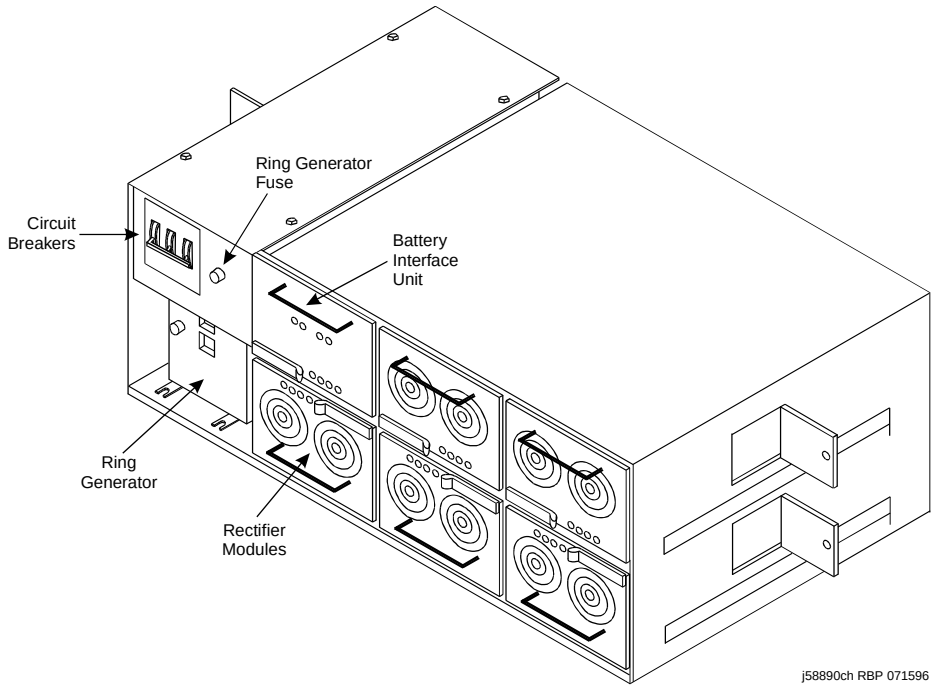


Figure 40: Power-Distribution Unit (J58890CH-1)

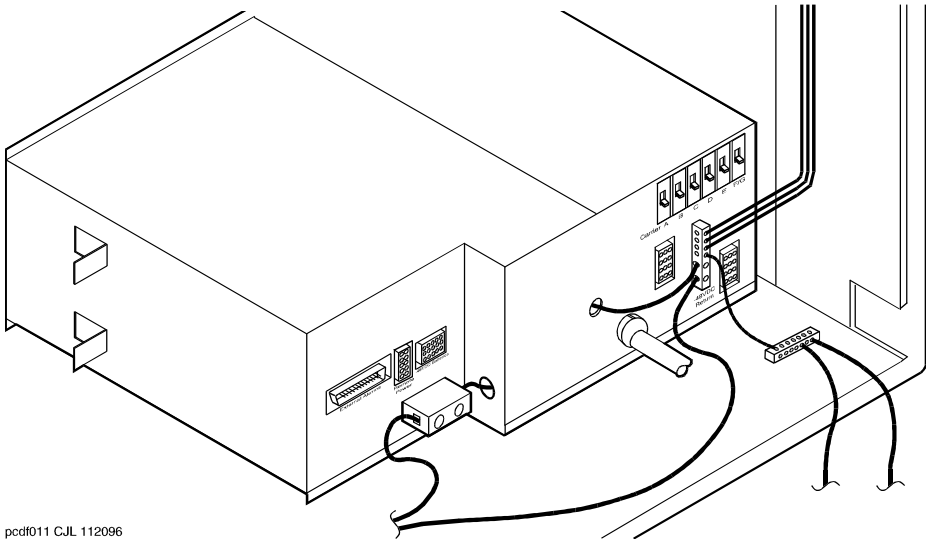


Power Backup

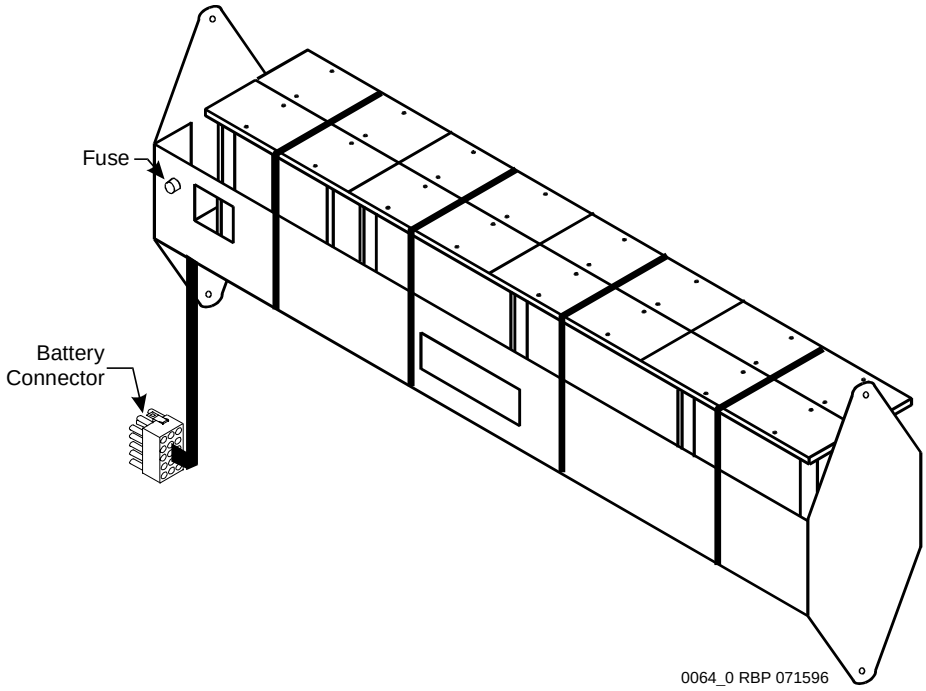
The small battery is at the center rear of the multicarrier cabinet. This 8-AH (Amp Hour) battery is fused for short circuit protection and is charged by the J58890CH-1. The batteries also contain a thermal sensor that changes the charging voltage depending on battery temperature.

The small batteries provide short-term battery holdover. If AC power fails, 48-V DC batteries power the system for:

- 15 seconds in a PN cabinet
- 10 minutes in the expansion control carrier in the “A” position of a PN cabinet

Figure 41, Small Battery Assembly, on page 584 shows the small battery assembly.

Figure 41: Small Battery Assembly

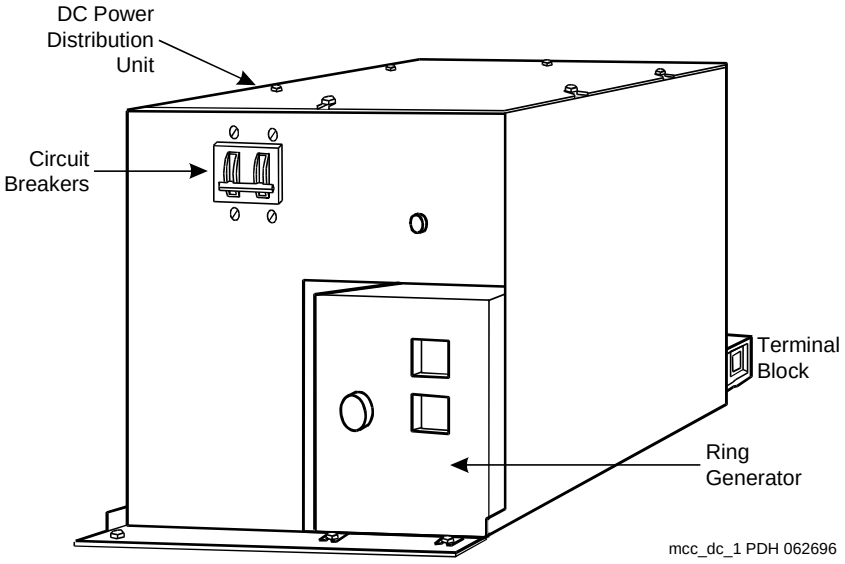


DC-Powered Cabinets

DC Power-Distribution Unit (J58890CF-2)

Figure 42, DC Power-Distribution Unit (J58890CF-2) — Front, on page 585 shows a power-distribution unit in some DC-powered multicarrier cabinets. The unit sits at the bottom of the cabinet and contains the ring generator, 20-Amp circuit breakers, terminal blocks, and system fan power.

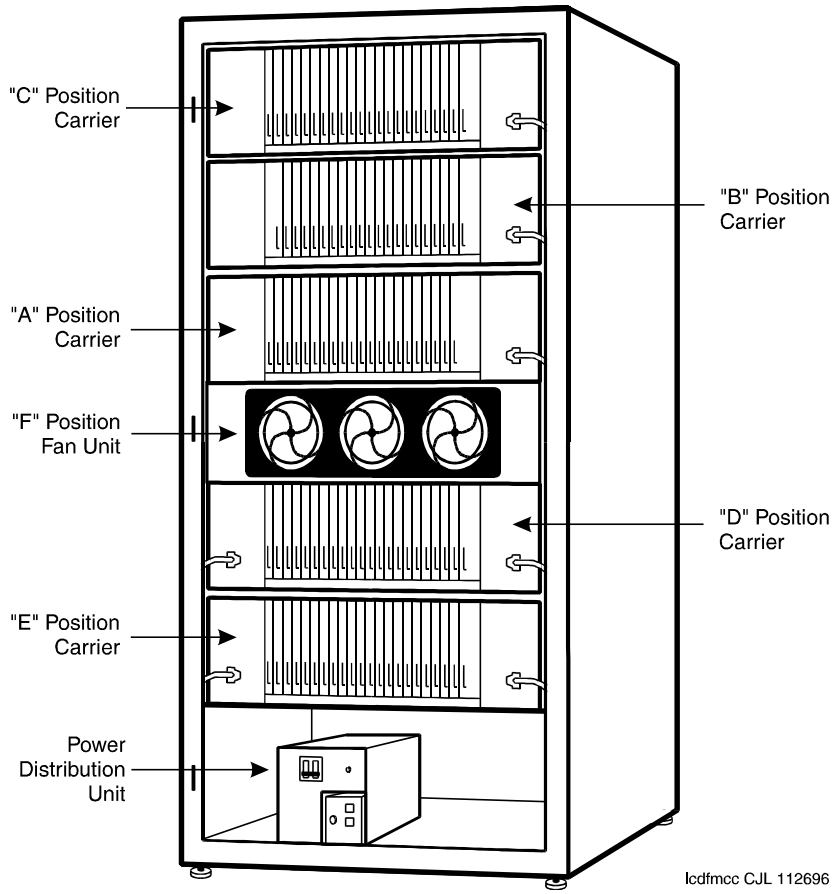
Figure 42: DC Power-Distribution Unit (J58890CF-2) — Front



Some carriers may contain two power supplies, the 644A and the 645B, that together supply the required voltages to the carrier. Other carriers may contain one 649A power supply located on the right side of the carrier. In these systems, an additional 649A is located on the right of the optional switch node carriers.

Figure 43, Typical Multicarrier Cabinet with 649A Power Units, on page 586 shows a typical AC-powered multicarrier cabinet.

Figure 43: Typical Multicarrier Cabinet with 649A Power Units



The table below shows what carriers are protected by each circuit breaker on the J58890CF-1. The ring generator is protected by a fuse located next to the main circuit breaker on the front of the unit.

Circuit Breaker	Associated Carriers
CB1	Carrier A, both sides
CB2	Carrier B, both sides
CB3	Carrier C, both sides
CB4	Carrier D, both sides
CB5	Carrier E, both sides
CB6	Level F (Fans) and Level G (Ring Generator)

The table below shows what carriers are protected by each circuit breaker on the J58890CH-1. The ring generator is protected by a fuse located next to the main circuit breaker on the front of the unit.

Circuit Breaker	Associated Carriers
CB1	Carrier A, both sides
CB2	Carrier B, both sides
CB3	Carrier C, both sides
CB4	Carrier D, both sides
CB5	Carrier E, both sides
CB6	Level F (Fans) and Level G (Ring Generator)

Neon Lamp Power

The system can also support neon message waiting lamps on analog telephones. Any carrier containing a TN769 Neon Analog Line circuit packs must also be supplied with 150 Volts from a TN755B power supply circuit pack. See the table above for other supported neon power circuit packs.

Error Log Entries and Test to Clear Values

Table 247: Carrier Port Power Supply Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1[1]	0 or 1	OLS Query test (#127)	MAJOR	ON	**test environment *UU* r 2** **recycle carrier *UUC***

1 Run the OLS Query test (#127) first using the **test environment** UU **r 2** command. Then, if a carrier must be recycled to clear the CARR-POW alarm, use the **recycle carrier** UUC command to run the OLS Recycle test (#126). The OLS Recycle test (#126) is not included in either the long or short test sequences.

WARNING:
The OLS Recycle test (#126) is destructive. For more information, see OLS Recycle Test (#126) on page 588.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the *Battery & Battery Charger Query* test (#5), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery & Battery Charger Query test (#5) (a)	X	X	ND
AC Power Query test (#78) (b)	X	X	ND
OLS Query test (carrier E) (#127)	X	X	ND
OLS Query test (carrier D) (#127)	X	X	ND
OLS Query test (carrier A) (#127)	X	X	ND
OLS Query test (carrier B) (#127)	X	X	ND
OLS Query test (carrier C) (#127)	X	X	ND
OLS Recycle Carrier test (#126)			D
Emergency Transfer Query test (#124) (c)	X	X	ND
Cabinet Temperature Query test (#122) (d)	X	X	ND
External Alarm Lead Query test (#120) (e)	X	X	ND
Analog Ring Generator Initialization test (#117) (f)	X	X	ND
Analog Ring Generator Query test (#118) (f)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a Refer to POWER section for a description of this test.

b Refer to AC-POWER section for a description of this test.

c Refer to EMG-XFER (Emergency Transfer) section for a description of this test.

d Refer to CABINET (Cabinet Sensors) section for a description of this test.

e Refer to EXT-DEV (External device alarm) section for a description of this test.

f Refer to RING-GEN (Analog Ring Generator) section for a description of this test.

OLS Recycle Test (#126)

This test is **destructive**.

This test removes power from the specified carrier and causes every circuit pack in the recycled carrier to be removed and inserted. These actions cause every call originating from or terminating to circuit packs in this carrier to be dropped. The pair of OLSs in the specified carrier is recycled. Both OLSs in the carrier are turned off for 2 seconds and then back on again. After the OLSs have been turned back on, the test queries a PN's Maintenance circuit pack for the status of the pair of OLSs in the specified carrier. If both OLSs are on and functioning, then the test passes. If both OLSs are not on and functioning, the test fails, and BOTH OLSs are turned off.

Table 248: Test #126 OLS Recycle Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1366	ABORT	Indicates that the active Tone-Clock for the PN is in requested carrier. **1** If duplicated Tone-Clock boards or IPSIs exist, use**set tone-clock** to switch Tone-Clocks, otherwise the power cannot be cycled. **2** If the switch succeeds, rerun the test.
1367	ABORT	Indicates that the active Expansion Interface link for the PN is in requested carrier. **1** If duplicated EIs exist, use **reset pnc interchange** to switch EIs, otherwise the power cannot be cycled. **2** If the switch succeeds, rerun the test.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2029, 2319, 2320, 2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	There is a problem with one or both OLSs on the cycled carrier. **1** Since the OLS Recycle test failed, both OLSs in the cycled carrier should have been powered off by the system software. Both OLSs should be showing a red status LED, instead of an amber one. Since the OLS Query test is a subset of the OLS Recycle test, the OLS Query test (#127) should also fail. Run the OLS Query test by using the **test environment *UU*** command where UU is the appropriate cabinet number. **2** If Test #127 fails, follow the repair procedures described for Test #127.
	PASS	Both OLSs in the recycled carrier were found to be healthy by a PN's Maintenance circuit pack after the OLSs were powered down and back up. If the status LEDs on both OLSs are not showing amber, then the MAINT (Maintenance) circuit pack may have incorrectly reported the state of the OLSs. Resolve any alarms on these MOs.

Off-Line Switcher (OLS) Query Test (#127)

This test queries the the PN's Maintenance for the status of the pair of OLSs in the specified carrier. If both OLSs are on and functioning, then the test passes. If both are not on and functioning, it fails.

Table 249: Test #127 OLS Query Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to ABORT with error code 2000, check for system powering problems with the PN's A carrier. Resolve every AC-POWER and CARR-POW alarm in a multicarrier-cabinet system or DC-POWER alarm in a single-carrier cabinet system. Then, repeat the test. **3** If the test continues to ABORT with a 2000 error code, resolve any errors against the PN's MAINT (Maintenance circuit pack). Then, repeat the test.
2029, 2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	**AC-POWERED SYSTEMS** There is a problem with one or both OLSs on the tested carrier. **1** For each OLS that has every status LED OFF, check the AC input to the OLS at the OLS outlet. If there is no AC, then check the appropriate fuses for the affected OLS. Replace open fuses. If the fuses open again or AC does not show up at the OLS outlet, then there is probably a power wiring problem in the cabinet. **2** At this point, AC should be present at the OLS outlet. Use **recycle carrier *UUC*** (where *UUC* is the appropriate cabinet and carrier) in an attempt to bring back the OLSs for this carrier. If the test passes, the trouble is cleared. If the test does not pass, one OLS or both, in the tested carrier is defective. If only one OLS is defective, then the status LEDs on the healthy OLS will light green for a moment. When the recycle test determines that both OLSs are defective, the software will turn off power to both the good and defective OLSs. This will cause the status LED(s) on the good OLS to light red. **3** Unplug both OLSs, and wait approximately 1-minute to allow the OLSs to cool down. Plug in the OLSs. If either OLS is operating properly (the status LEDs show green), then replace the defective OLS(s). See OLS Replacement Procedures in this section.

1 of 3

Table 249: Test #127 OLS Query Test

Error Code	Test Result	Description / Recommendation
	FAIL *(cont'd)*	**4** If the replaced OLS(s) still do not operate properly, then a circuit pack or a defective telephone connected to a circuit pack in the affected carrier could be causing an electrical load that is preventing the OLS from operating properly. Unseat every circuit pack in the carrier, and reissue the **recycle carrier** command. **w** If the recycle passes, then the OLSs are healthy, and the problem is with one of the circuit packs. Reinsert the circuit packs one at a time. If the status LED shows red after reinserting a circuit pack, then replace the defective circuit pack. If the status LED still shows red, then remove the amphenol connector on the back of the slot containing this circuit pack and reissue the **recycle carrier** command. If the status LED shows green, then the problem is with one of the telephones or the wiring to one of the telephones on this slot. **x** If either OLS still shows a red status LED, then check for bent pins and cable placement in the affected carrier. There are failures that can occur on the PN's Maintenance circuit pack that *will not* be detected by their respective maintenance, but that will cause many, if not every, environment test to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun.
	FAIL	**DC-POWERED SYSTEMS** There is a problem with one or both port carrier power supplies on the tested carrier. **1** For each port carrier power supply that has every status LED OFF, check the DC input to the port carrier power supply at the port carrier power supply outlet. If there is no DC, then check the appropriate circuit breakers for the affected port carrier power supply. If the circuit breaker has tripped, reset the circuit breaker. If the circuit breaker trips again or if DC is absent at the port carrier's power supply outlet, then there is probably a power wiring problem in the cabinet. **2** At this point, DC should be present at the port carrier power supply outlet. Use the **recycle carrier *UUC*** command (where *UUC* is the appropriate cabinet and carrier) in an attempt to bring back the port carrier power supplies for this carrier. If the test passes, the trouble is cleared. If the test does not pass, one port carrier power supply, or both, in the tested carrier is defective. If only one port carrier power supply is defective, then the status LEDs on the healthy port carrier power supply will light green for a moment. When the recycle test determines that both port carrier power supplies are defective, the software will turn off power to both the good and defective port carrier power supplies. This will cause the status LED(s) on the good port carrier power supply to light red.

Table 249: Test #127 OLS Query Test

Error Code	Test Result	Description / Recommendation
	FAIL *(cont'd)*	**3** Unplug both port carrier power supplies, and wait approximately 1-minute to allow the power supplies to cool down. Plug in the power supplies. If either power supply is operating properly (the status LEDs show green), then replace the defective power supplies). **4** If the replaced port carrier power supply(s) still do not operate properly, then a circuit pack or a defective telephone connected to a circuit pack in the affected carrier could be causing an electrical load that is preventing the power supply from operating properly. Unseat every circuit pack in the carrier, and reissue the **recycle carrier** command. **y** If the recycle passes, then the port carrier power supplies are healthy, and the problem is with one of the circuit packs. Reinsert the circuit packs one at a time. If the status LED shows red after reinserting a circuit pack, then replace the defective circuit pack. If the status LED still shows red, then remove the amphenol connector on the back of the slot containing this circuit pack and reissue the **recycle carrier** command. If the status LED shows green, then the problem is with one of the telephones or the wiring to one of the telephones on this slot. **z** If either port carrier power supply still shows a red status LED, then check for bent pins and cable placement in the affected carrier. There are failures that can occur on the PN's Maintenance circuit pack that *will not* be detected by their respective maintenance, but that will cause many, if not every, environment test to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun.
	PASS	AC-POWERED SYSTEMS Both OLSs in the tested carrier were found to be healthy by the PN's Maintenance circuit pack. If the status LEDs on both OLSs are not showing green, then the PN's MAINT circuit pack may have incorrectly reported the state of the OLSs. Resolve any alarms on these MOs. DC-POWERED SYSTEMS Both power supplies in the tested port carrier were found to be healthy by the PN's Maintenance circuit pack. If the status LEDs on both power supplies are not showing green, then the MAINT circuit pack may have incorrectly reported the state of the power supplies. Resolve any alarms on these MOs.

3 of 3

CDR-LNK (Call Detail Recording Link)

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
CDR-LINK	MINOR	**test cdr [primary | secondary] l**	CDR Link
CDR-LINK	WARNING	**test cdr [primary | secondary]**	CDR Link

Refer to PRI-CDR/SEC-CDR (Call Detail Recording Link) on page 1556 for Call Detail Recording Link problems.

CDR-LNK (CDR Link)

S8100 only

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
CDR-LINK	MINOR	test cdr-link	CDR Link
CDR-LINK	WARNING	test cdr-link	CDR Link

The CDR feature records detailed call information on incoming and outgoing calls on specified trunk groups and on calls set up between local stations based on the options specified using the **change system-parameters cdr** command. The CDR feature stores this call duration information in a CDR output file on S8100. This information is read by a Call Accounting Software (CAS) application software package running on a user-provided PC.

CDR Link Maintenance provides a strategy for verifying that the CDR files generated by S8100 are being retrieved by the CAS application software running on the customer's PC. This strategy includes a set of tests for periodic diagnosis, detection of errors during normal operation, actions for troubleshooting, and raising alarms for serious problems.

S8100 and the customer's PC are connected to a LAN which allows the CDR directory on the Communication Manager server to be mapped to a directory on the PC. The CDR software on S8100 writes CDR records to a cdr.out file on its hard drive. Every 10 minutes S8100 renames the file as cas.in if the cas.in file does not exist and opens a new cdr.out file. Within a few minutes after the cas.in file is created, the CAS software on the PC should read and delete the cas.in file to allow the S8100 to move a new cdr.out file to cas.in at the next 10 minute trigger.

The CAS software running on the customer's PC should retrieve the data from the cas.in file and delete the file at least every 10 minutes to allow S8100 to move the cdr.out file to the cas.in file. The size of the cdr.out file has been engineered to not fill up as long as the transfer takes place within 10 minutes. If the cas.in file is not removed by CAS by the time S8100 needs to rename cdr.out to cas.in, S8100 sets the state of the CDR link to "down" and keeps writing to the cdr.out file until the cdr.out file reaches a maximum size, at which time a CDR-LINK alarm is generated. New CDR data will continue to be written to an internal buffer on DEFNITY ONE but eventually that buffer will be filled up and CDR data will be lost. To clear the problem, the cas.in file must be deleted by the CAS system. The CDR link will then be put in the "up" state, the cdr.out file will be renamed to cas.in, and the buffered CDR data along with new CDR data will be written to the cdr.out file.

The ability for S8100 to move the cdr.out file to the cas.in file is monitored by the CDR-LINK Maintenance Object. From a user's viewpoint the CDR-LINK MO is similar to the PRI-CDR link MO used by Communication Manager to provide maintenance of the physical link between the Communication Manager server and an external CDR device. The S8100 CDR-LINK MO can be tested using the **test CDR-LINK** command, it can be busied out and released with the **busyout CDR-LINK** and **release CDR-LINK** commands, and it has an "up" and "down" state as displayed by the **status CDR-LINK** command.

Procedures for Restoring the CDR Link

1 Get the status of CDR links.

Enter **status cdr-link** command and make sure that the CDR links are not busied out for maintenance. If the link is down, then continue to the next step.

2 Verify that the PC running the CAS application software is in service and that the CAS application software is running.

3 Verify that the Cdr directory on S8100 is shared. For more information about the Cdr directory, see "Set up Call Accounting" in Chapter 3 of *Installation and Upgrades for the Avaya™ S8100 Media Server with the Avaya™ G600 Media Gateway and the Avaya™ CMC1 Media Gateway, 555-233-146*.

4 Verify that the customer's PC has a drive mapped to the shared directory on S8100 (see Possible Problem Areas below).

5 Log on to S8100 and select the "bash" application. From the bash session, change the current directory to *d:/LucentData/Cdr* (**cd d:/LucentData/Cdr**). Verify that the cas.in file is being read and deleted by CAS every few minutes by checking that a new cas.in file is created every 10 minutes (**ls -l cas.in**) and that it is removed within a few minutes after it is created.

NOTE:
To prevent generating false alarms when CDR is administered on S8100 but the CAS software on the PC is not operational, the CDR link can be busied out using the ***busyout CDR-LINK*** command.

Possible Problem Areas

1 The CDR directory (d:/LucentData/Cdr) on S8100 has to be shared with full control permissions from S8100. For more information about the Cdr directory, see "Set up Call Accounting" in Chapter 3 of *Installation and Upgrades for the Avaya™ S8100 Media Server with the Avaya™ G600 Media Gateway and the Avaya™ CMC1 Media Gateway, 555-233-146*.

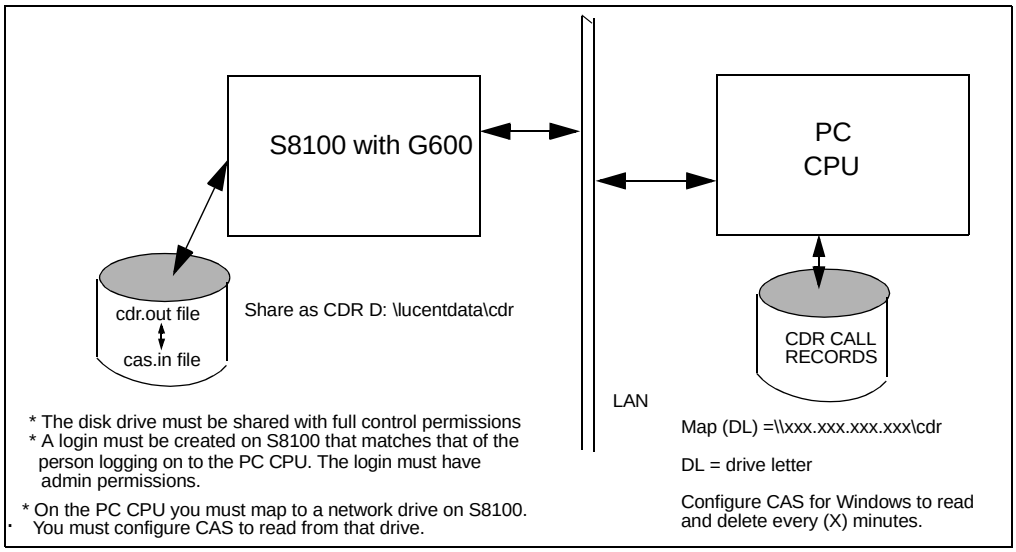
2 A login has to be created on S8100 that matches the login of the person logging into the WINDOWS 95 PC running the CAS application.

3 The login used for CAS on S8100 has to have administration rights.

4 On the WINDOWS 95 PC, the network drive used by CAS has to be mapped to the CDR directory on S8100.

5 CAS on the WINDOWS 95 PC has to be configured to read the mapped drive.

Figure 44: CDR Configuration



Error Log Entries and Test to Clear Values

Table 250: CDR Link Maintenance Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test cdr-link sh
18 (a)	0	busyout cdr-link	WARNING	OFF	release cdr-link
257 (b)	Any	Link Retry Test (#215)	MINOR/ WARNING[2]	OFF	test cdr-link
513 (c)	Any				test cdr-link

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

a System Technician has busied out the CDR link to the out-of-service state. No CDR records will be written to the cdr.out file on S8100.

b Link Retry Test (#215) fails. Refer to Procedures for Restoring the CDR Link on page 594 for resolution.

c The CDR link is down since the CAS system has not deleted the cas.in file in time for S8100 to move the cdr.out file to the cas.in file. Use the **status CDR-LINK** command to verify that the link is down and refer to Procedures for Restoring the CDR Link on page 594 for resolution. This error indicates that the CAS system is in an off-line state. Enter **test cdr-link** command to verify that the CDR link is back in the UP state.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Link Retry Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 251: CDR link system technician-demanded tests

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Link Tear Down Test (#213)		X	D
Link Retry Test (#215)	X	X	ND

1 D = Destructive; ND = Nondestructive

Link Tear Down Test (#213)

This test puts the CDR logical link in a DOWN state for S8100. The link will be restored to the UP state automatically by the Link Retry test (#215). The Link Tear Down test is used to help verify that the Link Retry test (#215) will return the state of the link to UP if the cdr.out file is not full. On Communication Manager, this test is used to actually take down the physical link to a CDR output device but on S8100 there is no hardware link to control.

CDR records will continue to be written to an internal buffer when the link is down so this is may not be a destructive test as long as the link is restored by the Link Retry test which is executed as part of the sequence of tests run for the **test cdr-link long** command.

Table 252: TEST #213 Link Tear Down Test

Error Code	Test Result	Description/ Recommendation
40	ABORT	Internal system error
50	ABORT	Internal system error **1** Retry the command at 1-minute intervals a maximum of 5 times.
1010	ABORT	The CDR link has been busied out to out-of-service. **1** Enter the **release cdr-link** command to release the CDR link from busyout state. **2** Retry the **test cdr-link long** command to execute the test.
	FAIL	Internal system error **1** Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The CDR link has been put in a DOWN state. CDR records are still recorded in an internal buffer but S8100 will not write to the cdr.out file. Test 215 is used to put the logical link into an UP state.

Link Retry Test (#215)

This test sets the state of the CDR link to UP if the cdr.out file is not full and to DOWN if the cdr.out file is full. The cdr.out file is used to record CDR records on S8100. The file will not get full if CAS system is periodically retrieving and deleting the cas.in file so that S8100 can rename the cdr.out file to cas.in.

Table 253: TEST #215 Link Retry Test

Error Code	Test Result	Description/ Recommendation
10	ABORT	Internal system error
20	ABORT	Internal system error. Internal error in Maintenance Action Process (MAP). MAP returns an error back to maintenance script (HMM). Timer expires while waiting for the reply from MAP. **1** Retry the command at 1-minute intervals a maximum of 5 times.
30	ABORT	Internal system error **1** Refer to Procedures for Restoring the CDR Link on page 594.
1010	ABORT	The CDR link has been busied out to out-of-service. **1** Enter **release cdr** command to release the CDR link from busyout state. **2** Retry **test cdr-link** command to execute the test.
	FAIL	The cdr.out file on S8100 is full since CAS is not retrieving call records from S8100. S8100 may still be storing CDR records in an internal buffer but it has stopped writing data to the cdr.out file. The cdr.out file on S8100 is periodically renamed as the cas.in file on S8100 to allow CAS software to retrieve the CDR records. The CAS software runs on a separate PC which maps the directory containing the cas.in file on S8100 to a drive letter on the PC. If CAS does not read and delete the cas.in file every few minutes, the cdr.out file may reach its maximum size which causes an alarm to be generated. The Link Retry test will fail when the cdr.out file is full. **1** Refer to the Procedures for Restoring the CDR Link on page 594 for instructions.
	PASS	The CDR link is up. CAS is reading and deleting the cas.in file on S8100 on a periodic basis so S8100 is able to move the cdr.out file to the cas.in file and continue writing new CDR records to the cdr.out file.

CLAN-BD (Control LAN Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
CLAN-BD	MINOR	**test board *location* long**	Control LAN circuit pack
CLAN-BD	WARNING	**test board *location* short**	Control LAN circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

Control LAN circuit pack

The TN799 Control LAN (C-LAN) packet port circuit pack provides TCP/IP connection to adjunct applications such as CMS, Intuity, and DCS Networking. The C-LAN circuit pack has one 10baseT Ethernet connection and up to 16 DS0 physical interfaces for PPP connections. C-LAN also extends ISDN capabilities to csi models by providing packet-bus access.

An RSCL (remote socket control link) links the C-LAN and the server to pass call- control and other management information. Because one link serves every port on the circuit pack, maintenance of the RSCL is part of the C-LAN circuit-pack maintenance.

The TN799 C-LAN circuit pack combines the functions of the PGATE and PI circuit packs into one circuit pack. Use a PGATE or PI with a C-LAN to create an X.25-to-TCP/IP bridge for adjunct and DCS connectivity.

C-LAN socket load balancing

Prior to Communication Manager Release 2.0, IP endpoints registered to C-LANs (TN799x) on a round-robin algorithm — an IP endpoint registers to the next available C-LAN within a list of available C-LANs. In a system with two or more C-LANs, this distribution method can result in one C-LAN controlling the majority of IP endpoints. This skewed distribution of endpoints among available C-LANs results in a vulnerability to a higher loss of telephony resources in the event of a C-LAN failure than if the IP endpoints were more uniformly distributed across the available C-LANs.

With Communication Manager Release 2.0, a new feature provides for a more uniform balancing of the load across the available C-LANs. With this feature, an IP endpoint registers to the C-LAN with ***the least number of used sockets*** (regardless of the number of available sockets). This will apply to the following IP endpoints:

- H.245, H.248, and H.323 signaling groups
- H.323 stations
- SIP endpoints

Socket counts will include H.245 and H.248 endpoints but the load-balancing algorithm will not be used for registering these endpoints. Sockets used by adjuncts will not be included in the socket count.

> **NOTE:**
> This allocation is performed for the C-LANs assigned within each network region, independently of the C-LANs assigned to other network regions.

A new field, `Number of CLAN Sockets Before Warning`, has been added to the ***ip-interfaces*** form. The system logs a warning to the hardware error log when a TN799x circuit pack has reached the socket usage specified in this field. The warning can be viewed using the **display errors** command.

> **NOTE:**
> IP endpoints can still register to this circuit pack after the warning has been issued.

The presence of the warning in the error log indicates that the customer needs to look at the network configuration. The **status clan-usage** command displays socket usage for C-LAN circuit packs in a system. This allows the customer to verify that IP endpoint registration has been evenly distributed, or to determine whether additional TN799x circuit packs are needed.

Also, even though all CLANs may be available, all endpoints are configured to be in a few specific network regions, and may possibly be overloading the CLANs in those network regions. This would indicate that additional capacity is required in the affected network regions, or that network configuration and administration needs to be altered to make it more balanced. Additional C-LANs can be administered, or existing administration of C-LANs can be changed using the **add/change ip-interfaces** commands (see *Maintenance Commands Reference (555-245-101)* for details).

> **NOTE:**
> When a TN799x is replaced or added, re-balancing does not occur. That is, the system does not un-register an IP endpoint for the purpose of load balancing. Replaced or added TN799x circuit packs will be detected as the least-used C-LANs, and IP endpoints will register with them until the socket load is evenly balanced.

C-LAN congestion controls

The switch activates congestion controls on a C-LAN when it detects a buffer exceeding the threshold. The switch releases the congestion controls when the C-LAN reports that its buffers have returned to normal levels.

If congestion:	Then the switch:
Persists for a 14-minute interval,	Raises MINOR alarm.
Exhausts buffers,	Raises MINOR alarm.
Ceases for 12 minutes,	Retires MINOR alarm.

Error Log Entries and Test to Clear Values

Table 254: CLAN-BD Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1(a)	0		MINOR	ON	
18 (b)	0		WARNING	OFF	**release board** *UUCSS*
217 (c)	0	None	WARNING	ON

3866 (ac)	Any				

2 of 2

Notes:

a **Error Type 1**: Circuit pack stopped functioning or is not physically present.

1 Verify that the circuit pack is present.

2 If circuit pack is present, reset the circuit pack (**reset board *UUCSS***).

3 If the error persists, replace the circuit pack.

b **Error Type 18**: The C-LAN circuit pack busied out.

c **Error Type 217**: applies to 10 circuit packs:

1 Remove the circuit pack(s) against which the error is logged.

d **Error Type 257**: Transient communication problem between switch and circuit pack; does not affect service and can be ignored.

1 Ignore this error, unless the Control Channel Loop Test (#52) fails.

2 If Test #52 fails, replace the circuit pack.

Repetitive failures of the Control Channel Loop test indicate circuit pack hardware failure.

e **Error Type 513**: Circuit pack detected and reported hardware failure.

1 Reset the circuit pack (**reset board *UUCSS*).**

Aux Data:

4352	External RAM error
4353	Internal RAM error
4355	ROM Checksum error
4356	Angel Message Corruption error
4357	Instruction set error

f **Error Type 769**: Logic error. By itself this error may be ignored, but it may result in other error types being reported.

g **Error Type 1293-1297**: Critical hardware or firmware error.

If the switch detects:	Then the switch:
1 error,	Resets circuit pack.
3 errors in 15 minutes,	Raises MINOR alarm.

Error Type descriptions are as follows:

1293	Insane onboard processor
1294	Onboard translation RAM error
1295	(Aux 3) RSCL link down
	Software requested a reset of the CLAN because it failed to get a keep-alive response from the CLAN for over a minute.
	(Aux 0) RSCL keep alive failure
1296	Software requested a reset of the CLAN.
1297	Software requested a reset of the CLAN

1. Attempt to clear the alarm (**reset board *UUCSS***).
2. If alarm persists, replace circuit pack.

h **Error Type 1537**: Switch removed hyperactive circuit pack that reported threshold number of errors.

1. Attempt to clear the alarm (**reset board *UUCSS***).
2. If the error recurs within 15 minutes, replace the circuit pack.

i **Error Type 1794**: Packet-bus transmit buffers have overflowed.

1. Attempt to clear the alarm (**reset board *UUCSS***).
2. If the error recurs within 15 minutes, replace the circuit pack.

Error Type 1797: Invalid layer 2 frame received.

j **Error Type 1798**: Unable to write translation RAM.

1. Attempt to clear alarm (**reset board *UUCSS***).
2. If alarm recurs within 15 minutes, replace the circuit pack.

k **Error Type 2049**: Packet Interface test (#598) failed.

1. Attempt to clear the alarm (**test board *UUCSS* l r 3**).
2. If alarm does not clear, reset the circuit pack (**reset board *UUCSS***).
3. If circuit pack resets, execute Packet Interface test (#598) several times.
4. If Packet Interface test (#598) continues to fail, replace the circuit pack.

l **Error Type 2305-2306**: Error in received frame from packet bus.

Error Type:	Description
2305	Received invalid LAPD frame.
2306	Detected parity error on received frame.

Most likely cause — packet-bus problem
Other cause — circuit-pack fault

Invalid LAPD frame errors occur when the frame

- contains a bad Cyclic Redundancy Check (CRC),
- is greater than the maximum length,
- violates the link level protocol.

1 Retry the command (**test board *UUCSS***) and see if the condition clears.

2 If condition persists, execute PPE/LANBIC Receive Parity Error Counter test (#597), and determine whether the condition clears.

3 If condition persists, execute Packet Interface test (#598) to verify circuit pack integrity.

4 If Packet Interface test (#598) fails, consult repair procedure for the packet bus.

m **Error Type 2561-2668:** System software received an indication that the socket was closed due to an error. Errors are reported as log only. Errors logged here are for the sockets that had *no* processor channels associated with them, for example, sockets to read SNMP data. The counter base is offset by the application type of the application associated with this socket that is down. The Aux Data field of the log entry contains this application's number, for example, a SNMP application would have its application number in the Aux Data field.

NOTE:
2561 - 2668 is a range of reserved numbers for future applications. 2570 currently represents an SNMP socket failure.

n **Error Type 2817-2819**: Congestion Query test (#600) failed.

The Error Types correspond to the descriptions:

2817	All buffers exhausted.
2819	Utilized buffers exceed threshold.

If:	Then:
Active buffers exceed threshold	C-LAN enters congested state.

1 Refer to Congestion Query test (#600) for Abort and Fail codes 3601.

o **Error Type 3073**: RSCL (Remote Socket Control Link) or Link Status test (#601) failed. This failure may be due to:

- This circuit pack
- The packet bus

- The Packet Interface circuit pack.

If:	Then:
RSCL disconnects at link level	Link fails
Link cannot be reconnected quickly	Switch raises MINOR alarm

p **Error Type 3330**: Critical failure in packet-bus interface.

Below, Error Types correspond to descriptions.

If the switch detects:	Then it:
1 error,	Resets circuit pack.
2 errors in 15 minutes,	Raises MINOR alarm.

1 Attempt to clear the alarm (**reset board *UUCSS***).

2 If alarm persists, replace circuit pack.

q **Error Type 3586 and 3999**: Switch removed hyperactive circuit pack that reported threshold number of errors. One or more of the following symptoms may be present:

- Circuit pack port tests return `NO BOARD`.
- List configuration command shows circuit pack and ports are installed properly

If Error Type 3999:	And traffic volume is:	Then:
Does not accompany Error Type 3586,	Heavy	Circuit pack is in service, but sent at least half hyperactive threshold. With heavy traffic, this is normal.
Does not accompany Error Type 3586,	Light	Circuit pack is in service, but sent at least half hyperactive threshold. With light traffic, this error indicates a problem with the circuit pack, its links, or the equipment attached to the links.
Accompanies Error Type 3586,	Either Light or Heavy	Switch removed hyperactive circuit pack.

1 Busyout **(busyout board *UUCSS*)** and release (**release board *UUCSS***) circuit pack

2 Allow 30 minutes for condition to clear itself.

3 To re-establish circuit pack into service manually, busyout (**busyout board *UUCSS***), reset (**reset board *UUCSS***), and release (**release board *UUCSS***) the circuit pack.

4 If error recurs within 15 minutes, replace the circuit pack.

5 If the same error occurs on a different circuit pack, follow normal escalation procedures.

r **Error Type 3840**: Circuit pack received bad control channel message from switch.

Aux Data:

4096	Bad major heading
4097	Bad port number
4098	Bad data
4099	Bad sub-qualifier
4100	State inconsistency
4101	Bad logical link
4102	Bad application identifier

s **Error Type 3841-3843**: errors do not affect service.

Below, Error Types correspond to descriptions.

3841	Internal firmware error.
3843	Bad translation RAM. Call uses another translation location.

These errors do not affect service, however, they may cause reports of other errors that do affect service.

If Error Type 3843 begins to affect service, it escalates to Error Type 1294.

t **Error Type 3842**: Packet interface receive buffers overflowed.

If this error occurs frequently, the overflow may be congesting the circuit pack.

1 Refer to Receive FIFO Overflow Error Counter test (#596).

u **Error Type 3844**: LAPD frame contains LAPD protocol error.

By themselves, these errors do not affect service.

v **Error Type 3845**: Angel interprocessor error.

By themselves, these errors do not affect service.

w **Error Type 3846**: High CPU occupancy.

By themselves, these errors do not affect service.

x **Error Type 3848**: Interprocessor LAPD protocol error.

By themselves, these errors do not affect service.

y **Error Type 3849**: Interprocessor LAPD frame error.

By themselves, these errors do not affect service.

z **Error Type 3850 - 3861**: IBL error.

By themselves, these errors do not affect service. These errors can occur only on a G3csi machine that has an Interboard Link (IBL).

aa **Error Type 3862**: Memory allocation failure.

By themselves, these errors do not affect service.

ab **Error Type 3865**: **S8700** / **S8500**: CLAN DLCI audit action has removed CIP only DLCIs. By themselves, these errors do not affect service.

ac **Error Type 3866**: **S8700** / **S8500**: CLAN DLCI audit action has removed CLAN only DLCIs. By themselves, these errors do not affect service.

ad **Error Type 2820:** A threshold number of sockets in use for IP endpoint registration per C-LAN can be administered by the customer. When the threshold is reached, a warning message is logged, but IP endpoints can still register with that C-LAN if it has additional sockets available. The warning can be viewed using the **display errors** command.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors in the order they appear in the table below.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Control Channel Loop-Around test (#52)	X	X	ND
Circuit Pack Restart test (#252)			D
Invalid LAPD Frame Error Counter test (#597)		X	ND
PPE/LANBIC Receive Parity Error Counter test (#595)		X	ND
Receive FIFO Overflow Error Counter test (#596)		X	ND
Packet Interface test (#598)	X	X	ND
Congestion Query test (#600)	X	X	ND
Link Status test (#601)	X	X	ND

1 D = Destructive; ND = Nondestructive

Control Channel Loop-Around Test (#52)

This nondestructive test fails if the circuit pack does not return to a sane state after being reset. This test queries the circuit pack for its code and vintage, and verifies its records.

Table 255: Test #52 Control Channel Loop-Around Test

Error Code	Test Result	Description / Recommendation
None, 2100	ABORT	Could not allocate the necessary system resources to run test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.
	FAIL	The circuit pack failed to return the code or vintage. **1** Retry command at 1-minute intervals up to 5 times. **2** Reset the board (**reset board *UUCSS***). **3** If reset aborts with error code 1115, busyout (**busyout board *UUCSS***), reset (**reset board *UUCSS***), and release board (**release board *UUCSS***). **4** If test continues to fail, replace the circuit pack. **5** Escalate the problem if failures continue.
	PASS	Test successful.

Circuit Pack Restart Test (#252)

This test is **destructive**.

Execute this test (not part of either short or long demand test sequence) to reset the circuit pack only if there are PPCPU errors. This test fails if the circuit pack does not return to a sane state after being reset. The circuit pack resets through the SAKI Sanity test (#53).

Table 256: Test #252 Circuit Pack Restart Test

Error Code	Test Result	Description / Recommendation
None	ABORT	Could not allocate the necessary system resources to run test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.
1015	ABORT	Port is not out-of-service. **1** Busyout the circuit pack (**busyout board *UUCSS***). **2** Retry the command at 1-minute intervals up to 5 times. **3** If the problem persists, escalate the problem.
2100	ABORT	Could not allocate the necessary system resources to run test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.

1 of 2

Table 256: Test #252 Circuit Pack Restart Test

Error Code	Test Result	Description / Recommendation
1, 2	FAIL	The circuit pack failed to reset. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, pull out and reseat the circuit pack. **3** If the problem persists, replace the circuit pack.
	PASS	The circuit pack initialized correctly.

2 of 2

PPE/LANBIC Receive Parity Error Counter Test (#595)

This test is nondestructive. When the C-LAN circuit pack detects a parity error with a received frame, it increments the PPE/LANBIC Receive Parity error counter. This test reads and clears the counter, and may verify repair of problem.

Errors may indicate a problem with:

- This circuit pack
- A packet bus
- Another circuit pack on the bus

Table 257: Test #595 PPE/LANBIC Receive Parity Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, reset the circuit pack (**reset board *UUCSS***). **3** If the problem persists, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run test.
2500	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.

1 of 2

Table 257: Test #595 PPE/LANBIC Receive Parity Error Counter Test

Error Code	Test Result	Description / Recommendation
1–10	FAIL	Circuit pack detects parity errors. The Error Code indicates the value of the on-board error counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, execute Packet Interface test (#598) (**test board *UUCSS***). **3** If Packet Interface test (#598) fails, see packet-bus repair procedures.
	PASS	Circuit pack detects no errors.

2 of 2

Receive FIFO Overflow Error Counter Test (#596)

This test is nondestructive. When the C-LAN circuit pack detects packet-bus buffer overflow, it increments the error on the FIFO Overflow error counter. This test reads and clears the counter.

If errors are:	Then they may be due to:
Occasional	Statistical buffer sizing
Persistent	Circuit pack congestion that requires redistribution of traffic load

Table 258: Test #596 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, reset the circuit pack (**reset board *UUCSS***). **3** If the problem persists, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run test.
2500	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.

1 of 2

Table 258: Test #596 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description / Recommendation
1–10	FAIL	Circuit pack detects overflow errors. The error code indicates the value of the on-board error counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, execute Packet Interface Test #598 (**test board *UUCSS***). **3** If Packet Interface Test #598 fails, see PKT-BUS (Packet Bus) on page 1406 for repair procedures.
	PASS	Circuit pack detects no errors.

Invalid LAPD Frame Error Counter Test (#597)

This test is nondestructive.

A C-LAN detects an invalid frame when it receives:

- a frame with a CRC error
- an unrecognizable frame
- a recognizable frame in an unexpected state

When the C-LAN circuit pack detects an invalid LAPD frame, it increments the Invalid LAPD Frame error counter. This test reads and clears the counter, and verifies the repair of the problem.

Errors may indicate a:

- circuit-pack problem
- packet-bus problem
- problem with another circuit pack on the bus

Table 259: Test #597 Invalid LAPD Frame Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, reset the circuit pack (**reset board *UUCSS***). **3** If the problem persists, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.

Table 259: Test #597 Invalid LAPD Frame Error Counter Test

Error Code	Test Result	Description / Recommendation
1–10	FAIL	The circuit pack detects LAPD frame errors. The error code indicates the value of the on-board error counter. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to fail, execute the Packet Interface test (#598) (**test board *UUCSS* long**). **3** If the Packet Interface test (#598) fails, see PKT-BUS (Packet Bus) on page 1406 for repair procedures.
	PASS	Circuit pack detects no errors.

Packet Interface Test (#598)

This nondestructive test checks the packet-bus interface circuitry on the C-LAN circuit pack. Test failure indicates faulty circuit pack.

Table 260: Test #598 Packet Interface Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, reset the circuit pack (**reset board *UUCSS***). **3** If the problem persists, replace the circuit pack.
2012	ABORT	Could not allocate the necessary system resources to run test.
2100	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.
	FAIL	Circuit pack has detected a failure of Packet Interface Test #598. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, reset the circuit pack (**reset board *UUCSS***). **3** If the test continues to fail, replace the circuit pack.
	PASS	Packet Interface Test #598 passed.

Congestion Query Test (#600)

This nondestructive test queries the number of used buffers to determine whether the C-LAN circuit pack is congested.

If:	Then:
Used buffers are, or are nearly, exhausted	The test fails
The test fails	The switch redirects outgoing calls to another available C-LAN, and denies new incoming calls

Normal call handling resumes when the C-LAN circuit pack has recovered from congestion.

Table 261: Test #600 Congestion Query Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, reset the circuit pack (**reset board *UUCSS***). **3** If the problem persists, replace the circuit pack.
2012	ABORT	Could not allocate the necessary system resources to run test.
2100	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.
1, 2	FAIL FAIL	The buffer level is nearly exhausted. The C-LAN is congested, and no buffers are available. **1** Retry command at 1-minute intervals up to 5 times. **2** If command continues to fail, examine the C-LAN port measurements to determine what ports are heavily utilized and the processor occupancy of the circuit pack. *Low processor occupancy* when C-LAN congested indicates circuit pack failure. **1** If the problem persists, reset the circuit pack (**reset board *UUCSS***). **2** If congestion recurs, replace the circuit pack. *High processor occupancy* indicates the C-LAN is congested due to traffic load. **1** To relieve congestion in the short term, selectively busyout ports (**busyout port *UUcSSpp***) on the Control LAN circuit pack. **2** To achieve a more permanent resolution, it may be necessary to move ports on this circuit pack to other Control LAN circuit packs. **3** Consider replacing affected C-LAN ports with new ports.

1 of 2

Table 261: Test #600 Congestion Query Test

Error Code	Test Result	Description / Recommendation
3	FAIL	The C-LAN circuit pack is not operating normally and is congested.
	PASS	Hardware setting and attached cable type match C-LAN circuit pack administration. The circuit pack detects no errors.

2 of 2

Link Status Test (#601)

This nondestructive test determines the state of the call-control signaling link for Control LANs. If the signaling link is physically connected, the test sends a test frame over the link and checks for a response. The test passes only if both the signaling link is connected and the test frame is successfully transmitted.

A failure may indicate a problem with:

- this circuit pack
- the packet bus
- the Packet Interface circuit pack

Table 262: Test #601 Link Status Test

Error Code	Test Result	Description / Recommendation
1125	ABORT	RSCL link or C-LAN board not in service. **1** Release the board. **2** Repeat the test. **3** Escalate if the problem persists.
2012	ABORT	Could not allocate the necessary system resources to run this test.
2100	ABORT	Internal system error. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, escalate the problem.
2	FAIL	The RSCL control link disconnected. **1** Retry command at 1-minute intervals up to 5 times. **2** If the test continues to fail, execute Packet Interface test (#598) (**test board *UUCSS***) to determine if the problem is due to the circuit pack. **3** If Packet Interface test (#598) fails, see PKT-BUS (Packet Bus) on page 1406 for repair procedures. **4** If Packet Interface test (#598) passes, refer to Packet Control circuit pack and packet-bus repair procedures.

1 of 2

Table 262: Test #601 Link Status Test

Error Code	Test Result	Description / Recommendation
3	FAIL	Received no response to RSCL control link test frame. **1** Retry command at 1-minute intervals up to 5 times. **2** If the problem persists, reset the circuit pack (**reset board *UUCSS***). **3** If test continues to fail, replace the circuit pack.
	PASS	RSCL control link connected.

2 of 2

CLSFY-BD (Call Classifier Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
CLSFY-BD	MINOR	**test board *location* sh**	Call Classifier circuit pack
CLSFY-BD	WARNING	**test board *location* sh**	Call Classifier circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 for circuit pack-level errors.
See also CLSFY-PT (Call Classifier Port) on page 617 for related port information.

CLSFY-PT (Call Classifier Port)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
CLSFY-PT[1]	MAJOR	**test port *location* sh**	Call Classifier Port
CLSFY-PT	MINOR	**test port *location* sh**	Call Classifier Port
CLSFY-PT	WARNING	**test port *location* sh**	Call Classifier Port

1 For information on specifying a location, see Command Syntax on page 179.

The TN744 Call Classifier is a service circuit pack that provides specialized tone detection capabilities to support the Outbound Call Management (OCM) and Inbound Call Management (ICM) features. The TN744 supports both A-law and Mu-law companding.

The TN744 has eight ports (CLSFY-PTs), each capable of supporting call classification, touch-tone reception and MFC-tone generation and detection. The CLSFY-PT MO implements a set of tests designed to ensure proper operation of the Call Classifier.

NOTE:
S8100: A TN744D Call Classifier/Tone Detector circuit pack may be required in systems with heavy traffic. This circuit pack can be installed into any slot, although slot 3 of Cabinet A is preferred.

Error Log Entries and Test to Clear Values

Table 263: Call Classifier Port (CLSFY-PT) Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1	any	Tone Detector Audit/Update test (#43)	MAJOR/ MINOR (a)	ON	**test port** *UUCSSpp* **r 2**
18		**busyout port**	WARNING	OFF	**release port** *UUCSSpp*
257 (b)	17666	Tone Detection Audit Update test (#43)	MAJOR/ MINOR (a)	ON	**test port** *UUCSSpp* **r 3**
513 (c)	any	Tone Detection Verification test (#42)	MAJOR/ MINOR (a)	ON	**test port** *UUCSSpp* **r 3**

Notes:

a There are two possible alarm levels for this error type: MAJOR and MINOR. A major alarm is raised if the total number of call classifier ports currently in-service is less than or equal to 1/2 of the administered threshold number. Otherwise, a minor alarm is raised. In either case, run the short test sequence on the alarmed port and follow the error code procedures for the individual tests.

The in-service threshold number for alarming call classifier ports is administered using the **change system-parameters maintenance** command. For details, see Chapter 1, "Maintenance SAT Commands" in *Maintenance Commands Reference (555-245-101)*.

1. Issue these commands in order: **busyout board**, **reset board**, **release board**. The board reset is required to reload on-board RAM associated with the TN744's DSPs. This takes all 8 Tone Detector ports out of service for a few seconds. Only 4 of the 8 would be out of service due to the alarm. (There are five Tone Detectors on each of the two DSPs.) Other than the unlikely potential of running out of Tone Detector resources in the switch, there is no other effect when the board is reset.
2. Test the board (**test board *UUCSS* long**).
3. If the test still fails, replace the board.

b The CLSFY-PT lost its translation. Testing the CLSFY-PT is sufficient to reload its translation. If testing the call classifier port does not clear the error, then the call classifier circuit pack containing the defective call classifier port should be replaced.

c This error indicates the call classifier port is having problems detecting call classification tones or detecting and generating R2-MFC tones This is usually accompanied by failures of some incoming or outgoing calls. If this error type is persistently logged, then replace the call classifier circuit pack containing the defective CLSFY-PT.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables. For example, by clearing error codes associated with the *Tone Detection Verification* test (#42), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Tone Detection Verification test (#42)	X	X	ND
Tone Detection Audit/Update test (#43)	X	X	ND

1 D = Destructive; ND = Nondestructive

Tone Detection Verification Test (#42)

This test checks the operation of the TN744 in touch-tone receiver, call classifier and R2-MFC modes. It verifies the circuit pack's ability to detect DTMF, ring back, busy reorder and modem answer tones and to generate and detect forward and backward MFC tones.

Table 264: Test #42 Tone Detection Verification Test

Error Code	Test Result	Description / Recommendation
none	ABORT	The system was not able to allocate every resource needed for this test, OR there was an internal system error.
1	ABORT	The system could not allocate every resource needed to test the tones.

Table 264: Test #42 Tone Detection Verification Test

Error Code	Test Result	Description / Recommendation
1001	ABORT	The system was unable to put the call classifier port in the appropriate mode to test it.
1002	ABORT	The system could not allocate time slots for the test connection. This situation could occur when the system is heavily loaded. If the system is not heavily loaded, use **test tdm** to test the TDM-BUS. **1** Retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a Tone-Clock for the test connection. This may be caused by a heavy load on the system or by a faulted Tone-Clock. **1** Check to see if there are any alarms against the Tone-Clock in the PN where the test aborted. If so, see TONE-BD (Tone-Clock Circuit) on page 1902 and TONE-PT (Tone Generator) on page 1927 for recommended procedures. **2** If a new Tone-Clock has been inserted, allow about 1-minute for maintenance to run on the newly inserted circuit pack. **3** Retry the command at 1-minute intervals up to 5 times.
S8100: 1003	ABORT	The system could not allocate a Tone-Clock circuit pack for the test connection. This situation could occur when the system is heavily loaded or if a Tone-Clock circuit pack is not present in the port network when this test is executed. **1** Verify the existence of a Tone-Clock circuit pack in the same port network. **2** If a Tone-Clock circuit pack is missing, install one in the same port network. **3** Allow approximately 1 minute for the Tone-Clock circuit pack maintenance to run on the newly inserted Tone-Clock circuit pack. **4** Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Call classifier circuit pack's response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.

2 of 3

Table 264: Test #42 Tone Detection Verification Test

Error Code	Test Result	Description / Recommendation
2006	ABORT	Indicates that the active Tone-Clock circuit pack or a Tone Detector circuit pack may not be functioning properly. **S8100**: If there is more than one Tone Detector circuit pack in the system, then the problem can be either with the Tone-Clock circuit pack or the Tone Detector circuit pack. This could also be caused by the mode administered for the system not matching that of the Tone Detector circuit pack. **1** **S8100**: Verify the existence of a Tone-Clock circuit pack in the same port network. **2** **S8100**: If a Tone-Clock circuit pack is missing, install one in the same port network. **1** Test the *active* Tone-Clock circuit pack in the PN with **test tone-clock *UUC***. See TONE-BD (Tone-Clock Circuit) on page 1902 for failures. **2** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1-3	FAIL	DTMF digits were not detected correctly. This may or may not impact reception of R2-MFC calls. **1** Run the short test sequence via the **test port *UUCSSpp* sh r 1** command. **2** If the problem persists, the system is still operating properly but capacity will be reduced. To restore performance to normal, replace the call classifier circuit pack containing the defective CLSFY-PT (Call Classifier Port).
S8700 S8500: 102	FAIL	2225-Hz Modem Answer tone was not detected correctly. This will impact call-classification operation. **1** Run the short test sequence via the **test port *UUCSSpp* sh r 1** command. **2** If the problem persists, the system can still operate properly but capacity will be reduced. In order to restore performance to normal, replace the call classifier circuit pack containing the defective port.
130 **S8100**: 101-122	FAIL	Forward or backward R2-MFC signals were not correctly generated or detected. This will impact R2-MFC calls. **1** Run the short test sequence via the **test port *UUCSSpp* sh r 1** command. **2** If the problem persists, the system can still operate properly but capacity will be reduced. In order to restore performance to normal, replace the call classifier circuit pack containing the defective port.
	PASS	Tone detection verification is successful. The call classifier port is able to detect and generate every necessary tone.

3 of 3

Tone Detector Audit/Update Test (#43)

This test performs a sanity audit on the CLSFY-PT (Call Classifier Port).

Table 265: Test #43 Tone Detector Audit/Update Test

Error Code	Test Result	Description / Recommendation
none	ABORT	The system was not able to allocate the resources for this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	Hardware audit failed. **1** Issue these commands in order: **busyout board**, **reset board**, **release board**. The board reset is required to reload on-board RAM associated with the TN744's DSPs. This takes all 8 Tone Detector ports out of service for a few seconds. Only 4 of the 8 would be out of service due to the alarm. (There are five Tone Detectors on each of the two DSPs.) Other than the unlikely potential of running out of Tone Detector resources in the switch, there is no other effect when the board is reset. **2** Test the board (**test board *UUCSS* long**). **3** If the test still fails, replace the board.
	PASS	The call classifier port has passed the sanity inquiry.

CO-BD (Central Office Trunk Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
CO-BD	MINOR	**test board *location* sh**	Central Office Trunk circuit pack
CO-BD	WARNING	**test board *location* sh**	Central Office Trunk circuit pack

1 For information on specifying a location, see Command Syntax on page 179.

See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 for circuit pack-level errors.
See also CO-TRK (Analog CO Trunk) on page 639 for related trunk information.

CO-DS1 (DS1 CO Trunk)

S8700 / S8500 / S8300 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
CO-DS1	MAJOR[1]	**test trunk *group#/member#* l**	DS1 CO Trunk
CO-DS1	MINOR	**test trunk *group#/member#* l**	DS1 CO Trunk
CO-DS1	WARNING	**test trunk *group#/member#***	DS1 CO Trunk

1 A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed. For more information about the **set options** command, see *Maintenance Commands Reference (555-245-101)*.

Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end. Refer to *"Chapter 12, Managing Trunks"*, in the *Administrator's Guide for Avaya™ Communication Manager, 555-233-506* for information on how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

A DS1 CO (central office) trunk provides a link for digitized voice or data communications between the system and a central office switch. There are two types of DS1 interfaces:

- 24 DS0 channels on a 1.544-Mbps link
- 31 DS0 channels + 1 framing channel on a 2.048-Mbps link

  32-channel mode is supported on the TN464, TN2207, and TN2464 circuit packs (**S8300**/**G700**: and on MM710 Media Modules).

The DS1-CO MO monitors and maintains a CO trunk port on a TN767 DS1 Interface circuit pack, a TN464 UDS1 Interface circuit pack, (**S8300** / **G700**: or MM710 Media Module). Throughout this discussion, the term DS1 applies to all. For more information, see one of the following maintenance objects:

Circuit Pack/Media Module	Maintenance Object
TN767 DS1 Interface Circuit Pack	DS1-BD
TN464 UDS1 Interface Circuit Pack	UDS1-BD
S8300 / **G700**: MM710 DS1 Media Module	MG-DS1

The DS1 circuit pack or media module supports low level CO trunk signaling interfaces for both ground-start and loop-start trunks. This maintenance strategy covers the in-line errors log, initialization tests, periodic tests, scheduled tests, demand tests, and alarm resolution.

S8300 / **G700**

The MM710 supports T1/E1, and delivers the same functionality as the TN464 circuit pack. Although the CO-DS1 MO is provided for G700/G350 Media Gateways, this MO only partially supports the MM710 DS1 Media Module.

Three trunk service states are specified by DS1 CO trunk maintenance:

out-of-service	The trunk is in a deactivated state and cannot be used for either incoming or outgoing calls.
in-service	The trunk is in an activated state and can be used for both incoming and outgoing calls.
disconnect (ready-for-service)	The trunk is in an activated state but can only be used for an incoming call.

Error Log Entries and Test to Clear Values

Table 266: DS1 CO Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value[1]
0 +	0	Any	Any	Any	**test trunk** *grp/mbr*
1 +	57408				
1 +	57487				
15 +	Any	Port Audit and Update test (#36)			
18 +	0	**busyout trunk** *grp/mbr*	WARNING	OFF	**release trunk** *grp/mbr*
130 +		None	WARNING	ON	**test trunk** *grp/mbr*
257 +	57392	DS1 CO Dial Tone Seizure test (#314) **For G700:** Aborts with Error Code 1412	MINOR WARNING	OFF

769 +	57484				

1 of 2

Table 266: DS1 CO Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value[1]
1025		DS1 CO Dial Tone Seizure test (#314) **For G700:** Aborts with Error Code 1412	MINOR WARNING [2]	OFF	**test trunk** *grp/mbr* **r 2**
1281		Conference Circuit test (#7) **For G700:** Aborts with Error Code 1412		ON	**test trunk** *grp/mbr* **l r 4**
1537		NPE Crosstalk test (#6) **For G700:** Aborts with Error Code 1412		ON	**test trunk** *grp/mbr* **l r 3**
1793 +					**test board** <***location***> **l**[3]
2562 +	16665				
2817 +	52992				
3840 +		Port Audit and Update test (#36)			

2 of 2

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Major alarms MO may be downgraded to Warning alarms based on the value used in the set options command.

3 For information on specifying a location, see Command Syntax on page 179.

+ Additional Information About Error Types:

Error Type 1: Aux Data 57408—No tip ground is detected on an outgoing call.
Aux Data 57487—PBX could not get "loop close" signal.

If the error occurred on a port of a TN767 DS1 or TN464 UDS1 Interface circuit pack, the circuit pack detected a hardware fault. These errors will cause Dial Tone Test #314 to run and are only considered a problem if the Dial Tone test fails (in which case Error Type 1025 will also show up). In this case, the trunk may be put in the ready-for-service state (shown as "disconnected" by the status command), which allows only incoming calls. Run Dial Tone Test #314, and follow the procedures.

S8300 / **G700**: If the error occurred on a port of an MM710 DS1 Media Module, Test #314 will abort with Error Code 1412. Escalate the problem.

Error Type 15: This is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors (if any).

Error Type 18: System Technician has busied out the trunk to the out-of-service state. No calls can be made on this trunk except Facility Access Test Calls.

Error Type 130: This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack or media module.

Error Type 257: The DS1 Interface circuit pack detects a hardware fault. Aux Data 57392 indicates no external release on PBX disconnect. This alarm will only be raised when the System-Parameter Country screen has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.

S8300 / **G700**: On an MM710 DS1 Media Module, Associated Test #314 will abort with Error Code 1412. Escalate the problem.

Error Type 513: The DS1 Interface circuit pack detects a hardware fault. Aux Data 57393 indicates belated external release on PBX disconnect. This alarm will only be raised when the System-Parameter Country screen has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.

S8300 / **G700**: On an MM710 DS1 Media Module, Associated Test #314 will abort with Error Code 1412. Escalate the problem.

Error Type 769: The DS1 Interface circuit pack or media module detects a hardware fault. The Aux Data contains the following error type:—57484, fault is detected on tip/ring.

Error Type 1793: DS1 Interface circuit pack or media module is out-of-service. Look in the Hardware Error Log:

If port is on	Look in
TN767 DS1 Board	DS1-BD
TN464 UDS1 Board	UDS1-BD
S8300 / **G700**: MM710 DS1 Media Module	MG-DS1

Error Type 2562: Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from call processing and is generated when a second attempt (retry) to seize an outgoing trunk fails.

Error Type 2817: Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a 2-way trunk from both the near and far ends. Attempt to place the call again. If the error persists, execute the Dial Tone Seizure test (#314), and follow those procedures.

S8300 / **G700**: If the error occurred on a port of an MM710 DS1 Media Module, Test #314 will abort with Error Code 1412. Escalate the problem.

Error Type 3840: Port Audit and Update test (#36) failed due to an internal system error. Enter the **status trunk** command to verify the status of the trunk. If the trunk is out-of-service, then enter the **release trunk** command to put it back into in-service. Retry the test command.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the *NPE Crosstalk* test (#6), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk test (#6) **S8300** / **G700:** Aborts with Error Code 1412.		X	ND
Conference Circuit test (#7) **S8300** / **G700:** Aborts with Error Code 1412.		X	ND
DS1 CO Trunk Seizure test (#314) **S8300** / **G700:** Aborts with Error Code 1412.	X	X	ND
Port Audit and Update test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 267: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. The **status health** command can be used to determine whether the system is experiencing heavy traffic. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Issue **list measurements tone-receiver** to display information about the system's tone receivers. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a user for a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. **1** Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the already existing error.

1 of 2

Table 267: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
2053	ABORT	At least one of the following errors was found on the DS1 circuit pack: Loss of signal (1281), Blue alarm (1793), Red alarm (2049), Yellow alarm (2305), or Hyperactivity (1537). **1** Look for the previous error types in the Hardware Error Log, and follow the procedures given in the appropriate DS1-BD or UDS1-BD maintenance documentation for the listed error types.
	FAIL	The NPE of the tested port was found to be transmitting in error. This will cause noisy and unreliable connections. **1** Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and examining station, trunk, or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive. **1** Verify that the board's translations are correct. Use **list config**, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, use **busyout board <*address*>**. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted. **NOTE:** Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing **list config** but the `Vintage` field reports that there is no board (when there really is a board), then **busyout board** and **release board** do not work, but the **reset board <*address*>** command does work. The software puts the hyperactive board back in service after the hyperactivity clears.

2 of 2

Conference Circuit Test (#7)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

Table 268: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	The test was aborted. System resources required to run this test were not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic and the port status is idle, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some of the Tone Detectors may be out of service. **1** Issue the **list measurements tone-receiver** command to display basic information about the system's tone receivers. **2** Resolve any TTR-LEV errors. **3** Resolve any TONE-PT errors. **4** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port has been seized by a user for a valid call. **1** Use **status station** or **status trunk** to determine when the port is available for testing. **2** Retry the command at 1-minute intervals up to 5 times.

Table 268: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
1018	ABORT	The test was disabled via translation. You may want to determine why the test has been disabled before you enable it. **1** Verify that the `Maintenance Test` field on the **Trunk Administration** form is set to **n**. To enable the test, change the trunk administration and enter **y** into the `Maintenance Test` field. **2** Repeat the test.
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. **1** Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.
1412	ABORT	This test does not execute on a G700/G350 Media Gateway.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
2053	ABORT	At least one of the following errors was found on the DS1 circuit pack: Loss of signal (1281), Blue alarm (1793), Red alarm (2049), Yellow alarm (2305), or Hyperactivity (1537). Look for the previous error types in the Hardware Error Log, and follow the procedures given in the appropriate DS1-BD or UDS1-BD maintenance documentation for the listed error types.

2 of 4

Table 268: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This will cause noisy and unreliable connections. **1** Enter the **list configuration board <*address*>** command. If the circuit pack is a TN767B vintage 8 or 9, replace the circuit pack with a TN767C V3 or later. The error log may have error type 1281 entries. **2** Test every administered trunk on the board. If one fails, this could be an off-board problem (such as an incoming seizure or an off-hook port seizure during the test). Retest the board. **3** If every port fails, check CARR-POW MO (**S8700 IP**: RMC-ENV MO) . **4** If several ports fail, check the error log for TONE-BD or TONE-PT errors. If there are such errors, take the appropriate action. When the TONE errors have cleared, rerun the test. **5** If the retry passes and troubles have been reported, coordinate isolation with the CO. Make sure that the switch, the CO, and any NTCE equipment (the CSI's) have the correct administration. **6** Replace the circuit pack. **NOTE:** If the conference circuit test fails for every port on a circuit pack, a -5 Volt power problem is indicated. To investigate problems with a power unit, see the CARR-POW (Carrier Power Supply) MO (**S8700 IP**: RMC-ENV MO). If a red LED is lit on a TN736 or TN752 power unit circuit pack, replace the pack.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.

3 of 4

Table 268: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted. **NOTE:** Hyperactivity causes some special problems with the sequence suggested above.If the ports are translated after issuing the **list config** command but the `Vintage` field reports that there is no board (when there really is a board), then the **busyout board** and the **release board** commands will not work (even though the **reset board <*address*>** command will work). The software will put the hyperactive board back in service after the hyperactivity clears.

4 of 4

Port Audit and Update Test (#36)

This test sends port level translation data from switch processor to the DS1 Interface circuit pack or media module to assure that the trunk's translation is correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of trunk.

Table 269: Test #36 Port Audit and Update Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. **1** Issue **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for error type 1025. The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1006	ABORT	The DS1 CO trunk is out of service. **1** Use **status trunk** to verify that the trunk is out of service. **2** If the trunk is out of service, determine why. **3** If it is OK to put the trunk back in service, issue **release trunk** to put the trunk back in service, and then retry the test.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	Test failed due to internal system error. **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack or media module and switch software are consistent. If the trunk is busied out, the test will not run but will return PASS. To verify that the trunk is in-service: **1** Enter **status trunk** to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service. **2** Enter **release trunk** to put the trunk back into in-service. **3** Retry the test command.

1 of 2

Table 269: Test #36 Port Audit and Update Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port. This result could be due to incorrect translations, no board inserted, an incorrect board inserted, an insane board inserted, or the board is hyperactive. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems that are found. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted. Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing the **list config** command but the `Vintage` field reports that there is no board (when there really is a board), then the **busyout board** and the **release board** commands do not work (even though the **reset board** command does work). The software puts the hyperactive board back in service after the hyperactivity clears.

2 of 2

DS1 CO Dial Tone Seizure Test (#314)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

The DS1 CO Dial Tone Seizure test checks the trunk's signaling capability provided by the DS1 Interface circuit pack. The maintenance software initiates the test by sending a "seizure" message to the DS1 Interface circuit pack and expects an "active" reply from the DS1 interface circuit pack. If the "active" message is received, then the test passes. If no message is received and the timer expires, the test is aborted. If the DS1 Interface circuit pack sends a "reorder" message back to maintenance software, then the test fails.

This test cannot be run on a trunk in any of the following conditions:

- **a** The trunk direction is administered as an incoming only trunk.
- **b** The trunk has been seized by a normal trunk call.
- **c** The trunk is administered with maintenance test disabled.
- **d** **S8300** / **G700**: The trunk is on a port of an MM710 DS1 Media Module.

Table 270: Test #314 DS1 CO Dial Tone Seizure Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	The test was aborted because system resources required to run this test were not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for error type 1025. The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The test was aborted because the port was seized by a user for a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1005	ABORT	Test failed due to incompatible configuration administered in trunk group screen. **1** Look at the trunk group administration form and see whether the trunk is incoming only, port 24 on a DS1 Interface with common control channel signaling, or an automatic CO type such as FX. Under any of these conditions this is a normal abort.
1018	ABORT	Test is disabled via translation. You may want to determine why the test has been disabled before you enable it. **1** Verify that the `Maintenance Test` field on the **Trunk Group** screen is **n**. To enable the test, issue **change trunk-group <*x*>** (**<*x*>** is the number of the trunk group to be tested). Change the `Maintenance Test` field on the screen to **y**. **2** Repeat the test.
1020	ABORT	The DS1 Interface circuit pack is out-of-service. **1** Look for DS1-BD/UDS1-BD errors in the Hardware Error Log. If present, see the appropriate DS1-BD/UDS1-BD (DS1/UDS1 Trunk circuit pack). **2** Retry the command.

1 of 3

Table 270: Test #314 DS1 CO Dial Tone Seizure Test

Error Code	Test Result	Description / Recommendation
1040	ABORT	The test was aborted because this port may be an access endpoint. **1** Verify that this port is an access endpoint by issuing **display port <*address*>**. **2** If the port has been administered as an access endpoint, then this is a normal abort.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 Media Gateway.
S8100: 2000	ABORT	Response to the test request was not received within the allowable time period.
2012	ABORT	The test was aborted due to an internal system error. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources for this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	FAIL	Response to the seizure message was not received within the allowable time period. **1** Enter **list configuration board <*address*>**. If the circuit pack is a TN767B vintage 8 or 9, a failure of test 314 causes a subsequent failure of test 7 due to a firmware bug. Eventually, the board and all of its ports will be taken out of service and extraneous on-board alarms will be generated. Replace the circuit pack with a TN767C V3 or later. **2** Verify that the `Trunk Type` field on the **Trunk Administration** form matches the trunk type administered on far-end switch. **3** Look for DS1-BD or UDS1-BD errors in the hardware error log. If present, see DS1-BD (DS1 Interface Circuit Pack) on page 760 or UDS1-BD (UDS1 Interface Circuit Pack) on page 1950. **4** Retry the command at 1-minute intervals up to 5 times.
2053	FAIL	At least one of the following errors was found on the DS1 circuit pack: Loss of signal (1281), Blue alarm (1793), Red alarm (2049), Yellow alarm (2305), or Hyperactivity (1537). **1** Look for these error types in the hardware error log, and then follow the procedures given in the maintenance documentation that is appropriate for the error type that was found.

2 of 3

Table 270: Test #314 DS1 CO Dial Tone Seizure Test

Error Code	Test Result	Description / Recommendation
	FAIL	The trunk cannot be seized for an outgoing call. This could cause in-line failures to be reported against the trunk (no answer would report error type 257 with auxiliary data 57487 in the error log). **1** Verify the `Trunk Type` field on the trunk administration screen screen matches the trunk type administered on far-end switch. **2** Look for DS1-BD/UDS1-BD errors in Error Log. If present, see DS1-BD (DS1 Interface Circuit Pack) on page 760. **3** Retry the command at 1-minute intervals up to 5 times.
	PASS	The trunk can be seized for an outgoing call.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive. **1** Verify that the board's translations are correct. Use **list config**, and resolve any problems that are found. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted. Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing **list config** but the `Vintage` field shows that there is no board (when there really is a board), **busyout board** and the **release board** do not work, even though **reset board** does work. The software puts the hyperactive board back in service after the hyperactivity clears.

3 of 3

CO-TRK (Analog CO Trunk)

S8700 / S8500 / S8300 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
CO-TRK	MAJOR[2]	**test port *location***	Analog CO Trunk
CO-TRK	MINOR	**test port *location***	Analog CO Trunk
CO-TRK	WARNING	**test port *location***	Analog CO Trunk

1 For information on specifying a location, see Command Syntax on page 179.

2 A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75% of the trunks in this trunk group are alarmed.

S8700 / S8500 / S8100

For systems supporting circuit packs:

If ATMS testing is enabled, check the error log for ATMS errors 3840 and 3841. If the error log indicates that measurements exceeded acceptable thresholds, and no other trouble is found with **test trunk**, run the ATMS test call with **test analog-testcall port <*address*> full**.

NOTE:
Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end.

Analog CO trunks are 2-wire analog lines to the CO that support both incoming and outgoing calls. CO trunk circuit packs have eight ports, each of which provides an interface between the 2-wire CO line and the 4-wire TDM bus. The system supports the following CO trunk circuit packs:

TN438	TN2138
TN447	TN2147
TN465	TN2148
TN747	

S8300 / G700

For systems supporting Media Modules:

Analog CO trunks are 2-wire analog lines to the CO which support both incoming and outgoing calls. CO trunk MM711 Analog Media Modules have eight ports.

NOTE:
Although the CO-TRK MO is provided for G700 and G350 media gateways, this MO only partially supports the MM711 Analog Media Module.

The following sequences show the interactions between the switch and the CO during call setup for both loop-start and ground-start trunks.

Loop Start Operation

Idle State: Tip = ground, Ring = CO Battery

Outgoing Call:

1. PBX Off-Hook (Seize message): Closes the Tip-Ring Loop

   CO response: DC loop current + Dial tone
2. PBX On-Hook (Drop message): Open Tip-Ring loop, no loop current

   CO response: CO goes to idle state (see Note)

Incoming Call:

1. CO Applies Ringing Voltage

   PBX response: Detect ringing current
2. PBX Off-Hook (Answer message): Close loop

   CO response: Trip ringing, provide loop current
3. PBX On-Hook (Drop message): Open Tip-Ring loop, no loop current

   CO response: CO goes to idle state

NOTE:
CO does not normally provide an On-Hook (Disconnect) signal. Exceptions to this rule include Netherlands loop start and UK loop-calling guarded-clearing.

Ground Start Operation

Idle state: Tip = open, Ring = CO Battery

Outgoing Call:

1. PBX Off-Hook (Seize message): Places ground on Ring

   CO response: Places ground on Tip

   PBX response: Close the loop

   CO response: Provide loop current

   PBX response: Dial out digits
2. PBX On-Hook first (Drop message): Open the Tip-Ring Loop, no loop current

   CO response: Open circuit on Tip
3. CO On-Hook first (Disconnect): Open circuit on Tip, no loop current

   PBX response: Open Tip-Ring loop

Incoming Call:

1. CO Off-Hook (Seizure): CO applies ground on Tip and applies ringing voltage

   PBX response: Make trunk busy for outgoing calls
2. CO Ringing: CO applies ringing voltage

   PBX response: Detect ringing, ring destination
3. PBX Off-Hook (Answer message): Close loop

   CO response: Trip ringing, provide loop current
4. PBX On-Hook first (Drop message): Open the Tip-Ring Loop, no loop current

   CO response: Open circuit on Tip
5. CO On-Hook first (Disconnect): Open circuit on Tip, no loop current

Error Log Entries and Test to Clear Values

Table 271: CO Trunk Error Log Entries

Table 271: CO Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
The ATMS Transmission Tests are not supported on the G700/G350, and abort with Error Code 1412.					
3840 (f)	8000	Transmission Tests (ATMS)(#844-848)		OFF	**test analog-testcall**
3841 (f)		Transmission Tests (ATMS)(#844-848)	MINOR	OFF	**test analog-testcall**

3 of 3

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Major alarms may be downgraded to Warning alarms based on the value used in the set options command.

Additional Information:

a These are in-line errors that have no specific test associated with them. Numerous Error Types in the table above have these errors. Refer to Table 272, CO Trunk Errors with No Tests, on page 644 for an explanation and appropriate action.

b **Error Type 15:** this is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors.

c **Error Type 130:** this error type indicates that the circuit pack has been removed or has been insane for at least 11 minutes. To clear the error, reinsert or replace the circuit pack.

d Numerous Error Types in the table above have these errors.

- Aux data 57345 — Single polarity ringing current
- Aux data 57376 — No loop current on incoming call
- Aux data 57408 — No tip ground detected on outgoing call
- Aux data 57424 — No loop current on outgoing call
- Aux data 57484 — No dial tone on outgoing call

These errors will cause Dial Tone Test #0 to run and are only considered a problem if the Dial Tone test fails (in which case Error Type 1537 will also show up). In this case, the trunk may be put in "Ready-for-Service" state (shown as "disconnected" by status command), that allows only incoming calls. Run Dial Tone Test #0, and follow its outlined procedures.

If error count associated with this error type is very high (i.e., 255) and if Alarm Status on the Hardware Error Report is "n" (not alarmed), then the existence of this error type indicates that, despite the fact that many in-line error messages have been received, every Call Seizure test has passed. Problems at the CO may cause this condition rather than problems with the PBX.

e **Error Types 1025/1281:** these errors will be logged for every version of the CO-TRK/CO-BD. However, no MINOR alarms will be generated for Central Office Trunks [TN747B] with vintages V8 or greater. Any failures received by this test will still be logged as Error type 1025/1281.

Check for the use of MFT/Range extenders. If there are extenders present, and there are no other complaints or maintenance errors against this trunk, then there is a good chance that Test #3 failed due to excessive loop current and may be ignored.

f **Error Types 3840/3841:** Error Type 3840 indicates that test calls made by the Automatic Transmission Measurement System (ATMS) returned measurements in the unacceptable range. Error Type 3841 indicates measurements were in the marginal range. Use **list testcall detail** to examine the specific transmission parameters that are out of spec, and investigate the trunk for that kind of noise. If the noise is acceptable, then the AMTS thresholds administered on the trunk group screen should be changed.

S8300 / **G700**: The associated tests for these error types do not run on a G700 Media Gateway, and abort with Error Code 1412.

Table 272: CO Trunk Errors with No Tests

Error Type	Aux Data	Error Description and Repair Action
1	57347	Port error. Ringing without ground. This error is detected on an incoming call on a ground-start CO trunk. The CO trunk circuit pack has not detected a Tip ground before ringing current is detected. This may indicate that the ground detector is not working. However, the call will be accepted. Busyout the affected port, and run a long test. Observe the test results. If any tests fail, refer to the description of the tests and the associated error codes. Release the port. If users continue to report troubles, check for other errors and make test calls to determine whether the problem should be referred to the CO.
257	50176	Battery reversal detected. This is usually caused by the CO (often seen with step-by-step and cross-bar offices in connection with outgoing calls). This is detected if the direction of the loop current changes from normal to reverse for at least 40 msec. Could occur if the trunk was just installed and for some reason the Tip and Ring wires were reversed at the PBX. If battery reversals occur during dialing, wrong numbers may result. Refer problem to CO. Ask them to remove the battery reversal option.
513	57364	Ground detector stuck active. After several occurrences, an on-board minor alarm is generated. Run the short test sequence. If test aborts with Error Code 1000, disconnect Tip and Ring and repeat short test. If test still aborts, replace circuit pack. If test passes, refer problem to CO. If any other error code is received, pursue that problem.
769	57392	CO not releasing after call is dropped from PBX end, or the loop is not open after a disconnect. After several occurrences, an off-board or on-board warning alarm is generated. Refer problem to CO.

1 of 2

Table 272: CO Trunk Errors with No Tests

Error Type	Aux Data	Error Description and Repair Action
2561	57345	Single polarity ringing current. This error results from abnormal ringing current, but does not prevent the incoming call from being accepted. One cause could be that the reverse current detector associated with the port is failing. (Will not be detected by any tests.) Another cause could be that normal current is not detected. In this case, neither incoming nor outgoing calls can be completed, and the dial tone test will also fail. The last cause could be that certain types of noise are present on the CO line during the silent period of ringing. First check for other errors. If the count for this error is very high (255), and every test passes, then either the reverse current detector is defective or the CO line is noisy. If the CO line is suspect, make Tip and Ring observations. If the line is determined to be noisy, refer the problem to the CO. If the reverse current detector is defective, ignore this error.
2817	57360	Ground but no ringing. This error occurs on an incoming call on a ground-start trunk. If ringing is not detected within 5 seconds of the Tip being grounded, the call is still accepted. If the CO is of the No. 5ESS. switch type, ringing delays of more than 5 seconds during heavy traffic are fairly common. Check for other errors.
2817	57393	The loop is opening too slowly after a disconnect. This error indicates an on-board problem, although the trunk may be functional. Check for other errors.
3073	57376	No loop current on incoming call. The incoming destination has already answered and no loop current has been detected. If this is a hard fault, the dial tone test and every outgoing call should also fail. Check for other errors.
3329	57408	Trunk error. No Tip ground detected on outgoing call. This error occurs when an attempt is made to seize a ground-start CO trunk for an outgoing call and Tip ground is not detected or the caller hangs up before Tip ground is detected. **1** Busyout the affected port, and run a long test. Observe the test results. If any tests fail, refer to the description of the tests and the associated error codes. Release the port. **2** If users continue to report troubles, check for other errors and make test calls to determine whether the problem should be referred to the CO. Busyout the affected port, and run a long test. If Dial Tone Test #0 passes, ignore this error. Release the port.
3585	57424	No loop current on outgoing call. This error occurs on attempt to seize a loop or ground-start trunk for an outgoing call. An error occurs if loop current is not detected or the caller hangs up before it is detected. Busyout the affected port, and run a long test. If CO Demand Diagnostic Test #3 passes and this error keeps occurring, refer problems to CO. Release the port.

2 of 2

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the *NPE Crosstalk* test (#6), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk test (#6) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
Dial Tone test (#0)		X	ND
CO Demand Diagnostic test (#3)	X	X	ND
Looparound and Conference test (#33) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
Audit Update test (#36)	X	X	ND
Transmission test - ATMS (#844-848) **S8300** / **G700**: This test aborts with Error Code 1412.			ND

1 D = Destructive; ND = Nondestructive

NOTE:
A Demand Diagnostic test (#3) will always return a PASS indication for CO-TRK/CO-BD [TN747B] version 8 or greater. However, any errors produced as a result of this test will be logged and produce no alarms.

If errors logged by Test #3 are the only complaints against this trunk, then the system technician should check if MFT/Range Extenders are being used. If extenders are present, then there is a good chance that there is excessive loop current, which will cause Test #3 to log errors.

However, all else being normal, these errors should not affect the customer.

NOTE:
The ATMS tests are not part of either test sequence. They are run either on demand with **test analog-testcall** or by the ATMS schedule.

Dial Tone Test (#0)

This test attempts to seize a port and checks for the return of a dial tone.

Table 273: Test #0 Dial Tone Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the service state indicates that the port is active, then it is unavailable for certain tests. Wait until the port is idle before retesting. **1** Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run this test were not available. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a user for a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the service state indicates that the port is active, then it is unavailable for certain tests. Wait until the port is idle before retesting. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1005	ABORT	Trunk has been administered as incoming-only; dial tone can only be obtained on outgoing trunks. This is a normal condition.
1018	ABORT	Test has been disabled by administration. **1** Verify that the `Maintenance Tests` field on the **Trunk Group** form is set to **n**. To enable the test, use **change trunk-group <*x*>** where **<*x*>** equals the number of the trunk group to be tested. Change the entry in the `Maintenance Tests` field on the screen to **y**
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 273: Test #0 Dial Tone Test

Error Code	Test Result	Description / Recommendation
	FAIL	Trunk was seized, but dial tone could not be detected. **1** Test every administered outgoing port on the board. Failure of 1 port indicates a problem toward the CO. **2** If every port fails, see note below. **3** Check for errors on the TONE-BD or TONE-PT. Clear any errors found, and repeat the test. **4** If the error has still not cleared, refer the problem to the CO. **5** If no service problems exist on the port, continue to use the port until the circuit pack or media module can be replaced (as a last resort). Perform a trunk test call to see if the trunk is operable. **NOTE:** If the dial tone test fails for every port on a circuit pack or media module, a -5 Volt power problem is indicated. To investigate problems with a power unit, seeCARR-POW (Carrier Power Supply) on page 578 (**S8700 IP**: RMC-ENV (Power/Fan Sensors) on page 1593).
2002	FAIL	Seizure portion of test failed due to hardware problem. Fault is usually caused by a disconnected trunk. **1** If the CO Demand Diagnostic test (#3) also failed, display the Hardware Error Log. If the CO Demand Diagnostic test failed because it could not detect ground (indicated by Error Type 1281 in the Hardware Error Log) AND Error Type 3329 or 3585 appears in the Hardware Error Log (with the same last occurred time as Error Type 1281 and 1537), replace the circuit pack or media module. **2** Check trunk wiring to ensure good connection; repeat test if wiring correction made. **3** Locate another identical CO trunk and swap its wiring with the one under test. Repeat test on both trunks, and determine whether problem follows trunk or remains at original port. If problem follows trunk, refer problem to CO. If problem remains at the port, replace the circuit pack or media module and repeat the test.
1009	PASS	Detected tone was not pure dial tone. No action required.

Table 273: Test #0 Dial Tone Test

Error Code	Test Result	Description / Recommendation
	PASS	Trunk was seized, and dial tone was detected. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port. **1** Verify that the board's translations are correct. Translate the board, if necessary. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*>** command. This should re-establish the linkage between the internal ID and the port.

3 of 3

CO Demand Diagnostic Test (#3)

For ground start trunks, circuit pack or media module port relays are operated and checks are made to see if the port can detect and apply ground on the Tip lead. This test also verifies that there is no external ground on the Ring lead. In the absence of other failures, the circuit pack or media module should be replaced only if this test fails with the CO line disconnected.

This test also checks the on-board programmable transmission circuits that allow the circuit pack or media module to support transmission characteristics of several different countries.

Table 274: Test #3 CO Demand Diagnostic Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the service state indicates that the port is active, then it is unavailable for certain tests. Wait until the port is idle before retesting. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.

1 of 4

Table 274: Test #3 CO Demand Diagnostic Test

Error Code	Test Result	Description / Recommendation
1004	ABORT	The port was seized by a user for a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the service state indicates that the port is active, then it is unavailable for certain tests. Wait until the port is idle before retesting. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1005	ABORT	Test inapplicable to present configuration. This is a normal condition.
1018	ABORT	Test has been disabled by administration. **1** For this test to run, the `Maintenance Tests` field on the **Trunk Group** form must be **n**. Use **change trunk-group <*grp*>#** to check the field.
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.

2 of 4

Table 274: Test #3 CO Demand Diagnostic Test

Error Code	Test Result	Description / Recommendation
	FAIL	Failure to detect ground or faulty ground detected on Ring lead. Display the hardware errors for this trunk, to determine whether the fault was on- or off-board. Look for Error Type 1025 or 1281 (if both appear in the Hardware Error Log, pick the most recent error). Error Type 1025 indicates a faulty ground detected on Ring lead (an off-board fault) and Error Type 1281 indicates failure to detect (internally generated) ground (an on-board fault). Faulty ground detected on Ring lead (Error Type 1025): **NOTE:** On TN747B vintage 8 and greater circuit packs, an incoming seizure during this test may cause it to fail with an off-board fault. **1** Repeat test. If test passes, ignore the original failure. If test aborts, follow the recommended procedures. **2** Repeat test with CO line removed. **3** If test fails, replace the circuit pack or media module. **4** If test passes, refer problem to CO. Failure to detect ground (Error Type 1281): **1** Run the long test sequence. If the CO Demand Diagnostic test fails, the Dial Tone test (#0) fails with Error Code 2002, AND Error Type 3329 or 3585 appears in the Hardware Error Log (with the same last occurred time as Error Type 1281 and 1537), replace the circuit pack or media module. **2** Repeat test with CO line removed. **3** If test fails, replace the circuit pack or media module. **4** If test passes, the CO may be drawing too much current. Refer problem to CO.
S8100: 57481	FAIL	On-board test of programmable transmission circuitry failed. **1** Replace the circuit pack.
	PASS	This test verifies that the port is able to apply ground for outgoing calls and detect ground for incoming calls; however, it does not provide information about whether a CO line is actually connected. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.

Table 274: Test #3 CO Demand Diagnostic Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). **1** Verify that the board's translations are correct. Translate the board, if necessary. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*>** command. This should re-establish the linkage between the internal ID and the port.

4 of 4

NPE Crosstalk Test (#6)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in approximately 20 to 30 seconds.

Table 275: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	The port was seized by a user for a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. Check the CO wiring, check for excessive loop current, and check the trunk translations. (If the trunk is translated incorrectly, this test will abort.) **3** If the port status is idle, busyout and release the trunk, and retry the command at 1-minute intervals up to 5 times. **4** If the test still aborts, replace the circuit pack.
1001	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 275: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 media gateway.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The NPE of the tested port was found to be transmitting in error. This will cause noisy and unreliable connections. **1** Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). **1** Verify that the board's translations are correct. Translate the board, if necessary. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*>** command. This should re-establish the linkage between the internal ID and the port.

2 of 2

Looparound and Conference Circuit Test (#33)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

This test checks the reflective loop-around and conference capabilities of a CO port circuit. The test uses 404-Hz, 1004-Hz, and 2804-Hz tones. Each tone is transmitted separately through the loop and checked.

Table 276: Test #33 Looparound and Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test.
7	ABORT	Conference Circuit test aborted.
129	ABORT	The 404-Hz reflective loop-around test aborted. Response to the test request was not received within the allowable time period.
131		The 1004-Hz reflective loop-around test aborted. Response to the test request was not received within the allowable time period.
133		The 2804-Hz reflective loop-around test aborted. Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for error type 769 (see the error log table for a description of this error and required actions). The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 276: Test #33 Looparound and Conference Circuit Test

Error Code	Test Result	Description / Recommendation
1004	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1018	ABORT	The test was disabled by administration. Verify that the `Maintenance Test` field on the Trunk Group screen is set to **n**. To enable the test, use **change trunk-group <x>**, where **<x>** equals the number of the trunk group to be tested. Change the `Maintenance Test` field on the screen to **y**. **1** Retry the command at 1-minute intervals up to 5 times.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 media gateway.
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
7	FAIL	The conference capabilities of the port failed (Error Code 7).
129		The reflective 404-Hz Tone test failed. No transmission was detected to or from the port (Error Code 129).
131		The reflective 1004-Hz Tone test failed. No transmission was detected to or from the port (Error Code 131).
133		The reflective 2804-Hz Tone test failed. No transmission was detected to or from the port (Error Code 133). FAULT ISOLATION: Proceed as follows unless power or tone problems are suspected (see notes on the next page). **1** To make sure the problem is on-board, disconnect the port from the CO and retry the test. Coordinate this with the CO, or do it after busy hours; otherwise, the CO may put the connection out of service. **2** If the retry fails, replace the circuit pack. **3** If the retry passes and no troubles have been reported, disable the test. If the retry passes and troubles have been reported, refer the problem to the CO.

2 of 3

Table 276: Test #33 Looparound and Conference Circuit Test

Error Code	Test Result	Description / Recommendation
7, 129, 131, or 133	FAIL	If the Looparound and Conference Circuit test (#33) fails for every port on a circuit pack, a -5 Volt power problem is indicated. To investigate problems with a power unit, see CARR-POW (Carrier Power Supply) on page 578 (**S8700 IP**: RMC-ENV (Power/Fan Sensors) on page 1593). If a red LED is lit on the power unit circuit pack, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test. **S8700 MC**: if the test fails again, see Fault Isolation Using Duplicated PNC on page 1487.
	PASS	CO Trunk Looparound and Conference test is successful. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). **1** Verify that the board's translations are correct. Translate the board, if necessary. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board<*address*>** command. **5** Issue the **test board <*address*>** command. This should re-establish the linkage between the internal ID and the port.

3 of 3

Port Audit Update Test (#36)

This test will send updates of the CO port translation for every port on the circuit pack or media module that has been translated. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack or media module. No response message is expected from the circuit pack or media module once it receives translation updates. The port translation data includes: ground or loop start trunk, tone or rotary dialing trunk, rotary dialing inter-digit timing, network balance R/RC, and disconnect timing.

Table 277: Test #36 Port Audit Update Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1006	ABORT	The port has been placed out of service, perhaps by craft busyout. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle before testing. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
2100	ABORT	System resources required to run this test were not available. **1** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	This test passed. Translation information was successfully updated on the circuit pack or media module. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring. If the trunk is busied out, the test will not run, but will return PASS. To verify that the trunk is in-service: **1** Enter **status trunk** to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to step 2. **2** Enter **release trunk** to put trunk back into in-service. **3** Retry the test command.
0	NO BOARD	The test could not relate the internal ID to the port (no board). **1** Verify that the board's translations are correct. Translate the board, if necessary. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue **test board <*address*>**. This should re-establish the linkage between the internal ID and the port.

Transmission Test (#844-848)

This test is nondestructive.

NOTE:
S8300 / **G700**: The G700 Media Gateway does not support the Automatic Transmission Measurement System. These tests abort with Error Code 1412.

NOTE:
Tests #844 – 848 are not supported on an International switch.

These tests are run by the ATMS (Automatic Transmission Measurement System). They are not part of the long or short trunk test sequences. Instead, they are run on demand with the **test analog-testcall** command or as part of ATMS scheduled testing. For more information, see 'Automatic Transmission Measurement System in Maintenance Procedures (555-245-103).

The test call is run from an analog port on a TN771 Maintenance/Test circuit pack. It attempts to seize a port and make a call to a TTL (terminating test line) on the trunk's far end. Transmission performance measurements are made and compared to administered thresholds. Errors are generated when results fall outside of "marginal" or "unacceptable" thresholds. Detail and summary measurement reports are obtainable via the **list testcalls** command.

Table 278: Test #844-848 Transmission Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is active, wait until it is idle before testing. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate timeslots for the test. The system may be under heavy traffic conditions or it may have timeslots out of service due to TDM bus errors. **1** If the system has no TDM bus errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use status trunk to determine when the port is available for testing. **2** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	Trunk has been administered as incoming-only; transmission tests can only be run on outgoing trunks.

Table 278: Test #844-848 Transmission Test

Error Code	Test Result	Description / Recommendation
1115	ABORT	The near-end test line on the TN771 circuit pack (**S8100**: TN2314 circuit pack) could not be allocated. **1** Verify that the TN771 circuit pack (**S8100**: TN2314 circuit pack) is in service and that port 1 is administered and in service with **status port**. **2** Retry the command at 1-minute intervals up to 5 times.
1900	ABORT	The test completion message was not received from the TN771 circuit pack (**S8100**: TN2314 circuit pack). **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
1901	ABORT	This error occurs when the TN771 circuit pack (**S8100**: TN2314 circuit pack) uplinks a message that is not the proper response for this test. The anticipated uplink messages are seize, ring or answer. **1** Verify that the trunk is administered properly.
1905	ABORT	Intercept tone detected from far end. **1** Get the test line data from and verify it with the far end. **2** Dial the test number manually to see if the TTL is reached. If not, then either the number is wrong or the far end is administered incorrectly.
1906	ABORT	Reorder tone detected from far end. **1** See actions for error code 1905.
1907	ABORT	Other unexpected tone detected from far end. **1** See actions for error code 1905.
1913	ABORT	Audible Ring detected from far end. **1** See actions for error code 1905.
1914	ABORT	Unidentified interrupted tone detected from far end. **1** See actions for error code 1905
1915	ABORT	Busy tone detected from far end. **1** Since the test line at the far end was busy, try the test again. **2** If the test continues to abort, the problem is with the far-end system.
1918	ABORT	Test progress tone not removed from far end (type 105 test line only). **1** The problem is with the far-end system; a technician at the far end should test the test line (TN771 (**S8100**: TN2314 circuit pack) or ADFTC).
1919	ABORT	Unexpected far-end release **1** The problem is with the far-end system; a technician at the far end should test the test line (TN771 (**S8100**: TN2314 circuit pack) or ADFTC).

Table 278: Test #844-848 Transmission Test

Error Code	Test Result	Description / Recommendation
1920	ABORT	No response from far end. **1** The problem is with the far-end system; a technician at the far end should test the test line (TN771 (**S8100**: TN2314 circuit pack) or ADFTC).
1921	ABORT	No data returned from far end. **1** The problem is with the far-end system; a technician at the far end should test the test line (TN771 (**S8100**: TN2314 circuit pack) or ADFTC).
1922	ABORT	Steady, unidentifiable tone from far end **1** See actions for error code 1905.
1923	ABORT	Broadband energy detected from far end (such as voice or announcement). **1** See actions for error code 1905.
1924	ABORT	No test tone from far end **1** See actions for error code 1905.
1938	ABORT	Near-end self test failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
1939	ABORT	Loss self check at 0dBm at 1004 Hz failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
1940	ABORT	Far-end noise self check failed. **1** The problem is with the far end system; a technician at the far end should test the test line (TN771 (**S8100**: TN2314 circuit pack) or ADFTC).
1941	ABORT	High-frequency singing return loss self check failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
1942	ABORT	Echo return loss self check failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
1943	ABORT	Singing return loss self check failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
1944	ABORT	Loss self check at -16 dBm at 1004 Hz failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
1945	ABORT	Loss self check at -16 dBm at 404 Hz failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
1946	ABORT	Loss self check at -16 dBm at 2804 Hz failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).

Table 278: Test #844-848 Transmission Test

Error Code	Test Result	Description / Recommendation
1947	ABORT	Noise with tone self check failed. **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
2000	ABORT	The test timed out while waiting for a response from the TN771 circuit pack (**S8100**: TN2314 circuit pack). **1** Retry the command at 1-minute intervals up to 5 times.
2012	ABORT	An internal software error occurred. **1** Retry the command at 1-minute intervals up to 5 times.
2053	ABORT	The test call could not be established, but an explanation is unavailable. **1** Retry the command at 1-minute intervals up to 5 times.
2056	ABORT	An error occurred while trying to obtain results from the TN771 circuit pack (**S8100**: TN2314 circuit pack). **1** Test the TN771 circuit packs (**S8100**: TN2314 circuit packs).
	FAIL	Measured transmission performance was in the unacceptable range as administered on the trunk group screen. Retrieve a measurement report via the **list testcalls** command. Make sure that ATMS thresholds are set properly on page 4 of the trunk group screen. Besides the facility, test failures can be caused by faulty test lines or switch paths. If the measurements point to a facility problem, report the results to the trunk vendor.
8000	FAIL	Measured transmission performance was in the marginal range as administered on the trunk group screen. This generally means that the trunk is usable but has an undesirable amount of noise or loss. If the user does not report unacceptable effects, it may not be necessary to take any action. Retrieve a measurement report via **list testcalls**. Make sure that ATMS thresholds are set properly on page 4 of the trunk group screen.

4 of 4

CONFIG (System Configuration)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
CONFIG	none	none	System Configuration

The System Configuration MO oversees logical insertion and removal of circuit packs in the system. When Switch Control detects that a circuit pack is present in a port slot, it informs System Configuration and System Configuration queries the circuit pack to determine the type and vintage of the circuit pack. Similarly, when Switch Control detects that a circuit pack has been removed from a port slot, it informs System Configuration.

There are no alarms or tests for System Configuration, but three types of errors are logged to the Hardware Error Log.

Error Log Entries and Test to Clear Values

Table 279: System Configuration Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	none	none	N/A	none
1–119 (a) **S8100**: 2-117	0–21	none			
257 (b)		none	MAJOR		
1001–1119 (c) **S8100**: 1002-1117	0–21	none			

1 This error should not occur. It indicates that an attempt was made by software to raise an alarm against CONFIG without first logging a CONFIG error.

Notes:

a This error indicates that a port circuit pack in the system did not respond to a circuit pack type inquiry. Follow the procedures outlined in (c) to determine whether there is an error.

b This error indicates that less than 25% of trunk group is available.

c This error indicates that a port circuit pack in the system did not respond to a vintage inquiry.

As a result of either of these errors, a port circuit pack may be physically inserted in a port slot, but the system may not recognize its existence. The `Aux Data` field specifies the circuit pack's port-network number as indicated in the following table.

Converting Aux Data to Port-Network Number

Aux Data	Port-Network Number
0	1
1	2
2	3
3	4
4	5
5	6
6	7
7	8
8	9
9	10
10	11
11	12
12	13
13	14
14	15
15	16
16	17
17	18
18	19
19	20
20	21
21	22

The `Error Type` field specifies the carrier and slot location of the circuit pack that caused the error as indicated in Table 280, Converting Error Types To Carrier Locations, on page 664. If the `Error Type` is greater than 1000, subtract 1000 from the `Error Type` field before consulting the table.

S8700 MC:Before proceeding, if multiple CONFIG errors are simultaneously logged with an Aux Data of 1, investigate any EXP-INTF (Expansion Interface) errors.

Once the port's circuit-pack location has been determined from Table 280, Converting Error Types To Carrier Locations, on page 664, use the **list configuration all** command to determine whether the circuit pack is inserted. If the circuit pack has already been inserted but the error persists, replace the circuit pack. If not, insert the pack.

4 of 4

Notes:

a These error types do not represent physical port circuit pack slots and are not logged against CONFIG..

b If this error type occurs in a PN, it refers to the circuit pack in slot A01.

c If this error type occurs in a PN, it refers to the circuit pack in slot A10.

d Slots B00, C00, D00, and E00 refer to the *Service Slots* in the B, C, D, and E carriers.

e In a PN's A carrier, slot A00 is the Tone Generator's slot.

CUST-ALM (Customer-Provided Alarming Device)

S8700 / S8500 / S8100

See MAINT (PN's Maintenance Circuit Pack) on page 1174 for information about this maintenance object.

DAT-LINE (Data Line Port)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DAT-LINE	MINOR	**test port *location* l**	Data Line port
DAT-LINE	WARNING	**test port *location* l**	Data Line port

1 For information on specifying a ***location***, see Command Syntax on page 179.

The TN726 Data Line circuit pack has eight ports, each of which supports an RS-232 interface to asynchronous CPE (customer-premises equipment). Each of these ports and the equipment connected to it constitute a data line. For DT-LN-BD (Data Line circuit pack) errors, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086. Check circuit pack-level errors first since the usability of the ports depend on the health of the circuit pack.

Use **add data-module** to administer data line ports at the terminal. The data module type is *data-line*. The **list data-module** command shows every administered data module in the system.

The TN750 Announcement circuit pack has one data line-type port on it. This data line port is used for saving and restoring announcements. For a description of and repair instructions for the TN750, see ANL-BD (Analog Line Circuit Pack) on page 262.

NOTE:
If the tests for the data line port in question pass, and user-reported complaints persist, there is probably an external problem. Test the ADU (asynchronous data unit), using the procedures in *User Manual Z3A Asynchronous Data Unit, 555-401-701*. If the ADU appears to be working properly, check the external wiring, and then check the customer equipment.

Error Log Entries and Test to Clear Values

Table 281: Data Line Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
1		Digital Looparound test (#171)	MINOR	ON	**test port** *UUCSSpp* **s r 2**
15(a)	Any	Audit Update test (#36)			
18	0	**busyout port** *UUCSSpp*	WARNING	OFF	**rel port** *UUCSSpp*
130 (b)		None	WARNING	ON	**test port** *UUCSSpp* **sh**
257		Conference Circuit test (#7)	MINOR	ON	**test port** *UUCSSpp* **l r 2**
513		NPE Crosstalk test (#6)	MINOR	ON	**test port** *UUCSSpp* **l r 2**
769(c)	40983 **S8100**: Any	None			

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

Notes:

a This is a software audit error that does not indicate any hardware malfunction. Run the short test sequence, and investigate errors.

b Indicates the circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, reseat or replace the circuit pack.

c Error type 769 indicates that the data line circuit pack found an error in the transmit/receive circuitry of an administered data line when the circuit pack was inserted. Perform the following:

1. Enter **busyout board UUCSS f**or the circuit pack on which the port resides.
2. Enter **reset board UUCSS**. Check the Error Log to determine whether Error Type #769 is logged again for DAT-LINE. Make sure that the `Active Alarms Only` field is set to **n**.

   If Error Type #769 reappears, replace the data line circuit pack. If not, proceed to step 3.
3. Enter **release board UUCSS**.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table. For example, by clearing error codes associated with the Digital Looparound test, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Digital Looparound test (#171)	X	X	ND
NPE Crosstalk test (#6)		X	ND
Conference Circuit test (#7)		X	ND
Audit Update test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 282: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run test are not available. The port may be in use on a valid call. Use **status data-module** to determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** Resolve any TDM-BUS errors. **2** If the system is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 282: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present, or some tone detectors may be out-of-service. **1** Resolve any TTR-LEV and TONE-PT errors. **2** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was in use on a valid call. **1** Determine whether the port is available for testing (**status data-module**). **2** When available, retry the command at 1-minute intervals up to 5 times.
1020	ABORT	An existing Error Type 769 on this port prevented the test from running. **1** Follow the procedures for Error Type 769.
2000	ABORT	Response to the test command was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The NPE of the tested port was transmitting in error, which can cause noisy and unreliable connections. **1** Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. **1** Investigate user-reported troubles on this port using other port tests and examining the ADU, external wiring, and customer equipment.

2 of 2

Conference Circuit Test (#7)

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a tone detector port. If the level of the tone is within a certain range, the test passes.

Table 283: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. Use **status data-module** to determine when the port is available for testing.
1004	ABORT	The port has been seized by a user for a valid call. Use **status data-module** to determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times.
1020	ABORT	An existing Error Type #769 on this port prevented the test from running. **1** Follow the procedure following the Error Log Table for Error Type #769.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The conference circuit test failed (possible off-board problem). **1** Busyout and release the port (data line), and then retest. **2** Replace the circuit pack if the test continues to fail.
	PASS	The port can correctly conference multiple connections. Investigate user-reported troubles on this port using other port tests and examining the ADU, external wiring, and customer equipment.

Audit Update Test (#36)

This audit verifies that the hardware state of the data line is consistent with the system translations. The audit queries the port for the switchhook state, the software state is updated according to the returned value. Also, the audit data line options down to the port.

Table 284: Test #36 Audit Update Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times. **2** Escalate the problem if the test continues to abort.
1006	ABORT	An existing Error Type #769 on this port prevented the test from running. **1** Follow the procedure following the Error Log Table for Error Type #769.

1 of 2

Table 284: Test #36 Audit Update Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	ABORT	Internal system error **1** Try the command again at 1-minute intervals up to 5 times.
7	FAIL	Internal system error **1** Try the command again at 1-minute intervals up to 5 times.
	PASS	The hardware port state is consistent with the software state. Investigate user-reported troubles on this port using other port tests and examining the ADU, external wiring, and customer equipment.

2 of 2

Digital Loop-Around Test (#171)

The Digital Looparound test checks the data line port's ability to transmit and receive data on the TDM Bus. Data is sent through an available Maintenance/Test digital port over the TDM Bus, internally looped through the data line port back onto the TDM Bus, and received again by the same Maintenance/Test digital port.

Only one of the two digital ports on a Maintenance/Test circuit pack is used for this test, and that port must be the **first** such port; such as port 02. If port 02 is in use, out-of-service, or not present, the test aborts. This test may fail if the Maintenance/Test digital port used by the test is not functioning properly. If there are any M/T-DIG errors in the Error Log, see M/T-BD (Maintenance/Test Circuit Pack) to clear them first.

S8100

If there are any DATA-CHL errors in the Error Log, see DATA-BD (Data Channel Processor circuit pack) maintenance documentation to clear them first.

This test will pass regardless of any customer equipment that may be connected to the port, as long as the equipment is not using the port.

Table 285: Test #171 Digital Loop-Around Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run test are not available. The port may be in use on a valid call. Use **status data-module** to determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times.
S8100: 1005 1007	ABORT	Data Channel 3 is not administered. This port is required to run this test. **1** Verify that data channel 3 is not administered with the **list data-module** command. Administer data channel 3 with the **add data-module** command, and run this test again.
S8100: 1016	ABORT	Data Channel 3 is busy. The port may be in use on a valid call. Use **status data-module** to determine when the port is available for testing. **1** Retry the command at 1-minute intervals a maximum of 5 times.
1020	ABORT	An existing Error Type #769 on this port prevented the test from running. **1** Follow the procedure following the Error Log Table for Error Type #769.
1042	ABORT	Port under test is a TTI port and has only default translations with no assigned extension. The executed test requires an assigned extension associated with the port being tested. Therefore, this test cannot successfully execute. **1** If there is a need to execute the test on this particular port, then the tester must ensure that the port is fully translated such that the port has an assigned extension.

Table 285: Test #171 Digital Loop-Around Test

Error Code	Test Result	Description / Recommendation
1180	ABORT	There is no Maintenance/Test circuit pack digital port available to carry out the test. **1** Check to see if the Maintenance/Test digital ports are present. (Enter **list config**; ports 02 and 03 should show). **2** If the digital ports (02 and 03) on the Maintenance/ Test circuit pack are not present, see M/T-BD (Maintenance/Test Circuit Pack) on page 1338. **3** If the digital ports are present, retry the command at 1-minute intervals up to 5 times.
1181	ABORT	No time-slots available to connect digital ports for the test.
1182	ABORT	Internal system error. Failed to connect the digital ports with time-slots. **1** Retry the command at 1-minute intervals up to 5 times.
1340	ABORT	No Maintenance/Test digital port is currently available to perform this test. **1** Use **list config** to determine whether any Maintenance/Test digital ports (ports 02 and 03 on the Maintenance/Test circuit pack) are present in the system. At least one Maintenance/Test circuit pack must be present in PN 1 of the system. There should be at least two such ports present. If the ports are present, proceed to step 2. Otherwise, determine why no ports appear in the **list config** display. Refer to "M/T-DIG" and "M/T-BD". **2** Look for M/T-DIG errors in the Error Log. If present, see M/T-DIG (Maintenance/Test Digital Port). **3** If the ports are present and no errors are logged against them, retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, replace the Maintenance/Test circuit pack.
1392	ABORT	This port is currently a TTI port and the test will not execute on it. **1** Verify that the port is a TTI port using either the **display port** command (the display shows that the port is a TTI port) or the **list config** command (the display shows a "t" for the port). **2** If either **list config** or **display port** indicates that the port is **not** a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct for the test, and no action is necessary.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times. **2** Escalate the problem if the test continues to abort.
S8100: 2003	ABORT	Failed to receive an off-hook from the Data Line. **1** Retry the command at 1-minute intervals a maximum of 5 times.

Table 285: Test #171 Digital Loop-Around Test

Error Code	Test Result	Description / Recommendation
S8100: 2004	ABORT	Failed to receive an off-hook from the Data Channel.
2004	ABORT	Off hook was not received from the data line device. **1** Busyout the digital port being tested on the data line circuit pack. Retry the command at 1-minute intervals up to 5 times. **2** If the test still aborts, replace the circuit pack.
2005	ABORT	The handshake between the Maintenance/Test circuit pack digital port and the data line port failed. **1** Resolve any M/T-DIG errors. S8100: Look for DATA-CHL errors in the Error Log. If present, refer to DATA-BD (Data Channel Processor circuit pack) Maintenance documentation. **2** Retry the command at 1-minute intervals up to 5 times. **3** If the test still aborts, replace the data line circuit pack.
S8100: 2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals a maximum of 5 times.
2312	ABORT	Test did not finish, did not receive loop back data. **1** Resolve any M/T-DIG errors. **2** Retry the test, if still aborts, replace the Data Line circuit pack.
2313	ABORT	Failed to receive a response from the Maintenance/Test digital port. **1** Resolve any M/T-DIG errors. **2** Retry the command at 1-minute intervals up to 5 times. **3** If the test continues to abort, replace the Maintenance/Test circuit pack.
2314	ABORT	Data line port did not respond to downlinked message. **1** Busyout the digital port being tested on the data line circuit pack. Retry the command at 1-minute intervals up to 5 times. **2** If the test still aborts, replace the circuit pack.
2500	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times.

Table 285: Test #171 Digital Loop-Around Test

Error Code	Test Result	Description / Recommendation
S8100: 2000	FAIL	The test failed waiting for the transmitted data to be looped back. **1** Look for DATA-CHL errors in the Error Log. If present, refer to DATA-BD (Data Channel Processor circuit pack) Maintenance documentation. **2** Repeat this test. **3** If the test fails again, replace the Data Line circuit pack.
	FAIL	The test failed because the data received did not match the data sent. This would indicate that there is a fault somewhere in the transmit/receive path to the TDM Bus, which will probably result in data corruption over this port. This test may fail if the Maintenance/Test digital port (S8100: Data Channel 3) used by the test is not functioning properly. **1** Resolve any M/T-DIG errors. S8100: Look for DATA-CHL errors in the Error Log. If present, refer to DATA-BD (Data Channel Processor circuit pack) Maintenance documentation. **2** Repeat Test #171. **3** If the test fails again, replace the data line circuit pack.
	PASS	The port can correctly transmit/receive data. Investigate user-reported troubles on this port using other port tests and examining the ADU, external wiring, and customer equipment.

4 of 4

DC-POWER (Single-Carrier Cabinet Environment)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DC-POWER	MAJOR	**test environment *UU***	Single-Carrier Cabinet Environment

1 ***UU*** is the universal cabinet number indicated in the PORT field of the alarm log.

The S8700 Sever in a Multi-Connect configuration supports two different cabinet types: multicarrier and single-carrier. Single-carrier cabinets are used only for PNs. Both cabinet types may be powered by either AC or DC external power source. Environmental maintenance differs according to cabinet type and external power supply. Refer to the following table to determine which MO documentation to use for environmental maintenance.

Cabinet Type	Power Source	Environmental Maintenance Objects
Single-carrier (PN)	AC or DC	DC-POWER (all environmental maintenance)
Multicarrier	AC	AC-POWER for AC-powered systems (external power source) POWER for AC-powered systems (battery backup) CARR-POW (carrier port power supply) CABINET (temperature and fan sensors)
Multicarrier	DC	CARR-POW (carrier port power supply) CABINET (temperature and fan sensors)

The DC-POWER MO represents all environmental maintenance for single-carrier cabinets, whether the external power supply is AC or DC. This includes the external power supply and every Carrier Port Power Supply in an PN composed of a single-carrier cabinet stack. A Carrier Port Power Supply provides +5, -5, and/or -48 Volts DC to the circuit packs on the carrier. The following power supplies are used:

WP-91153	Accepts AC power input
676B	Accepts DC power input

Each power unit has one amber LED. A lit LED signifies normal operation. An unlit LED signifies a loss of external power to the cabinet, or a fault in the power unit. When hardware detects a problem with any of these components, it reports the information to the system software through a single lead. System software does not differentiate between different environmental failures. Since several environmental elements of single-carrier cabinets are logged against the DC-POWER MO, it is possible to have a DC-POWER alarm while there is still power to the system.

If a Carrier Port Power Supply is physically removed from a carrier in a single-carrier cabinet, there will not be a DC-POWER alarm. DC-POWER maintenance cannot distinguish between removal of the power supply and the physical absence of the cabinet.

There is a nominal power holdover of .25 second in an PN single-carrier cabinet.

Hardware Error Log Entries and Test to Clear Values

Table 286: Single-Carrier Cabinet Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value[1]
0[2]	0	Any	Any	Any	**test environment *UU***
513	0 or 1	Single-Carrier Cabinet Power Query Test (#79) on page 681	MAJOR	ON	**test environment *UU* r 2**

1 UU is the universal cabinet number indicated in the PORT field of the Alarm Log.

2 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the Single-Carrier Cabinet Power Query test, for example, you may also clear errors generated from other tests in the testing sequence. Test description(s) and recommended maintenance procedures follow for every error that can occur during technician-demanded testing.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Single-Carrier Cabinet Power Query test (#79)	X	X	ND
Emergency Transfer Query test (#124) (a)	X	X	ND
External Alarm Lead Query test (#120) (b)	X	X	ND
Analog Ring Generator Initialization test (#117) (c)	X	X	ND
Analog Ring Generator Query test (#118) (c)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a See EMG-XFER (Emergency Transfer) on page 885 for a description of this test.

b See EXT-DEV ADMIN? Y (External Device Alarm) on page 972 for a description of this test.

c See RING-GEN (Analog Ring Generator) on page 1587 for a description of this test.

Single-Carrier Cabinet Power Query Test (#79)

This test queries an PN's Maintenance circuit pack about the power's status in a single-carrier cabinet PN. This test can only detect power problems in the carriers of the PN where the Carrier Port Power Supply physically resides.

Table 287: Test #79 Single-Carrier Cabinet Power Query Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to ABORT with a 2000 error code, check for and resolve every MAINT (Maintenance circuit pack) error. Then, repeat the test. **3** If the test still aborts with this error code, escalate the problem.
2029, 2319, 2320, 2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1	FAIL	There is currently a problem with the environment of the power system. **1** The power supply to any one of the carriers may have been lost. **a** Verify, and if necessary restore, AC power at the wall outlet for each carrier. **b** Rerun the test. If the test still fails, proceed to step 2. **2** One of the WP-91153 or 676-B power units for one of the carriers could be defective. **a** If a WP-91153 or 676-B power unit does not have its yellow status LED on, then replace the power unit (procedure in Chapter 8, "Component replacement" in *Maintenance Procedures (555-245-103)*). **b** Rerun the test. If the test still fails, proceed with step 3. **3** The PN's MAINT (Maintenance circuit pack) could be incorrectly reporting this error. Resolve every alarm on these MOs, and rerun the test. There are failures that can occur on the PN's Maintenance circuit pack that *will not* be detected by their respective maintenance, but that will cause many, if not all, environment tests to fail. If more than two environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If the test still fails, follow normal escalation procedures.
	PASS	The PN's MAINT (Maintenance circuit pack) has reported no problem with the power.

DETR-BD (Tone Detector Circuit)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DETR-BD	MINOR	**test board *location***	Tone Detector circuit
DETR-BD	WARNING	**test board *location***	Tone Detector circuit

1 For information on specifying a ***location***, see Command Syntax on page 179.

For proper tone detection, the companding mode administered for the system must match that of the DETR-BD circuit. The companding mode is administered on the ***location-parameters*** screen.

For any DETR-BD (Tone Detector circuit) errors, see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

DID-BD (Direct Inward Dial Trunk Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DID-BD	MINOR	**test board *location* sh**	Direct Inward Dial Trunk circuit pack
DID-BD	WARNING	**test board *location* sh**	Direct Inward Dial Trunk circuit pack

1 For information on specifying a ***location***, see Command Syntax on page 179.

See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 for circuit pack-level errors. See also DID-TRK (Direct Inward Dial Trunk) on page 695 for related trunk information.

DID-DS1 (Direct Inward Dial Trunk)

S8700 / S8500 / S8300 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run	Full Name of MO
DID-DS1	MAJOR[1]	**test trunk *grp/mbr* long**	Direct Inward Dial Trunk
DID-DS1	MINOR	**test trunk *grp/mbr* long**	Direct Inward Dial Trunk
DID-DS1	WARNING	**test trunk *grp/mbr***	Direct Inward Dial Trunk

1 A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed. For more information, see the **set options** command.

The DID-DS1 trunk provides a digital Direct Inward Dial (DID) trunk from a CO switch to the system through a DS1 link. A 24-channel DS1 link can support up to 24 DID-DS1 trunk calls simultaneously. A 32-channel link can support up to 30.

A DID-DS1 trunk can be used for digitized voice and data communications with DS1 signaling mode (for example, common-channel signaling). The TN767 and TN464 series circuit packs, and the MM710 Media Module, support wink-start and immediate-start trunks and Avaya™ Communication Manager signaling. Throughout this section, the term DS1 applies to all. For more information, see one of the following maintenance objects:

Circuit Pack/Media Module	Maintenance Object
TN767 DS1 Interface Circuit Pack	DS1-BD
TN464 UDS1 Interface Circuit Pack	UDS1-BD
S8300 / **G700**: MM710 DS1 Media Module	MG-DS1

S8300 / **G700**: Although the DID-DS1 MO is provided for a G700 Media Gateway, this MO only partially supports the MM710 DS1 Media Module.

Information included in this section covers the in-line errors log, initialization tests, periodic tests, scheduled tests, system technician demand tests, and alarms escalation and elimination. Two trunk service states are specified in the DID-DS1 trunk maintenance:

out-of-service	The trunk is in a deactivated state and cannot be used for incoming calls.
in-service	The trunk is in an activated state and can be used for incoming calls.

If a DS1 is out-of-service, then every trunk on the circuit pack or media module is put into the out-of-service state, and a Warning alarm is raised.

Error Log Entries and Test to Clear Values

Table 288: DID-DS1 Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test trunk *grp#/mbr#***
1 *	Any				
15 *	Any	Port Audit and Update test (#36)			
18 *			WARNING	OFF	**release trunk *grp#/mbr#***
130 *		None	WARNING	ON	**test trunk *grp#/mbr#***
257 *	57474 57473				
513 *	57392		MAJOR MINOR[2]		
769 *	57393		MAJOR MINOR[2]		
1281		Conference Circuit test (#7)	MINOR WARNING[3]	ON	**test trunk *grp#/mbr#* l r 4**
1537		NPE Crosstalk test (#6)	MINOR WARNING[3]	ON	**test trunk *grp#/mbr#* l r 3**
1793 *					**test board <*address*> l**
2305 *	50944	None	MAJOR MINOR[2]	OFF	
3840 *		Port Audit and Update test (#36)			

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

2 This alarm will only be raised when the System-Parameter Country screen has the `Base Tone Generator` field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.

3 Major alarms may be downgraded to Warning alarms based on the value used in the set options command.

NOTE:
For information on a specific **<*address*>**, refer to Command Syntax on page 179.

Error Additional Information:

Error Type 1: DS1 Interface circuit pack or media module detects a hardware error on the DS1 DID trunk. The `Aux Data` field indicates the following:

57476	On-hook before wink
57477	On-hook before ready to receive digits
57485	Wink too short for valid signal

Maintenance does not start any testing or generate any alarms in response to these errors.

Error Type 15: This is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate errors (if any).

Error Type 18: The trunk has been taken out of service by a demand busyout. No calls can be made on this trunk.

Error Type 130: This error type indicates that the circuit pack or media module has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack or media module.

Error Type 257: DS1 Interface circuit pack or media module detects a hardware error on the DS1 DID trunk. The `Aux Data` field indicate the source of the error:

57474	Rotary dial rate above 12 pulses per second
57473	Rotary dial rate below 8 pulses per second

Error Type 513: DS1 Interface circuit pack or media module detects a hardware error on the DS1 DID trunk. Aux Data 57392 indicates no external release on PBX disconnect.

Error Type 769: DS1 Interface circuit pack or media module detects a hardware error on the DS1 DID trunk. Aux Data 57393 indicates belated external release on PBX disconnect.

Error Type 1793: DS1 Interface circuit pack or media module is out-of-service. Look in the Hardware Error Log:

If port is on	Look in
TN767 DS1 Board	DS1-BD
TN464 UDS1 Board	UDS1-BD
S8300 / **G700**: MM710 DS1 Media Module	MG-DS1

Error Type 2305: This error indicates that a signaling change was detected by the PBX trunk circuit pack or media module which is inconsistent with the present state of the trunk.

Error Type 3840: Port Audit and Update test (#36) failed due to an internal system error. Enter **status trunk** to verify the status of the trunk. If the trunk is out-of-service, enter **release trunk** to put it back to in-service. Retry the test command.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order they are presented in the following table. By clearing error codes associated with the *NPE Crosstalk* test, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk test (#6) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
Conference Circuit test (#7) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
Port Audit and Update test (#36)	X **S8100**: (blank)	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 289: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required for this test are not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/ member number of the port. Use **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for Error Type #1025. The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of- service due to TDM BUS error. Use **status health** to determine whether the system is experiencing heavy traffic. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Issue **list measurements tone-receiver** to display information about the tone receivers. **2** Resolve any TTR-LEV errors. **3** Resolve any TONE-PT errors. **4** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a user for a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. **1** Examine Error Log for existing errors against this port or circuit pack and attempt to diagnose the previously existing error.

1 of 2

Table 289: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
2053	ABORT	At least one of the following errors is found on the DS1 circuit pack (DS1-BD or UDS1-BD): 1281 – Loss of signal, 1793 – Blue Alarm, 2049 – Red Alarm, 2305 – Yellow Alarm, or 1537 – Hyperactivity **1** Resolve any of the previous error types.
ANY	FAIL	This can be due to off-board problems, including EXP-PN and EXP-INTF faults, RMC-ENV faults (**S8700 IP**), TDM-BUS faults, and Tone Detectors/Tone Generators. Clear every off-board problem before replacing the board. A TDM-BUS problem is usually a faulty board or bent pins on the backplane. **1** Resolve any EXP-PN, EXP-INTF, RMC-ENV (**S8700 IP**), TDM-BUS, TONE-BD, and TONE-PT errors in the error log. **2** Retest when errors are cleared. Replace the board if the test fails.
	PASS	The port is correctly using its allocated time slots. Investigate user-reported troubles on this port using other port tests and by examining station, trunk, or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port. This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board translations are correct. Use **list config,** and resolve any problems that are found. **2** Issue **busyout board <*address*>**. Issue **reset board <*address*>**. Issue **release board <*address*>**. **3** Issue **test board <*address*> long**. This should re-establish the link between the internal ID and the port. If not, check to see that there is a valid board inserted.

2 of 2

Conference Circuit Test (#7)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together.

Table 290: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources for this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required for this test were not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for Error Type #1025. The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic and the port status is idle, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Issue **list measurements tone-receiver** to display information about the tone receivers. **2** Resolve any TTR-LEV errors. **3** Resolve any TONE-PT errors. **4** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a user for a valid call. **1** Use **display port <*address*>** to determine the trunk group/member number of the port. Issue **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.

Table 290: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
1018	ABORT	The test was disabled via translation. Determine why the test has been disabled before you enable it. **1** Verify that the `Maintenance Test` field on the ***Trunk Administration*** form is set to **n**. To enable the test, change the trunk administration and enter **y** for this field. **2** Repeat the test.
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. **1** Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 media gateway.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2053	ABORT	At least one of the following errors is found on the DS1 circuit pack (DS1-BD or UDS1-BD): 1281 – Loss of signal, 1793 – Blue Alarm, 2049 – Red Alarm, 2305 – Yellow Alarm, 1537 – Hyperactivity **1** Resolve any of the previous error types.
Any **S8100**: (blank)	FAIL	The NPE of the tested port did not conference the tones correctly. This can cause noisy and unreliable connections. **1** Enter **list configuration board <*address*>**. The circuit pack must be a TN767C V3 or later. The error log may have Error Type #1281. **2** Test every administered trunk on the board. If one fails, this could be an off-board problem (such as an incoming seizure or an off-hook port seizure during the test). Retest the board. **3** If every port fails, a -5V power problem is indicated. Check CARR-POW (Carrier Power Supply). **S8100**: Check CAB-PFL (Power Fan Lead). **4** If several ports fail, resolve any TONE-BD (Tone-Clock Circuit) or TONE-PT (Tone Generator) errors and rerun the test. **5** If the retry passes and troubles are reported, coordinate isolation with the CO. Make sure that the switch, the CO, and any NTCE equipment (the CSUs) have the correct administration. **6** Replace the circuit pack.

Table 290: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	PASS	The port can correctly conference multiple connections. Investigate user-reported troubles on this port using other port tests and by examining station, trunk, or external wiring. **S8100**: This test always passes for TN742 Analog circuit packs prior to Vintage 4.
0	NO BOARD	The test could not relate the internal ID to the port. This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **lIst config**, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue **busyout board <*address*>**. **3** Issue **reset board <*address*>**. **4** Issue **release board <*address*>**. **5** Issue **test board <*address*> long**. This should re-establish the link between the internal ID and the port. If not, check to see that there is a valid board inserted.

3 of 3

Port Audit and Update Test (#36)

This test sends port-level translation data from the switch processor to the DS1 Interface circuit pack or media module to assure that a trunk's translations are correct. The port audit operation verifies the consistency of the current state of the trunk as kept in the DS1 Interface circuit pack or media module and in switch software.

Table 291: Test #36 Port Audit and Update Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	The port may be busy with a valid call. **1** Issue **display port <*address*>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for Error Type #1025. The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1006	ABORT	The test was aborted because the trunk is out of service. **1** Use **status trunk** to verify that the trunk is out of service. **2** If the trunk is out of service, determine why. **3** To put the trunk back in service, issue **release trunk**. Retry the test.
2000	ABORT	Response to the test was not received in the allowable time period.
2100	ABORT	Could not allocate resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	Test failed due to internal system error. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 291: Test #36 Port Audit and Update Test

Error Code	Test Result	Description / Recommendation
	PASS	Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit packor media module and switch software are consistent. If the trunk is busied out, the test will not run but will return PASS. To verify that the trunk is in-service: **1** Enter **status trunk** to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service. **2** Enter **release trunk** to put the trunk back into in-service. **3** Retry the test command.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **list config** command, and resolve any problems that are found. **2** If the board was found to be correctly inserted in step 1, issue **busyout board <*address*>**. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*> long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.

2 of 2

DID-TRK (Direct Inward Dial Trunk)

S8700 / S8500 / S8300 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DID-TRK	MAJOR[2]	**test port *location* l**	DID Trunk
DID-TRK	MINOR	**test port *location* l**	DID Trunk
DID-TRK	WARNING	None	DID Trunk

1 For information on specifying a ***location***, see Command Syntax on page 179.

2 A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

NOTE:
Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end. Refer to *Administrator's Guide for Avaya™ Communication Manager, 555-233-506,* for information about how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

S8100

Direct Inward Dial (DID) trunks coming from the Central Office (CO) allow outside parties to call directly to an extension in the system. DID Trunk circuit packs include:

TN753	United States
TN2146	Belgium and the Netherlands
TN2139	Italy
TN 436	Australia
TN459	United Kingdom

DID trunk circuit packs and the MM711 Media Module support eight incoming-only ports. Each port provides an interface between the 2-wire analog CO line and the 4-wire TDM bus on the switch.

S8300 / **G700**: Although the DID-TRK MO is provided for a G700/G350 Media Gateway, this MO only partially supports the MM711 Analog Media Module.

DID Trunk Operation

The DID port receives three to five digits from the CO that are used to directly connect an outside caller to the called station without assistance from an attendant. For each call, the CO switch signals the system by opening and closing individual DID loops (one of the eight ports), causing the starting or stopping of loop current.

DID Trunk Testing

The system uses technician-invoked tests of on-board circuitry to diagnose the health of the trunk. These are described in the following sections. Additionally, in-line testing which can generate errors, is performed while a call is in progress. See the Error Log table for a description of these errors. These errors may be reproduced by placing a call on the trunk and checking the Hardware Error Log.

Problems detected during signaling may be caused by off-board faults in the CO switch or connections for which a Warning alarm is raised.

Before a maintenance test can be run on a port, the port must be idle. If an incoming call seizes a port that is being tested, the test will abort and the incoming call will proceed.

For transmission and signaling standard specification, refer to *Digital PBX Standards, RS4648*.

Ports Out-of-Service without Errors or Alarms

A common trouble on DID trunks that produces no errors or alarms occurs when the CO busies out (disconnects) the port. This situation occurs when the CO thinks there are problems with the DID port. In this case, no incoming calls will be possible through this port. This may result in complaints from outside callers trying unsuccessfully to call in. This problem can be diagnosed by listing measurements on lightly used trunks. If a particular port is detected as idle, a call to the CO will be necessary to get the connection back in service.

Error Log Entries and Test to Clear Values

Table 292: DID Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port <*address*> sh r 1**
1 *	Any	None	WARNING	OFF	
1 *	57476	None	WARNING	OFF	
1 *	57477	None	WARNING	OFF	
1 *	57483	None	WARNING	OFF	
15 *	Any	Port Audit Update (#36)			
18	0	**busyout trunk *grp/mbr***	WARNING	OFF	**release trunk *grp/mbr***
130 *		None	WARNING	ON	**test trunk *grp/mbr***
257 *	57472	None	WARNING	OFF	

Table 292: DID Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
257 *	57473	None	WARNING	OFF	
257 *	57474	None	WARNING	OFF	
257 *	57475	None	WARNING	OFF	
513 *	57392	None	MINOR WARNING[2]	OFF	
510 *	57393	None

1025		Looparound and Conference (#33)	MINOR WARNING[2]	ON	**test port <*address*> l r 3**
1281		NPE Crosstalk (#6)	MINOR WARNING[2]	ON	**test port <*address*> l r 3**
1537	Any	Port Diagnostic (#35)	MAJOR MINOR WARNING[2]	OFF	**test port <*address*> r 3**
1793 *	57489	None	None		

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

2 Major alarms may be downgraded to Warning alarms based on the value used in the set options command.

NOTE:
See also the preceding section on trunk problems without errors or alarms.

Error Additional Information:

Error Type 1; Aux Data - Any: This condition occurs when the tone detector times out waiting for digits. Change wink/immediate-start parameter to wink/immediate-start and rotary/tone-dial parameters.

1 Verify trunk administered wink/immediate-start parameter.

2 Test trunk using BUTT set.

3 Refer problem to CO.

Error Type 1; Aux Data - 57476: Rotary dial before wink — This condition occurs when the CO starts dialing before the PBX sends wink on a wink-start trunk.

1 Verify trunk administered wink/immediate-start parameter.

2 Refer problem to CO.

Error Type 1; Aux Data - 57477: Rotary dial too early — This condition occurs when the CO starts dialing too soon after seizure on an immediate-start trunk.

1 Verify trunk administered wink/immediate-start parameter.

2 Refer problem to CO.

Error Type 1; Aux Data - 57483: Rotary dial pulse during wink — This condition occurs when the CO sends rotary dial digits too soon after seizure on a wink-start trunk.

1 Verify trunk administered wink/immediate-start parameter.

2 Refer problem to CO.

Error Type 15: This is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors (if any).

Error Type 130: This error type indicates that the circuit pack or media module has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack or media module.

Error Type 257; Aux Data - 57472: Rotary dial pulse on-hook longer than 105 msec — Break between rotary pulses is too long.

1 Test trunk by performing an incoming test call.

2 Refer problem to CO.

Error Type 257; Aux Data - 57473: Rotary dial rate below 8 pulses/sec — More than 135 msec between two successive breaks.

1 Verify trunk administered interdigit-timing parameters.

2 Refer problem to CO.

Error Type 257; Aux Data - 57474: Rotary dial rate above 12 pulses/sec — Less than 75 msec between two successive breaks.

1 Verify trunk administered interdigit-timing parameters.

2 Refer problem to CO.

Error Type 257; Aux Data - 57475: Digit detection — CO is starting new rotary dial digit within 150 msec of previous digit.

1 Verify trunk administered interdigit timing parameters.

2 Refer problem to CO.

Error Type 513; Aux Data - 57392: Loop current active — CO not releasing trunk after PBX disconnect. Occurs when the PBX end drops first and the CO does not release the trunk within 4 minutes.

1 Verify the interface to the network with a hand telephone set. If calls are placed correctly, then refer problem to the CO.

2 If unable to place calls or this equipment is not available, check the status on port using the **status trunk** command. If active but not connected, disconnect bridging clips at the network interface. Check status on the trunk. If trunk went idle, then replace clips. If trunk is still active but unable to place calls, refer problem to the CO.

Error Type 513; Aux Data - 57393: Late CO trunk release — This event only occurs after the occurrence of Error Type 513. The CO released the trunk 4 minutes after the PBX dropped the call. This event decrements the severity (error count) of Error Type 513, or may mean the problem related to Error Type 513 has been fixed.

Verify that Error Type 513 does not occur again. Refer to Error 513.

Error Type 1793: Incomplete Dial timer expired. This error only applies to the TN459 and indicates a problem with incoming dialing stream. Refer the problem to the CO.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the *NPE Crosstalk* test for example, you may also clear errors generated from subsequent tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk test (#6) **S8300 / G700:** This test aborts with Error Code 1412.		X	ND
Port Diagnostic test (#35)	X	X	ND
Looparound and Conference Circuit test (#33) **S8300 / G700:** This test aborts with Error Code 1412.		X	ND
Port Audit Update test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

NOTE:
S8300 / G700: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot on the TDM bus and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 293: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources for this test. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Enter **display port <*address*>** to determine the station extension, attendant number, or trunk group/member number of the port. Enter **status station**, **status attendant**, or **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is active but the port is idle (no calls), check the Error Log for Error Type 513. The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of- service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. **1** Enter **display port <*address*>** to determine the station extension, attendant number, or trunk group/member number of the port. Enter **status station**, **status attendant**, or **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** Retry the command at 1-minute intervals up to 5 times.
S8300 / G700: 1412	ABORT	This test does not execute on a G700 media gateway.

Table 293: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources for this test. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	This test can fail due to off-board problems, including EXP-PN and EXP-INTF faults RMC-ENV faults (**S8700 IP**), TDM-BUS faults, and Tone Detectors/Tone Generators. Clear every off-board problem before replacing the board. A TDM-BUS problem is usually a faulty board or bent pins on the backplane. **1** Resolve any EXP-PN and EXP-INTF, RMC-ENV (**S8700 IP**), TDM-BUS, TONE-BD, and TONE-PT errors in the error log. **2** Retest the board. Replace the board if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and by examining station, trunk, or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). **1** Verify that the board's translations are correct. Translate the board if necessary. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*>** command. This should re-establish the linkage between the internal ID and the port.

2 of 2

Looparound and Conference Circuit Test (#33)

NOTE:
S8300 / G700: This test aborts with Error Code 1412.

This test checks the reflective and non-reflective loop-around and conference capabilities of a DID port circuit. The test that uses 404-, 1004-, and 2804-Hz tones is an on-board test only. Each tone is separately transmitted to and from the port (loop around within the port) and verified.

This test may fail due to noise induced by adjacent electric power lines. Resolve this problem with the local power company. To temporarily alleviate the alarm caused by the failure of this test, disable the test from the trunk administration `Test` field. This also disables the port diagnostic test.

Table 294: Test #33 Loop-Around and Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port. **1** Retry the command at 1-minute intervals up to 5 times.
3	ABORT	System resources required to run this test are not available. The seized tone detector did not respond. This abort code is usually associated with tone-clock (TONE-BD, TONE-PT, and TDM-CLK) resources. **1** Clear any tone errors in the error log. **2** Retry the command a 1-minute intervals up to 5 times. **3** If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Enter **display port <*address*>** to determine the station extension, attendant number, or trunk group/member number of the port. Use **status station**, **status attendant**, or **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is active but the port is idle (no calls), check the Error Log for Error Type 513. The port may be locked up. **3** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. **1** Enter **display port <*address*>** to determine the station extension, attendant number, or trunk group/member number of the port. Use **status station**, **status attendant**, or **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook), if the handset is plugged in and the port is not busied out. **2** Retry the command at 1-minute intervals up to 5 times.

Table 294: Test #33 Loop-Around and Conference Circuit Test

Error Code	Test Result	Description / Recommendation
1018	ABORT	Test disabled by administration. Verify that the `Maintenance Tests?` field on the ***Trunk Group*** form is set to **n**. To enable the test, issue the **change trunk-group <*x*>** command (**<*x*>** is the trunk group number). Then change the entry in the `Maintenance Tests?` field to **y**.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	System resources required to run this test are not available. This may be due to the port being seized. **1** This abort code is usually associated with tone-clock (TONE-BD, TONE-PT, and TDM-CLK) resources. Clear any tone errors in the error log. **2** Retry the command at 1-minute intervals up to 5 times.

2 of 4

Table 294: Test #33 Loop-Around and Conference Circuit Test

Error Code	Test Result	Description / Recommendation
3	FAIL	The nonreflective 1004-Hz tone test of the port failed. An echo was detected from the port. Poor-quality transmission was detected to or from the port. The problem may be off-board.
7		The conference capabilities of the port failed. Poor-quality transmission was detected to or from the port. The problem may be off-board.
129		The reflective 404-Hz tone test failed. Poor-quality transmission was detected to or from the port. The problem may be off-board.
131		The reflective 1004-Hz tone test failed. Poor-quality transmission was detected to or from the port. The problem may be off-board.
133		The reflective 2804-Hz tone test failed. Poor-quality transmission was detected to or from the port. The problem may be off-board. **CAUTION:** The port may still be operational, or the fault may be off-board (connections or CO). Off-board problems include incoming seizures or off-hook port seizures during the test and, perhaps, noise induced by adjacent electric power lines. The test may be disabled from trunk administration 'Test' field. This turns off all testing for that trunk group except for tests 6 and 36.

3 of 4

Table 294: Test #33 Loop-Around and Conference Circuit Test

Error Code	Test Result	Description / Recommendation
3 7 129 131 133 *(cont'd)*	FAIL *(cont'd)*	Proceed as follows unless power or tone problems are suspected (see following note). **1** To see if the problem is on-board, disconnect the port from the far end, and retry the test. Coordinate this with the CO, or do it after busy hours. **2** If the retry fails, replace the circuit pack. **3** If the retry passes and no troubles have been reported, disable the test in the trunk group administration. If the retry passes and troubles are reported, coordinate isolation with the CO. If the loop-around and conference circuit test fails for every port on a circuit pack, a -5V power problem is indicated. A power unit may be defective (CARR-POW (Carrier Power Supply)). If the test fails on more than 1 port, check for errors on the TONE-BD (Tone-Clock Circuit) or the TONE-PT (Tone Generator) MOs. **1** Rerun the test.
	PASS	DID Trunk Looparound and Conference test is successful. This port is functioning properly. **1** If users are reporting troubles, examine loop connections to the port and refer problem to the CO.
0	NO BOARD	The test could not relate the internal ID to the port (no board). **1** Verify that the board's translations are correct. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*>** command. This should establish the link between the internal ID and the port.

4 of 4

Port Diagnostic Test (#35)

This test checks a port's battery feed circuitry for on-/off-hook detection, battery shutdown, and battery reversal (wink) capabilities.

Table 295: Test #35 Port Diagnostic Test

Error Code	Test Result	Description / Recommendation
	ABORT	System resources required to run this test were not available. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. **1** Enter **display port <_address_>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is active but the port is idle (no calls), check the error log for Error Type 513. The port may be locked up. **3** If the port status is idle, busyout and release the trunk, and retry the command at 1-minute intervals up to 5 times. **4** If the test continues to abort, check for wiring errors toward the CO which may cause the trunk to lock up. **5** If the wiring is good and the test continues to abort, replace the circuit pack or media module.
1004	ABORT	The port was seized by a valid call during the test. **1** Enter **display port <_address_>** to determine the station extension, attendant number, or trunk group/member number of the port. Use the **status station**, **status attendant**, or **status trunk** command to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** Retry the command at 1-minute intervals up to 5 times.
1018	ABORT	Test disabled via administration. Verify that the `Maintenance Tests` field on the ***Trunk Group*** form is set to **n**. To enable the test, issue **change trunk-group <_x_>,** where **<_x_>** is the trunk group number. Change the entry in the `Maintenance Tests` field to **y**.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
61446	FAIL	Battery feed test failed. A loop current fault was detected. This is most probably an incoming CO-line problem. This failure code is only reported by the TN2139 Italian DID circuit pack. **1** Check the incoming CO-line for loop current. If none is detected refer the problem to the CO. **2** If the CO-line checks out OK, the failure must be on the DID port. Replace the circuit pack.

Table 295: Test #35 Port Diagnostic Test

Error Code	Test Result	Description / Recommendation
61456	FAIL	Battery feed test failed. An on-board problem was detected. This port is out-of-service. **1** Replace the circuit pack or media module.
61472	FAIL	Battery feed test failed. A problem with the incoming CO-line was detected. **1** Check the incoming CO-line for proper operation. If warranted, refer the problem to the CO. **2** If the CO-line is not at fault, the failure must be on the DID port. Replace the circuit pack or media module.
	PASS	Current flow was detected for this port. **1** User-reported troubles on this port should be investigated using other port tests and by examining connections. **2** Refer problem to the CO.
0	NO BOARD	The test could not relate the internal ID to the port (no board). **1** Verify that the board's translations are correct. Translate the board if necessary. **2** Issue the **busyout board <*address*>** command. **3** Issue the **reset board <*address*>** command. **4** Issue the **release board <*address*>** command. **5** Issue the **test board <*address*>** command. This should re-establish the linkage between the internal ID and the port.

2 of 2

Port Audit Update Test (#36)

This test sends updates of the DID port translation for every port on the circuit pack or media module that has been translated. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack or media module. No response message is expected from the circuit pack or media module once it receives translation updates. The port translation data includes:

- Wink or immediate start trunk
- Dial tone or rotary dialing trunk
- Rotary dialing inter-digit timing
- Network balance R/RC
- Disconnect timing

Table 296: Test #36 Port Audit Update Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1006	ABORT	The port is out of service, perhaps busied out. **1** Use **display port <_address_>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is out of service, wait until the port is in service and idle before testing. **2** If the port status is in service and idle, then retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run the test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	This test passed. Translation information was successfully updated on the circuit pack or media module. **1** If signaling troubles are reported (Error Types 1, 257, or 513), verify translation for this port. **2** Refer problem to the CO. **S8100**: If the trunk is busied out, the test does not run, but returns PASS. To verify that the trunk is in-service: **1** Enter **status-command** to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to Step 2. **2** Enter **release-trunk** command to put trunk back into in-service. **3** Retry the test command.
0	NO BOARD	The test could not relate the internal ID to the port. **1** Verify that the board's translations are correct. Translate the board if necessary. **2** Issue the **busyout board <_address_>** command. **3** Issue the **reset board <_address_>** command. **4** Issue the **release board <_address_>** command. **5** Issue the **test board <_address_>** command. This should re-establish the linkage between the internal ID and the port.

DIG-BD (Digital Line Circuit Pack)

S8700 / S8500 / S8300 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DIG-BD	MINOR	**test board *location* sh**	Digital Line circuit pack
DIG-BD	WARNING	**test board *location* sh**	Digital Line circuit pack

1 For information on specifying a ***location***, see Command Syntax on page 179.

See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 for circuit pack-level errors. See also DIG-LINE (Digital Line) on page 716 in this chapter for related line information.

NOTE:
The separate, but equivalent, MG-DCP MO can reside in slots 1–4 of a G700 media gateway. Refer to MG-DCP (Digital Line Media Module) on page 1254 for information about G700 MOs.

DIG-IP-STN (Digital IP Station)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIG-IP-STN	WARNING	**test station *extension***	Digital IP Station

The DIG-IP-STN MO represents Softphone and Avaya 46XX phones. Softphone has some DCP maintenance capability in the form of audits, updates, error log entries, and test to clear values. Avaya 46XX IP phones communicate to the switch via an IP LAN and emulate DCP signaling carried over TCP.

The IP phone is not attached to a port board. Insertion of the phone is driven by successful registration of the endpoint, not by board insertion. It is maintained via a set of explicit TCP/IP ping requests and errors reported by the User Manager software, which terminates the H.323 signaling portion of each endpoint. The MO follows standard maintenance methodology and supports **test**, **busyout**, **release** and **status** commands.

A registered extension has a port number or ID in the form of S*NNNNN*, where *N* is a digit from 0–9. This ID indicates that the extension is a virtual port and a station.

NOTE:
A port number or ID of SNNNNN does not necessarily indicate that the extension is registered. A registered extension retains the S*NNNNN* port number or ID, even if the extension later unregisters.

Maintenance for Softphone includes Error Log Entries and Test to Clear Values.

Table 297: DIG-IP-STN Digital IP Station Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any		**test station *extension***
1 (a)		Registration Status Inquiry (#1372)	WARNING	OFF	
18 (b)	0	**busyout port | station**	WARNING	OFF	**release port |station**
257 (c)		Signaling Path PING test (#1373)	WARNING	OFF	
(d)		Digital Terminal Lamp Update (#16)	WARNING	OFF	
(e)		Digital Terminal Audit Update (#17)	WARNING	OFF	
513 (f)	Any	Station Digital AUDIT test (#17)	WARNING	OFF	**test port | station**
1281 (g)	Any	Station Digital AUDIT test (#17)	WARNING	OFF	**test port | station**

Table 297: DIG-IP-STN Digital IP Station Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1537 (h)	4096 8		WARNING	OFF	**test port | station**
2305 (i)	Any	None			
2817 (j)		Station Hyperactivity			

Error Notes:

a **Error Type 1** — This error reports the registration status of the endpoint. If Communication Manager software claims the endpoint is registered and receives keep-alive handshakes from the endpoint, the test passes. If keep-alive handshaking has failed, the test fails. If the user has intentionally un-registered from the S8700 media server, the station is now basically an AWOH station and is no longer being maintained; no tests run for this station.

b **Error Type 18** — This error type is logged when the port/station is busied out by maintenance personnel. Make sure the port/station is released from busy via the **release port | station** command (IP terminal only).

c **Error Type 257** — This error tracks failures of the signaling path PING test. The test attempts to send a PING packet to the endpoint IP address, as reported during registration. The PING packet originates with the C-LAN board through which the endpoint is registered. If the PING response packet is received, the test passes. If the PING response packet times out, the test fails.

d This refreshes the lamp state of every lamp on a virtual DCP station. If successful, the update always passes. It can abort, but it never fails. This update (test number 16) is the same one used for existing DCP stations.

e This refreshes the ringer state on a virtual DCP station and queries the virtual station's switch-hook state. If successful, the update always passes. It can abort, but it never fails. This runs a subset of the entire audit update that runs for standard DCP sets.

f **Error Type 513** — This error type indicates that the terminal failed to respond to the ID Query request. This implies that there is something wrong with the terminal or the communication path. (IP terminal only).

g **Error Type 1281** — This error type indicates that the terminal is reporting a bad state of health (IP terminal only).

h **Error Type 1537** — This error type indicates that the link has gone down between the terminal and its gateway to the switch. This likely means that the terminal has unregistered (IP terminal only).

i **Error Type 2305** — This error indicates that there was an unsolicited Link Reset even though switch software believed the terminal to be functional and in service. This error can be ignored if no user complaints are received (IP terminal only).

j **Error Type 2817** — This error tracks failures of the port hyperactivity counter. If a port generates more than 50 uplink CCMS messages within 10 seconds, the port is taken out-of-service for 30 seconds. Even though the Softphone actually signals over a TCP/IP link, DCP CCMS messages received over the TCP link are counted as regular CCMS uplinks and can cause the station to be marked as hyperactive.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the Signaling Path PING test, for example, you can also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Registration Status Inquiry (#1372)	X	X	ND
Signaling Path PING Test (#1373)	X	X	ND
Digital Terminal Lamp Update Test (#16)	X	X	ND
Digital Terminal Audits Test (#17)		X	ND

1 D = Destructive; ND = Nondestructive

Registration Status Inquiry (#1372)

The Registration status inquiry reports the H.323 registration status of the endpoint. An endpoint must be registered and authenticated in order to receive service from the system.

Registration is initiated when the endpoint user attempts to login using the Avaya registration software application running on the endpoint PC. The user must provide a valid extension and security code. The registration messages are sent to the IP address of a C-LAN's Ethernet port.

A registered extension has a port number or ID that appears as SNNNNN, where N is a digit from 0–9 and is an indication that the port is virtual and a station.

Table 298: Test #1372 Registration Status Inquiry

Error Code	Test Result	Description / Recommendation
1, 2, 3	FAIL	The endpoint is not successfully registered. **1** Verify that the user is entering the: • Correct extension and security code • C-LAN's IP address **2** Verify that the extension has been enabled for IP softphone operation. **3** If many endpoints cannot register, investigate any errors of the C-LAN's Ethernet port. **4** Examine the Ethernet cabling from the endpoint PC to the Ethernet hub.
	PASS	The endpoint is successfully registered and continues to respond to registration handshaking.

Signaling Path PING Test (#1373)

This test is **non**destructive.

The test determines the local C-LAN through which the signaling originates and the endpoint's IP address. It then requests the local C-LAN to execute a PING on the endpoint's address. If the PING is successful, the test passes, if the PING is not successful, the test fails.

NOTE:
Multiple failures of this test can take the Digital IP Station out of service.

This test checks the circuitry involved in the data path of a peer-to-peer IP layer connection.

NOTE:
This nondestructive test runs due to in-line errors, during periodic and schedule maintenance, and on demand.

Table 299: Test #1373 Signaling Path PING Test

Error Code	Test Result	Description / Recommendation
2100	ABORT	Could not locate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times. **2** Escalate if the problem persists.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times. **2** Escalate if the problem persists.
1003	FAIL	Ping to the destination failed. **1** Retry the command at 1-minute intervals up to 3 times. **2** Investigate any errors of the C-LAN's Ethernet port.
1007	FAIL	The system could not PING the registered endpoint via the C-LAN. **1** Verify that at least one destination reachable through this port. PING this destination (**ping ip-address *xxx.xxx.xxx.xxx***). **2** If a PING to any destination is successful through this port, the link is up. **3** If PING to every destination fails, test the C-LAN port (**test port *UUCSSpp* short**), and follow repair procedures for Session Status test (#1286) failures. **4** If only this station cannot be pinged: • Make sure the PC is up. • Make sure the PC has a network connection (Ethernet or dial-up). • Check the Ethernet cabling.
	PASS	The system can successfully send IP packets to the registered endpoint from the C-LAN.

Digital Terminal Lamp Update (#16)

This test updates internal lamp states that can or cannot be shown on the actual PC graphical user interface. The lamp updates run only if the station is in-service. The status of the station is checked and the lamp updates are blocked from taking place if the station is not in the in-service state. This test does not affect the status of the Message Waiting lamp.

Table 300: Test #16 DIG-LINE Station Lamp Updates Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1	ABORT	This port could have been busied out by system technician. **1** Look in the Error Log for Error Type 18 (port busied out) for this port. If this error type is present, then release the port via **release station *extension*** and run the test again. **2** Make sure that the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
3	ABORT	Station could be in ready-for-service or out-of-service state. **1** Use **status station** to verify state of station. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port could be busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the station extension of the port. Use **status station** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	The message to light every station lamp was successfully sent to the port.

Digital Terminal Audits Test (#17)

This is a series of tests that are classified as audits. The media server sends messages to the softphone application or IP phone to perform the following tests. These audits run only if the station is in-service.

- Switchhook Inquiry test — This updates the media server's records according to the softphone switch-hook state.
- Ringer Update test — This updates the softphone's ringer state according to the media server's records.
- ID Request — This queries the station for its status. The terminal returns its configuration information and health information. The information is checked, and a PASS/ABORT result is provided. If the result is ABORT, an error is logged in the hardware error log (IP terminal only).

Table 301: Test #17 Station (Digital) Audits Test

Error Code	Test Result	Description / Recommendation
1	ABORT	Switchhook audit timed out.
2	ABORT	ID request fails, health bit returned from voice terminal is bad (IP Terminal only). **1** Make sure voice terminal is connected, and repeat test. **2** If test fails, replace the voice terminal, and repeat test.
4	ABORT	Internal system error **1** Resolve any outstanding circuit pack maintenance problems. **2** Retry the command at 1-minute intervals up to 5 times.
5	ABORT	Ringer update aborted due to station being in ready-for-service or out-of-service state.
6	ABORT	This port could have been busied out by system technician. **1** Look in the Error Log for Error Type 18 (port busied out) for this port. If this error is present, then release the port via **release station *extension***. **2** Make sure that the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required for this test are not available.
2000	ABORT	Response to the test was not received in the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	Station Audits passed. **1** If complaints persist, investigate by using other port tests, and by examining the station, wiring, and connections.

DIG-LINE (Digital Line)

S8700 / S8500 / S8300 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DIG-LINE	MINOR	**test port *location* l**	Digital Line
DIG-LINE	WARNING	**test port *location* sh**	Digital Line

1 For information on specifying a ***location***, see Command Syntax on page 179.

DIG-LINE monitors and tests ports on digital line circuit packs or digital line media modules and on hardware administered as a digital station on those ports. These include stations with only a digital phone and stations with a digital phone linked to a data module.

S8700 / S8500 / S8100

Standalone data modules, and data adaptors in standalone mode, are covered by the PDMODULE (Processor Data Module) TDMODULE (Trunk Data Module) MOs. Circuit pack-level maintenance is covered by DIG-BD (Digital Line Circuit Pack) on page 709, the strategy for which is described in XXX-BD (Common Port Circuit Pack/Media Module).

S8100

The following circuit packs support digital lines:

Table 302: Digital Line Circuit Packs

Code	Ports	Type	Companding	Endpoints
TN754	8	4-wire DCP	mu-law	7400 series digital voice terminals, attendant consoles, 510D personal terminals, MT515 BCTs, DCP data modules
TN754B	8	4-wire DCP	A-law/mu-law	
TN2181	16	2-wire IDCP	A-law/mu-law	
TN2224B/CP	24	2-wire IDCP	A-law/mu-law	
TN2136	8	2-Wire IDCP	A-law/mu-law	Data Adaptors (DA), Italtel Digital Telephone Models 1 and 2 (IDT1/2).
TN2181	16	2-wire IDCP	A-law/mu-law	
TN2224B/CP	24	2-wire IDCP	A-law/mu-law	

Each digital line port supports two 64 kbps information channels (primary and secondary) and one 8kbps signaling channel. Digital voice terminals always use the primary information channel. Thus only one voice terminal can be connected to each port. The secondary information channel can be used to connect a data terminal via a Digital Terminal Data Module (DTDM) or a Data Adaptor (DA). All other devices currently supported by Digital Line circuit packs communicate on the primary information channel. Figure 45, Digital Line Connectivity, on page 717 shows examples of digital line connectivity.

Only the TN754B or TN2136 circuit packs should be used in out-of-building applications. For important information pertaining to protection required for out-of-building digital voice terminals, refer to *Avaya™ Communication Manager, Avaya DEFINITY® Servers and Avaya™ S8100 Media Server Library, 555-233-823*.

It should be noted that TN2181 and TN2224B/CP support both modes as shown in Figure 45, Digital Line Connectivity, on page 717 and Figure 46, Digital Line Connections, on page 718.

Figure 45: Digital Line Connectivity

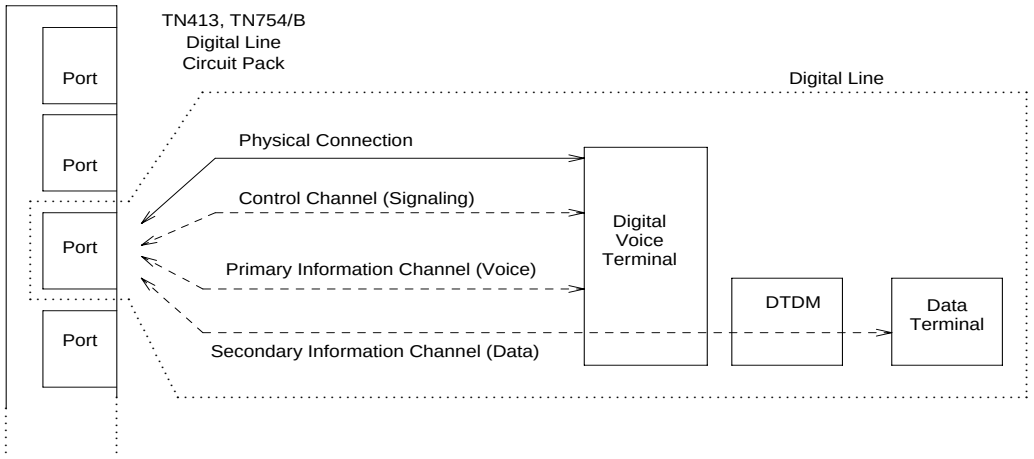

Figure 46: Digital Line Connections

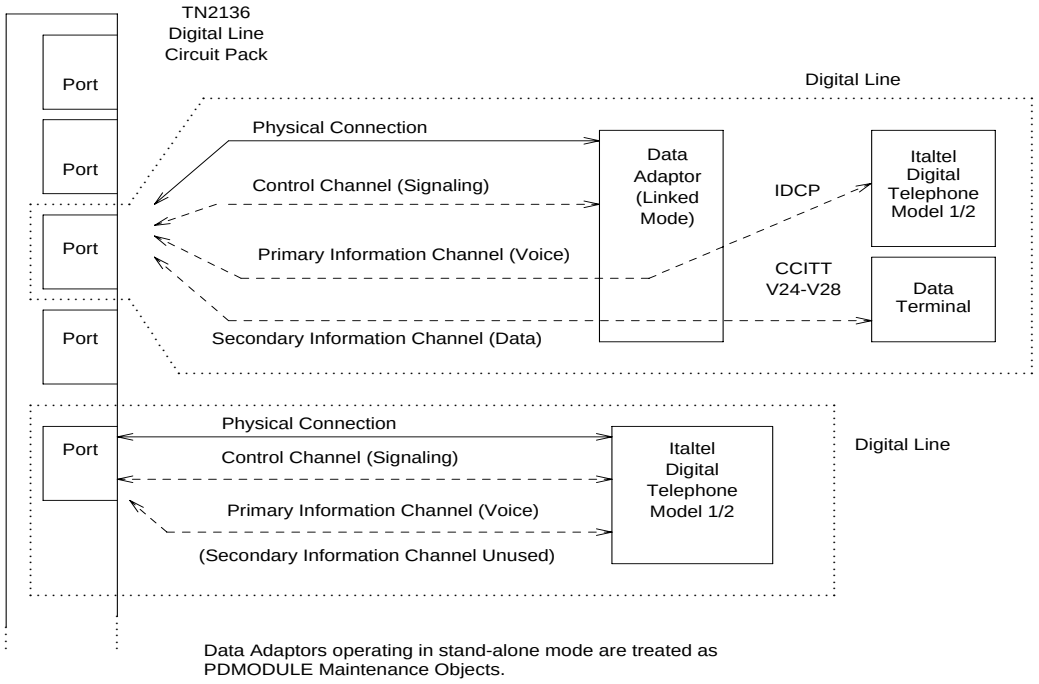

Only 2-wire Italtel Digital Telephone Models 1 and 2 (IDT1/2) or DAs can directly connect to a TN2136 circuit pack. Avaya DCP (4-wire) digital voice terminals and data modules can connect to these circuit packs via Italtel's 2/4-wire adapter. DAs can operate in either of two modes, and they are covered by different MOs:

DA Mode	Administered as:	Endpoint	MO
Standalone	PDM	Data endpoint only	PDMODULE
Linked	DTDM	IDT1/2 and optional data terminal	DIG-LINE

S8300 / G700

Media Gateway-level maintenance is covered by MG-DCP (Digital Line Media Module), the strategy for which is described in XXX-BD (Common Port Circuit Pack/Media Module).

NOTE:
Although the DIG-LINE MO is provided for a G700 media gateway, this MO only partially supports the G700's MM712 DCP media module.

Service States

Digital line maintenance interacts with digital line circuit pack (DIG-BD), or with digital line media module (MG-DCP) maintenance. The health of the digital-line circuit pack or media module can affect the results of DIG-LINE testing. Keep this in mind when investigating digital-line problems.

There are instances where it is important to know the service state of a station. The different service states that apply to digital-line stations are explained as follows:

Out-of-Service state	The port, and thus the station, have been removed from service. Busyout puts the port in the out-of-service state.
Ready-for-Service state	The port on the circuit pack or media module has been put into service, but the voice terminal has not yet established signaling communications with the port.
In-Service state	The voice terminal has established signaling communications with the port, and the system is ready to process calls to and from that station. A terminal in the ready-for-service state will progress to the in-service state if it is functioning normally. It can also be forced into the in-service state by going off-hook.

Downloading Terminal Parameters

The following information explains how maintenance software interacts with terminal parameter downloading.

For Systems Supporting Circuit Packs

Terminal Types:

The software can interact with the following terminal types:

- 84xx multibutton digital voice terminals (8403D01A, 8410B, 8410D02A, 8434D01A) with optional expansion module.
- 603A1 and 603D1 Callmaster terminals for telemarketing applications.
- 302B1 and 302C1 attendant console.

Circuit Packs:

- 8400x, 302B1 Terminals
  - TN754 (4-wire, mu-law)

    NOTE:
    Minimum usable vintage for 8410D and 8434D terminals - V11

  - TN413 (4-wire, A-law)
  - TN754B (4-wire, A-law/mu-law selectable)
  - TN2177 (2-wire, 16-port, A-law/mu-law selectable)

  - TN2181 (2-wire, 16-port, A-law/mu-law selectable)
  - TN2224 (2-wire, 24-port, A-law/mu-law selectable)
- 603A1/D1 Terminals
  - TN754 (4-wire, mu-law),
  - TN413 (4-wire, A-law)
  - TN754B (4-wire, A-law/mu-law selectable)

S8300 / G700

The MM712 Media Module supports 8410D and 8434D terminals (2-wire, 8-port, A-law/mu-law selectable).

Programmable Terminals

The following parameters are downloaded to programmable terminals.

Table 303: Parameters Downloadable to Programmable Terminals

Parameter	Scope	Terminal
International Flags (A-law/mu-law, Display Mode, DLI Voltage level)	System level	84xx, 603x, 302B1
Primary Levels (Transmission & Sidetone)	System level	84xx, 603x, 302B1
Adjunct Levels (Transmission & Sidetone)	System level	84xx
Handset Expander Option	System level	84xx
Administrable Options (Speakerphone & Mute Button)	Per-terminal	84xx
Administrable Softkeys	Per-terminal, System level	8410D, 8434D

Nonvolatile Memory

Nonvolatile memory stores downloadable parameters in programmable terminals. Once the terminal is downloaded, it is not be necessary to download it again, even if power is removed from the terminal. If nonvolatile memory fails with power still present, the terminal reverts to its default factory settings except for its A-law/mu-law companding settings which are stored in RAM. If power is removed after the nonvolatile memory fails, the terminal reverts to its factory default settings.

NOTE:
The mu-law companding mode is assigned as a default setting at the factory. For the United States, a programmable terminal can place calls even though it has not been downloaded from the system.

Download Actions

There are several different scenarios that cause a terminal to be downloaded. These can occur as part of background maintenance activity or on demand from the system access terminal or from a station.

For the following background actions, the terminal downloads automatically if a download retry flag for the terminal is set in software. This flag is set:

- At boot time when translation is loaded
- When translation that affects the parameters of a terminal is changed as part of system administration action
- When a port is inserted in software as a result of board insertion or translation change

Automatic Download Actions

This section describes download actions that occur automatically.

System Reboot/Restart

A global download action is started when periodic maintenance tests start after a system reboot/restart regardless of whether the parameters have been downloaded previously.

Periodic Tests

If the download flag is still set when periodic tests are run on a terminal, a download action will occur. This operation is required in case a terminal could not be downloaded previously either:

- Because it was off-hook at the time the system first booted
- Because the terminal was off-hook at the time translation associated with downloadable parameters was changed

NOTE:
It may take more than 1 hour for periodic tests to reach the terminal that needs to be downloaded.

Terminal Administration

A downloadable terminal is automatically downloaded when translation changes associated with downloadable parameters are made as part of system administration. As shown in Table 303, Parameters Downloadable to Programmable Terminals, on page 720, these changes can be for a specified terminal or may be system-wide. If the change is for system-level parameter, a background global update request is made to download all programmable terminals.

This global update may take more than an hour for a system with several thousand programmable terminals.

Port Insertion

Whenever maintenance software initiates a request to place a port into service, a terminal download action is started on that terminal if that terminal is programmable. This port insertion action occurs under the following circumstances:

- A digital line circuit pack or media module that is physically inserted into the system has ports currently administered for programmable terminals.

If more than 20 port insertion requests are received within a few seconds, a global download request is started up as a background task. This action updates all programmable terminals instead of just those being inserted. This is done to avoid system overload for situations where there is massive board insertion. This could occur when connectivity to an PN is re-established after that PN was down.

- A station port is added to the system by **add station** or **change station**.
- A TTI port is activated.

Audits

As part of periodic maintenance, the hardware status audit test queries programmable terminals to determine what levels and/or options are being used. If the reported values are not equal to the administered values, the system will initiate a terminal download action. This audit does NOT check the parameters used for softkeys.

Activation of TTI

A terminal is downloaded automatically when it is activated using the Terminal Translation Initialization feature. Therefore, no special user actions are required for TTI.

NOTE:
Plugging the station cord into a terminal does not automatically cause the terminal to be downloaded. If this terminal has factory defaults or if the terminal has been previously downloaded with parameters different from those desired, use one of the following demand download actions to download the terminal.

Demand Download Actions

Busyout/Release Command

A maintenance demand busyout/release request for a station will cause the terminal to be downloaded regardless of its previous download status.

Feature Access Code

A Refresh Terminal Parameters Feature Access Code can be used to request a terminal download action. When this code is followed by a pound sign (#), the programmable parameters for the current terminal are downloaded when the terminal goes on hook. When this code is followed by an extension, the programmable parameters for the specified station are downloaded.

This Refresh Terminal Parameters Feature Access Code is assigned on the second page of the **Feature Access Codes** form.

A confirmation is returned if the download request is accepted. A busy tone is returned if the request is made from a different station when the target station is off-hook.

NOTE:
For systems supporting circuit packs, the first three green call appearance LEDs on the 84xx 603x terminal will be turned on for three seconds if the station was successfully downloaded as a result of an entry of a Refresh Terminal Parameters Facility Access Code. This is not true for the 302B1 terminal.

There is no visible display on a station for the other background or demand download actions. However, as follows, the **Status Station** and **Status Attendant** forms can be used to check the download status of a specified terminal.

Status of Parameter Downloads

The **Status Station** and **Status Attendant** forms display the current download status of individual 84xx terminals (**S8300** / **G700**: MM712 Media Module), and 84xx, 603, and 301B1 terminals (**S8700** / **S8500** / **S8100**) in the `Download Status` field. The possible download states are:

Status	Explanation
Complete	Terminal successfully downloaded sometime in the past.
Pending	System waiting to download the terminal. This may require the execution of a background periodic test which could take more than an hour. A demand download as previously described may also be used to initiate an immediate download.
Not Applicable	Not a programmable terminal.

Possible reasons for a terminal not being downloaded include:

- Terminal is off-hook.
- Terminal detected a bad checksum.
- Terminal detected a bad or missing EEPROM (refer to hardware error log).
- Terminal is busy programming data from a previous PROGRAM message.
- Terminal is in the Programming Disabled state.
- Terminal is in the Local Program Options mode.
- Terminal is disconnected or out of service (use **status station** command).

Error Log Entries and Test to Clear Values

Table 304: Digital Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port <*address*> sh r 1**
1 *	40987, 1 – 20	None	WARNING	OFF

3840 *	40965, 40989	None			
3841 *	41029	None			

2 of 2

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to the test's description and follow the recommended procedures.

2 Major alarms may be downgraded to Warning alarms based on the value used in the set options command.

Error Additional Information:

Error Type 1; Aux Data - 40987: This Error Type with Aux Data 40987 could indicate a noisy port or link. This is an off-board problem detected by the port circuit. Check for defective wiring, a defective voice terminal, or move voice terminal closer to the switch (in terms of feet of wire from the jack to the switch). If the problem still exists, replace the circuit pack. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.

Error Type 1; Aux Data - 1 to 20: This Error Type and Aux Data 1 to 20 will occur when at least 15 off-board problems have been detected with the link to the terminal. When an error with the link is detected, an on-board counter is incremented.

The user could experience a noisy port or link. This is an off-board problem detected by the port circuit. Check for defective wiring, a defective voice terminal, or move voice terminal closer to the switch (in terms of feet of wire from the jack to the switch). If the problem still exists, replace the circuit pack. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.

Error Type 18: This error type is logged when the port in question is busied out by maintenance personnel. Make sure port is released from busyout via the **release port** <***address***> command.

Error Type 130: This error type indicates that the circuit pack or media module has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the circuit pack or media module.

Error Type 257: Problems transmitting to the voice terminal. This problem can be caused by defective wiring. Defective wiring can cause varying degrees of problems on different types of sets. Sets such as the 7410 appear to be more susceptible to wiring problems than other sets. This is usually an on-board problem and can be ignored if no user complaints are received.

Error Type 767: This is an in-line event that produces this error type when a favorable response is received from running the Digital Line Electronic Power Feed test (#11). No *craft* action is necessary. This alarm will be resolved with the passing of time.

Error Type 769: With Aux Data 40963, this error type is a result of an unfavorable response to the Electronic Power Feed/ Positive Temperature Coefficient test (#11). With Aux Data 40988, this error type indicates that the EPF/PTC circuit has been turned off due to an overcurrent condition.

S8700 / **S8500** / **S8100**

For TN754 vintage 13 or earlier and TN413, the EPF circuit senses an overcurrent condition at the voice terminal. Check for a short in the wiring, a damaged jack, an incorrect type of voice terminal, or a defective voice terminal.

For TN754 vintage 14 or later, TN754B and TN2136, the PTC will open if there is a short on the power line for 1/2 second or longer. The voice terminal is probably not operating properly. Unplug the voice terminal for 30 seconds and then plug it back in. If the voice terminal still does not operate, then check for a short in the wiring, a damaged jack, an incorrect type of voice terminal, or a defective voice terminal.

Once the problem has been resolved, it may take up to 1 hour for the alarm to clear due to "leaky bucket" strategy. If the problem cannot be resolved by one of the previous steps, then replace the circuit pack or media module.

Error Type 1026: There is a problem with the voice terminal EEPROM. When the voice terminal is repaired the alarm will be resolved with the passing of time.

Error Type 1537: An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice terminal. This can be ignored if no user complaints are received. Otherwise, make sure the voice terminal is connected, check for defective wiring, check for a defective voice terminal, and move voice terminal to a jack that is closer to the switch (in terms of feet of wiring between the jack and the switch). If the problem still exists, replace the circuit pack or media module. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.

Error Type 2304: Internal system error. No action is necessary.

Error Type 2305; Aux Data - 32770: This indicates that the station went off-hook while it was in the ready-for-service state. Use the **status station** command to determine the state of the station. The off-hook should have moved the station to ready-for-service. No *craft* action is necessary.

Error Type 2305; Aux Data - 40967: An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice terminal. This can be ignored if no user complaints are received. Otherwise, make sure the voice terminal is connected, check for defective wiring, check for a defective voice terminal, and move voice terminal to a jack that is closer to the switch (in terms of feet of wiring between the jack and the switch). If the problem still exists, replace the circuit pack or media module. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.

Error Type 2817: Port Level Hyperactivity. Fifty or more CCMS uplink messages were received from the port within ten seconds. The user is taken out of service for a short interval of time (default 30 seconds).

Error Type 3585: This error type indicates that an attempt to execute a firmware download of a DCP terminal has failed. The DCP terminal must be replaced before the firmware download can be executed successfully. Replace the DCP terminal and re-execute the firmware download.

Error Type 3840; Aux Data - 40965: No terminal is connected to the Digital Line board. No maintenance action is required.

Error Type 3840; Aux Data - 40989: An uplink message has been logged indicating that the Electric Power Feed (EPF) is on with no load on it. No action is necessary.

Error Type 3841: The circuit pack's or media module's message buffer is full. This may be caused by having many display phones with heavy traffic connected to the circuit pack or media module. No action is necessary.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the Voice and Control Channel Local Loop-Around test, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Digital Terminal Remote Loop-around Test (#1201) **S8300 / G700:** This test aborts with Error Code 1412.		X	D
Voice and Control Channel Local Loop-Around Test (#13) **S8300 / G700:** This test aborts with Error Code 1412.		X	ND
Digital Line NPE Crosstalk Test (#9) **S8300 / G700:** This test aborts with Error Code 1412.		X	ND
Digital Line Electronic Power Feed Test (#11)		X	ND
DIG-LINE Station Lamp Updates Test (#16)	X	X	ND
Station (Digital) Audits Test (#17)	X	X	ND

1 D = Destructive; ND = Nondestructive

Digital Terminal Remote Loop-around Test (#1201)

NOTE:
On the G700/ G350, this test aborts with Error Code 1412.

This test checks the connection between the media server and the digital terminal and the ability of the terminal and the associated port to send and receive data. This test is based on procedure 622 to isolate digital terminal problems.

A request is presented to the terminal to go into loop-back mode. Data is sent to the terminal and when received back, checked for consistency. This test is run as a part of the test long procedure. It is not included in any error recovery strategy and generates no error log entries or alarms. To begin the test, Maintenance will ask Communication Manager to make the associated endpoint and port Maintenance Busy. This test succeeds if the endpoint is “idle”. If the reserve request fails then the test aborts. If the request succeeds then the media server sends a message to loop around both information channels for the digital terminal.

1. First the primary information (voice information channel 1 or l1) channel loop-back test is run. The test is performed by sending a digital count from the Tone-Clock circuit on the primary information channel time slot and receiving the same digital count with a general purpose tone detector.
2. If the primary information channel test is successful, the loop-around test for the secondary information (data, Information Channel 2 or I2) channel is then performed. This is the same test as the primary information channel’s loop around test and is performed only if a DTDM is administered. This is also the case for a linked DA.

Only one value (Pass, Fail, or Abort) is generated as a result of the two tests run. If any test fails aborts, the sequence is stopped. Upon completion of this test, the associated endpoint and port are moved back into the previous service state.

Table 305: Test #1201 Digital Terminal Remote Loop-around Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use the **display port <*address*>** command to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run this test are not available. **1** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. **1** ***Enter display port <address>*** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before resetting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The installed circuit pack does not support this operation.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 media gateway.

Table 305: Test #1201 Digital Terminal Remote Loop-around Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	System resources required to run this test are not available. **1** Make sure terminal is connected and repeat test. **2** If test fails replace terminal and repeat test. **3** Retry the command at 1-minute intervals up to 5 times.
14	FAIL	The primary channel is not operating properly. User impact may range from noticing nothing to not being able to use the port. **1** Check the results of "Voice and Control Channel Local Loop test (#13). **2** If that test fails, suspect the Digital Line circuit pack. If that test passes then replace the terminal. **3** If both tests fail, and component replacement does not change the results, then: **a** Run circuit pack tests to check the tone generator circuit and the Tone Detector circuit using **test board <*address*>**. **b** Resolve any problems that are detected on the Tone Generator circuit or Tone Detector circuit.
1015	ABORT	The station is not busied out (**busyout station**).
16	FAIL	The secondary channel is not operating properly. User impact may range from noticing nothing to not being able to use this terminal. **1** Check the results of Voice and Control Channel Local Loop test (#13). **2** If that test fails, suspect the Digital Line circuit pack. If that test passes then replace the terminal. **3** If both test fail, and component replacement does not change the results, then: **a** Run circuit pack tests to check the tone generator circuit and the Tone Detector circuit pack using **test board <*address*>**. **b** Resolve any problems that are detected on the Tone Generator circuit or Tone Detector circuit.
	PASS	Voice and Control Channel Local Loop test passed. All channels are transmitting properly. **1** To verify that this is not an intermittent problem, repeat this test up to ten times. **2** If complaints persist (noisy connections for voice. corrupted data transfer for data), examine the station, connections, and wiring.

Digital Line NPE Crosstalk Test (#9)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

S8100: Crosstalk testing is performed on both the primary information channel (voice) and the secondary information channel (data) associated with each digital station port. If this test fails on either channel, the station and the DTDM are taken out-of-service.

Table 306: Test #9 Digital Line NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1	ABORT	During testing of the primary information channel, system resources were not available. Also, the port may have been busy during the test. **1** Enter **display port <*address*>** to determine the station extension of the port. Use **status station** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
2	ABORT	During testing of DTDM, system resources may not have been available. Also, the port may have been busy during the test. **1** Check if port is being used. If possible, disconnect by toggling disconnect button on DTDM. Retry command after 1 minute. **WARNING:** This action will drop the call in progress.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Enter **display port <*address*>** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 306: Test #9 Digital Line NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out of service due to TDM-BUS errors. **1** If system has no TDM-BUS errors and is not handling heavy traffic. Retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Enter **display port <*address*>** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out.
1020	ABORT	Test disabled by background testing. Use **status station** command to determine when station is available for testing.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 media gateway.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
1, 2	FAIL	The Network Processing Element (NPE) of the tested port was transmitting in error. Error code 1 = Crosstalk test failed on the primary channel. Error code 2 = Crosstalk test failed on the secondary channel. **1** Replace circuit pack.
	PASS	The port is correctly using its allocated time slots. **1** To verify that this is not an intermittent problem, repeat this test up to 10 times. **2** If complaints persist, examine the station, connections, and wiring.

Digital Line Electronic Power Feed/Positive Temperature Coefficient/PPF Test (#11)

S8700 / S8500 / S8100

For TN413, and TN754 vintage 13 or earlier, this is an Electronic Power Feed (EPF) restoral test. In this test, the processor requests that the EPF be turned on for a given port, and an attempt is made to turn on the power supply to the station. If no current is drawn, the station is probably not connected. If an overcurrent condition is sensed, there may be a short in the loop. A message is returned reporting that either the EPF was successfully turned on, or that an overcurrent condition was sensed. This test is repeated again 5 seconds later.

For TN754 vintage 14 or later, TN754B and TN2136 this is a Positive Temperature Coefficient (PTC) restoral test. In this test, the processor requests that the PTC be turned on for a given port, and an attempt is made to turn on the power supply to the station. If an overcurrent condition is sensed, there is probably a short on the power line that causing the PTC to open and disconnect the voice terminal. Since the PTC does not have self-restoral capability, the voice terminal must be manually unplugged for 30 seconds and then plugged back in to restore the PTC. A message is returned reporting that either the PTC was successfully turned on successfully with no problem or an overcurrent condition was sensed. This test is repeated again 5 seconds later.

TN2181 and TN2224 boards carry a Protected Power Feed (PPF) relays, one for each port. Therefore this will be a Protected Power Feed restoral test. The test procedure and its response is same as that of EPF. One of differences between EFP and PPF is that, if the port goes into a overcurrent state, PPF does not report this change of state because it is a transient state which will not last more than 50ms. If the over current persists the power will be shut off automatically and an EPF_off_overcurrent message is sent uplink.

S8300 / G700

MM711 Media Modules provide power to the terminals. Therefore this will be an EPF restore test. The test procedure and its response is same as that of EPF. If the over current persists the power will be shut off automatically and an EPF_off_overcurrent message is sent uplink.

Table 307: Test #11 Digital Line Electronic Power Feed Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Enter **display port <*address*>** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	Electronic Power Feed test passed. The message to turn on the power to the station was successfully sent to the port. **1** Although, except for the previous **Internal system error**, this test never actually returns a FAIL result, it will log an error indicating the real results of the test. Check the Error Log for any entries with Error Types 767 or 769 after the test completes. **2** If Error Type 767 appears in the Error Log, this indicates that the test sensed no problems with the power to the station. To verify that the station is powered up correctly, run a self-test on the station and check that every feature button is operating. **3** If Error Type 769 appears in the Error Log, this indicates some problem with the power to the station. Check for a short in the wiring, a damaged jack, a defective voice terminal, or an incorrect type of terminal.

Voice and Control Channel Local Loop Test (#13)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

These tests check the information and control channels between the media server and the Digital Line port circuit. The media server sends a message to loop around both the port's information and control channels.

1 First, the primary information (voice) channel's loop-back test is run.

The test is performed by sending a digital count from the Tone-Clock circuit on the primary information channel's time slot and receiving the same digital count with a General-Purpose Tone Detector.

2 While the primary information channel is still looped around, the Control Channel Loop-Around test is run.

This test consists of sending four different transparent patterns to the on-board microprocessor, receiving them back, and comparing them.

3 Then, the secondary information (data) channel's loop-around test is run.

This is the same test as the primary information channel's loop-around test and is performed only if a DTDM is administered.

4 Next, a Conference test is run for the primary information channel.

This is the same test as Conference test (#6).

This 4-test sequence only generates one value (Pass, Fail, or Abort). If any test fails or aborts, the sequence stops.

Table 308: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out of service due to TDM-BUS errors. **1** If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 308: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Use **display port <*address*>** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** Retry the command at 1-minute intervals up to 5 times.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Rerun the test at 1-minute intervals up to 5 times.
7	FAIL	Conference test failed on primary channel. In some cases, users may not notice disruption in service. In extreme cases, conferencing feature may not work at all.
14	FAIL	The primary voice channel is not transmitting properly. User impact may range from noticing nothing to not being able to use this port.
15	FAIL	The control channel between the processor and digital circuit pack is not transmitting properly. User impact may range from noticing nothing to not being able to use the port. Could also be disruptive to other users.
16	FAIL	The secondary voice channel is not transmitting properly. User impact may range from noticing nothing to not being able to use this port. **1** Run circuit pack tests to check the Tone Generator circuit and the Tone Detector circuit using **test board <*address*>**. **2** Resolve any problems that are detected on the Tone Generator circuit or Tone Detector circuit. **3** If the Tone Generator and Tone Detector circuit are functioning properly, and the test still fails, replace the Digital Line circuit pack.
	PASS	Voice and Control Channel Local Loop test passed. All channels are transmitting properly. **1** To be sure that this is not an intermittent problem, repeat this test up to 10 times. **2** If complaints persist (noisy connections for voice, corrupted data for data transfer), examine the station, connections, and wiring.

DIG-LINE Station Lamp Updates Test (#16)

This test lights all lamps on the terminal as specified. The lamp updates will run only if the station is in-service. The status of the station is checked and the lamp updates are blocked from taking place if the station is not in the in-service state. This test does not affect the status of the Message Waiting lamp.

Table 309: Test #16 DIG-LINE Station Lamp Updates Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1	ABORT	This port may have been busied out by system technician. **1** Look in the Error Log for Error Type 18 (port busied out) for this port. If this error type is present, then release the port via the **release station <*extension*>** command and run the test again. **2** Make sure that the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
3	ABORT	Station may be in ready-for-service or out-of-service state. **1** Use **status station** command to verify state of station. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port <*address*>** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1392	ABORT	This port is currently a TTI port and the test will not execute on it. **1** Verify that the port is a TTI port using either the **display port** command (the display shows that the port is a TTI port) or the **list config** command (the display shows a "`t`" for the port). **2** If either **list config** or **display port** indicates that the port is *not* a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct, and no action is necessary.

1 of 2

Table 309: Test #16 DIG-LINE Station Lamp Updates Test

Error Code	Test Result	Description / Recommendation
	FAIL	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	The message to light every station lamp was sent successfully to the port. **1** Observe the station lamps being lit when running the test. If all lamps do not light, the other Digital Line test results may indicate related problems that do not allow the lamps to light. **2** Investigate by using other Digital Line port tests, and by examining the station, wiring, and connections.

2 of 2

Digital Station Audits Test (#17)

This is a series of six tests that are classified as audits. The media server sends messages to the on-board microprocessor to perform the following tests. These audits run only if the station is in-service.

- Switchhook Inquiry test — This is an update of the media server's records according to the circuit pack's or media module's records. This inquiry is sent all the way to the voice terminal.
- Bad Scan Inquiry test — An up-link message is sent containing a count generated by certain events relating to the link's conditions. This can be an indication of communications problems between the media server and Digital Port circuit pack or media module.
- ID Request test — A request is made to the station for its status. The station sends its configuration information and health information back. This information is checked and a pass/fail result is provided.
- Ringer Update test — This updates the digital telephone ringer state according to the processor records.
- DTMF Administration Update test — This is a message to the digital station to refresh the default value that causes the station to send touch- tones only in the primary information channel. This value is set initially when the station is put in-service and every time the station's state changes from other states to in-service state.

S8700 / S8500 / S8100

- EPF/PTC Inquiry test — For a TN413 or a TN754 (vintage 13 or earlier), an up-link status message of the Electronic Power Feed (EPF) is sent. Possible conditions are: EPF-on-ok, EPF-off, and EPF-no-load.

  For TN754 (vintage 14 or later), TN754B, TN2136, TN2181, or TN2224, an up-link status of the PTC is sent. Possible conditions are: PTC-on-ok, PTC-off, and PTC-no- load.

S8300 / G700

- For the MM712 Media Module, the status of the EPF is sent uplink. Possible conditions are: EPF-on-ok, EPF-off, and EPF-no-load.

Table 310: Test #17 Station (Digital) Audits Test

Error Code	Test Result	Description / Recommendation
1	ABORT	Switchhook audit timed out.
2	ABORT	ID request fails, health bit returned from voice terminal is bad. **1** Make sure voice terminal is connected, and repeat the test. **2** If test fails, replace voice terminal and repeat test.
3	ABORT	**S8700** / **S8500** / **S8100**: The EPF/PTC has detected an overcurrent condition. **1** For a TN754 vintage 13 or earlier Digital Line circuit pack, use **test <*address*> long**. • If Test #11 passes, then the EPF/PTC condition was cleared. Rerun the Short Test Sequence. • If Test #11 does not pass, follow the repair procedures described for Test #11. **S8700** / **S8500** / **S8100** / **S8300**: **2** Look for Error Type 769 logged against DIG-LINE and follow the procedures in the additional information. If any additional problems are found, rerun the test.
4	ABORT	Internal system error **1** Resolve any outstanding circuit pack or media module maintenance problems. **2** Retry the command at 1-minute intervals up to 5 times.
5	ABORT	Ringer update aborted due to station being in ready-for-service or out-of-service state.
6	ABORT	This port may have been busied out by system technician. **1** Look in the Error Log for Error Type 18 (port busied out) for this port. If this error is present, the release the port via **release station <*extension*>.** **2** Make sure that the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required for this test are not available.

1 of 2

Table 310: Test #17 Station (Digital) Audits Test

Error Code	Test Result	Description / Recommendation
1392	ABORT	This port is currently a TTI port and the test will not execute on it. **1** Verify that the port is a TTI port using either the **display port** command (the display shows that the port is a TTI port) or the **list config** command (the display shows a "`t`" for the port). **2** If either **list config** or **display port** indicate that the port is *not* a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct, and no action is necessary.
2000	ABORT	Response to the test was not received in the allowable time period.
	FAIL	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	Station Audits passed. This Digital Port circuit pack or media module is functioning properly. **1** If complaints persist, investigate by using other port tests, and by examining the station, wiring, and connections.

2 of 2

DIOD-BD (DIOD Trunk Circuit Pack)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DIOD-BD	MINOR	**test port *location* s**	DIOD circuit pack

1 For information on specifying a ***location***, see Command Syntax on page 179.

See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

DIOD-DS1 (DS1 DIOD Trunk)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIOD-DS1	MAJOR[1]	**test trunk *group# member#* l**	DS1 DIOD Trunk
DIOD-DS1	MINOR	**test trunk *group# member#* l**	DS1 DIOD Trunk
DIOD-DS1	WARNING	**test trunk *group# member#***	DS1 DIOD Trunk

1 A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed. For more information, see the **set options** command.

NOTE:
Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end. Refer to *Administrator's Guide for Avaya™ Communication Manager, 555-233-506* for information on how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

A DS1 DIOD trunk provides a link for digitized voice or data communications between the system and a central office switch. There are two types of DS1 interfaces:

- 24 DS0 channels on a 1.544-Mbps link
- 31 DS0 channels + 1 framing channel on a 2.048-Mbps link

NOTE:
32-channel mode is supported only on TN464 circuit packs and beginning with G3r V2 systems.

The DS1-DIOD MO monitors and maintains a DIOD trunk port on a TN464 UDS1 Interface circuit pack. See UDS1-BD (UDS1 Interface Circuit Pack) on page 1950 for more information about this circuit pack. The DS1 circuit pack supports low-level CO trunk signaling interfaces for both ground-start and loop-start trunks. This maintenance strategy covers the in-line errors log, initialization tests, periodic tests, scheduled tests, demand tests, and alarm resolution and escalation.

Three trunk service states are specified by DS1 DIOD trunk maintenance:

out-of-service	The trunk is in a deactivated state and cannot be used for either incoming or outgoing calls.
in-service	The trunk is in an activated state and can be used for both incoming and outgoing calls.
disconnect (ready-for-service)	The trunk is in an activated state but can only be used for an incoming call.

2817 (m)	52992				
3840 (n)		Port Audit and Update test (#36)			

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

2 This alarm is only raised when the System-Parameter Country screen has the `Base Tone Generator` field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.

3 Major alarms may be downgraded to Warning alarms based on the value used in the set options command.

Error Notes:

a **Error Type 1** — Aux Data 57408 — No tip ground is detected on an outgoing call.

Aux Data 57476 – Rotary Dial before Wink.
Aux Data 57477 – Rotary Dial pulse too early.
Aux Data 57485 – Wink too short for a valid signal.
Aux Data 57487 – PBX could not get "loop close" signal.

The DS1 Interface circuit pack detected a hardware fault. These errors will cause the Dial Tone test (#314) to run and are only considered a problem if the Dial Tone test fails (in which case Error Type 1025 will also show up). In this case, the trunk may be put in the ready-for-service state (shown as "disconnected" by the status command), which allows only incoming calls. Run the Dial Tone test (#314) and follow the procedures.

b **Error Type 15** — This is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors (if any).

c **Error Type 18** — System Technician has busied out the trunk to the out-of-service state. No calls can be made on this trunk except Facility Access Test Calls. For details, see Facility test calls in *Maintenance Procedures (555-245-103)*.

d **Error Type 130** — Indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

e **Error Type 257** — The DS1 Interface circuit pack detects a hardware fault. Aux Data 57392 indicates no external release on PBX disconnect.

f **Error Type 513** — The DS1 Interface circuit pack detects a hardware fault. Aux Data 57393 indicates belated external release on PBX disconnect.

g **Error Type 769** — The DS1 Interface circuit pack detects a hardware fault. Aux Data 57484indicates fault is detected on tip/ring.

h The DS1Interface circuit pack detects a hardware fault, and the `Aux Data` field contains the following error type: 51200, port is unavailable. Run the Dial Tone test (#314), and follow procedures.

i **Error Type 1793** — DS1 Interface circuit pack is out-of-service. Look for UDS1-BD errors in the Hardware Error Log if the port is on a TN464 UDS1 board. See UDS1-BD (UDS1 Interface Circuit Pack) on page 1950 for details.

j **Error Type 2049** — With the following Aux Data:

Aux Data 57473 – Rotary dial rate below 8 pulses per second.
Aux Data 57474 – Rotary dial rate above 12 pulses per second.
Aux Data 57475 – Rotary Dial interdigit time is too short.

The DS1 interface circuit pack detects a hardware error on the DS1 DIOD trunk. The trunk cannot communicate with the far end because it is unable to interpret digits sent from the far-end switch. Check with the far-end switch or Operating Company for proper trunk connection.

k **Error Type 2305** — Recorder message, trunk could not be seized (Aux Data 50944). Run Test #314, and follow the outlined procedures.

l **Error Type 2562** — Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from Communication Manager and is generated when a second attempt (retry) to seize an outgoing trunk fails.

m **Error Type 2817** — Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a 2-way trunk from both the near and far ends. Attempt to place the call again. If the error persists, execute the Dial Tone Seizure test (#314), and follow those procedures.

n **Error Type 3840** — Port Audit and Update test (#36) failed due to an internal system error. Enter the **status trunk** command to verify the status of the trunk. If the trunk is out-of-service, then enter the **release trunk** command to put it back into in-service. Retry the test command.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order they are presented in the following table. By clearing error codes associated with the *NPE Crosstalk* test, for example, you may also clear errors generated from other tests in the testing sequence.

Table 312: System Technician-Demanded Tests: DS1-BD

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk test (#6)		X	ND
Conference Circuit test (#7)		X	ND
DS1 Dial Tone test (#314)	X	X	ND
Port Audit and Update test (#36)	X	X	ND

1 D = Destructive, ND = Nondestructive

NPE Crosstalk Test (#6)

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 313: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. **1** Use **status station** or **status trunk** to determine when the port is available for testing. **2** Retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 313: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Use **status health** to determine if the system is experiencing heavy traffic. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Issue **list measurements tone-receiver** to see information about the system's tone receivers. **2** Resolve any TTR-LEV errors. **3** Resolve any TONE-PT errors. **4** If neither condition exists, retry the test at 1-minute intervals up to 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use **status trunk** to determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times.
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. **1** Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the already existing error.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
2053	ABORT	At least one of the following errors is found on the DS1 circuit pack: • 1281 – Loss of signal • 1793 – Blue alarm • 2049 – Red alarm • 2305 – Yellow alarm • 1537 – Hyperactivity Look for the previous error types in the Hardware Error Log, and follow the procedures given in the DS1-BD (DS1 Interface Circuit Pack) or UDS1-BD (UDS1 Interface Circuit Pack) maintenance documentation for the listed error types.

2 of 3

Table 313: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	FAIL	The NPE of the tested port was found to be transmitting in error. This will cause noisy and unreliable connections. **1** Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and examining station, trunk, or external wiring.

3 of 3

Conference Circuit Test (#7)

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a tone detector port. If the level of the tone is within a certain range, the test passes.

Table 314: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. **1** Use **status station** or **status trunk** to determine when the port is available for testing.
1004	ABORT	The port has been seized by a user for a valid call. **1** Use **status station** or **status trunk** to determine when the port is available for testing. **2** Retry the command at 1-minute intervals up to 5 times.
1018	ABORT	Test disabled by administration. This only applies to analog stations. **1** To enable test, use **change station *extension*** and set the `Test` field to **y**. Use the command.
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. **1** Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 314: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
2053	ABORT	At least one of the following errors is found on the DS1 circuit pack: • 1281 – Loss of signal • 1793 – Blue alarm • 2049 – Red alarm • 2305 – Yellow alarm • 1537 – Hyperactivity Look for the previous error types in the Hardware Error Log, and follow the procedures given in the DS1-BD (DS1 Interface Circuit Pack) or UDS1-BD (UDS1 Interface Circuit Pack) maintenance documentation for the listed error types.
	FAIL	The NPE of the tested port did not conference the tones correctly. This will cause noisy and unreliable connections. **1** Replace the circuit pack.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.

2 of 2

Port Audit and Update Test (#36)

This test sends port-level translation data from switch processor to the DS1 Interface circuit pack to assure that a trunk's translations are correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of trunk kept in the DS1 Interface circuit pack and in switch software.

Table 315: Test #36 Port Audit and Update Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.

1 of 2

Table 315: Test #36 Port Audit and Update Test

Error Code	Test Result	Description / Recommendation
	FAIL	Test failed due to internal system error. **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack and switch software are consistent. If the trunk is busied out, the test will not run but will return PASS. To verify that the trunk is in-service: **1** Enter **status trunk** to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to step 2. **2** Enter **release trunk** to put the trunk back into in-service. **3** Retry the test command.

2 of 2

DS1 CO Dial Tone Seizure Test (#314)

DS1 CO Dial Tone Seizure test checks the trunk's signaling capability provided by the DS1 Interface circuit pack. The maintenance software initiates the test by sending a "seizure" message to the DS1 Interface circuit pack and expects an "active" reply from the DS1 interface circuit pack. If the "active" message is received, then the test passes. If no message is received and the timer expires, the test is aborted. If the DS1 Interface circuit pack sends a "reorder" message back to maintenance software, then the test fails.

This test cannot be run on a trunk in any of the following conditions:

- The trunk direction is administered as an incoming only trunk.
- The trunk has been seized by a normal trunk call.
- The trunk is administered with maintenance test disabled.

Table 316: Test #314 DS1 CO Dial Tone Seizure Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. Use **status trunk** to determine when the port is available for testing.
1004	ABORT	The port has been seized by a user for a valid call. Use **status trunk** to determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 316: Test #314 DS1 CO Dial Tone Seizure Test

Error Code	Test Result	Description / Recommendation
1005	ABORT	Test failed due to incompatible configuration administered in trunk group screen. **1** Look at the ***Trunk Group*** administration screen and see if the trunk is incoming only, port 24 on a DS1 Interface with common control-channel signaling, or an automatic CO type such as FX. Under any of these conditions this is a normal abort.
1018	ABORT	Test has been disabled via administration. **1** Verify that the `Maintenance Tests` field on the ***Trunk Group*** screen is set to **n**. To enable the test, issue **change trunk-group *x*** where "***x***" equals the number of the trunk group to be tested, and change the `Maintenance Tests` field on the screen to **y**. **2** Repeat the test.
1020	ABORT	The DS1 Interface circuit pack is out-of-service. **1** Look for UDS1-BD errors in the Hardware Error Log. If present, see UDS1-BD (UDS1 Interface Circuit Pack) on page 1950. **2** Retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2053	ABORT	At least one of the following errors is found on the DS1 circuit pack: • 1281 – Loss of signal • 1793 – Blue alarm • 2049 – Red alarm • 2305 – Yellow alarm • 1537 – Hyperactivity Look for the previous error types in the Hardware Error Log, and follow the procedures given in the DS1-BD (DS1 Interface Circuit Pack) or UDS1-BD (UDS1 Interface Circuit Pack) maintenance documentation for the listed error types.
	FAIL	The trunk cannot be seized for an outgoing call. **1** Verify that the `Trunk Type` field on the trunk administration screen screen matches the trunk type administered on far-end switch. **2** Look for UDS1-BD errors in Hardware Error Log. If present, see UDS1-BD (UDS1 Interface Circuit Pack) on page 1950. **3** Retry the test at 1-minute intervals up to 5 times.
	PASS	The trunk can be seized for an outgoing call.

DIOD-TRK (DIOD Trunk)

S8700 / S8500 / S8300 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DIOD-TRK	MAJOR[2]	**test port *location***	DIOD Trunk
DIOD-TRK	MINOR	**test port *location***	DIOD Trunk
DIOD-TRK	WARNING	**test port *location***	DIOD Trunk

1 For information on specifying a ***location***, see Command Syntax on page 179.

2 A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

NOTE:
Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end. Refer to *Administrator's Guide for Avaya™ Communication Manager, 555-233-506*, for information about how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

Direct inward and outward dial (DIOD) trunks are 2-wire analog lines to the CO which support the following services:

- Both incoming and outgoing CO calls
- DID trunk
- DID trunk and 1-way outgoing DIOD

TN429 DIOD trunk circuit packs and MM711 Analog Media Modules provide eight ports for loop-start CO trunks and serve as an interface between the 2-wire analog CO line and the 4-wire TDM bus on the switch.

NOTE:
S8300 / **G700**: Although the DIOD-TRK MO is provided for a G700 Media Gateway, this MO only partially supports the MM711 Analog Media Module.

Loop Start Operation

Idle State: Tip = ground, Ring = CO Battery

Outgoing Call

1 PBX Off-Hook (Seize Message): Closes the Tip-Ring Loop CO Response: DC loop current + Dial tone

2 PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current CO Response: CO goes to idle state (see Note)

Incoming Call

1 CO Applies Ringing Voltage PBX Response: Detect ringing current

2 PBX Off-Hook (Answer Message): Close loop CO Response: Trip ringing, provide loop current

3 PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current CO Response: CO goes to idle state (see Note)

Direct Inward Dialing (DID)

1 CO Applies Ringing Voltage

PBX Response: Detect ringing current and close loop

CO Response: Send DTMF digits

PBX Response: Acknowledge of Number dialed and open loop

2 PBX Off-Hook (Answer Message): Close loop CO Response: Trip ringing, provide loop current

3 PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current CO Response: CO goes to idle state (see Note)

NOTE:
CO does not normally provide an On-Hook (Disconnect) signal.

Error Log Entries and Test to Clear Values

Table 317: DIOD Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port sh**
15 *	any	Port Audit Update test (#36)			
18	0	**busyout trunk *grp/mbr***	WARNING		**release trunk**
769 *	57392	None	MAJOR MINOR WARNING[2]	ON	
1537		Dial Tone test (#0)	MAJOR MINOR WARNING[2]	ON	**test port long r 2**
1793		Looparound and Conference test (#33)	MAJOR MINOR WARNING[2]	ON	**test port long r 3**
2049		NPE Cross Talk test (#6)	MAJOR MINOR WARNING[2]	ON	**test port long r 3**
2561 *	57345	None			
2817 *	57393	None			

1 of 2

Table 317: DIOD Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3073 *	57376	None			
3585 *	57424	None			

2 of 2

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

2 Major alarms on this MO may be downgraded to Warning alarms based on the value used in the set options command. If the Minor alarm is not downgraded by the **set-options** values, the Minor alarm is upgraded to a Major alarm if 75 percent of the trunks in this trunk group are alarmed.

Error Additional Information:

Error Type 15: This is a software audit error and does not indicate any hardware malfunction. Run the short test sequence, and investigate associated errors.

Error Type 769; Aux Data - 57392: These are in-line errors that have no specific test associated with them. The CO is not releasing after the call is dropped from the PBX end. After several occurrences, an off-board warning alarm is generated. Refer the problem to the CO.

Error Type 2561; Aux Data - 57345: Single polarity ringing current — This is an in-line error that has no specific test associated with it. This error results from abnormal ringing current, but does not prevent the incoming call from being accepted. This error code is logged for information purposes only and does not cause additional testing to occur. One cause could be that the reverse current detector associated with the port is failing. (Will not be detected by any tests.) The other cause could be that normal current is not detected. In this case, neither incoming nor outgoing calls can be completed, and the Dial Tone test (#0) also fails. Check for other errors.

Error Type 2817; Aux Data - 57393: This is an in-line error that has no specific test associated with it. CO released the trunk at least four minutes after the PBX dropped the call. This error code is log only and causes no other testing to occur. No alarm is generated. Check for other errors.

Error Type 3073; Aux Data - 57376: This is an in-line error that has no specific test associated with it. No loop current on incoming call. The incoming destination has already answered and no loop current has been detected. If this is a hard fault, the Dial Tone test (#0) and every outgoing call should also fail. Check for other errors.

Error Type 3585; Aux Data - 57424: This is an in-line error that has no specific test associated with it. No loop current on outgoing call. This error occurs on an attempt to seize a loop or ground-start trunk for an outgoing call. An error occurs if loop current is not detected or the caller hangs up before it is detected. Busyout the affected port, and run a Long test. If the Dial Tone test (#0) passes, ignore this error. Release the port.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order they are presented in the following table. By clearing error codes associated with the *NPE Crosstalk* test, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk test (#6) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
Dial Tone test (#0) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
Looparound and Conference test (#33) **S8300** / **G700**: This test aborts with Error Code 1412.		X	ND
Audit Update test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

Dial Tone Test (#0)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

This test attempts to seize a port and checks for the return of a dial tone.

Table 318: Test #0 Dial Tone Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port <address>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. Wait until the port is idle before retesting. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.

Table 318: Test #0 Dial Tone Test

Error Code	Test Result	Description / Recommendation
1004	ABORT	The port has been seized by a user for a valid call. Use **status trunk** to determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times.
1018	ABORT	Test has been disabled via administration. **1** The `Maintenance Tests` field must be **y** on the ***Trunk Group*** form for this test to run. Use **change trunk-group** <***grp#***> to access the form. Then change the entry in the `Maintenance Tests?` field on the form to **y**.
1005	ABORT	Trunk has been administered as incoming-only; or DID trunk group type; dial tone can only be obtained on outgoing trunks. This is a normal condition.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	Trunk was seized, but dial tone could not be detected. **1** Check for errors on TONE-BD or TONE-PT. Clear any errors and repeat test. **2** If error has still not cleared, refer problem to CO.
2002	FAIL	Seizure portion of test failed due to hardware problem. Fault is usually caused by a disconnected trunk. **1** Check trunk wiring to ensure good connection; repeat test if wiring correction made. **2** Locate another identical CO trunk and swap its wiring with one under test. Repeat test on both trunks and determine whether problem follows trunk or remains at original port. If problem follows trunk, refer problem to CO. If problem remains at port, replace the circuit pack and repeat test.
1009	PASS	Detected tone was not pure dial tone. No action required.
	PASS	Trunk was seized, and dial tone was detected. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.

2 of 2

NPE Crosstalk Test (#6)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 319: Test #6 NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Enter **display port <address>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before testing. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the test at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. **1** Enter **display port <address>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is in use, wait until it is idle before retesting.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 Media Gateway.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. **1** Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.

Looparound and Conference Circuit Test (#33)

NOTE:
S8300 / **G700**: This test aborts with Error Code 1412.

This test checks the reflective loop and conference abilities of a CO port circuit. The test uses 404-, 1004-, and 2804-Hz tones. Each tone is transmitted separately through the loop and checked.

Table 320: Test #33 Looparound and Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate system resources to run this test.
7	ABORT	Conference Circuit test aborted.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Enter **display port <address>** to determine the trunk group/member number of the port. Use **status trunk** to determine the service state of the port. If the port is unavailable, wait until it is idle before testing. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use **status trunk** to determine when the port is available for testing. **1** Retry the command at 1-minute intervals up to 5 times.
S8300 / **G700**: 1412	ABORT	This test does not execute on a G700 Media Gateway.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
7	FAIL	**1** Check for errors on TONE-BD or TONE-PT. **2** If the Reflective Looparound test fails for every port on a circuit pack, a -5V power problem is indicated. **S8700** / **S8500** / **S8100**: If a TN736 or TN752 power unit circuit pack is present, check the circuit pack for a red LED. If the red LED is on, then replace the power unit circuit pack. If neither the TN736 nor the TN752 Power Unit circuit pack is present, then the OLS631DB AC power unit may be defective. The system may contain a TN736 or TN752 power unit circuit pack *or* an OLS631DB AC power unit, *but not both*. See the RMC-ENV MO (**S8700 IP**), or the CARR-POW MO (**S8700 MC**). **3** Rerun the test. **4** If the test fails again, replace the circuit pack.
	PASS	CO Trunk Looparound and Conference test is successful. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.

Port Audit Update Test (#36)

This test sends updates of the CO port translation for every translated port on the circuit pack or media module. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack or media module. No response message is expected from the circuit pack or media module once it receives translation updates. The port translation data includes: ground or loop start trunk, tone or rotary dialing trunk, rotary dialing inter-digit timing, network balance R/RC, and disconnect timing.

Table 321: Test #36 Port Audit Update Test

Error Code	Test Result	Description / Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run the test.
	FAIL	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	This test passed. Translation information was successfully updated on the circuit pack or media module. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring. If the trunk is busied out, the test does not run, but returns PASS. To verify that the trunk is in-service: **1** Enter **status trunk** to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to step 2. **2** Enter **release trunk** to put trunk back into in-service. **3** Retry the test command.

DLY-MTCE (MO-DAILY)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
DLY-MTCE	MINOR	NONE	DLY-MTCE
DLY-MTCE	MAJOR	NONE	DLY-MTCE

The DLY-MTCE MO monitors daily translation saves. If a translation save times out or fails to run, an error is logged against this MO.

If Save Fails	Then System Raises
Three times in a row	MINOR Alarm
Seven times in a row	MAJOR Alarm

Daily Maintenance Interference

Every action used in Communication Manager SAT administration commands is listed in the following table. The table also indicates the command actions that, while active, interfere with daily maintenance. They are the **add**, **change**, **duplicate**, **remove**, and **set** commands. Customer administrators frequently use these commands while performing routine administration of the system.

Table 322: Communication Manager SAT Command Actions

Likely to Disrupt	Less Likely to Disrupt	
add	backup	ping
change	busyout	recycle
duplicate	clear	release
remove	display	reset
set	enable	restore
	format	resume
	get	save
	list	status
	mark	test
	monitor	upgrade
	netstat	

Other command actions can also interfere with daily maintenance when certain qualifiers are used in the commands, or under certain circumstances. For example, certain "test" commands, when used with the modifier "continuously", could potentially interfere with daily maintenance. However, such command

actions are not typically used by customer administrators doing routine administration, and are less likely to disrupt daily maintenance routines than are the **add**, **change**, **duplicate**, **remove**, and **set** command actions.

Incomplete Command Time-Out

A time-out feature exists on the Maintenance-Related System Parameters screen. Use **change system parameters maintenance** to access the screen. The time-out feature improves the operation of daily maintenance by allowing maintenance routines to run that might otherwise not run. It also helps to prevent the loss of translations that were not saved with a **save translation**, and were also not saved because daily maintenance was prevented from running prior to the system reset. Highlights of the feature include:

- Options for blank, 1, 2, 3, 4, 5, or 6 hours (the default is 2 hours)
- The blank option indicates that the feature is not active
- Only commands that block the running of daily maintenance (add, change, duplicate, remove, and set) are affected
- All logins will time-out if any of these commands are active for the prescribed time (except for the “blank” option)
- The feature applies to all logins, regardless of type (init, dadmin, craft, inads) or permissions granted to the specific login ID of an administration or maintenance user
- The corresponding “time-out” entry is appended to the list history log

The `Command Time-out` field can be viewed by customer administrators. A craft, init, dadmin, or inads login is required to change the option for the field. Maintenance-Related System Parameters (change system-parameters maintenance) shows the Maintenance-related System Parameters screen for Communication Manager. Command Time-out Entry on the LIST HISTORY screen shows an example of the LIST HISTORY screen with the “time-out” entry. The final line indicates that **change system-parameters maintenance** was being executed when the time-out period of 2 hours expired.

DS1-BD (DS1 Interface Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DS1-BD	MAJOR	**test board *location* sh**	DS1 Interface circuit pack
DS1-BD	MINOR	**test board *location* l**	DS1 Interface circuit pack
DS1-BD	WARNING	**test board *location* sh**	DS1 Interface circuit pack

1 For information on specifying a ***location***, see Command Syntax on page 179.

The DS1 Interface circuit pack provides an interface to an external DS1 facility and supports 24 DS0 channels carried on a 1.544-Mbps DS1 link. These DS0 channels can be administered as either trunks to other switches or lines to off-premises stations. The TN464C (or higher-suffixed) Universal DS1 Interface also supports a 32-channel interface on a 2.048-Mbps link. The functions and maintenance strategy for the TN464 circuit packs are covered under a separate MO, UDS1-BD (UDS1 Interface Circuit Pack) on page 1950.

DS1-BD maintenance logs in-line errors reported by the DS1 Interface circuit pack, runs tests for error diagnosis and recovery, and raises and clears alarms. The following table shows the capabilities of each DS1 circuit pack. The TN722 and TN722B are not supported on G3r V1 or later systems.

Circuit Pack Code	24-Channel	32-Channel	Tie Trunk Signaling	CO Trunk Signaling	DID Trunk Signaling	OPS Line Signaling
TN722/B	X		X			
TN767/B/C/D/E	X		X	X	X	X
TN464C/D/E/F	X	X	X	X	X	X (24-chl only)
TN2313	X	X	X	X	X	X

ISDN-PRI Trunk signaling (for example, Q.921, Q.931) requires a TN464D and is handled by system software. The TN464 is covered in UDS1-BD (UDS1 Interface Circuit Pack) on page 1950.

Each trunk and line have their own maintenance strategies. However, they all depend on the health of the DS1 Interface circuit pack. See the following sections for details: TIE-DS1 (DS1 Tie Trunk) on page 1864, CO-DS1 (DS1 CO Trunk) on page 623, DID-DS1 (Direct Inward Dial Trunk) on page 684, OPS-LINE (DS1 Off-Premises Station Line) on page 1361, ISDN-TRK (DS1 ISDN Trunk) on page 1141, and ISDN-PLK (ISDN-PRI Signaling Link Port) on page 1121. Signaling over the DS1 link must be synchronized between the transmitting and receiving ends to ensure error-free communication. See SYNC (Port-Network Synchronization) on page 1751 for details.

Combined with a TN767E circuit pack, Avaya's 120A1 Integrated CSU module becomes an enhanced CSU. The 120A1 CSU, combined with new switch software and the functionality provided by a TN767E's hardware and firmware, provides functionality equivalent to an external stand-alone Avaya

ESF T1 CSU. The 120A1 CSU connects to the TN767E circuit pack on the I/O connector panel behind the port carrier, and thus becomes an integrated part of the system. Throughout this document, the term 120A1 means a 120A1 (or later-suffixed) CSU.

The 120A1 CSU (**S8100**: and the TN767E) is for use in the United States of America with 1.544-Mbps DS1 service. For more information about the 120A1 CSU module see *DEFINITY® Communications System Generic 1, Generic 2 and Generic 3 V1 and 2 – Integrated Channel Service Unit (CSU) Module Installation and Operation, 555-230-193*.

A TN767E and a 120A1 integrated CSU support on-demand loop-back tests assisting fault detection between the:

- TN767E circuit pack and the integrated CSU
- Integrated CSU and an optional customer-premises loop-back jack
- Integrated CSU and a remote CSU.

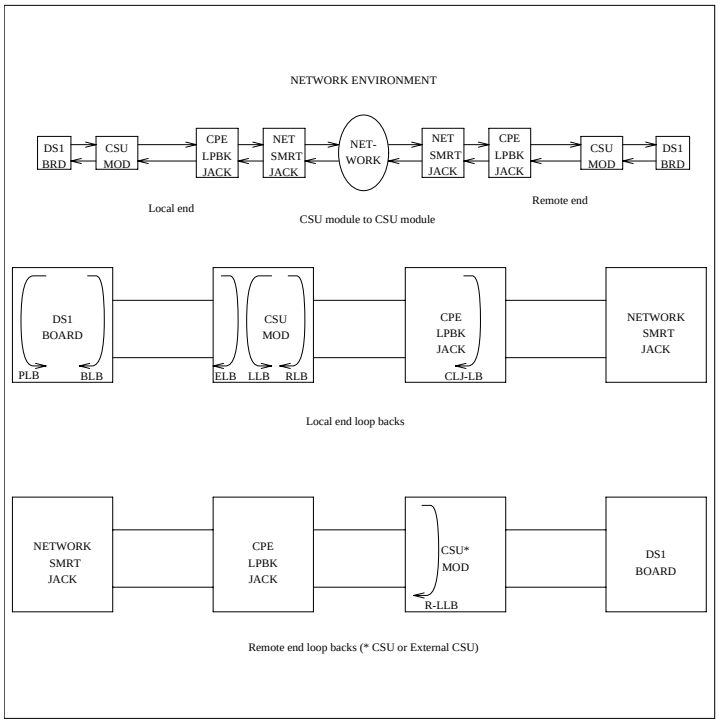
These loop-back tests are explained in detail later in this DS1-BD section, but Figure 49, High-Level Overview Of Loop-Back Points, on page 762 gives a high-level overview of the loop-back points.

The following list of acronym definitions are for Figure 49, High-Level Overview Of Loop-Back Points, on page 762:

- PLB = Payload Loopback
- BLB = Board Loopback
- ELB = Equipment Loopback
- LLB = Line Loopback
- RLB = Repeater Loopback
- CLJ = Loop-Back Jack Loopback
- R-LLB = Remote Line Loopback
- SMRT = Smart Jack
- LPBK = Loopback

For more information about DS1 interfaces, refer to the DEFINITY® Communications System Generic 2.2 and Generic 3 V2 DS1/CEPT1/ISDN-PRI Reference, 555-025-107.

Figure 49: High-Level Overview Of Loop-Back Points



Error Log Entries and Test to Clear Values

3 of 3

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to the test's description and follow the recommended procedures.

Error Notes:

a This error indicates that the circuit pack has stopped functioning or is not completely administered. The alarm is logged about 15 minutes after the circuit pack has been removed or 11 minutes after the SAKI test (#53) fails.

To be completely administered, a DS1 circuit pack must meet all 3 of the following conditions:

1 Have an entry in the circuit plan field in **change circuit-packs**

2 Be administered using **add ds1** ***UUCSS***

3 Be physically inserted in the correct slot

If the circuit pack has an entry in the circuit plan and either of the other two conditions are *not* met, a MINOR alarm is logged. To resolve the error, either:

1. Make sure all conditions for administration are met and that a functioning DS1 circuit pack is inserted in the correct slot.
2. Completely remove the DS1-BD from the system using the following steps:
   a. Remove any administered DS1 trunks or access endpoints associated with the circuit pack from their trunk groups.
   b. Execute **remove ds1 *UUCSS*** and **change circuit-packs *UU***.

If all the administration conditions are met for this circuit pack and the red LED is still on, follow the instructions in LED alarms without Alarm Log entry or with Error Type 1 on page 27.

b The DS1 Interface circuit pack has been busied out by a **busyout board** UUCSS command.

c The DS1-BD circuit pack is not completely administered. A completely administered DS1-BD circuit pack should have an entry in the circuit plan via **change circuit-packs**, should have been administered via **add ds1 *UUCSS***, and should have been inserted into the correct port slot.

d The circuit pack in the slot does not match the type administered to that position. Either replace the circuit pack with one of the type administered, or use **change circuit-packs** to re-administer the slot. This error may also indicate that the 24/32-channel selection on the DS1 administration screen does not match the configuration of the circuit pack.

e This error is associated with the Common Port circuit pack maintenance test. See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 for details.

f The DS1 Interface circuit pack has detected a transient hardware problem (for example, external RAM failure, internal RAM failure, internal ROM failure, or instruction set failure). This error will disappear when no faults are detected for 30 minutes. The value in the `Aux Data` field indicates the type of hardware problem. However, when this error is reported with Aux Data in the range of 4352 to 4358, it indicates the circuit pack has reported a hardware failure. This problem should be escalated.

g The DS1 Interface circuit pack has detected a transient hardware logic error (for example, program logic inconsistency). This error will disappear when no faults are detected for 100 minutes. The value in `Aux Data` field indicates the type of hardware problem.

h CSU module or T1 sync splitter missing. The `Near-End CSU Type` field on the **add ds1** screen has been administered as `integrated`, but the 120A1 CSU or T1 sync splitter is not physically connected (or is improperly connected) to the TN767E board behind the port carrier.

If using the 120A1 CSU or T1 sync splitter, plug (or replug) the CSU or T1 sync splitter into the TN767E circuit pack's connector on the I/O connector panel on back of the carrier. Otherwise, change the `Near-End CSU Type` field using the **change ds1** screen to `other`.

If this error remains after plugging the 120A1 CSU or T1 sync splitter into the board's connector, there could be a problem with the I/O connector panel.

i CSU module/T1 sync splitter not expected. The 120A1 CSU or T1 sync splitter is physically connected to the TN767E board behind the port carrier, but the `Near-End CSU Type` field on the **add ds1** screen has not been administered as `integrated`.

If the 120A1 CSU or T1 sync splitter is to be used, use the **change ds1** command to change the `Near-End CSU Type` field to `integrated`. Otherwise, physically remove the 120A1 CSU or T1 sync splitter from the back of the port carrier.

j DS1 configuration error. Attempting to use a 120A1 CSU with a TN767E circuit pack that is configured for 32-channel (2.048-Mbps) operation. This CSU only works with a DS1 board configured for 24-channel (1.544-Mbps) operation in the United States of America.

k DS1 circuit pack suffix incorrect for CSU or T1 sync splitter. The `Near-End CSU Type` field on the **add ds1** screen has been administered as `integrated` but the DS1 circuit pack is not a TN767E (or higher-suffixed) DS1 board.

If the 120A1 CSU or T1 sync splitter is to be used, remove the circuit pack and replace it with a TN767E (or higher-suffixed) board. Otherwise, use the **change ds1** command to change the `Near-End CSU Type` field to `other`.

l BLB failure. This error occurs when the DS1 Board Loopback (BLB) demand test fails. Repeat the test using the following commands: **busyout board *UUCSS***, **test ds1-loop *UUCSS* ds1/csu-loop-back jack-tests**, **release board *UUCSS***. If the BLB test continues to fail, then the TN767E circuit pack needs to be replaced.

m ELB failure. This error occurs when the Integrated CSU (I-CSU) Module Equipment Loopback (ELB) test fails. This test is executed during I-CSU/T1 sync splitter power-up/reset (i.e., the TN767E board is physically inserted and the CSU module/T1 sync splitter is already installed) or when the CSU module/T1 sync splitter is plugged on to an already initialized DS1 board. The ELB test is also executed as part of the command **test ds1-loop *UUCSS* ds1/csu-loopback-tests**.

Attempt to clear the alarm via the following commands: **busyout board *UUCSS***, **test ds1-loop *UUCSS* ds1/csu-loopback-tests**, and **release board *UUCSS***. If the ELB test continues to fail, then either the TN767E board, the CSU module, the T1 sync splitter, or the I/O cable between the backplane and the CSU module/T1 sync splitter (or any combination thereof) has failed. Escalate this problem.

n RLB failure. This error occurs when the Integrated CSU (I-CSU) Module Repeater Loopback (RLB) test fails. This test is executed during I-CSU/T1 sync splitter power-up/reset (i.e., the TN767E board is physically inserted and the CSU module/T1 sync splitter is already installed) or when the CSU module/T1 sync splitter is plugged on to an already initialized DS1 board. The RLB test is also executed as part of the command **test ds1-loop *UUCSS* ds1/csu-loopback-tests**.

Attempt to clear the alarm via the following commands: **busyout board *UUCSS***, **test ds1-loop *UUCSS* ds1/csu-loopback-tests**, and **release board *UUCSS***. If the RLB test continues to fail, then the CSU module/T1 sync splitter needs to be replaced.

o CPE loop-back jack deactivation error. This error occurs when the TN767E circuit pack could not deactivate a CPE loop-back jack loop-back.

Attempt to clear the alarm via the following commands: **busyout board *UUCSS***, **test ds1-loop *UUCSS* end-loopback/span-test**, and **release board *UUCSS***. If the attempt to deactivate the CPE loop-back jack loop back continues to fail, other steps must be taken to deactivate the loop back.

p Far CSU Loopback deactivation error. This error occurs when the TN767E circuit pack could not deactivate a far-end CSU loop back on power-up/reset or upon software request.

Attempt to clear the alarm via the following commands: **busyout board *UUCSS***, **test ds1-loop *UUCSS* end-loop back/span-test**, **release board *UUCSS***. If the attempt to deactivate the Far CSU loop back continues to fail, then escalate the problem.

q The hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:

1 The common circuit pack-level tests such as Test #51 and/or Test #220 are aborting with error code 2000.

2 The tests run on the ports of this circuit pack are returning NO BOARD.

3 A busyout/release of the circuit pack has no affect on test results.

4 A **list configuration** command shows that the circuit pack and ports are properly installed.

The circuit pack is isolated from the system and all trunks of this circuit pack are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 Interface circuit pack is restored to normal operation. All trunks of the DS1 Interface circuit pack are then returned to the in-service state. If the error recurs after 15 minutes, then escalate this problem.

r For later releases of G3V4 and beyond, only error 3073 will show that this board is receiving Slips and the AUX data shows the last Slip count that was reported.

s For later releases of G3V4 and beyond, only error 3329 will show that this board is receiving misframes and the AUX data shows the last misframe count that was reported.

t This error is not service-affecting and can be ignored.

u Error 3900 is used to give status information about a CPE Loopback Jack test. The value in the `Aux Data` field indicates the status of the loop-back test.

1 — Test is currently running.

2 — Test failed because loop back could not be activated.

3 — Test failed because test pattern could not be detected.

4 — Test has been deactivated.

v Error 3901 is used to give status information about a Far CSU Loopback test. The value in the `Aux Data` field indicates the status of the loop-back test.

1 — Test is currently running.

2 — Test failed because loop back could not be activated.

3 — Test failed because test pattern could not be detected.

4 — Test has been deactivated.

w Error 3902 is used to give status information about a One-Way Span test. The value in the `Aux Data` field indicates the status of the span test.

1 — Test is currently running.

2 — Test has failed because test could not be activated.

3 — Test pattern was not received from the far end.

4 — Test has been deactivated.

x Error type 3999 indicates that the circuit pack sent a large number of control-channel messages to the switch within a short period of time. If Error Type #1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If Error Type #1538 is absent, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order they are presented in Table 324, System Technician-Demanded Tests: DS1-BD, on page 768. By clearing error codes associated with the *NPE Connection Audit* test, for example, you may also clear errors generated from other tests in the testing sequence

Table 324: System Technician-Demanded Tests: DS1-BD

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	test ds1-loop Command	D/ND[1]
NPE Connection Audit test (#50)		X			ND
Control Channel Loop test (#52)		X			ND
Loss of Signal Alarm Inquiry test (#138)	X	X			ND

NPE Connection Audit Test (#50):

The system sends a message to the on-board microprocessor to update the network connectivity translation for all the Network Processing Elements (NPEs) on the circuit pack.

Table 325: Test #50 NPE Connection Audit Test

Error Code	Test Result	Description / Recommendation
None, 2100	ABORT	System resources required for this test are not available.
1019	ABORT	Test already in progress.
	FAIL	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	The circuit pack's NPEs have been updated with their translation.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** Issue the **busyout board** command. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Control Channel Loop-around Test (#52)

This test queries the circuit pack for its circuit pack code and vintage and verifies its records.

Table 326: Test #52 Control Channel Loop-around Test

Error Code	Test Result	Description / Recommendation
None 2100	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.

Table 326: Test #52 Control Channel Loop-around Test

Error Code	Test Result	Description / Recommendation
	FAIL	The test failed because the circuit pack did not return the circuit pack code or vintage. **Note:** Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as Tests 138 and 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test result. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem. **1** Retry the command up to 5 times. **2** If the problem continues, check for hyperactivity. Resolve the problem, as appropriate. **3** If there is no longer hyperactivity, retry the command up to 5 times. **4** If the test continues to fail, escalate this problem.
	PASS	Communication with this circuit pack is successful.

2 of 3

Table 326: Test #52 Control Channel Loop-around Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

3 of 3

SAKI Sanity Test (#53)

This test is **destructive**. This test **resets** the circuit pack.

Table 327: Test #53 SAKI Sanity Test

Error Code	Test Result	Description / Recommendation
None	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	Wrong circuit pack configuration to run this test. This error applies only to DS1 Interface circuit packs. It means the DS1 Interface circuit pack is providing timing for the system and, therefore, it cannot be reset without major system disruptions. **1** If the circuit pack needs to be reset, then set synchronization to another DS1 Interface circuit pack or to the Tone-Clock circuit and try again. Refer to "SYNC (Synchronization)".
1015	ABORT	Port is not out-of-service. **1** Busyout the circuit pack. **2** Execute the command again.
2100	ABORT	System resources required for this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1	FAIL	The circuit pack failed to reset.

1 of 2

Table 327: Test #53 SAKI Sanity Test

Error Code	Test Result	Description / Recommendation
2	FAIL	The circuit pack failed to restart. **1** Execute the command again. **2** If the problem persists, escalate this problem.
	PASS	The circuit pack initializes correctly. **1** Run the short test sequence.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

2 of 2

Internal Loop-Around Test (#135)

This test is **destructive**.

The Internal Looparound test is run by looping the transmitted DS1 bit stream back into the DS1's board receiver. The loop occurs just before the DS1 facility interface. The test is highly destructive and can only be initiated by a technician-demanded **reset board *UUCSS*** command.

All trunks on the DS1 Interface circuit pack must be busied out via the system technician **busyout board** command before running the Internal Looparound test. When the Internal Looparound test is initiated, maintenance software sends messages to the DS1 Interface circuit pack to start the test. The test uses the Tone Generator and Tone Detector to exercise a bit pattern consistency test for all ports. If the transmitted and received bit patterns on a trunk are different, the test fails.

When the test is complete, the maintenance software sends a stop loop around message to the DS1 Interface circuit pack to put the circuit pack back into the normal operation mode. All trunks of the DS1 Interface circuit pack are restored to the in-service state after the **release board** command is entered.

Table 328: Test #135 Internal Loop-Around Test

Error Code	Test Result	Description / Recommendation
2012	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. **1** If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the test at 1-minute intervals up to 5 times.
1004	ABORT	Received an incoming call on a port of the DS1 circuit pack during the test. **1** Enter **busyout board *UUCSS*** to put every trunk on the DS1 circuit pack into the out-of-service state. **2** Retry the command at 1-minute intervals up to 5 times.
1015	ABORT	Ports on DS1 Interface circuit pack have not been busied out. **1** Enter **busyout board *UUCSS*** to put every trunk on the DS1circuit pack into the out-of-service state. **2** Retry the command.
1039	ABORT	The DS1 Interface circuit pack is providing timing for the system. Therefore, it cannot be reset without major system disruption. **1** If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit using the following command sequence: **a** Issue the **disable synchronization-switch** command. **b** Issue the **set synchronization *UUCSS*** command. **c** Issue the **enable synchronization-switch** command.

Table 328: Test #135 Internal Loop-Around Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	The test was aborted. Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as Tests 139 and 140) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error recurs after 15 minutes, escalate this problem.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	DS1 Interface circuit pack failed the Internal Looparound test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the DS1 Interface circuit pack is a TN767, enter **list measurement ds1-log *UUCSS*** to read the error seconds measurement. Otherwise, skip this step. **3** Verify that both of the DS1 link's endpoints are assigned with the same signaling mode, framing mode, and line coding. **4** Check the physical connectivity of DS1 Interface circuit packs and cable. **5** Contact T1 Network Service to diagnose remote DS1 endpoint. **6** If 2 to 5 are OK and the problem recurs, escalate the problem.

2 of 3

Table 328: Test #135 Internal Loop-Around Test

Error Code	Test Result	Description / Recommendation
	PASS	Every administered trunk of DS1 Interface circuit pack passed the Internal Looparound test. The bit pattern consistency test executed successfully over the path that covers a DS1 port, cable, and the external NCTE device.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

3 of 3

Loss of Signal Alarm Inquiry Test (#138)

This test verifies the synchronization status and continuity of the DS1 link. The Loss of Signal alarm indicates that the DS1 Interface circuit pack is unable to derive the synchronization clock from the DS1 facility. When the DS1 Interface circuit pack detects a Loss of Signal alarm, it stops providing the synchronization clock for the system if it is administered as a timing source and transmits a Yellow alarm to the remote DS1 endpoint.

When the Loss of Signal alarm is confirmed, the maintenance software places all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. The inquiry test will run every 10 minutes until the loss of signal has been restored. The DS1 Interface circuit pack raises a Loss of Signal alarm after the signal has been lost for about 1second. It will not retire the alarm until the signal has returned for about 10 seconds.

S8700 MC

This test is also used to maintain the 120A CSU module and the 401A T1 sync splitter. The CSU module, when combined with the functionality provided by the TN767E circuit pack, provides functionality equivalent to an external standalone ESF T1 CSU The 401A T1 sync splitter, when combined with the functionality provided by the TN767E circuit pack, allows an ATM switch to derive its timing off a T1 facility connected to the S8700 Multi-Connect's DS1circuit pack.

If a TN767E circuit pack detects certain I-CSU/T1 sync splitter hardware errors, it will notify the maintenance subsystem. When the subsystem receives notification of the error, it executes this Loss of Signal Inquiry test. The test, in addition to querying for a Loss of Signal alarm condition, will also query the TN767E board to confirm the error. A Minor or Warning alarm will be raised depending on the severity of the error. The trunks on the board may be taken out of service if the error is deemed serious.

If a Loss of Signal alarm and an I-CSU/T1 sync splitter error co-exist, the Loss of Signal alarm condition takes priority, and the board and all of its trunks are put in the out-of-service state. However both errors will be logged.

When the maintenance subsystem receives notification that the ICSU/T1 sync splitter hardware error condition no longer exists, maintenance will restore the board and all trunks to their previous service state if the alarm can be cleared (no other errors or Loss of Signal alarm exist).

Table 329: Test #138 Loss of Signal Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.

Table 329: Test #138 Loss of Signal Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	FAIL	DS1 Interface circuit pack detects a Loss of Signal alarm. The physical link is broken or the remote DS1 endpoint is down. All trunks or ports of this DS1 interface circuit pack are out-of-service. If the DS1 Interface circuit pack is designated as the supplier of the system synchronization source, then the system synchronization maintenance will adopt a source elsewhere. Refer to "SYNC (Synchronization)" section for details. **1** If the DS1 Interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the DS1 Interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. **2** Check the physical connection of the DS1 Interface circuit pack and the cable. If a 120A1 CSU module/T1 sync splitter is physically connected to a TN767E board behind the port carrier, check the physical connection of the CSU module/T1 sync splitter, and make sure the Network Interface cable is plugged into the CSU module's/T1 sync splitter's NETWORK jack.
1300	FAIL	The CSU module or the T1 sync splitter is missing. The `Near-End CSU Type` field on the **add ds1** screen has been administered as *integrated*, but the 120A1 CSU module/T1 sync splitter is not physically connected to the TN767E board behind the port carrier. **1** If using the 120A1 CSU module/T1 sync splitter, plug the CSU module/T1 sync splitter into the TN767E circuit pack's connector on the I/O connector panel on back of the carrier. Otherwise, set the `Near-End CSU Type` field using the **change ds1** screen to **other**. **2** Run the test again.
1301	FAIL	The 120A1 CSU module or the T1 sync splitter is physically connected to the TN767E board behind the port carrier, but the `Near-End CSU Type` field on the **add ds1** screen has not been administered as *integrated*. **1** If the 120A1 CSU module/T1 sync splitter is to be used, use **change ds1** to change the `Near-End CSU Type` field to *integrated*. Otherwise, physically remove the 120A1 CSU module/T1 sync splitter from the back of the port carrier. **2** Run the test again.
1302	FAIL	Attempting to use a 120A1 CSU module with a TN767E circuit pack that is configured for 32-channel (2.048-Mbps) operation. This CSU only works with a DS1 board configured for 24-channel (1.544-Mbps) operation in the United States of America. **1** If the 120A1 CSU is to be used, physically remove the TN767E circuit pack, and reconfigure it for 24-channel (1.544-Mbps) operation. **2** Reinsert the circuit pack, and run the test again.

Table 329: Test #138 Loss of Signal Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
1303	FAIL	The DS1 circuit pack's suffix is incorrect for CSU module/T1 sync splitter administration. The `Near-End CSU Type` field on the **add ds1** screen has been administered as *integrated*, but the DS1 circuit pack is not a TN767E (or higher-suffixed) DS1 board. **1** If the CSU module or the T1 sync splitter is to be used, and the `Near-End CSU Type` field is set to *integrated* to allow for CSU module/T1 sync splitter administration, remove the circuit pack and replace it with a TN767E (or higher-suffixed) board. Otherwise, use **change ds1** to set the `Near-End CSU Type` field to **other**.
1310	FAIL	The DS1 Board Loopback (BLB) demand test (#1209) failed. **1** Repeat the test using **test ds1-loop *UUCSS* ds1/csu-loopback-tests**. **2** If the BLB test continues to fail, then replace the TN767E circuit pack. **3** Run this test again.
1311	FAIL	The Integrated CSU (I-CSU) Module Equipment Loopback (ELB) test (#1210) failed. This test is executedduring ICSU/T1 sync splitter power-up/reset (the TN767E board is physically inserted and the CSU module/T1 sync splitter is already installed) or when the 120A CSU module/T1 sync splitter is plugged on to an already initialized DS1 board. The ELB test is also executed as part of the command **test ds1-loop *UUCSS* ds1/csu-loopback-tests**. **1** Execute **test ds1-loop *UUCSS* ds1/csu-loopback-tests**. If the ELB test continues to fail, then either the TN767E board, the CSU module/T1 sync splitter, or the I/O cable between the backplane and the CSU module/T1 sync splitter (or any combination thereof) has failed. Attempt to isolate the problem to one of these areas. **2** Replace the CSU module/T1 sync splitter and run **test ds1-loop *UUCSS* ds1/csu-loopback-tests**. **3** If the ELB test continues to fail, then replace the TN767E board and run **test ds1-loop *UUCSS* ds1/csu-loopback-tests** again. **4** If the ELB test continues to fail, the problem could be in the I/O cable between the backplane and the CSU module/T1 sync splitter.
1312	FAIL	The Integrated CSU (I-CSU) Module Repeater Loopback (RLB) test (#1211) failed. This test is executed during ICSU/T1 sync splitter power-up/reset (the TN767E board is physically inserted and the CSU module/T1 sync splitter is already installed), or when the 120A1 CSU module/T1 sync splitter is plugged on to an already initialized DS1 board. The RLB test is also executed as part of the command **test ds1-loop *UUCSS* ds1/csu-loopback-tests**. **1** Execute **test ds1-loop *UUCSS* ds1/csu-loopback-tests**. **2** If the RLB test continues to fail, replace the CSU module/T1 sync splitter. **3** Run this test again.

Table 329: Test #138 Loss of Signal Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
1313	FAIL	The TN767E circuit pack could not deactivate a CPE loop-back jack loop back. **1** Execute **test ds1-loop *UUCSS* end-loopback/span-test**. **2** If the attempt to deactivate the CPE loop-back jack is not successful, check the cabling and investigate the problem at the CPE loop-back jack. **3** Run the test again.
1314	FAIL	The TN767E circuit pack could not deactivate a far-end CSU loop loop-back. **1** Execute **test ds1-loop *UUCSS* end-loopback/span-test**.
1320	FAIL	A CSU module/T1 sync splitter hardware failure or an ICSU/T1 sync splitter serial interface audit failure was detected by the TN767E DS1 circuit pack. **1** Replace the CSU module/T1 sync splitter, and then run the test again. **2** If the test continues to fail with this error code, replace the TN767E and run the test again. **3** If the test continues to fail with this error code, the problem could be in the I/O cable between the backplane and the CSU module/T1 sync splitter.
1321	FAIL	DTE LOS (loss of signal) was detected between the TN767E DS1 board and the 120A1 CSU module or the T1 sync splitter. Either the TN767E board, the 120A1 CSU module/T1 sync splitter, or the I/O cable between the backplane and the 120A1 CSU module or the 401A T1 sync splitter (or any combination thereof) has failed. Attempt to isolate the problem to one of these areas. **1** Replace the CSU module/T1 sync splitter, and run the test again. **2** If the test continues to fail with this error code, then replace the TN767E board, and run the test again. **3** If the test continues to fail with this error code, the problem could be in the I/O cable between the backplane and the 120A1 CSU module or the 401A T1 sync splitter.
1322	FAIL	No 5-Volt power detected from the TN767E circuit pack to the 120A1 CSU module/T1 sync splitter. Problem is probably due to an open fuse on the DS1 board or a faulty ICSU/T1 sync splitter. **NOTE** *Do not swap DS1 boards as this may open the fuse on the new board.* **1** Remove the TN767E from the system and reinsert. **2** Run the test again once the board has finished its reset. **3** If the test continues to fail with this error code, then replace the CSU module/T1 sync splitter, and run the test again. **4** If the test continues to fail with this error code, the problem could be in the I/O cable between the backplane and the 120A1 CSU module or the 401A T1 sync splitter. **5** If the test continues to fail with this error code, escalate this problem.

Table 329: Test #138 Loss of Signal Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
1323	FAIL	A service-affecting CSU module/T1 sync splitter audit failure was detected by the TN767E DS1 circuit pack. All administered ports on the DS1 circuit pack are affected and maintenance software will place the ports into the out-of-service state. **1** Replace the 120A1 CSU module/T1 sync splitter.
1324	FAIL	A non-service-affecting CSU module/T1 sync splitter audit failure was detected by the TN767E DS1 circuit pack. No ports should be affected. No immediate action is required. These errors indicate that the CSU module/T1 sync splitter hardware may have a problem, and that it should be replaced when practical to avoid further deterioration.
	PASS	DS1 signal is present and the physical link is healthy. In addition, no Integrated CSU errors are detected.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use the **add ds1 *UUCSS*** command to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

5 of 5

Blue Alarm Inquiry Test (#139)

A remote DS1 endpoint sends a blue-alarm signal across the DS1 link when it is out-of-service. When a local DS1 Interface circuit pack detects a blue alarm from the remote DS1 endpoint, the circuit pack sends both:

- Periodic yellow alarms to the remote DS1 endpoint
- A BLUE ALARM message to the maintenance software

The Blue Alarm Inquiry test checks the remote DS1 endpoint's blue-alarm status. After the blue alarm is confirmed, maintenance software

- Takes every DS1 trunk on the circuit pack out of service
- Runs this test every 10 minutes until the blue alarm is cleared

For blue alarms, a DS1 Interface circuit pack takes much longer to recognize and report its ***resolution*** (~ **16** seconds) than its ***occurrence*** (~ **2** seconds). So, when a blue alarm is cleared, the local DS1 Interface circuit pack avoids false blue alarms by quickly:

- Restoring the DS1 trunks to service
- Discontinuing yellow alarms to the remote endpoint

before the remote endpoint can recognize and report another blue alarm.

Line Loopback Alarm

The Line Loopback (LLB) is used by the remote DS1 endpoint to put the ICSU or DS1 into a loop-back mode. When the ICSU or DS1 Board is in the LLB mode, the arriving bit pattern is regenerated and sent back. Line Loopback (LLB) Alarm is activated when the in-band activate LLB bit pattern has been arriving continuously for 5 seconds on the DS1 line. LLB is deactivated when the in-band deactivate LLB bit pattern has been arriving continuously for 5 seconds on the DS1 line.

Since LLB is a maintenance condition rendering all DS0 channels unavailable for signaling or bearer traffic, maintenance software treats this the same as a Blue Alarm.

Payload Loopback Alarm

The Payload Loopback (PLB) is used by the remote DS1 endpoint to put the switch DS1 into a loop-back mode. PLB Alarm is activated when a network protocol activate bit pattern arrives over the 4-kbps ESF data link on the DS1 line. PLB is deactivated when a network protocol deactivate bit pattern arrives over the 4-kbps ESF data link on the DS1 line.

Since PLB is a maintenance condition rendering all DS0 channels unavailable for signaling or bearer traffic, maintenance software treats this the same as a Blue Alarm.

Table 330: Test #139 Blue Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 330: Test #139 Blue Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
	FAIL	The remote DS1 endpoint is out-of-service. **1** If the DS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote endpoint. **2** If the DS1 interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint.
1794	FAIL	The DS1 Interface circuit pack detects a Line Loopback Alarm (LLB). **1** If the DS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. **2** If the DS1 interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. **3** If the DS1 interface circuit pack connects directly to a line-side terminating device (for example, a PRI terminal adapter), call the vendor of the terminating device to diagnose the equipment.
1795	FAIL	The DS1 Interface circuit pack detects a Payload Loopback Alarm (PLB). If the DS1 Interface circuit pack connects to a leased T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the DS1 Interface circuit pack connects directly to another DS1 board, call the system technician of the remote switch to diagnose the DS1 endpoint.

Table 330: Test #139 Blue Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	PASS	Remote DS1 endpoint is in-service. Neither a Blue alarm nor a Line Loopback alarm nor a Payload Loopback alarm is detected in the DS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

3 of 3

Red Alarm Inquiry Test (#140)

DS1 Interface circuit pack raises a Red alarm when the framing pattern of the incoming DS1 bit stream has been lost. The Red Alarm Inquiry test checks the framing status of a DS1 Interface circuit pack. DS1 Interface circuit pack takes 3 seconds to recognize and report a Red alarm and 10 seconds to recognize and report the resolution of a Red alarm.

When the DS1 Interface circuit pack detects a Red alarm, the circuit pack will transmit a Yellow alarm to the remote DS1 endpoint and send a RED ALARM message to the maintenance software. After the Red alarm is confirmed, the maintenance software places all trunks of the circuit pack into the out-of-service state. The inquiry test will be run every 10 minutes until the Red alarm is cleared.

When the Red alarm is cleared, the DS1 Interface circuit pack will stop transmitting the Yellow alarm to the remote DS1 endpoint. The maintenance software restores all trunks of the DS1 Interface circuit pack to the service state before the Red alarm occurs.

Loss of Multiframe Alarm: If the DS1 Interface circuit pack is administered using DMI-BOS signaling, the DS1 Interface circuit pack raises a Loss of Multiframe Alarm (LMA) when it cannot interpret the incoming signaling bits to synchronize to the multiframe pattern received in the 24^{th} channel. Once DS1 Interface circuit pack detects an LMA, the circuit pack will transmit a Remote Multiframe Alarm (RMA) to the remote DS1 endpoint. Maintenance software handles both Red alarm and LMA alarm(s) using the same mechanism.

Table 331: Test #140 Red Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
	FAIL	The DS1 Interface circuit pack detects a Red alarm. An out-of-frame condition occurs on the DS1 Interface circuit pack. DS1 Interface circuit pack will transmit a Yellow alarm to the remote DS1 endpoint until the Red alarm is retired. **1** Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. Likewise, verify that any intermediate CSUs are administered correctly. **2** If the DS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the DS1 interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. **3** Check the physical connectivity of the DS1 pack and of the cable. **4** If this continues to fail, escalate this problem.

1 of 2

Table 331: Test #140 Red Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
1	FAIL	The DS1 interface circuit pack detected a loss of multiframe alarm (LMA). An out of frame condition occurred on the DS1 interface circuit pack. The DS1 interface circuit pack will transmit a remote multiframe alarm (RMA) to the remote DS1 endpoint until the LMA is retired. **1** Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. Likewise, verify that any intermediate CSUs are administered correctly. **2** If the DS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the DS1 interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. **3** Check the physical connectivity of the DS1 pack and of the cable. **4** If this continues to fail, escalate this problem.
	PASS	No Red alarm is detected on DS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

2 of 2

Yellow Alarm Inquiry Test (#141)

Receiving a Yellow alarm from remote DS1 endpoint indicates that the remote DS1 endpoint has an out-of-frame condition. The Yellow Alarm Inquiry test is used to determine whether the remote DS1 endpoint is transmitting a Yellow alarm. The DS1 Interface circuit pack takes ½ second to recognize and report either a:

- Yellow alarm condition
- Cleared Yellow alarm condition

When the DS1 Interface circuit pack detects a Yellow alarm from the remote DS1 endpoint, it will send a YELLOW-ALARM uplink message to the maintenance software. After the maintenance software

receives the YELLOW-ALARM message, the Yellow Alarm Inquiry test is run to confirm the Yellow alarm. Once the Yellow alarm is confirmed, the maintenance software places all trunks on the circuit pack into the out-of-service state. The Inquiry test will be run every 10 minutes until the Yellow alarm is cleared.

When the Yellow alarm is cleared, the maintenance software restores all trunks on the DS1 Interface circuit pack back to their previous service state before the Yellow alarm is raised.

This Yellow Alarm corresponds to the yellow F2 state documented in CCITT recommendation I.431.

Remote Multiframe Alarm: Remote Multiframe Alarm (RMA) indicates that the remote DS1 endpoint is in a Loss of Multiframe Alarm condition while the DS1 Interface circuit pack is administered using the DMI-BOS common-channel signaling. The RMA is handled as a Yellow alarm.

Yellow F5 State Alarm: For 32-channel E1 operation with CRC4 on, the F5 fault state is defined as a fault in the user-network interface, specifically in the direction from the user (PBX) to the network. Refer to CCITT recommendation I.431

Table 332: Test #141 Yellow Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may appear. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.

Table 332: Test #141 Yellow Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	FAIL	The DS1 interface circuit pack detected a yellow alarm sent by the remote DS1 endpoint. An out of frame condition occurred at the DS1 endpoint.
1	FAIL	The DS1 Interface circuit pack detects a Remote Multiframe Alarm sent by the remote DS1 endpoint. An out-of-frame condition occurs on the remote DS1 endpoint.
2	FAIL	The DS1 Interface circuit pack is reporting a yellow F5 State alarm. There is a fault in the user-network interface from the user (PBX) to the network. **1** Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. Likewise, verify that any intermediate CSUs are administered correctly. **2** If the DS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the DS1 interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. **3** Check the physical connectivity of the DS1 pack and of the cable. **4** If this continues to fail, escalate this problem.
	PASS	No Yellow alarm nor Remote Multiframe Alarm nor F5 State Alarm is received from the remote DS1 endpoint.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

2 of 2

Major Alarm Inquiry Test (#142)

The Major alarm raised by a DS1 Interface circuit pack indicates that the average bit error rate on the DS1 facility is greater than 1/1000. The Major Alarm Inquiry test is used to determine that the received DS1 bit error rate is greater than 1/1000. When D4 framing mode is selected, the DS1 Interface circuit pack takes 16 seconds to recognize and report a Major alarm and 16 seconds to recognize and report that

a Major alarm condition is cleared. If ESF framing mode is selected, the DS1 Interface circuit pack takes 10 seconds to recognize and report a Major alarm and 10 seconds to recognize and report that a Major alarm condition is cleared.

When the DS1 Interface circuit pack detects a Major alarm, it will send a MAJOR-ALARM message to the maintenance software. After the maintenance software receives a MAJOR-ALARM message, the Major Alarm Inquiry test is initiated to confirm the Major alarm on the DS1 Interface circuit pack. The Inquiry test will be run every 10 minutes until the Major alarm is cleared. The maintenance software places all trunks on the circuit pack in the out-of-service state if the Major alarm persists for more than 20 minutes.

When the Major alarm is cleared, the maintenance software restores all trunks on the circuit pack to their previous service state before a Major alarm occurs.

Table 333: Test #142 Major Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. This should re-establish the link between the internal ID and the port.

2 of 2

Minor Alarm Inquiry Test (#143)

The Minor alarm raised by a DS1 Interface circuit pack indicates that the average bit error rate on the DS1 facility is greater than 1/1,000,000, but less than 1/1000. The Minor Alarm Inquiry test is used to determine that the received DS1 bit error rate is greater than 1/1,000,000 and less than 1/1000. When D4 framing mode is selected, the DS1 Interface circuit pack takes 41 minutes to recognize and report a Minor alarm and 41 minutes to recognize and report that a Minor alarm condition is cleared. If ESF framing mode is selected, the DS1 Interface circuit pack takes 10 minutes to recognize and report a Minor alarm and 10 minutes to recognize and report that a Minor alarm condition is cleared.

When the DS1 Interface circuit pack detects a Minor alarm condition, it will send a MINOR-ALARM message to the maintenance software. After the maintenance software receives a MINOR-ALARM message, the Minor Alarm Inquiry test is initiated to confirm the Minor alarm. All trunks on the circuit pack are kept in the in-service state after the Minor alarm is confirmed. The Minor Alarm Inquiry test is run every 10 minutes until the Minor alarm is cleared.

Table 334: Test #143 Minor Alarm Inquiry Tests

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
	FAIL	The DS1 Interface circuit pack detects a Minor alarm. The DS1 bit error rate is greater than 1/1,000,000 and less than 1/1000. **1** The performance of DS1 link between DS1 Interface circuit pack and remote DS1 endpoint is poor. If DS1 Interface circuit pack is TN767, enter **list measurement ds1-log *UUCSS*** to read the error seconds measurement. **2** Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. **3** If the DS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. 1 of 2

Table 334: Test #143 Minor Alarm Inquiry Tests

Error Code	Test Result	Description / Recommendation
	PASS	No Minor alarm is detected in DS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

Slip Alarm Inquiry Test (144)

Slips occur when transmitter and receiver are not running at precisely the same clock rate. The DS1 Interface circuit pack can detect both positive and negative slips on the DS1 facility. The Slip Alarm Inquiry test is used to acquire the total number of slips occurred on a DS1 link.

When the DS1 Interface circuit pack detects a slip condition, the circuit pack will increase the on-board slip counter by 1. A SLIP-COUNT message is spontaneously sent to the system software after the counter reaches a threshold (for example, 88). When the maintenance software receives the SLIP-COUNT message, the Slip Alarm Inquiry test is initiated to query the slip counters on DS1 Interface circuit pack and total the slip counts in the maintenance software.

If the count of slips is over the threshold, a Minor alarm is raised against the DS1 Interface circuit pack. All trunks of the DS1 Interface circuit pack are still in the in-service state. If the DS1 Interface circuit pack is used to supply the system synchronization source, the MINOR alarm will initiate a synchronization source switch. See "TDM-BUS" and "SYNC (Synchronization)" for details.

Table 335: Test #144 Slip Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

Table 335: Test #144 Slip Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
1 to 88	FAIL	The DS1 interface circuit pack detected a slip alarm. The error code equals the number of slips detected by the DS1 interface circuit pack since the last slip alarm inquiry test. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the DS1 interface circuit pack is a TN767, enter **list measurement ds1-log *UUCSS*** to read the error seconds measurement. **3** Verify that both endpoints and all intermediate equipment of the DS1 link are administered using the same signaling mode, framing mode, and line coding. **4** If the DS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the DS1 interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. **5** Check the active alarm and error logs for recent alarms and errors against the synchronization (SYNC). Follow the suggested repair procedure for these errors. **6** Check the physical connectivity of the DS1 pack and of the cable. **7** If this continues to fail, escalate this problem.

Table 335: Test #144 Slip Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	PASS	No Slip alarm is detected on the DS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

3 of 3

Misframe Alarm Inquiry Test (#145)

Misframe Alarm indicates that framing bits observed on a DS1 Interface circuit pack are in error. Misframe Alarm Inquiry test queries the total number of misframes that occurred on a DS1 Interface circuit pack since the last inquiry.

When the DS1 Interface circuit pack detects a misframe error, it will increase its misframe counter by 1. If the counter reaches the threshold, a MISFRAME-COUNT message is automatically sent to the switch maintenance software. After the maintenance software receives the MISFRAME-COUNT message, the Misframe Alarm Inquiry test is initiated to collect the misframe counts from the DS1 Interface circuit pack.

When the threshold of misframes is reached, if the DS1 Interface circuit pack is supplying the system synchronization source, then a switching synchronization source message is sent to the TDM Bus Clock. See TDM-BUS (TDM Bus) Maintenance documentation for details. A Minor alarm against the DS1 Interface circuit pack is raised, but all trunks of the DS1 Interface circuit pack are still in the in-service state.

Table 336: Test #145 Misframe Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 336: Test #145 Misframe Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may appear. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
ANY	FAIL	The test failed because the DS1 interface circuit pack detected errors in the received framing bits pattern. The error code equals the number of misframes detected by the DS1 interface circuit pack since the last misframe alarm inquiry test. Major bit and minor bit error rate (error types 2561 and 2817) error logs often accompany misframe alarms. Clearing the cause of these error logs may clear the misframes that are occurring. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the DS1 interface circuit pack is a TN767, enter **list measurement ds1-log *UUCSS*** to read the error seconds measurement. **3** Verify that both endpoints and all intermediate equipment of the DS1 link are administered using the same signaling mode, framing mode, and line coding. **4** If the DS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the DS1 interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. **5** Check the active alarm and error logs for recent alarms and errors against the synchronization (SYNC). Follow the suggested repair procedure for these errors. **6** Check the physical connection of the DS1 pack and of the cable. **7** If this continues to fail, escalate this problem.
	PASS	No Misframe alarm is detected on the DS1 Interface circuit pack.

Table 336: Test #145 Misframe Alarm Inquiry Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

3 of 3

Translation Update Test (#146)

The Translation Update test sends the circuit pack-level information specified by System Administration to the DS1 Interface circuit pack. Translation includes the following data administered for a DS1 Interface circuit pack (see output of **display ds1 *UUCSS*** command): DS1 Link Length between two DS1 endpoints, Synchronization Source Control, All Zero Suppression, Framing Mode, Signaling Mode, time-slot number of 697-Hz tone, time-slot number of 700-Hz tone, etc.

If a TN767E or later DS1 circuit pack is combined with a 120A CSU module or a T1 sync splitter to screen an integrated CSU module, this test will also send the administration for this Integrated CSU to the circuit pack to assure the board's translations are correct. The administration of the CSU module is done using the DS1 circuit pack administration screen. Translation for the CSU module includes the following data: Transmit LBO, Receive ALBO, Supply CPE loop-back jack Power?, and so forth.

Table 337: Test #146 Translation Update Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system software error. **1** Enter **display ds1 *UUCSS*** to verify the DS1 Interface circuit pack translation.

1 of 2

Table 337: Test #146 Translation Update Test

Error Code	Test Result	Description / Recommendation
	PASS	Translation data has been downloaded to the DS1 Interface circuit pack successfully.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

2 of 2

DS1 Board Loop-Back Test (#1209)

This test is **destructive**.

The DS1 BLB (Board Loopback) test causes a loop back at the TN767E DS1 board edge, and tests DS1 board internal circuitry.

The test is destructive and is initiated by a technician-demanded **test ds1-loop *UUCSS* ds1/csu-loopback-tests**.

All trunks or ports on the DS1 Interface circuit pack must be busied out using **busyout board** before running the BLB test.

When the BLB test is initiated, maintenance software sends a message to the TN767E DS1 Interface circuit pack to start the test. The board sets up the BLB loop back, transmits a test pattern, and verifies that the pattern is received unaltered through the loop back. If the transmitted and received pattern is different, the test fails.

When the test is complete, enter **release board** to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 338: Test #1209 DS1 Board Loop-Back Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry **test ds1-loop *UUCSS* ds1/csu-loopback-tests** at 1-minute intervals up to 5 times.
1005	ABORT	DS1 Board Loopback test cannot be executed in the current configuration. To run this test, the TN767E (or higher-suffixed) DS1 must be administered for 24-channel operation. The `Bit Rate` field on the DS1 circuit pack administration screen must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. **1** Enter **busyout board *UUCSS*** to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. **2** Retry the command.
1039	ABORT	The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence: **1** Issue the **disable synchronization-switch** command. **2** Next, issue the **set synchronization *UUCSS*** command. **3** Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). The hardware error log will indicate whether a Customer loop-back jack test, Far CSU Loopback test, or the One-Way Span test is executing or if the board is in line loop-back or payload loop-back mode. Only one long-duration loop-back/span test can be active at a given time. Thus, if a loop-back/span test is already active, that test must be deactivated via the *test* **ds1-loop *UUCSS* end-loopback/span-test** command in order to execute this test.
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 338: Test #1209 DS1 Board Loop-Back Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
	FAIL	DS1 Interface circuit pack failed the DS1 Board Loopback test. **1** Retry **test ds1-loop *UUCSS* ds1/csu-loopback-tests**. **2** If the BLB test continues to fail, then replace the DS1 circuit pack.
	PASS	The BLB test executed successfully. The test pattern was transmitted and received successfully up to the TN767E DS1 board edge.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

2 of 2

CSU Equipment Loop-Back Test (#1210)

This test is **destructive**.

The CSU ELB (Equipment Loopback) test causes a loop back at the near-edge of the local 120A CSU module or T1 sync splitter, and tests the connection from the TN767E DS1 board to the CSU module/T1 sync splitter (DS1 board edge interconnecting cable, and CSU module/T1 sync splitter edge). This test will only be performed if the 120A CSU module/T1 sync splitter is present, administered, and connected to a 1.544-Mbps TN767E DS1 circuit pack behind the port carrier.

The test is destructive and can only be initiated by a technician-demanded **test ds1-loop *UUCSS* ds1/csu-loopback-tests** command.

Use **busyout board** to busy out all trunks or ports on the DS1 Interface circuit pack before running the ELB test.

When the ELB test is initiated, maintenance software sends a message to the TN767E DS1 Interface circuit pack to start the test. The board sets up the ELB loop back, transmits a test pattern, and verifies that the pattern is received unaltered through the loop back. If the transmitted and received pattern is different, the test fails.

The DS1 circuit pack hardware applies a DC current while the test is running in order to detect any broken wires that may not be detected by the loop-back pattern.

When the test is complete, use **release board** to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 339: Test #1210 CSU Equipment Loop-Back Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry **test ds1-loop *UUCSS* ds1/csu-loopback-tests** at 1-minute intervals up to 5 times.
1005	ABORT	CSU Equipment Loopback test cannot be executed in the current configuration. To run this test, the `Near-End CSU Type` field on the DS1 circuit pack administration screen must be set to *integrated* and the `Bit Rate` field must be set to “1.544” (for 24-channel operation). **1** Use **change ds1 *UUCSS*** and set the `Near-End CSU Type` field on the DS1 circuit pack administration screen to **integrated**, and/or set the `Bit Rate` field to **1.544** if the board is to be used in a 24-channel configuration. **2** Retry **test ds1-loop *UUCSS* ds1/csu-loopback-tests**.
1015	ABORT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. **1** Enter **busyout board *UUCSS*** to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. **2** Retry the command.

Table 339: Test #1210 CSU Equipment Loop-Back Test

Error Code	Test Result	Description / Recommendation
1039	ABORT	The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence: **1** Issue the **disable synchronization-switch** command. **2** Next, issue the **set synchronization *UUCSS*** command. **3** Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). The hardware error log will indicate whether a Customer loop-back jack test, Far CSU Loopback test, or the One-Way Span test is executing or if the board is in line loop-back or payload loop-back mode. Only one long-duration loop-back/span test can be active at a given time. Thus, if a loop-back/span test is already active, that test must be deactivated via the **test ds1-loop *UUCSS* end-loopback/span-test** command in order to execute this test.
1951	ABORT	The CSU Equipment Loopback test could not be executed because the 120A CSU module/T1 sync splitter was not physically installed. Physically connect the 120A CSU module/T1 sync splitter to the TN767E board behind the port carrier.
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

2 of 4

Table 339: Test #1210 CSU Equipment Loop-Back Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
	FAIL	DS1 Interface circuit pack failed the CSU Equipment Loopback test. **1** Retry **test ds1-loop UUCSS ds1/csu-loopback-tests**. **2** If the ELB test continues to fail, then either the TN767E board, the CSU module/T1 sync splitter, or the I/O cable between the backplane and the 120A1 CSU module or the 401A T1 sync splitter (or any combination thereof) has failed. Attempt to isolate the problem to one of these areas. Replace the CSU module/T1 sync splitter, and run **test ds1-loop UUCSS ds1/csu-loopback-tests** again. **3** If the ELB test continues to fail, then replace the TN767E board and run **test ds1-loop UUCSS ds1/csu-loopback-tests** again. **4** If the ELB test continues to fail, the problem could be in the I/O cable between the backplane and the 120A1 CSU module or the 401A T1 sync splitter.

Table 339: Test #1210 CSU Equipment Loop-Back Test

Error Code	Test Result	Description / Recommendation
	PASS	The ELB test executed successfully. The test pattern was transmitted and received successfully over the connection from the TN767E DS1 board to the near-edge of the 120A1 CSU module/T1 sync splitter.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

4 of 4

CSU Repeater Loop-Back Test (#1211)

This test is **destructive**.

The CSU RLB (Repeater Loopback) test causes a loop back at the far-edge of the local 120A CSU module or T1 sync splitter, and tests the connection from the TN767E DS1 board to and including the CSU module/T1 sync splitter circuitry. The test runs only if the 120A CSU module/T1 sync splitter is present, administered, and connected to a 1.544-Mbps TN767E DS1 circuit pack behind the port carrier.

The test is destructive and can only be initiated by **test ds1-loop *UUCSS* ds1/csu-loopback-tests**.

Use **busyout board** to busy out all trunks or ports on the DS1 Interface circuit pack before running the RLB test.

When the RLB test is initiated, maintenance software sends a message to the TN767E DS1 Interface circuit pack to start the test. The board sets up the RLB loop back, transmits a test pattern, and verifies that the pattern is received unaltered through the loop back. If the transmitted and received pattern is different, the test fails.

The DS1 circuit pack hardware applies a DC current while the test is running in order to detect any broken wires that may not be detected by the loop-back pattern.

When the test is complete, use **release board** to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 340: Test #1211 CSU Repeater Loop-Back Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry **test ds1-loop UUCSS ds1/csu-loopback-tests** at 1-minute intervals up to 5 times.
1005	ABORT	CSU Repeater Loopback test cannot be executed in the current configuration. **1** Use **change ds1 *UUCSS*** snd set the `Near-End CSU Type` field on the DS1 circuit pack administration screen to **integrated**, and/or set the `Bit Rate` field to **1.544** if the board is to be used in a 24-channel configuration. **2** Retry **test ds1-loop *UUCSS* ds1/csu-loopback-tests**.
1015	ABORT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. **1** Enter **busyout board *UUCSS*** to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. **2** Retry the command.
1039	ABORT	The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence: **1** Issue the **disable synchronization-switch** command. **2** Next, issue the **set synchronization *UUCSS*** command. **3** Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). This should re-establish the link between the internal ID and the port.

3 of 3

CPE Loopback Jack Test (#1212)

This test is **destructive**.

The CPE Loopback Jack (CLJ-LB) test causes a loop back at the CPE loop-back jack and tests the building wiring connection between the TN767E DS1 board and the CPE loop-back jack.

The test is highly destructive and can only be initiated by a technician-demanded **test ds1-loop *UUCSS* cpe-loopback-jack-test-begin [*number-of-bits bit-pattern*]** command. The system technician can either enter a loop-back activation code on the command line or use the default code (0x47F).

Use **busyout board** to busy out all trunks or ports on the DS1 Interface circuit pack before running the CPE Loopback Jack test.

The CPE Loopback Jack test has the TN767E DS1 Interface circuit pack transmit a loop-back activation code to the CPE loop-back jack, waits up to 10 seconds for return of the code to verify the loop back has been established, transmits a framed 3-in-24 test pattern, begins counting bit errors in the received test pattern, and returns a PASS result to indicate that the pattern was successfully sent. If the loop back is not established within the 10 seconds, the test returns FAIL.

The status of the CPE Loopback Jack test appears in the hardware error log via Error Type #3900. Several distinct aux values give information on the status of the test.

Use **list measurements ds1 summary** to show the length of time the test has been running (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). If the test pattern is passed through the loop back cleanly, the number of bit errors should be very

low. The command also shows the type of loop-back/span test executing (`Test` field), the type of pattern generated for the loop-back/span test (`Pattern` field), and whether the pattern (*3-in-24 Pattern*) is synchronized (`Synchronized` field).

Use **test ds1-loop *UUCSS* end-loopback/span-test** to end the test.

Table 341: Test #1212 CPE Loopback Jack Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry **test ds1-loop *UUCSS* cpe-loopback-jack-test-begin** at 1-minute intervals up to 5 times.
1005	ABORT	CPE Loopback Jack test cannot be executed in the current configuration. To run this test, the TN767E (or higher-suffixed) DS1 must be administered for 24-channel operation. The `Bit Rate` field on the DS1 circuit pack administration screen must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. **1** Enter the **busyout board *UUCSS*** command to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. **2** Retry the command.
1039	ABORT	The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence: **1** Issue the **disable synchronization-switch** command. **2** Next, issue the **set synchronization *UUCSS*** command. **3** Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). The hardware error log will indicate whether a Customer loop-back jack test, Far CSU Loopback test, or the One-Way Span test is executing or if the board is in line loop-back or payload loop-back mode. Only one long-duration loop-back/span test can be active at a given time. Thus, if a loop-back/span test is already active, that test must be deactivated via the **test ds1-loop *UUCSS* end-loopback/span-test** command in order to execute this test.
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 341: Test #1212 CPE Loopback Jack Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
2	FAIL	The CLJ-LB test failed because it was not set up properly. The DS1 interface pack could not successfully put the CPE loop-back jack into loop-back mode. **1** Rerun **test ds1-loop *UUCSS* cpe-loopback-jack-test-begin**. **2** If the test continues to fail, the problem could be with the TN767E board, the CPE loop-back jack equipment, or somewhere between. Run **test ds1-loop *UUCSS* ds1/csu-loopback-tests** to determine if the loop-back tests that are closer to the TN767E board are successful. If any of the tests fail, follow the maintenance strategy that is associated with the failing test.
3	FAIL	The CPE Loopback Jack test was not set up properly. The framed 3-in-24 test pattern, generated by the DS1 Interface circuit pack and looped back through the CPE loop-back jack, could not be detected properly by the DS1 circuit pack. **1** Retry **test ds1-loop UUCSS cpe-loopback-jack-test-begin**. **2** If the CPE Loopback test continues to fail, the problem could be with the TN767E board, the CPE loop-back jack equipment, or somewhere in between. Run **test ds1-loop *UUCSS* ds1/csu-loopback-tests** to see if the loop-back tests closer to the TN767E board are successful. If any of those loop-back tests fail, follow the maintenance strategy associated with those.

Table 341: Test #1212 CPE Loopback Jack Test

Error Code	Test Result	Description / Recommendation
	PASS	The CPE Loopback Jack test has successfully began executing. The test runs until the system technician enters the **test ds1-loop *UUCSS* end-loopback/span-test** or **release board *UUCSS***.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

3 of 3

Far CSU Loop-Back Test (#1213)

This test is **destructive**.

The Far CSU Loopback (R-LLB) test causes a loop back at the far-end CSU, and tests all circuitry and facilities from the local TN767E DS1 board to the far-end CSU.

The test is destructive and can only be initiated by a technician-demanded **test ds1-loop *UUCSS* far-csu-loopback-test-begin** command.

Use **busyout board** to busy out all trunks or ports on the DS1 Interface circuit pack before running the Far CSU Loopback test.

If the far-end CSU is not a 120A CSU module or a 401A T1 sync splitter, and the DS1 is administered for ami-zcs line coding, disable density protection on the CSU during the test, due to the large number of zero's in the 3-in-24 test pattern.

The Far CSU Loopback test has the TN767E DS1 Interface circuit pack transmit a loop-back activation code to the remote CSU, waits up to 15 seconds for return of the code to verify the loop back has been established, transmits a framed 3-in-24 test pattern, begins counting bit errors in the received test pattern, and returns a PASS result. If the loop back is not established within the 15 seconds, the test fails.

The status of the Far CSU Loopback test appears in the hardware error log via Error Type #3901. Several aux values give information on the status of the test.

Use **list measurements ds1 summary** to show the length of time the test has been running (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). If the test pattern is passed through the loop back cleanly, the number of bit errors should be very low. The command also shows the type of loop-back/span test executing (`Test` field), the type of pattern generated for the loop-back/span test (`Pattern` field), and whether the pattern (*i.e., 3-in-24 Pattern*) is synchronized (`Synchronized` field).

Use **test ds1-loop *UUCSS* end-loopback/span-test** or **release board** to end the test. Use **release board** to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 342: Test #1213 Far CSU Loop-Back Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry **test ds1-loop UUCSS far-csu-loopback-test-begin** at 1-minute intervals up to 5 times.
1005	ABORT	Far CSU Loopback test cannot be executed in the current configuration. To run this, the TN767E (or higher-suffixed) DS1 must be administered for 24-channel operation. The `Bit Rate` field on the DS1 circuit pack administration screen must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. **1** Enter **busyout board *UUCSS*** to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. **2** Retry the command.
1039	ABORT	The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence: **1** Issue the **disable synchronization-switch** command. **2** Next, issue the **set synchronization *UUCSS*** command. **3** Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). The hardware error log will indicate whether a Customer Loopback Jack test, Far CSU Loopback test, or the One-Way Span test is executing or if the board is in line loop-back or payload loop-back mode. Only one long-duration loop-back/span test can be active at a given time. Thus, if a loop-back/span test is already active, that test must be deactivated via the **test ds1-loop *UUCSS* end-loopback/span-test** command in order to execute this test.
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 342: Test #1213 Far CSU Loop-Back Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.

2 of 3

Table 342: Test #1213 Far CSU Loop-Back Test

Error Code	Test Result	Description / Recommendation
2	FAIL	The far CSU Loopback test was not set up properly. The DS1 Interface circuit pack could not put the far-end CSU into loop-back mode.
3	FAIL	The far CSU Loopback test was not set up properly. The framed 3-in-24 test pattern, generated by the DS1 Interface circuit pack and looped back through the far-end CSU, could not be detected by the DS1 circuit pack. **1** Retry **test ds1-loop *UUCSS* far-csu-loopback-test-begin**. **2** If the Far CSU Loopback test continues to fail with this error code, the problem could be with the TN767E board, the far-end CSU equipment, or somewhere in between. Run **test ds1-loop *UUCSS* cpe-loopback-jack-test-begin** to see if the CPE Loopback Jack test that is closer to the TN767E board is successful. If a CPE loop-back jack device is not being used, run **test ds1-loop *UUCSS* ds1/csu-loopback-tests** to see if the closer loop-back tests succeed. If the closer loop-back test fails, follow the maintenance strategy associated with that loop back
	PASS	The Far CSU Loopback test has successfully began executing. The test runs until the system technician enters **test ds1-loop *UUCSS* end-loopback/span-test** or the **release board *UUCSS***.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

3 of 3

One-Way Span Test (#1214)

This test is **destructive**.

The One-Way Span test allows 1-way span testing to and from remote test equipment or another Communication Manager solution. This tests all circuitry and facilities from the local TN767E DS1 board to the remote test equipment or other Communication Manager solution.

The test is destructive and can only be initiated by a technician-demanded **test ds1-loop *UUCSS* one-way-span-test-begin** command.

Use **busyout board** to busy out all trunks or ports on the DS1 Interface circuit pack before running the One-Way Span test.

The One-Way Span test has the TN767E DS1 Interface circuit pack transmit a framed 3-in-24 test pattern and attempts to receive and verify the pattern. If the TN767E board receives a framed 3-in-24 test pattern sent from another Communication Manager system or test equipment at the far end of the DS1, it begins counting bit errors within the received pattern.

NOTE:
G700: When a TN464 and an MM710 are connected, the One-Way Span test does not frame-align to the 3-in-24 repetitive pattern, and the test fails.

The status of the One-Way Span test appears in the hardware error log via Error Type #3902. Several aux values give information on the status of the test.

Use **list measurements ds1 summary** to see the length of time the test has been running (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). If the test pattern is sent cleanly over the span from the far end, the number of bit errors should be very low. The `Test Duration` field is **0** until the test pattern is received from the far end. Upon receiving the test pattern, the board begins calculating the test duration and number of bit errors. The command also shows the type of loop-back/span test executing (`Test` field), the type of pattern generated for the loop-back/span test (`Pattern` field), and whether the pattern (*i.e., 3-in-24 Pattern*) is synchronized (`Synchronized` field).

Use **test ds1-loop *UUCSS* end-loopback/span-test** or the **release board** to end the test. Use **release board** to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 343: Test #1214 One-Way Span Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry **test ds1-loop *UUCSS* one-way-span-test-begin** at 1-minute intervals up to 5 times.
1005	ABORT	One-Way Span test cannot be executed in the current configuration. To run this, the TN767E (or higher-suffixed) DS1 must be administered for 24-channel operation. The `Bit Rate` field on the DS1 circuit pack administration screen must be set to “1.544” for 24-channel operation.
1015	ABORT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. **1** Enter **busyout board *UUCSS*** to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. **2** Retry the command.

1 of 3

Table 343: Test #1214 One-Way Span Test

Error Code	Test Result	Description / Recommendation
1039	ABORT	The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence: **1** Issue the **disable synchronization-switch** command. **2** Next, issue the **set synchronization *UUCSS*** command. **3** Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). The hardware error log will indicate whether a Customer Loop-Back Jack test, Far CSU Loopback test, or the One-Way Span test is executing or if the board is in line loop-back or payload loop-back mode. Only one long-duration loop-back/span test can be active at a given time. Thus, if a loop-back/span test is already active, that test must be deactivated via the **test ds1-loop *UUCSS* end-loopback/span-test** command in order to execute this test.
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
G700:	FAIL	Test was run between a TN464 and an MM710, which generate incompatible patterns.

Table 343: Test #1214 One-Way Span Test

Error Code	Test Result	Description / Recommendation
	PASS	The One-Way Span test has successfully began transmitting a framed 3-in-24 test pattern. The test will continue to run until the system technician enters **test ds1-loop *UUCSS* end-loopback/span-test** or **release board *UUCSS***.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

3 of 3

Inject Single Bit Error Test (#1215)

This test is **destructive**.

The Inject Single Bit Error test causes a single bit error to be sent within an active framed 3-in-24 test pattern.

The test is highly destructive and can only be initiated by a technician-demanded **test ds1-loop *UUCSS* inject-single-bit-error** command. An attempt to use this command is rejected if none of the three long-duration DS1 loop-back/span tests (CPE Loopback Jack test, Far CSU Loopback test, One-Way Span test) are active on a TN767E circuit pack.

Use **busyout board** to busy out all trunks or ports on the DS1 Interface circuit pack before running the Inject Single Bit Error test.

Use **list measurements ds1 summary** to show the number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). Injecting this single bit error should increment the bit error count of the loop-back/span test by one.

Use **release board** to restore the trunks or ports on the TN767E DS1 Interface circuit pact to the inservice state.

Table 344: Test #1215 Inject Single Bit Error Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry **test ds1-loop *UUCSS* inject-single-bit-error** at 1-minute intervals up to 5 times.
1015	ABORT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. **1** Enter **busyout board *UUCSS*** to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. **2** Retry the command.
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.

1 of 2

Table 344: Test #1215 Inject Single Bit Error Test

Error Code	Test Result	Description / Recommendation
	PASS	A single bit error has been successfully injected into an active framed 3-in-24 test pattern.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

2 of 2

End Loopback/Span Test (#1216)

This test is **destructive**.

The End Loopback/Span test deactivates an active loop-back or span test on a TN767E DS1 circuit pack. Bit error counting against the received test pattern stream halts, and sending of the framed 3-in-24 test pattern ceases. If either the CPE loop-back jack or the far-end CSU is looped, the loop-back deactivate code is sent. If the loop back could not be deactivated, the test will FAIL and a MINOR alarm is noted in the alarm log until the loop back is cleared.

The test is highly destructive and can only be initiated by a technician-demanded **test ds1-loop *UUCSS* end-loopback/span-test** command. Since only one of these three different long-duration loop-back/span tests can be active at a time, the TN767E circuit pack knows which loop-back/span test to halt.

Use **busyout board** to busy out all trunks or ports on the DS1 Interface circuit pack before running this End Loopback/Span test.

Use **list measurements ds1 summary** to show the length of time the test ran (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field).

Use **release board** to restore the trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 345: Test #1216 End Loopback/Span Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry **test ds1-loop *UUCSS* end-loopback/span-test** at 1-minute intervals up to 5 times.
1005	ABORT	End Loopback/Span test cannot be executed in the current configuration. To run this, the TN767E (or higher-suffixed) DS1 must be administered for 24-channel operation. The `Bit Rate` field on the DS1 circuit pack administration screen must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. **1** Enter **busyout board *UUCSS*** to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. **2** Retry the command.
	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. • The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A **busyout** or a **release** command has no affect on the test results. • A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
1313	FAIL	The TN767E DS1 circuit pack could not deactivate the loop back through the Customer loop-back jack. **1** Retry **test ds1-loop *UUCSS* end-loopback/span-test** at 1-minute intervals up to 5 times.

1 of 2

Table 345: Test #1216 End Loopback/Span Test

Error Code	Test Result	Description / Recommendation
1314	FAIL	The TN767E DS1 circuit pack could not deactivate the loop back through the far-end CSU. **1** Make sure that the far-end DS1 is installed if the far-end CSU is a 120A CSU module/T1 sync splitter. **2** Retry **test ds1-loop *UUCSS* end-loopback/span-test** at 1-minute intervals up to 5 times.
	PASS	The active long-duration loop-back or span test on the TN767E circuit pack was successfully deactivated.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, use **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the link between the internal ID and the port.

2 of 2

ICSU Status LEDs Test (#1227)

The TN767E DS1 circuit pack has four status LEDs on the faceplate in addition to the three standard faceplate LEDs. These four status LEDs are associated with the 120A1 Channel Service Unit (CSU) Module that can be connected to the TN767E board via the I/O connector panel behind the port carrier.

This test is a visual test. It lights the four status LEDs red for 5 seconds, green for 5 seconds, and yellow for 5 seconds. It then turns the LEDs off and returns control of the status LEDs to the circuit pack.

This test runs only on TN767E (or higher-suffixed) DS1 circuit packs administered for 24-channel operation (1.544 Mbps).

If the 1201 CSU module/T1 sync splitter is not installed, the status LEDs are always off and this test aborts.

Table 346: Test #1227 ICSU Status LEDs Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1005	ABORT	The ICSU Status LEDs test cannot be executed for the current configuration. The test applies only to TN767E or later DS1 circuit packs administered for 24-channel (1.544-Mbps) operation. **1** If the circuit pack is a TN767E (or higher-suffixed) DS1 circuit pack, then retry the command.
1951	ABORT	The ICSU Status LEDs test cannot be executed because a 120A1 (or higher-suffixed) CSU module or a 401A (or higher-suffixed) T1 sync splitter is not physically installed. If using a 120A1 CSU module/T1 sync splitter, physically connect it to the TN767E board behind the port carrier. Otherwise, ignore this abort.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
2500	ABORT	Internal system error. **1** Retry the command.
	PASS	The ICSU Status LEDs test executed successfully. A PASS result, however, does not necessarily mean that the status LEDs behaved properly. It only means that the software successfully attempted to light the status LEDs. This is a visual test. The service technician must visually exam the behavior of the LEDs while the test is running. The LEDs are functioning properly if the four status LEDs are lit red for 5 seconds, then lit green for 5 seconds, then lit yellow for 5 seconds. If the LEDs behave differently, escalate this problem.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. **1** Verify that the board's translations are correct. Use **add ds1 *UUCSS*** to administer the DS1 interface if it is not already administered. **2** If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. **3** If the board was found to be correctly inserted in step 1, issue **busyout board**. **4** Issue the **reset board** command. **5** Issue the **release board** command. **6** Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

DS1-FAC (DS1 Facility)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DS1-FAC	MAJOR	**test board *location* sh r 1**	DS1 Facility
DS1-FAC	MINOR	**test board *location* sh r 1**	DS1 Facility
DS1-FAC	WARNING	**test board *location* sh r 1**	DS1 Facility

1 For information on specifying a ***location***, see Command Syntax on page 179. See Chapter 7, or the DS1C-BD section, for identification of DS1 facility LEDs.

The DS1-FAC is a part of the DS1 Converter (DS1C-BD) complex. The DS1C-BD complex consists of two TN574 DS1C-BD circuit packs or two TN1654 DS1C-BD circuit packs connected by one to four DS1 facilities. The MO name for the DS1 converter circuit pack is DS1C-BD, and the MO name for the connected DS1 facilities is DS1-FAC.

The TN1654 DS1 Converter circuit pack is a redesign of the TN574 DS1 Converter board. The TN1654 provides functionality equivalent to the TN574, and adds a 32-channel E1 interface for international support as well as circuit-switched wideband connections (NxDS0).

The TN1654 DS1 converter circuit pack is not compatible with the TN574 DS1 converter board or the Y-cable used to interface to the TN574 DS1 converter. A TN573B (or higher-suffixed) SNI board must be used when connecting to the TN1654 DS1 converter board. See DS1C-BD for information about both DS1 converter circuit packs.

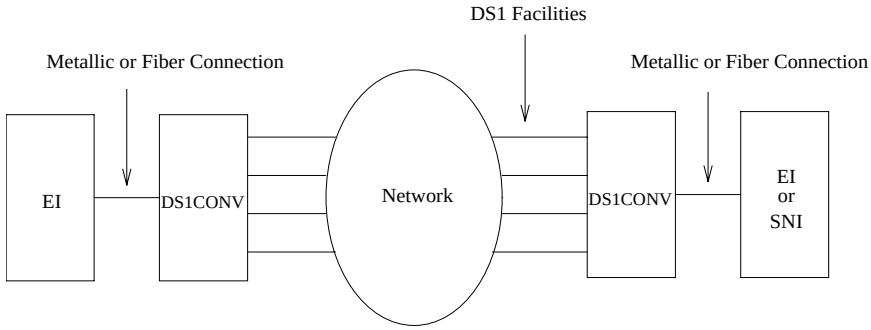
The DS1 converter complex is a part of the port-network connectivity (PNC). The DS1 converter complex is used to extend the range of the 32-Mbps fiber links that connect PNs to the Center Stage Switch, allowing PNs to be located at remote sites.

The DS1 converter circuit pack contains on-board firmware that detects DS1 facility alarms and errors, communicates status to maintenance software, and runs either background or on-demand tests from maintenance software. The overall maintenance software strategy includes demand tests, recovery strategies, error and alarm logging, and periodic audits.

Every error condition reported by the firmware is associated with the background tests that the firmware runs autonomously. Demand tests that are executed by the maintenance software do not have any functionality that would effect any additional error manipulation by the firmware. However, the Failure Audit test (#949) affects auditing of the software error log by forcing the firmware to report the pending errors again.

DS1 converter circuit packs are connected to the Expansion Interface (EI) circuit packs (TN570) and the Switch Node Interface (SNI) circuit packs (TN573) as shown in Figure 50, DS1 Converter Complex and the DS1 Facilities, on page 821.

Figure 50: DS1 Converter Complex and the DS1 Facilities



The DS1 converter complex can replace fiber links between two EIs and fiber links between an PN's EI and an SNI. Fiber links between two SNIs and fiber links between the and the Center Stage Switch (CSS) cannot be replaced by a DS1 converter complex.

On the TN574 DS1 converter circuit pack, one of the four DS1 facilities is used as the primary facility (or packet facility), and it is the only facility that can carry packet traffic besides providing circuit connections. The primary facility has 22 channels available for circuit and packet connections. Other facilities each have 24 channels available for circuit connections. On the TN574 primary facility, channels 1and 24 are not available for packet or for circuit connections. Channel 1 is used for excess packets traffic to prevent packet overflow that might result from zero code substitutions. Channel 24 is the DS1 control channel that carries control link data between the two DS1 converter circuit packs.

The primary facility on the TN1654 DS1 converter circuit pack is restricted to facility A or facility B. The TN1654 provides fixed packet bandwidth of 192 kbps while the TN574 provides packet bandwidth of up to 1408 kbps with a dynamic allocation mechanism that could change packet/circuit use of individual channels. The first three 64-kbps channels on the primary facility of the TN1654 are reserved as the packet channels. The DS1 control channel will be Channel 24 in T1 mode and Channel 31 in E1 mode. In T1 format the TN1654 provides 24 circuit channels for use on non-primary facilities and 20 circuit channels on the primary facility. E1 format provides 31 circuit channels for use on non-primary facilities and 27 circuit channels on the primary facility.

When there are alarms on the packet facility, DS1 converter circuit pack firmware changes the mapping of the DS1 channels to move the packet traffic to another facility. On TN574 DS1 converter boards, the packet traffic will be moved to another "Digital Data Compatible" facility (as indicated on the fiber link administration screen). On TN1654 DS1 converter boards, the packet traffic will be moved to either facility A or B if available. This mapping is done to keep the packet service operational at all times as the system control links are carried on these packet connections. When packet traffic is moved to another facility, circuit connections on the new facility are torn down and circuit connections on the old (faulty) facility are re-mapped to the new packet facility.

After firmware initialization, facility A, the first facility, is chosen as the default primary facility for both DS1 converter boards.

The TN574 DS1 converter has seven LEDs that provide an indication of the state of the DS1 converter circuit pack and the DS1 facilities. There is a yellow, a green, and a red LED under software and/or firmware control. There are four Green LEDs under hardware control that indicate, for each DS1 facility, whether a receive signal is present for the DS1 facility. From top to bottom these green LEDs correspond to DS1 facilities A, B, C, and D respectively. If one of the four green LED is on, it indicates a signal is

present, but it does not imply that the signal is using the correct framing format (ESF or D4) or line coding (ZCS or B8ZS). See section DS1C-BD for the description of the red, the green, and the amber LEDs on the DS1 converter circuit pack.

The TN1654 DS1 converter board has eleven LEDs on its faceplate. The top three system standard LEDs (yellow, green and red) are used to provide an indication of the state of the DS1 converter board. The bottom four LEDs on the TN1654 board are labeled SPAN LEDs. These LEDs are under firmware control. If the facility is not administered, then the LED is not lit. The LED is lit amber if the facility is running alarm free. If the facility is detecting either a red alarm (loss-of-signal or loss-of-frame), a yellow alarm (remote frame alarm) or a blue alarm (AIS signal) then the LED is lit red. See section DS1C-BD for a complete description off all the LEDs.

The TN1654 DS1 converter circuit pack supports the Wideband Switching feature. The TN574 DS1 converter does not.

DS1 Facility Busyout

Busy out the MO to gracefully disconnect service. Busyout puts the object out-of-service until the repair procedures are completed.

Use **busyout ds1-facility** to busy out DS1 facilities. When an attempt is made to busyout the packet facility (or primary facility), the system prints a warning message indicating that the **override** option must be used to busyout the packet facility. Busying out the packet facility moves the packet traffic to another facility, and disconnects circuit connections on that new facility.

The system does not allow the last packet DS1 facility to be busied out. In this case, busy out the DS1 converter circuit pack instead.

When the **busyout ds1-facility** command is executed, software communicates with both DS1 converter circuit packs in the DS1 converter complex. If the board at which the facility is being busied out is not accessible, the abort code 2100 is returned. If the board at the other end of the DS1 converter complex is not accessible, the abort code 105 is returned.

DS1 Facility Administration

DS1 facility administration is a part of the fiber link administration. DS1 options are set on the Fiber Link Administration screen. For critical-reliability systems, the Fiber Link Administration screen contains the DS1 facility options for the B side of the PNC.

DS1 facility administration is explained in the following sections. These descriptions do not provide complete coverage of fiber link administration.

Replacing a DS1 Facility

Disconnecting a DS1 facility is service disrupting except on critical-reliability systems since they have PNC duplication.

For a standard-, duplex-, or high-reliability system (no PNC duplication):

This procedure is **destructive**.

1. Use **busyout ds1-facility** to busy out the DS1 facility.
2. Replace the DS1 facility.
3. Use **release ds1-facility** to release the DS1 facility.

For a critical-reliability system (PNC duplication):

This procedure is nondestructive.

1. If the DS1 facility to be replaced is on the active PNC (its amber LED is on solid), use **reset pnc interchange** to do a PNC demand interchange. Use **status pnc** to determine the active PNC.
2. When the DS1 facility to be replaced is on the standby PNC (if the DS1 facility was originally on the standby PNC or after the PNC interchange has finished), use **busyout ds1-facility** to busyout the DS1 facility.
3. Replace the DS1 facility.
4. Use **release ds1-facility** to release the DS1 facility.

Installing a DS1 Facility

To install a DS1 facility:

1. Connect the facility.
2. Use **list fiber-link** to check the fiber link number.
3. Use **change fiber-link** to administer the DS1 facility via the command. Set the `Facility Installed` field to **y** for the facility that is being installed.
4. Use **busyout board** to busyout the DS1 converter circuit pack.
5. Use **test board *UUCSS* long** to run the DS1 Facilities Connectivity test (#790), to ensure that the facilities are connected correctly.
6. Use **release board** to release the DS1 converter circuit pack.

Removing a DS1 Facility

Removing a DS1 facility is service disrupting in any system configuration, because the DS1 facility administration is similar on both sides of the PNC on critical-reliability systems.

This procedure is **destructive**.

1. Use **busyout ds1-facility** to busyout the DS1 facility.
2. Use **list fiber-link** to check the fiber link number.
3. Use **change fiber-link** to administer the DS1 facility. Set the `Facility Installed` field to **n** for the facility that is being removed.
4. Disconnect the DS1 facility (or facilities in a critical-reliability system configuration).

DS1 Interface Options

Use fiber link administration to set the following DS1 Interface options. Use **list fiber-link** to check the number of the fiber link. Execute **change fiber-link** and set the following fields:

Facility Installed

The Facility Installed field is **y** when the facility is installed.

For TN574 DS1 converter boards, facility A must be installed first. Install Facilities B, C and D in any order on any of the four facilities.

For TN1654 DS1 converter boards, facility A must be installed first, then B, then C or D. This is required because the primary facility can only reside on facilities A or B.

Passes Far-End Clock

The field is **y** when the DS1 facility is used as a clock reference for the receive fiber signal.

This field appears on the Fiber-Link screen only for TN574 DS1 converter circuit packs. On the TN1654 DS1 converter board, none of the facilities can be used as a clock reference for the receive fiber signal, and administration of this field is not applicable.

DS1 facilities cannot be used as system synchronization sources.

Digital Data Compatible

The Digital Data Compatible field is **y** when the DS1 facility is digital data compatible and suitable for carrying packet traffic.

This field appears on the Fiber-link screen only for TN574 DS1 converter circuit packs. The TN574 circuit pack allows any of the four facilities to be used as the primary facility that carries the packet traffic. The TN1654 DS1 converter board allows packet traffic only on facilities A and B, and administration of this field is not applicable.

Bit Rate

This field is used to select domestic T1 operation or international E1 operation for all facilities in the TN1654 DS1 converter complex. The field is set to 1.544 Mbps for T1 operation and 2.048 Mbps for E1 operation.

This field appears on the fiber-link screen only for TN1654 DS1 converter circuit packs.

> **NOTE:**
> The TN1654 DS1 converter circuit pack is also field configurable for T1 or E1 operation. All four DS1 facilities are configured to either T1 or E1 as a group via an option switch located on the component side of the circuit pack. An error will be logged and an alarm will be raised if there is a T1/E1 inconsistency between the administered bit rate and the board option switch setting.

Idle Code

This field is used to set the idle code for all facilities on the TN1654 DS1 converter board. This field can accept any combination of ones (1) and zeros (0) with the exception that the second left-most digit must be set to one (1) at all times.

This field appears on the fiber-link screen only for TN1654 DS1 converter circuit packs.

CRC

This field determines if CRC is enabled for every facility on a TN1654 circuit pack. The field is **y** if a cyclic redundancy check (CRC) is to be performed on transmissions that the board receives.

CRC only applies to E1 operation and appears on the Fiber-link screen only for TN1654 DS1 converter circuit packs with a bit rate of 2.048 Mbps.

DS1 Converter-1 and DS1 Converter-2 Line Compensation

The DS1 facility line signal is pre-equalized at the transmitter on the DS1 converter circuit pack so that DS1 line pulses have correct amplitude and shape when they reach the Network Interface (see Figure 51, DS1 Facility Connections, on page 832). The amount of equalization necessary is determined by the distance to the Network Interface, and also by the type of wiring used to connect to the Network Interface. If the equalization is not set to the correct value, potentially high error rates (errored seconds) will be observed on the DS1 facility. Equalization values are determined as follows:

	Distance to Network Interface (feet)	
Equalizer Setting	**Cable type 22 AWG ABAM & 24 AWG PDS**	**Cable type 26 AWG PDS**
1	1 to 133	0 to 90
2	133 to 266	90 to 180
3	266 to 399	180 to 270
4	399 to 533	270 to 360
5	533 to 655	360 to 450

Line compensation is applicable only to T1 operation, thus these fields will not appear on the fiber-link screen if the TN1654 DS1 converter is administered for a bit rate of 2.048 Mbps.

Line Coding

This field is used to administer the line coding for the DS1 facility. For the TN574 board and the TN1654 board in T1 mode, the field may be set to *ami-zcs* or *b8zs*. If the TN1654 board is set for E1 operation, the line coding may be set to either *ami-basic* or *hdb3*. The line coding must be the same at each end of the DS1 converter complex.

Framing Mode

Either *esf* or *d4* framing mode can be selected for the DS1 facility. The same framing mode must be used at each end of the DS1 converter complex.

For TN574 DS1 converter boards, the `Framing Mode` field is administrable.

For TN1654 DS1 converter boards, this field is display only. It cannot be administered. The TN1654 has option switches located on the component side of the circuit pack. If T1 operation is selected via the first switch, four additional switches are used to select the framing mode for each facility. Each facility can be set to either D4 or ESF framing. The `Framing Mode` field will display what the switch is set to for the DS1 facility.

Framing Mode is applicable only to T1 operation, thus this field will not appear on the fiber-link screen if the TN1654 DS1 converter is administered for a bit rate of 2.048 Mbps.

Line Termination

This field displays the line termination for the DS1 facility on the TN1654 DS1 Converter circuit pack. This field is display only. It cannot be administered. The TN1654 has option switches located on the component side of the circuit pack. If E1 operation is selected via the first switch, four additional switches are used to select the line termination for each facility. Each facility can be set to either CEPT 75 ohm coaxial or 120 ohm CEPT twisted pair. This line termination field will display what the switch is set to for the DS1 facility.

Line Termination is applicable only to E1 operation, thus this field will not appear on the fiber-link screen if the TN1654 DS1 converter is administered for a bit rate of 1.544 Mbps

Facility Circuit ID

These fields are used to specify a unique alpha-numeric name up to 40 characters long for each DS1 facility. This field will be displayed for each facility whose *Facility Installed?* field is set to **yes**.

DS1 Converter Performance Measurements Report

The DS1 Converter Performance Measurements provide link performance measurements for the DS1 facilities.

When no facility alarms exist on the DS1 facility, events that indicate a degradation in the performance of the DS1 facility are monitored and recorded. These events will generate alarms when performance of the DS1 facility has degraded below acceptable levels. These measurements include errored seconds, bursty seconds, severely errored seconds, and failed seconds.

There are two DS1 Converter Performance Measurements Sub-reports. The first sub-report, DS1 Converter Performance Measurements Summary Report, provides information about the worst 15-minute interval of data, the total for 24 hours of data and the current 15-minute counter for each of the previously mentioned counters.

The second sub-report, DS1 Converter Performance Measurements Detailed Report displays a detailed log for the last 96 15-minute intervals for each of the previously mentioned counters.

The DS1 Converter Performance Measurements Summary Report can be accessed with **list measurements ds1-facility summary *UUCSSf* [print | schedule]**. A more detailed version of the report is accessed with **list measurements ds1-facility log *UUCSSf* [print | schedule]**.

The user can reset every hardware- and software-measurement counter for a given facility with **clear measurements ds1-facility *UUCSSf***. The *Counted Since* time is also reset and the *Number of Valid Intervals* count is set to zero.

The reports are printed on the screen or, by using the *print* option, on a printer attached to the terminal.

Clearing Firmware Errors

DS1 converter error reports are generated by firmware autonomously. DS1 converter error reports are not associated with technician-demanded tests. The **test board clear** command does not affect the error status known by the DS1 converter firmware. To clear every on-board firmware-detected error unconditionally, use **clear firmware-counters**.

Error Log Entries and Test to Clear Values

Table 347: DS1 Facility Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	SAT Test to Clear Value
0[1]	0	Any	Any	Any	**test ds1-facility** *UUCSSf* **sh r 1**
1 (a)		Failure Audit #949	MAJOR	ON	**test board** *UUCSS* **sh r 1**
18 (b)	0	**busyout ds1-facility** *UUCSSf*	WARNING	OFF	**release ds1-facility** *UUCSS*
257 (c)		Failure Audit #949	MINOR	ON	**test board** *UUCSS* **sh r 1**
513 (d)	1	Failure Audit #949	MINOR	OFF	**test board** *UUCSS* **sh r 1**
513 (d)	2	Failure Audit #949	MINOR	OFF	**test board** *UUCSS* **sh r 1**
856 (e)		DS1 Facility Query for Slips/Misframes #972	MINOR	OFF	**none**
1025 (f)		Failure Audit #949	MAJOR[2]	OFF	**test board** *UUCSS* **sh r 1**
1281 (g)	None	Failure Audit #949	MAJOR[2]	OFF	**test board** *UUCSS* **sh r 1**
1281 (g)	1	Failure Audit #949	MAJOR[2]	OFF	**test board** *UUCSS* **sh r 1**
1281 (g)	2	Failure Audit #949	MAJOR[2]	OFF	**test board** *UUCSS* **sh r 1**
1537 (h)		Failure Audit #949	MAJOR[2]	OFF	**test board** *UUCSS* **sh r 1**
1793 (i)		Failure Audit #949	MAJOR[2]	OFF	**test board** *UUCSS* **sh r 1**
2065 (j)		DS1 Facility Query for Slips/Misframes #972	MINOR	OFF	**none**
2305 (k)		Failure Audit #949	MAJOR	OFF	**test board** *UUCSS* **sh r 1**
2561 (l)		Failure Audit #949	MINOR[3]	OFF	**test board** *UUCSS* **sh r 1**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

2 These failures are logged as a WARNING alarm when the error is first reported. The alarm severity is raised to a MAJOR in 15 minutes if the problem persists.

3 This failure is logged as a WARNING alarm when the error is first reported. The alarm severity is raised to a MINOR in 15 minutes if the problem persists.

Notes:

When problems persist, use **reset board** to reset the DS1 converter circuit pack. This may temporarily resolve the error condition and restore service until further assistance is provided.

a A major failure occurred on the DS1 interface hardware on the DS1 converter circuit pack associated with this DS1 facility. Replace the DS1 converter circuit pack.

b This error indicates that the DS1 facility has been busied out via the **busyout ds1-facility** command. To resolve this error, release the DS1 facility via the **release ds1-facility** command.

c A minor failure occurred on the DS1 interface hardware on the DS1 converter circuit pack associated with this DS1 facility. Replace the DS1 converter circuit pack.

d DS1 converter circuit packs in this DS1 converter complex do not match in their framing formats or line coding formats.

Aux Data 1 indicates that the framing formats (ESF or D4) do not match. For TN574 DS1 converter boards, the framing mode is administered on the fiber-link screen. The TN1654 DS1 converter has option switches located on the component side of the circuit pack. If T1 operation is selected via the first switch, four additional switches are used to select the framing mode for each facility. The `Framing Mode` field on the fiber-link screen is display-only for the TN1654 boards. It displays what the switch is set to for the DS1 facility. It cannot be administered.

Aux Data 2 indicates that the line coding formats do not match. Line Coding is an administrable value on the fiber-link screen. The line coding options are *ami-zcs* or *b8zs* for TN574 boards and TN1654 boards in T1 mode. For TN1654 boards in E1 mode, the line coding options are *ami-basic* or *hdb3*.

This error should clear in 15 minutes.

1. Verify that DS1 facility and the network is using the same line coding (ami-zcs, b8zs, ami-basic, hdb3) and framing mode (ESF, D4). Use **list fiber-link** and **display fiber-link** commands to check the values for this DS1 facility. Contact T1 Network Service to check the modes used by the network.

   If the framing mode format differs on boards in a TN1654 DS1 converter complex, the DS1 converter board that has its option switch set incorrectly will have to be physically removed from the system in order to set the facility framing mode switch properly.
2. If the problem persists, reset both DS1 converter circuit packs via the **reset board** command.
3. If the problem still persists, replace this DS1 converter circuit pack.
4. If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

e More than 88 negative and/or positive slip errors occurred. This error will clear when there are no slips for 1 hour.

1. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
2. Verify that the DS1 facility and the network are using the same Line Coding. For TN574 boards and TN1654 boards in T1 mode, also verify that the Framing Mode used is the same. Use **list fiber-link** and **display fiber-link** to check the values for this DS1 facility. Contact T1 Network Service to check the modes used by the network. See the previous sections, “Line Coding” and “Framing Mode” for details on how these options apply to the TN574 and TN1654 DS1 converter boards.

3 For TN574 boards and TN1654 boards in T1 mode, check line equalization settings as described in the previous section, “DS1 converter-1 and DS1 converter-2 Line Compensation.”

4 Enter **display errors** and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints. Enter **display errors** and follow the associated repair procedures for any FIBER-LK errors for this fiber link.

5 If the problem still persists, replace this DS1 converter circuit pack.

6 If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

f Loss of Frame Alignment (LFA) Alarm, the RED alarm: This alarm indicates that the DS1 interface associated with the DS1 facility cannot frame up on the received data.

For the following repair procedure, see to Figure 51, DS1 Facility Connections, on page 832 and the diagrams in the related test descriptions.

1 If the network is used instead of private T1 lines, check that the DS1 facility and the network are using the same line coding. For TN574 boards and TN1654 boards in T1 mode, also verify that the Framing Mode used is the same. For TN1654 boards, verify that the two boards in the DS1 converter complex are using the same bit rate. Use **list fiber-link** and **display fiber-link** to check the values for this DS1 facility. Contact T1 Network Service to verify the modes set for the network. See the previous sections, “Line Coding”, “Framing Mode”, and “Bit Rate” for details on how these options apply to the TN574 and TN1654 DS1 converter boards.

2 Run the Near-End External Loopback test (#799) via the **test ds1-facility *UUCSSf* external-loopback** command by setting up a loop back at CPE side of CSU towards DS1 converter circuit pack shown as loop back point **LB 1** in the test description diagram. If the test fails, replace connectors and the cables between CSU and the DS1 converter circuit pack.

3 If the test passes, run the Near-End External Loopback test (#799) via the **test ds1-facility *UUCSSf* external-loopback** command by setting up a loop back at DS1 facility side of CSU towards the DS1 converter circuit pack shown as loop-back point **LB 2** in the test description diagram. If the test fails, replace the CSU.

4 If Test #799 passes, run the Far-End Internal Loopback test (#797) via the **test ds1-facility *UUCSSf* long** command. If Test #797 passes, go to step 6. If the test fails, then run the Near-End External Loopback test (#799) via the **test ds1-facility UUCSSf external-loopback** command at the other end of the DS1 converter complex, and repeat steps 2 and 3 for the other endpoint.

If this is not a critical-reliability system and if there is only one DS1 facility, then Test #799 can only be executed at the end that is closer to the media server relative to the DS1 converter circuit pack at the end of the DS1 converter complex. If the test cannot be executed for this reason, then replace the cables, connectors and the CSU at the other end of the DS1 converter complex.

5 If the problem could not be isolated by the near-end external loop-back tests, then the fault should be between CSU A and CSU B. Contact T1 Network Service to resolve the problem(*).

6 If the problem still persists, check for excessive slips and synchronization problems. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, or SNC-BD errors. For TN574 boards and TN1654 boards in T1 mode, check line equalization settings as described in the previous section, *“DS1 Converter-1 and DS1 Converter-2 Line Compensation”*.

7 Enter **display errors** and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints. Enter **display errors** and follow the associated repair procedures for any FIBER-LK errors for this fiber link.

8 If the problem still persists, replace this DS1 converter circuit pack.

9 If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

If D4 framing mode is used, an in-band alarm signal (RFA) will be transmitted that will corrupt the transmit data on this facility.

g *Aux Data None* This entry in the DS1 Facility Error Log will only occur prior to Release V5. The DS1 converter circuit pack's neighbor (the DS1 converter circuit pack at the other end of the DS1 converter complex) is unable to frame up on the signal being sent to it by this DS1 converter circuit pack on this DS1 facility. The far-end facility will be in LFA state. To isolate faults for this case, follow the repair procedure for Error Type #1025 for the other end of the DS1 facility. Note that references to the near and far ends are reversed, for example, the neighbor is now the near end. If D4 framing is used, received data will be corrupted as well as transmitted data.

Aux Data 1 indicates that the facility is detecting a Remote Frame Alarm (RFA), also known as the YELLOW alarm, being sent by the remote DS1 endpoint. This Yellow alarm corresponds to the yellow F2 state documented in CCITT Recommendation I.431. If D4 framing is used, received data will be corrupted in addition to transmitted data.

Aux Data 2 indicates that the facility is detecting a yellow F5 state alarm. This error only applies to TN1654 DS1 converter boards in 32-channel E1 operation with CRC enabled via the fiber-link screen. The F5 fault state is defined as a fault in the user-network interface, specifically in the direction from the user (PBX) to the network. Refer to CCITT recommendation I.431.

The far-end facility will be in LFA state. To isolate faults for this case, follow the same repair procedure as in Error Type #1025 (loss of frame alignment) for the other end of the DS1 facility.

h Alarm Indication Signal (AIS), the BLUE alarm. This alarm indicates that the far end of the facility is out of service. This means that the other end of the DS1 facility is undergoing maintenance testing or has a LOS condition and the CSU is providing a **Keep Alive** signal. If the **Keep Alive** signal is not supplied by the CSU, a LOS condition will exist on the facility instead of the AIS. If a LOS condition exists on the facility, the green LED on the TN574 DS1 converter circuit pack that is associated with the facility will be off; if an AIS condition exists on the facility, the green LED that is associated with the facility that has the AIS will be on. For TN1654 DS1 converter boards, the LED associated with the facility will be lit red if either the LOS or AIS conditions exist.

To isolate faults for this case, follow the same repair procedure as in Error Type #1793 (loss of signal) for the other end of this DS1 facility.

An RFA alarm indication (YELLOW alarm) is transmitted in response to this BLUE alarm. If D4 framing is used, transmitted data is corrupted.

i Loss of Signal (LOS) alarm. This alarm indicates that no signal is present at the DS1 interface associated with the facility. On TN574 DS1 converter boards, the green LED that is associated with the facility will be off. For TN1654 DS1 converter boards, the LED that is associated with the facility will be lit red. If the LED behavior differs, replace the DS1 converter circuit pack.

Fault isolation for this problem may be different depending on the capabilities of the CSU device that is being used. Typically, CSUs provides an LED that is useful for fault isolation (see Figure 52, Typical CSU Maintenance Capabilities, on page 833). This is the "16 Zeros" LED. This LED is momentarily lit when a string of 16 consecutive zeros is detected in the DS1 signal from the DS1 converter. Zeros on a DS1 link are represented by an absence of a pulse. Thus, an active 16 Zeros LED indicates a LOS alarm from the DS1 converter.

For the following repair procedure, see <Link>Figure 51 on page 832 and the diagrams in the related test descriptions.

1. If the DS1 facility side LOS indication on CSU A is off (inactive), check for a problem between the DS1 converter A circuit pack and the CPE side of CSU A. Connectors, cables, and the CSU may need to be replaced.
2. If the DS1 facility side LOS indication on CSU A is on (active), check for a problem between the CSU A and the CSU B. Contact T1 Network Service to resolve the problem.[1]
3. If the CPE side LOS indication on CSU B is on (active), check for a problem between the CPE side of CSU B and the DS1 converter B circuit pack. Connectors, cables, and the CSU B may need to be replaced.
4. If the CSU A and the CSU B do not provide visual CPE side and DS1 facility side LOS indications, follow the repair procedure that is given for Error Type1025 (loss of frame alignment). Apply the procedure first to the DS1 converter B side instead of the DS1 converter A where the error is reported (external loop-back test is not expected to pass if we execute it at this end as long as we have the LOS indication).

   Repair procedure for Error Type #1025 (loss of frame alignment) includes execution of the Near-End External Loopback test (#799). If this is not a critical-reliability system and if there is only one DS1 facility, then Test #799 can only be executed at the end that is closer to the media server relative to the DS1 converter circuit pack at the end of the DS1 converter complex. If the test cannot be executed for that reason, then still make the external loop back as if the test was going to be executed, but instead of executing the test, check the green LED at the face plate of the DS1 converter B that is associated with this DS1 facility. If the green LED is off, then replace the connectors, cables, and the CSU B.
5. If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.
6. If the problem still persists, replace this DS1 converter circuit pack.

If D4 framing is used, an in-band alarm signal (RFA) is transmitted that corrupts transmit data in response to this alarm.

j More than 17 misframe errors occurred. This error will clear when there are no misframes for 1 hour.

1. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, or SNC-BD errors.
2. Verify that the DS1 facility and the network are using the same Line Coding. For TN574 boards and TN1654 boards in T1 mode, also verify that the Framing Mode used is the same. Use **list fiber-link** and **display fiber-link** commands to check the values for this DS1 facility. Contact T1 Network Service to check the modes used by the network. See the previous sections, "''Line Coding'' and ''Framing Mode'' for details on how these options apply to the TN574 and TN1654 DS1 converter boards.
3. For TN574 boards and TN1654 boards in T1 mode, check line equalization settings as described in the previous section *"DS1 Converter-1 and DS1 Converter-2 Line Compensation"*.

---

1 DS1 facility may be a private line or it may be connected to the Network. Network Interface (NI) point is where the customer's maintenance responsibility ends and the DS1 facility vendor's maintenance responsibility begins. This point ideally is the T, R, T1, and R1 terminals on the rear of the CSU to which the wires of the DS1 facility vendor's DS1 facility is attached. If the NI does not occur at this point, then any cabling between the CSU terminals and the NI is also considered to be part of the CPE. This cable typically runs between the DS1 facility terminals of the CSU and a cross-connect field where the DS1 facility vendor has terminated the DS1 facility. Maintenance responsibility for this portion of the DS1 facility resides with the customer unless other arrangements are made.

4 Enter **display errors** and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints. Enter **display errors** and follow the associated repair procedures for any FIBER-LK errors for this fiber link.

5 If the problem still persists, replace this DS1 converter circuit pack.

6 If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

k Facility Packet Channel Loopback Error. This error indicates that the DS1 converter primary facility that carries the packet time slots and DS1 control channel is looped to itself. This error applies only to facilities A and B on TN1654 DS1 converter boards. If both facilities A and B are being used and firmware detects a loop-back condition an attempt will be made to switch the primary facility to the other facility. If the other facility is looped, down or not being used, the PN will be down until this loop back is removed.

1 Check the loop-back LEDs on both CSU A and CSU B as shown in Figure 51, DS1 Facility Connections, on page 832 to see if a CSU is in a loop-back mode. Also check to see if the CSUs have been manually hard-wired into a loop-back mode. Remove detected loop backs.

2 If the CSUs are not in loop-back mode, reset both DS1 converter boards via the **reset board** command.

l Facility Jitter Alarm. This alarm indicates excessive receive jitter on the DS1 facility. This error only applies to TN1654 DS1 converter boards. The problem is external to the DS1 converter board. It could be caused by bad wiring, a bad device (CSU or repeater) or a bad signal coming in at the Network Interface.

Figure 51: DS1 Facility Connections

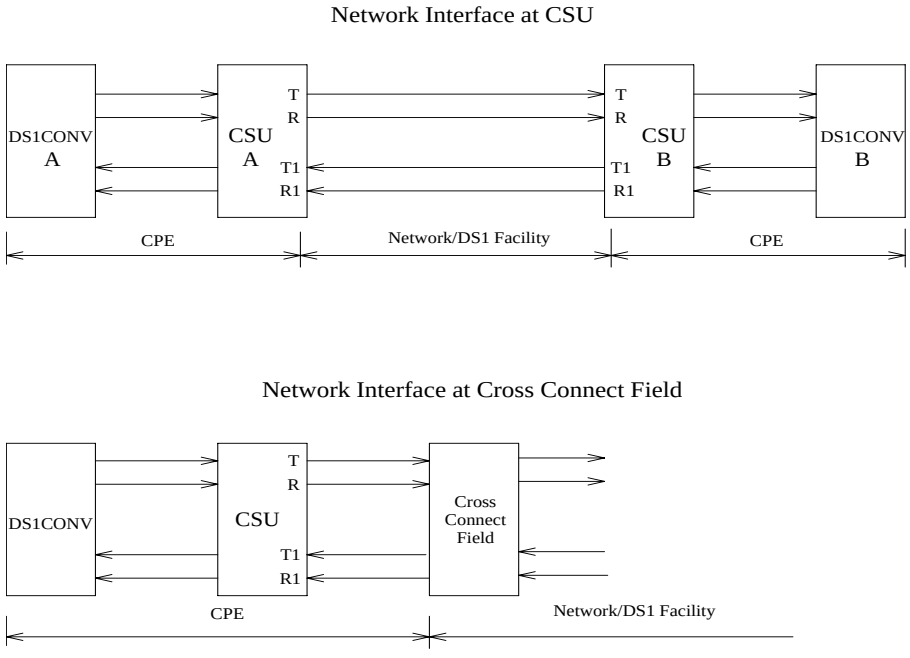


Figure 52: Typical CSU Maintenance Capabilities

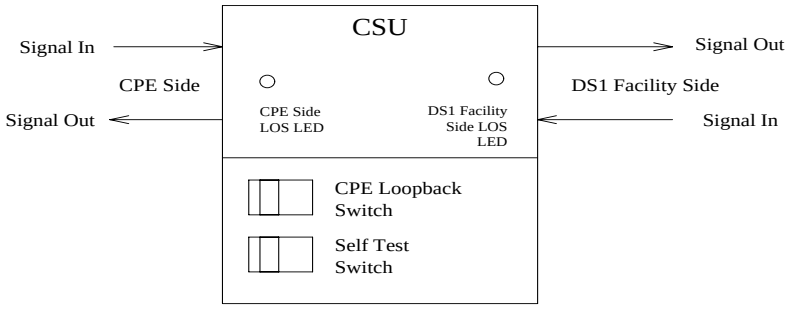

System Technician-Demanded Tests: Descriptions And Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the Failure Audit, for example, you may also clear errors generated from other tests in the testing sequence. The Failure Audit test is executed via the test board command

Order of Investigation	Short Test Sequence	Long Test Sequence	External Loopback	Reset Sequence	D/ND[1]
Failure Audit (#949)					ND
DS1 Interface Options Audit (#798)	X	X			ND
Far-End Internal Loopback test (#797)		X			D
Near-End External Loopback test (#799)			X		D

1 D = Destructive; ND = Nondestructive

Far-End Internal Loop-Back Test (#797)

This test is **destructive**.

This test starts at the DS1 converter circuit pack whose equipment location was entered and traverses over the specified facility and loops at the internal facility interface on the other DS1 converter circuit pack in the DS1 converter complex. See the following diagram.

Every part of this test is executed under firmware control and the result is sent back to the maintenance software. The test is executed by sending digital data through every DS1 channel on this facility. For TN574 DS1 Converter facilities, test patterns are sent through every DS1 channel. For TN1654 DS1 Converter facilities, test patterns are sent through one DS1 channel.

If there is only one DS1 facility available, the system will not allow that last facility to be busied out. In that case, the DS1 converter circuit pack must be busied out before executing this test.

For a standard-, duplex-, or high-reliability system (no PNC duplication), if there is only one DS1 facility available, then this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack because of its impacts on the system control links. For TN574

DS1 converter boards, the completion of the test will be delayed in this configuration to wait for the recovery of the system control links. For a critical-reliability system (PNC duplication) or for a system with multiple DS1 facilities, the test can be executed at any DS1 converter circuit pack.

If the test passes on a TN1654 DS1 facility, the *round trip delay time* will be displayed in milliseconds in the `Error Code` field. The round trip delay time is defined as the length of time in milliseconds it takes for the firmware to receive the test pattern after it has been sent.

Figure 53: Far-End Internal Loop-Back Test (#797)

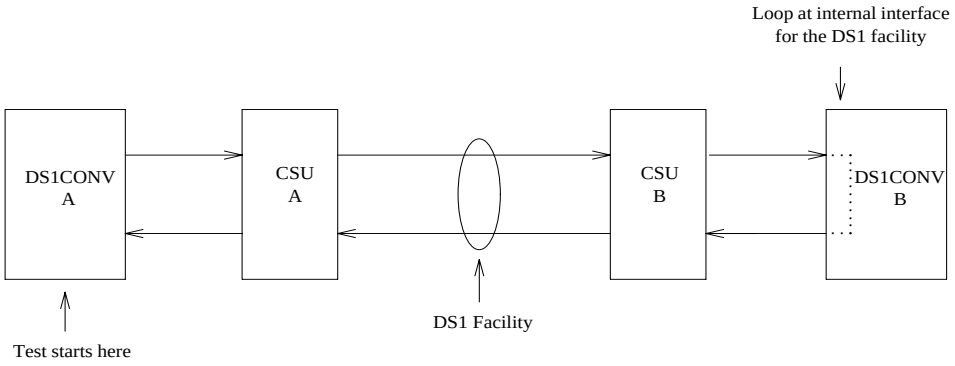

Table 348: Test #797 Far-End Internal Loop-Back Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Timed out while waiting for a response from the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Use **add fiber-link** to administer the DS1 converter.
2321	ABORT	DS1 facility is not busied out. Use **busyout ds1-facility** to busyout the DS1 facility. If there is only one DS1 facility, use **busyout board** to busyout the DS1 converter circuit pack.
2332	ABORT	For this system configuration, test is not allowed to execute at the far end when there is only one DS1 facility available. Execute the test at the other end of the DS1 converter complex.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

1 of 2

Table 348: Test #797 Far-End Internal Loop-Back Test

Error Code	Test Result	Description / Recommendation
	FAIL	Far-End Internal loop back failed. A problem exists between DS1 converter A and DS1 converter B's internal interface for the DS1 facility (see previous diagram). **1** If the test is executed as a part of an error analysis, then return back to the related section. **2** Enter **display errors** and follow the associated repair procedures for any on-board DS1C-BD errors on this DS1 converter circuit pack and the DS1 converter circuit pack at the other end of the DS1 converter complex. **3** If the network is used instead of private T1 lines, verify that the DS1 facility and the network are using the same Line Coding. For TN574 boards and TN1654 boards in T1 mode, also verify that the Framing Mode used is the same. Use **list fiber-link** and **display fiber-link** to check the values for this DS1 facility. Contact T1 Network Service to check the modes used by the network. See the previous sections, "Line Coding" and "Framing Mode" for details on how these options apply to the TN574 and TN1654 DS1 converter boards. **4** Isolate the problem by running the Near-End External Loopback test (#799) via **test ds1-facility *UUCSSf* external-loopback**, first at this end and then at the other end of the DS1 converter complex. Setup loop backs at different points as shown in the description diagram for Test #799, and follow repair procedures described for Test #799. **5** If the problem could not be found by near-end external loop-back tests, then the fault should be between the CSU A and the CSU B. Contact T1 Network Service to resolve the problem, also see the repair procedures for Error Type #1025 (loss of frame alignment).
Any	PASS	Transmission through the path of the loop back is successful. TN1654 DS1 facilities will display the round trip delay time in milliseconds in the `Error Code` field. The round trip delay time is defined as the length of time in milliseconds it takes for the firmware to receive the test pattern after it has been sent.

2 of 2

DS1 Interface Options Audit Test (#798)

This test is nondestructive.

This test sends the administered DS1 Interface options to the DS1 converter circuit pack. Options are sent to both DS1 converter circuit packs at the same time to prevent any transitional mismatch of options.

The following DS1 facility options are sent to the TN574 DS1 converter circuit pack: Framing Mode, Line Coding and DS1 converter-1 and DS1 converter-2 Line Compensation.

The following DS1 facility options are sent to the TN1654 DS1 converter circuit pack: Line Coding and DS1 converter-1 and DS1 converter-2 Line Compensation (T1 only). These option fields appear on the Fiber-link Administration screen.

Table 349: Test #798 DS1 Interface Options Audit

Error Code	Test Result	Description / Recommendation
105	ABORT	The neighbor DS1 converter circuit pack at the other end of the DS1 converter complex is not accessible.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2000	ABORT	Timed out while waiting for a response from the circuit pack.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Use **add fiber-link** to administer the DS1 converter fiber link.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	PASS	The DS1 Interface options are sent to the circuit pack.

Near-End External Loop-Back Test (#799)

This test is **destructive**.

This test starts at the DS1 converter circuit pack whose equipment location was entered and traverses over the specified facility and loops back at the manually hard-wired external loop-back device. Depending on the type of physical connectivity of the DS1 facility, special tools, cables or connectors may be required to make the hard-wired loop backs.

To isolate a problem, set the loop back first at the loop-back point **LB 1**, and then at the loop-back point **LB 2**, see Figure 54 and Figure 51. Place the loop backs at as many points as your CSU capabilities will allow. Hard-wired loop backs at the far end are not desirable, because the equalization-level adjustments may cause problems.

Every part of this test is executed under firmware control and the result is sent back to the maintenance software. The test is executed by sending digital data through every DS1 channel on this DS1 facility.

This test is executed via the **test ds1-facility *UUCSSf* external-loopback** command. It is not part of the long test sequence because it requires modifications to the physical connectivity of the DS1 facility.

If there is only one DS1 facility available, system will not allow the last facility to be busied out. In that case, the DS1 converter circuit pack must be busied out before executing this test.

For a standard-, duplex-, or high-reliability system (no PNC duplication), if there is only one DS1 facility available, then this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack because of its impacts on the system control links. For a critical-reliability system (PNC duplication) or for a system with multiple DS1 facilities, the test can be executed at any DS1 converter circuit pack.

If the test passes on a TN1654 DS1 facility, the *round trip delay time* will be displayed in milliseconds in the `Error Code` field. The round trip delay time is defined as the length of time in milliseconds it takes for the firmware to receive the test pattern after it has been sent. This measurement is taken on the last DS1 channel tested.

Figure 54: Loopback Points for Test #799

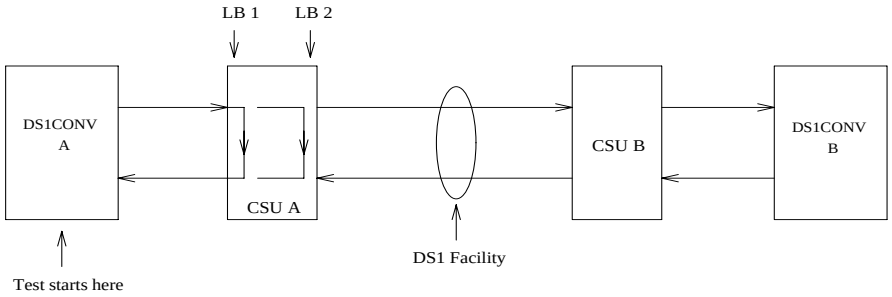

Table 350: Test #799 Near-End External Loop-Back Test

Error Code	Test Result	Description / Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test.
2000	ABORT	Timed out while waiting for a response from the circuit pack.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Use **add fiber-link** to administer the DS1 converter fiber link.
2321	ABORT	DS1 facility is not busied out. Busyout the DS1 facility via **busyout ds1-facility**. If there is only one DS1 facility, busyout the DS1 converter circuit pack via **busyout board**.
2332	ABORT	With this system configuration, test is not allowed to execute at the far end when there is only one DS1 facility available. Check the green LED at the face plate of the DS1 converter circuit pack. The green LED should be on if the loop is complete.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

Table 350: Test #799 Near-End External Loop-Back Test

Error Code	Test Result	Description / Recommendation
	FAIL	Near-end external loop back failed. A problem exists in the path of the loop back. **1** If the test is executed as a part of an error analysis, then return back to the related section. **2** Enter **display errors** and follow the associated repair procedures for any on-board DS1C-BD errors. **3** If the loop-back point is **LB 1**, replace connectors and cables between the DS1 converter A and the CSU A. If the loop-back point is **LB 2**, replace CSU A. Also see the repair procedure for Error Type #1025 (loss of frame alignment). **4** If the test still fails, replace DS1 converter A circuit pack.
Any	PASS	Transmission through the path of the loop back is successful. TN1654 DS1 facilities will display the round trip delay time in milliseconds in the `Error Code` field. The round trip delay time is defined as the length of time in milliseconds it takes for the firmware to receive the test pattern after it has been sent. This measurement is taken on the last DS1 channel tested.

Failure Audit (#949)

This test is nondestructive.

This test queries the DS1 converter circuit pack for any existing circuit pack or facility failures and any unacknowledged cleared failure messages. Upon receiving the query request, DS1 converter firmware sends failure reports to the maintenance software for every error in its failure database.

This test operates on both MOs DS1C-BD and DS1-FAC. Error counts of both MOs (DS1C-BD and DS1-FAC) that are displayed in the error log will be incremented when this test is executed. This test is executed via the **test board** command. The test is also executed internally by the maintenance software when an alarm is resolved

Table 351: Test #949 Failure Audit

Error Code	Test Result	Description / Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test.
2000	ABORT	Timed out while waiting for a response from the circuit pack.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Use **add fiber-link** to administer the DS1 converter fiber link.

1 of 2

Table 351: Test #949 Failure Audit *Continued*

Error Code	Test Result	Description / Recommendation
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	FAIL	The DS1 converter circuit pack reported failures or retransmitted a cleared failure message. **1** Enter **display errors** and follow the associated repair procedures for any DS1C-BD and DS1-FAC errors.
	PASS	The DS1 converter circuit pack has no failures.

2 of 2

DS1C-BD

S8700 MC only

Also called DS1 Converter

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DS1C-BD	MAJOR	**test board *location* sh r 1**	DS1 converter circuit pack
DS1C-BD	MINOR	**test board *location* sh r 1**	DS1 converter circuit pack
DS1C-BD	WARNING	**test board *location* sh r 1**	DS1 converter circuit pack

1 For information on specifying a ***location***, see Command Syntax on page 179.

The DS1 converter complex is part of the port-network connectivity (PNC) consisting of two TN574 DS1 Converter or two TN1654 DS1 Converter circuit packs connected by one to four DS1 facilities. It is used to extend the range of the 32-Mbps fiber links that connect PNs to the Center Stage Switch, allowing PNs to be located at remote sites.

The TN1654 DS1 Converter Circuit pack is a redesign of the TN574 DS1 Converter board. The TN1654 provides functionality equivalent to the TN574 but also adds a 32-channel E1 interface for international support as well as circuit-switched wideband connections (NxDS0). The TN1654 is supported beginning with DEFINITY Release 5r.

Every error condition reported by the firmware is associated with background tests that the firmware runs autonomously. Demand tests that are executed by the maintenance software do not cause any new error generation by the firmware. However, Failure Audit test (#949) affects auditing of the software error log by forcing the firmware to report the pending errors again.

Maintenance of the DS1 facilities themselves is covered under the "DS1-FAC" MO.

The DS1 converter complex can extend a fiber link between two EIs or between a PN EI and an SNI. Fiber links between two SNIs or between a PN and the Center Stage Switch (CSS) cannot be extended.

The TN1654 board is not compatible with the TN574 board. A DS1 converter complex may consist of two TN574 boards or two TN1654 boards, but a TN574 cannot be combined with a TN1654 in the same complex. A system with multiple DS1 converter-remoted PNs may contain DS1 converter complexes of both types, TN1654 board-pairs and TN574 board-pairs. Critical-reliability configurations with a pair of DS1 converter complexes serving an PN require identical board pairs and facilities. For example, a TN574 complex and a TN1654 complex may not be used together to serve the same PN in a critical-reliability configuration.

DS1 converter circuit packs connect to TN570 Expansion Interface (EI) circuit packs and TN573 Switch Node Interface (SNI) circuit packs via metallic cables as shown in Figure 55, DS1 converter connection to EIs and SNIs, on page 841. A fiber link cable can be used instead of the metallic cable if it is necessary to locate the DS1 converter far from the connected EI or SNI circuit pack, for example, in an adjacent cabinet.

The DS1 converter circuit pack can be placed in any regular slot in a PN carrier. However, the DS1 converter circuit pack can only be placed in slots 1 and 21 in a Switch Node (SN) carrier. The DS1 converter circuit pack is not connected to the TDM bus or the SN backplane. Communication to the circuit pack is done through the connected EI or the SNI circuit packs. Therefore, there is considerable interaction between the DS1 converters and the connected EIs and the SNIs. A special “Y” cable connects the DS1 converter circuit pack to the Fiber Endpoint and to the facilities.

NOTE:
The two DS1 converter boards, TN1654 and TN574, use unique “Y” cables that are incompatible with each other.

The TN573 SNI circuit pack is incompatible with the TN1654 board. A TN573B (or higher-suffixed) SNI board must be used when connecting to a TN1654 board. The TN573B SNI board is fully backward compatible with the TN573 board and can be connected to either TN1654 or TN574 boards.

NOTE:
A TN573B (or higher-suffixed) board must be used when connecting a SNI board to a TN1654 board. Error 125 will be logged and an on-board minor alarm will be generated against the SNI board if it is incompatible with the TN1654 circuit pack.

Figure 56, DS1 converter Complex in Direct Connect PNC, on page 842 and Figure 57, DS1 Converter Complex in Duplicated PNC with 1 SN, on page 843 show DS1 converter connections in a direct-connect PNC configuration and between the CSS and an PN in a critical-reliability system configuration (duplicated PNC).

Figure 55: DS1 converter connection to EIs and SNIs

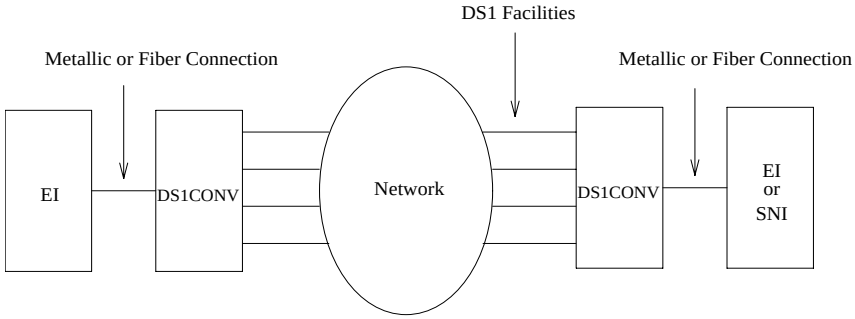

Figure 56: DS1 converter Complex in Direct Connect PNC

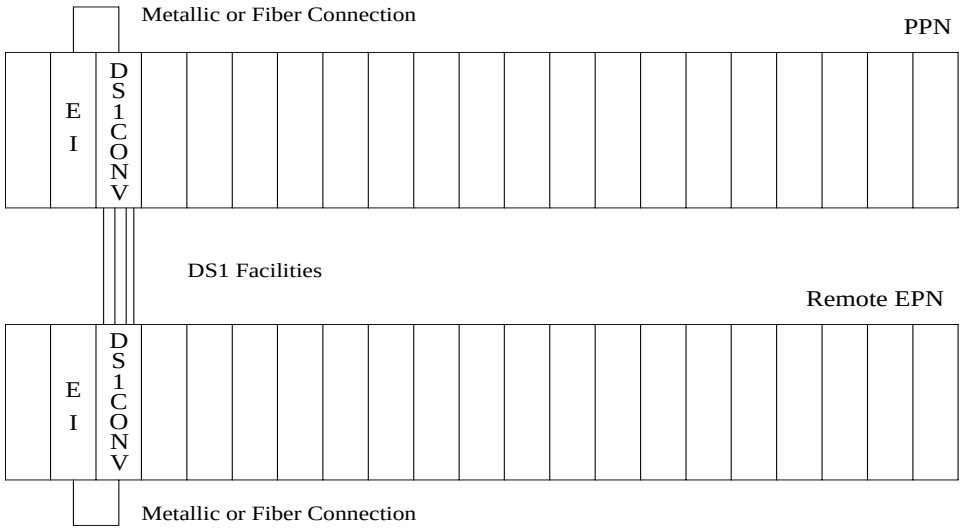

Figure 57: DS1 Converter Complex in Duplicated PNC with 1 SN

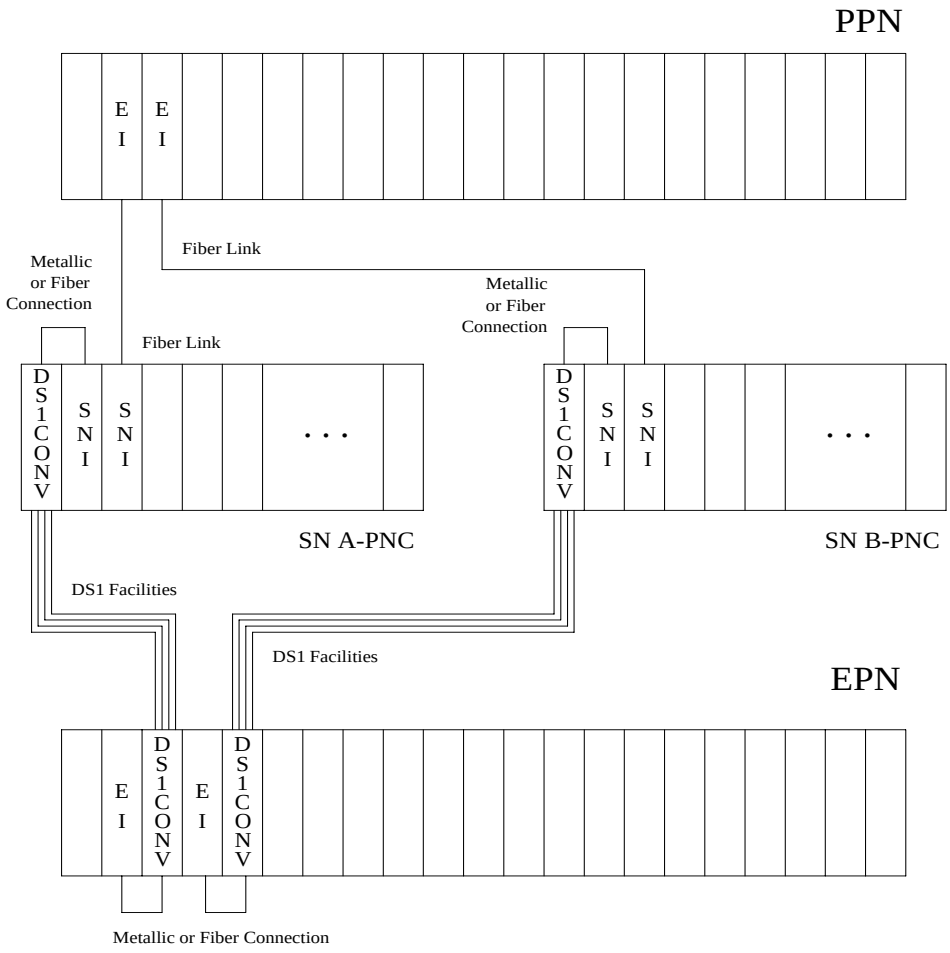

DS1 Converter Administration and Board Insertion

Board insertion is the detection of a circuit pack by the system. The DS1 converter circuit pack will not be inserted unless the circuit pack type, TN574 or TN1654, is entered into the associated field in circuit pack administration screen. The Fiber Endpoint (the EI or the SNI) must also be inserted and be operational for the DS1 converter circuit pack to function.

Fiber link administration must be completed before the DS1 converter maintenance can be operational. Fiber links are administered via the **add fiber-link** command. Fiber Endpoints, DS1 converter circuit pack locations and DS1 facility options are entered as a part of the fiber link administration.

Administration steps for a standard-, duplex-, or high-reliability system (no PNC duplication) are as follows:

1. Administer carriers via the **add/change cabinet** command.
2. Administer circuit packs via the **change circuit-pack** command.

3 Administer connectivity and the facility options of the DS1 converter complex via the **add/change fiber-link** command.

Administration steps for a critical-reliability system (PNC duplication) are as follows:

1 Enable PNC duplication feature using the **change system-parameter customer-option** command.

2 Administer carriers via the **add/change cabinet** command.

3 Administer circuit packs via the **change circuit-pack** command.

4 Administer connectivity and the DS1 facility options of each DS1 converter complex via the **add/change fiber-link** command.

5 Turn on PNC duplication via the **change system-parameter duplication** command.

TN1654 Board Configuration Switch Settings

The TN1654 DS1 converter circuit pack is field configurable for T1 or E1 operation so that a single board serves worldwide application. All four DS1 facilities are configured to either T1 or E1 as a group via an option switch located on the component side of the circuit pack. If T1 operation is selected, four additional switches are used to select the framing mode for each facility. Each facility can be set to either D4 or ESF framing. If E1 operation is selected, the same four switches are used to select the E1 facility line termination impedance. The E1 line termination impedance for each facility can be set to either 120Ω for twisted-pair or 75Ω for coaxial wiring.

T1 or E1 operation must also be administered for the TN1654 DS1 converter board on the fiber-link screen via the `Bit Rate` field. An error will be logged and an alarm will be raised if there is a T1/E1 inconsistency between the administered bit rate and the board option switch setting.

The T1 facility framing mode and the E1 facility line termination impedance are defined by the option switch settings only. Administration of these values is not allowed. The fiber-link screen will display the selected option switch settings for each facility.

DS1 Converter LEDs

The TN574 board has seven LEDs on its faceplate. The TN1654 board has eleven LEDs on its faceplate. The top three system standard LEDs are used to provide an indication of the state of the DS1 converter board. These LEDs are under firmware control until the board has established a link to the media server via the EI or SNI. Once the link is established, software controls the three LEDs. If the link breaks, the LEDs are again under firmware control.

The red and green LEDs have the traditional use where red means an alarm condition and green indicates that maintenance testing is in progress. The red and green LED is also turned on during circuit pack initialization by firmware. When the control link to the circuit pack is lost, firmware controls the red LED to indicate an alarm condition.

The amber LED under firmware control is used to indicate the state of the:

- Physical fiber interface
- Fiber channel (link to EI or SNI)
- DS1 control channel (link to opposite DS1 converter board)
- Server communications link

in the following manner and descending order of priority. (The amber LED stays lit longer as the DS1 converter complex approaches full operation.)

1. If the fiber is out of frame or is in a loss-of-signal condition, the amber LED will flicker at a 5-Hz rate (on for 0.1 second, off for 0.1 second).
2. If the fiber channel is down (DS1 Converter circuit pack/fiber endpoint communications), the amber LED will flash at a 1-Hz rate (on for ½ second, off for ½ second).
3. If the DS1 control channel is down between the two DS1 converters in the DS1 converter complex, the amber LED will pulse at a 1/2-Hz rate (on for 1 second, off for 1 second).
4. If the media server communications link is down, the amber LED will wink off every 2 seconds for 200 msec (2 seconds on, 0.2 second off).
5. If all is well with the Fiber Interface and every communications channel, the amber LED will remain on continuously in a standard-, duplex-, or high-reliability system. In a critical-reliability system (duplicated PNC):
   - An active DS1 converter circuit pack's amber LED remains on continuously.
   - A standby DS1 converter circuit pack's amber LED remains off.

   The LED will then be under software control.

The bottom four green LEDs on the TN574 DS1 converter board are under hardware control. The four green LEDs indicate, for each DS1 converter facility, whether a receive signal is present for the DS1 facility.

The next four LEDs on the TN1654 DS1 converter board are labeled STATUS LEDs and are for future use. These LEDs will not be lit.

The bottom four LEDs on the TN1654 board are labeled SPAN LEDs. These LEDs are under firmware control. If the facility is not administered, then the LED is not lit. The LED is lit amber if the facility is running alarm free. If the facility is detecting either a red alarm (loss-of-signal or loss-of-frame), a yellow alarm (remote frame alarm) or a blue alarm (AIS signal) then the LED is lit red. The SPAN SELECT Switch on the TN1654 faceplate is for future use. Pushing the switch will have no affect on the board.

Clear Firmware-Counters Command

DS1 converter firmware generates error reports autonomously. This takes place independently of technician-demanded tests. The **test board *UUCSS*** clear command will not affect the error status reported by firmware. The **clear firmware-counters** command clears every on-board firmware-detected error unconditionally.

The **clear firmware-counters *UUCSS*** command sends a downlink message to the DS1 converter circuit packs, causing them to clear out their firmware error counters and failure databases. Once the firmware failure database is cleared, the failure audit test (#949) will pass. If problems still exist, the firmware will increment its error counters and the failure audit test will begin failing again.

This command should not be used as a replacement for the repair procedures associated with the hardware error log entries. This command may be useful if a problem has been fixed and off-board alarms associated with the problem are still active.

Downtime Required when Upgrading to TN1654 DS1 Converter Circuit Packs

WARNING:
Upgrading from TN574 DS1 converter circuit packs to TN1654 DS1 converter circuit packs will require down time for the affected PN.

The TN1654 DS1 Converter circuit pack is not compatible with the TN573 SNI circuit pack, the TN574 DS1 converter board, the Y-cable used to connect to the TN574 DS1 converter board or pre-G3V5 software. All DS1 converter boards and Y-cables must be upgraded. If the PN is remoted via a Center-Stage Switch, the connected SNI must also be upgraded. A TN573B (or higher-suffixed) SNI board must be used when connecting to a TN1654 DS1 converter board.

The fiber-link administration for the TN574 DS1 converter complex must be removed via the remove fiber-link command. The Change Circuit-Pack screen must be updated to reflect that TN1654 boards are now being used. The TN1654 DS1 converter complex can then be administered via the add fiber-link command.

Replacing a DS1 Converter Circuit Pack with the Same Type DS1 Converter Circuit Pack — Unduplicated PNC

WARNING:
Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:
Replacing a Switch Node Interface, Switch Node Clock, Expansion Interface or DS1 Converter circuit pack on an unduplicated system disrupts service. The service effect can range from outage of a single PN to outage of the entire system.

WARNING:
A DS1 Converter complex must consist of two TN574 boards or two TN1654 boards. A TN574 cannot be combined with a TN1654 in the same DS1 converter complex.

Steps	Comments
Enter **busyout board** UUCSS.	UUCSS represents the cabinet-carrier-slot address of the circuit pack to be replaced. A G3-MT logged in at the PN's Maintenance circuit pack remains active, despite the busyout.
Replace the circuit pack with the same DS1 converter board type.	
Wait for the circuit pack to reset.	Red and green LEDs will light and then go out.

Steps	Comments
Enter **release board** UUCSS	**CAUTION:** *Do not busyout any Expansion Interface circuit packs after this point.*
Enter **test alarms long clear** for category **exp-intf**.	
Wait 5 minutes for SNI-BD, FIBER-LK, AND DS1C-BD alarms to clear, or enter **clear firmware-counters a-pnc**.	

Replacing a DS1 Converter Circuit Pack with the Same Type DS1 Converter Circuit Pack—Duplicated PNC

WARNING:

On a system with duplicated PNC, synchronization may be provided over a combination of active and standby components. This condition is indicated by an OFF-BOARD WARNING alarm against TDM-CLK with Error Type #2305. Repairs to standby PNC in this state may disrupt service. Otherwise, if the active PNC is functional, replacement of a standby component will not disrupt service.

Steps	Comments
Enter **status pnc**.	Verify that the component to be replaced is on the standby PNC.
Enter **busyout pnc**.	
Enter **busyout board** UUCSS.	UUCSS represents the cabinet-carrier-slot address of the circuit pack to be replaced.
Replace the circuit pack with the same DS1 converter board type.	
Enter **release board** UUCSS.	**CAUTION:** *Do not busyout any Expansion Interface circuit pack after this point.*
Enter **test alarms long clear** for category **exp-intf**.	
Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK, and DS1C-BD alarms to clear, or enter **clear firmware-counters** <**a-pnc** or **b-pnc**>.	Use the letter designation of the pnc that holds the replaced component (the standby pnc).
Enter **status pnc**.	If either PNC's state of health is not "functional", consult the PNC-DUP section of the Maintenance Manual.
Enter **release pnc**.	

WARNING:

Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:

Replacing a Switch Node Interface, Switch Node Clock, Expansion Interface or DS1 Converter circuit pack on an unduplicated system disrupts service. The service effect can range from outage of a single PN to outage of the entire system.

WARNING:

A DS1 Converter complex must consist of two TN574 boards or two TN1654 boards. A TN574 cannot be combined with a TN1654 in the same DS1 converter complex.

WARNING:

The two DS1 converter boards, TN1654 and TN574, use unique “Y” cables that are incompatible with each other.

WARNING:

A TN573B (or higher-suffixed) board must be used when connecting a SNI board to a TN1654 DS1 Converter board.

Steps	Comments
Enter **list fiber-link**	Determine the fiber-link number associated with the two TN574 circuit packs to be upgraded.
Enter **busyout fiber-link *fiber#***	***Fiber#*** represents the fiber-link number associated with the TN574 DS1 converter complex that is being upgraded to a TN1654 DS1 converter complex.
Enter **remove fiber-link *fiber#***	
Remove the TN574 DS1 converter circuit packs from the system.	
Replace the TN574 Y-cables with TN1654 Y-cables.	
Replace the removed TN574 DS1 converter circuit packs with TN1654 DS1 converter circuit packs. Prior to installing the TN1654 boards, review the prior section, *TN1654 Board Configuration Switch Settings*.	
If a TN1654 DS1 converter board is connected to an SNI board, upgrade the SNI to a TN573B or greater.	
Wait for the circuit packs to reset	Red and green LEDs will light and then go out.
Enter **change circuit-packs *cabinet #***. Update the screen to show that TN1654 boards are now being used instead of TN574 boards. Also update the connected SNI, if applicable, to suffix B.	***Cabinet #*** represents the cabinet associated with a DS1 converter board. The ***change circuit-packs*** screen needs to be updated for both DS1 converter boards. Also, if needed, re-add translations for connected EI boards.

Steps	Comments
Enter **add fiber-link *fiber#*** to re-add the fiber-link using TN1654 DS1 converter circuit packs.	***Fiber#*** represents the fiber-link number associated with the TN574 DS1 converter complex that is being upgraded to a TN1654 DS1 converter complex
Enter **test alarms long clear** for category **exp-intf**.	
Wait 5 minutes for SNI-BD, FIBER-LK AND DS1C-BD alarms to clear, or enter **clear firmware-counters a-pnc**	

Upgrading TN574 DS1 Converter Circuit Packs in a Fiber-Link to TN1654s — Duplicated PNC

WARNING:
Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:
In duplicated PNC configurations, one DS1 converter complex in the fiber-link serves as the active and the second DS1 converter complex serves as the standby. Each DS1 Converter complex consists of two TN574 boards or two TN1654 boards. A TN574 cannot be combined with a TN1654 in the same DS1 converter complex. It is also required that all four DS1 converter boards and interconnecting facilities that serve an PN be of the same type. Note, however, that TN574 and TN1654 boards can coexist within the same system, they just cannot be in the same fiber-link.

WARNING:
The two DS1 converter boards, TN1654 and TN574, use unique “Y” cables that are incompatible with each other.

WARNING:
A TN573B (or higher-suffixed) board must be used when connecting a SNI board to a TN1654 DS1 Converter board.

Table 352: Upgrading TN574 DS1 Converter Circuit Packs in a fiber-link to TN1654s — Duplicated PNC

Steps	Comments
Enter **status pnc.**	Verify that the A-PNC is active. If the B-PNC is active, enter the reset pnc interchange command to cause the A-PNC to go active.
Enter **busyout pnc-standby.**	Fiber link cannot be removed if PNC duplication is operational. Must busyout the standby PNC first.

1 of 3

Table 352: Upgrading TN574 DS1 Converter Circuit Packs in a fiber-link to TN1654s — Duplicated PNC

Steps	Comments
Enter change system-parameters duplication. Change the `Enable Operation of PNC Duplication` field to **`n`**.	Disable PNC duplication.
Enter **list fiber-link.**	Determine the fiber-link number that the four TN574 circuit packs to be upgraded are associated with.
Enter **busyout fiber-link *fiber#***.	***fiber#*** represents the fiber-link number associated with the TN574 DS1 converter complexes that are being upgraded to TN1654 DS1 converter complexes.
Enter **remove fiber-link *fiber#***.	
Remove the four TN574 DS1 converter circuit packs from the system.	
Replace the TN574 Y-cables with TN1654 Y-cables.	
Replace the removed TN574 DS1 converter circuit packs with TN1654 DS1 converter circuit packs. Prior to installing the TN1654 boards, review the prior section, *TN1654 Board Configuration Switch Settings*.	
If a TN1654 DS1 converter board is connected to an SNI board, upgrade the SNI to a TN573B or greater.	
Wait for the circuit packs to reset.	Red and green LEDs will light and then go out.
Enter **change circuit-packs *cabinet#***. Update the screen to show that TN1654 boards are now being used instead of TN574 boards. Also update the connected SNI, if applicable, to suffix B.	***cabinet#*** represents the cabinet associated with a DS1 converter board. The *change circuit-packs* screen needs to be updated for all four DS1 converter boards. Also, if needed, re-add translations for connected EI boards.
Enter **change system-parameters duplication**. Change the `Enable Operation of PNC Duplication?` field to **`y`**.	Enable PNC duplication.
Enter **add fiber-link *fiber#*** to re-add the fiber-link using TN1654 DS1 converter circuit packs.	***fiber#*** represents the fiber-link number associated with the TN574 DS1 converter complexes that are being upgraded to TN1654 DS1 converter complexes.
Enter **test alarms long clear** for category **exp-intf**.	

2 of 3

Table 352: Upgrading TN574 DS1 Converter Circuit Packs in a fiber-link to TN1654s — Duplicated PNC

Steps	Comments
Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK and DS1C-BD alarms to clear, or enter **clear firmware-counters a-pnc | b-pnc**.	
Enter **status pnc**.	If either PNC's state of health is not "functional", consult the PNC-DUP section of the Maintenance Manual.

3 of 3

Converting DS1-CONV Complex to Direct-Connect Fiber (duplicated PNC)

NOTE:
The following procedure is generic in its scope. Check the customer's switch configuration for EI/SNI structures.

WARNING:
Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:
In duplicated PNC configurations, one DS1-CONV complex in the fiber-link serves as the active and the second DS1-CONV complex serves as the standby. Each DS1 Converter complex consists of two TN574 or TN1654 circuit packs.

Table 353: Convert from DS1-CONV to direct-connect fiber in a duplicated PNC

Step	Command/Step	Description
1	status pnc	Verify that the A-side is active. • If the B-PNC is active, enter **reset pnc-interchange** and press Enter. • Then verify that the A-side is active (**status pnc**).
2	busyout pnc-standby	Busyout the duplicated switch side.
3	change system-parameters duplication	Disable PNC duplication by changing the `Enable Operation of PNC Duplication?` field to **n**.
4	list fiber-link	Lists administered fiber connections by number. Select the link number associated with the DS1-CONV complex that you are removing.

1 of 2

Table 353: Convert from DS1-CONV to direct-connect fiber in a duplicated PNC

Step	Command/Step	Description
5	busyout fiber link *n*	Busyout the fiber link of interest. The fiber link number (step 6) is **n** for this command.
6	remove fiber link *n*	Remove the link administration for this link.
7	change circuit-pack *cabinet*	Remove the DS1-CONV administration for the four designated circuit packs (***cabinet*** is the cabinet number where these DS1-CONV complexes reside). Press Enter.
8	Remove the DS1- CONV hardware.	Remove the 4 TN574 or TN1654 DS1-CONV circuit packs and Y-cables. The TN1654 and TN574 DS1-CONV boards use unique "Y" cables that are incompatible with each other. Reuse these cables only with the proper circuit pack.
9	Install fiber-optic cable.	Add the lightwave transceivers (multimode 9823A or single-mode 300A) to match the lightguide fiber. Add these to the EIs and SNIs formerly connected to the DS1 converter circuit packs. Connect the lightwave transceivers with lightguide fiber.
10	Check fiber-optic cable connections.	Ensure that the fiber-optic cables are securely connected to the lightwave transceivers that are attached to the designated circuit packs through the connections behind the cabinet.
11	add fiber-link *n*	Administer the new EI/SNI fiber connection.
12	change system-parameters duplication	Enable PNC duplication by changing the `Enable Operation of PNC Duplication` field to **y**.
13	Enter **test alarms long clear** for category **exp-intf**.	
14	Wait 5 minutes.	SNI-BD, SNI-PEER, FIBER-LK and EXP-INTF MOs need time to clear (or enter **clear firmware-counters *a-pnc*** or ***b-pnc*)**
15	Enter **status pnc**.	If either PNC's state of health is not `functional`, consult the PNC-DUP MO.

2 of 2

Removing Fiber Connectivity to an PN

This procedure covers removing the connectivity to an PN or between SNs. Removing an PN and its associated carrier and circuit packs can be handled on a board-type basis.

If this system is duplicated, start with step 1; otherwise, start with step 6.

NOTE:
The following procedure is generic in its scope. Check the customer's switch configuration for EI/SNI structures.

WARNING:
Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:
In duplicated PNC configurations, one DS1-CONV complex in the fiber-link serves as the active and the second DS1-CONV complex serves as the standby. Each DS1Converter complex consists of two TN574 or TN1654 circuit packs.

Table 354: Removing Fiber Connectivity from a PN

Step	Command/Step	Description
1	status pnc	Verify that the A-side is active. **a** If the B-PNC is active, enter **reset pnc-interchange** and press Enter. **b** Verify that the A-side is active (**status pnc**).
2	busyout pnc standby	Busyout the duplicated switch side.
3	change system-parameters duplication	Disable PNC duplication by setting the `Enable Operation of PNC Duplication` field to **n**.
4	list fiber-link	List administered fiber connections by number. Record the endpoints (EIs, SNIs, and DS1Cs), and fiber link numbers that you are removing.
5	**busyout fiber-link *n***	Busyout the fiber link of interest. The fiber link number (step 4) is ***n*** for this command.
6	**remove fiber- link *n***	Remove the link administration for this link.
7	change system-parameters duplication	Enable PNC duplication by changing the `Enable Operation of PNC Duplication` field to **y**.
8	Physically remove the a-pnc and b-pnc fiber endpoint circuit packs	Physically remove EI, SNI, and DS1C circuit packs associated with the **b-pnc**.
9	change circuit-pack	Un-administer the PNC circuit packs.
10	clear firmware	Clear any alarms or errors against those circuit packs.
11	status pnc	Use **status pnc** to ensure that the PNC is in good health.

Downgrading from Critical to High Reliability

The strategy this downgrade follows is to change from critical to high reliability. High reliability is actually duplication of the media server, control network, and IPSIs without duplicate paths from IPSIs to CSS.

Table 355: Downgrading from Critical to High Reliability

Step #	Command/Step	Description
1	status pnc	Check to see if A-side is active. If not: **a** Resolve any alarms against **a-pnc**. **b** **reset pnc-interchange** to activate **a-pnc**.
2	busyout pnc-standby	Busyout the standby PNC.
3	change system-parameters duplication	Disable PNC duplication by setting the `Enable Operation of PNC Duplication` field to **n**.
4	list fiber-link	Lists administered fiber connections by number.
5	**change fiber-link *n***	**Change fiber** removes the b-pnc endpoints (EI, DS1Cs, if equipped). ***n*** is the number of the fiber from step 4. Repeat this step for every fiber from step 4.
6	Physically remove the b-pnc endpoint circuit packs	Start with the switch carrier most distant from the media server. Physically remove EI, SNI, and SNC circuit packs associated with the **b-pnc**. Remove fiber cable not used for b-pnc carriers. **See the following CAUTION.**
7	change circuit-packs	Update the translations for the removed circuit packs using the **change circuit-packs** command for the: • Cabinet with b-pnc SN carrier — SNIs — SNCs — EIs and DS1Cs, if any • Cabinet with b-pnc SN carrier — DS1Cs from port carrier • Cabinet with b-pnc EIs in every PN (also DS1Cs, if equipped)
8	change cabinet *UU*	Remove the b-pnc SN carrier.
9	Disable duplication.	Obtain a license file to disable PNC duplication.

CAUTION:
The removal of hardware and fiber cable will interrupt service.

NOTE:
At this point in the downgrade procedure, the system is in unduplicated mode and is operational. The physical removal of the SN carriers may be done at a time that is convenient for the customer. The next step in the downgrade is to follow the normal upgrade procedures from standard to high reliability.

Error Log Entries and Test to Clear Values

Table 356: DS1 Converter Board Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	SAT Test to Clear Value
0[1]	0	Any	Any	Any	**test board** *UUCSS* **sh r 1**
1 (a)		Failure Audit test (#949)	MAJOR	ON/OFF	**test board** *UUCSS* **sh r 1**
18 (b)	0	**busyout board** *UCSS*	WARNING	OFF	**release board** *UCSS*
125 (c)	3	None	MINOR	ON	
218 (d)	any	None	MAJOR	ON	
257 (e)		Failure Audit test (#949)	MINOR	ON	**test board** *UUCSS* **sh r 1**
513 (f)	1	Failure Audit test (#949)	MAJOR	ON	**test board** *UUCSS* **sh r 1**
513 (g)	2	Failure Audit test (#949)	MAJOR	ON	**test board** *UUCSS* **sh r 1**
513 (h)	3	Failure Audit test (#949)	MAJOR	ON	**test board** *UUCSS* **sh r 1**
513 (i)	4	Failure Audit test (#949)	MAJOR	ON	**test board** *UUCSS* **sh r 1**
513 (j)	5	Failure Audit test (#949)	MAJOR	ON	**test board** *UUCSS* **sh r 1**
769 (k)	1	Failure Audit test (#949)	MINOR	ON/OFF	**test board** *UUCSS* **sh r 1**
769 (l)	2	Failure Audit test (#949)	MINOR	ON/OFF	**test board** *UUCSS* **sh r 1**
769 (m)	3	Failure Audit test (#949)	MINOR	ON/OFF	**test board** *UUCSS* **sh r 1**
769 (n)	5	Failure Audit test (#949)	MINOR	ON/OFF	**test board** *UUCSS* **sh r 1**
769 (o)	6	Failure Audit test (#949)	MINOR	ON	**test board** *UUCSS* **sh r 1**
769 (p)	7	Failure Audit test (#949)	MINOR	ON	**test board** *UUCSS* **sh r 1**
1281(q)		Failure Audit test (#949)	MINOR	OFF	**test board** *UUCSS* **sh r 1**
1537 (r)		Failure Audit test (#949)	MAJOR	OFF	**test board** *UUCSS* **sh r 1**
1793 (s)		Failure Audit test (#949)	MAJOR	OFF	**test board** *UUCSS* **sh r 1**
2049 (t)		Failure Audit test (#949)	MAJOR	OFF	**test board** *UUCSS* **sh r 1**
3329 (u)		Failure Audit test (#949)	WARNING	OFF	**test board** *UUCSS* **sh r 1**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

Notes:

When problems persist, resetting the DS1 converter circuit pack via the **reset board** command may temporarily resolve the error condition and restore service until further assistance is provided.

a If the alarm is on board, then a major hardware error has occurred in a common part of the circuit pack, not circuit or packet specific. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a major hardware error has occurred in a common part of the circuit pack, or a good clock signal cannot be recovered from the synchronization source. The synchronization source can be the fiber link or any one of the DS1 facilities.

1. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
2. Enter **display errors** and follow the associated repair procedures for any FIBER-LK and DS1-FAC errors.
3. If the problem persists, replace the DS1 converter circuit pack.

b This error indicates that the DS1 converter circuit pack has been busied out via the **busyout board** command. To resolve this error, release the DS1 converter circuit pack via the **release board** command.

c The 24/32-channel option switch setting on the TN1654 circuit pack does not match the administered Bit Rate on the fiber-link screen. If the on-board switch setting is wrong, the circuit pack must be physically removed to change the setting of the board option switch. If the administered bit rate is wrong, use the **change fiber-link** command to correct it.

d The DS1 converter board is physically installed in a slot different than its administered slot. Remove the DS1 converter board and install it in its administered slot or execute the r**emove fiber-link** command followed by the **add fiber-link** command to re-add the fiber-link setting the DS1 converter board's administered location to the physically installed slot.

e A minor hardware error has occurred in a common part of the circuit pack, not circuit or packet specific. Replace the DS1 converter circuit pack.

f A major hardware problem has occurred that affects only circuit data being received from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

g A major hardware problem has occurred that affects only circuit data being transmitted from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

h A major hardware problem has occurred that affects only packet data being received from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

i A major hardware problem has occurred that affects only packet data being transmitted from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

j A major lightwave transceiver transmit error occurred that affects data transmitted from the fiber link to the DS1 facility. Replace the DS1 converter circuit pack.

k *This error only applies to TN574 DS1 converter circuit packs.*

If the alarm is on board, then a minor hardware problem has occurred that affects only circuit data being received from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a minor hardware problem has occurred that affects only circuit data being received into the DS1 converter circuit pack or a good clock signal cannot be recovered from one of the DS1 facilities.

1. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
2. Enter **display errors** and follow the associated repair procedures for any DS1-FAC errors.
3. If the problem persists, replace the DS1 converter circuit pack.

l *This error only applies to TN574 DS1 converter circuit packs.*

If the alarm is on board, then a minor hardware problem has occurred that affects only circuit data being transmitted from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a minor hardware problem has occurred that affects only circuit data being transmitted from the DS1 converter circuit pack or a good clock signal cannot be recovered from the fiber channel.

1. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
2. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, SNI-BD, and FIBER-LK errors.
3. If the problem persists, replace the DS1 converter circuit pack.

m *This error only applies to TN574 DS1 converter circuit packs.*

If the alarm is on board, then a minor hardware problem has occurred that affects only packet data being received from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a minor hardware problem has occurred that affects only packet data being received from the DS1 converter circuit pack or corrupted packets are being received from the packet facility.

1. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, SNI-BD, and DS1-FAC errors.
2. If the problem persists enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
3. If the problem still persists, replace the DS1 converter circuit pack.

n If the alarm is on board, then a minor FOI transmit error occurred that affects data transmitted from the fiber link to the DS1 facility. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a minor FOI transmit error occurred that affects data transmitted from the fiber link to the DS1 facility. or corrupted packets are being received from the packet facility.

1. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, SNI-BD, and DS1-FAC errors.
2. If the problem persists enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
3. If the problem still persists, replace the DS1 converter circuit pack.

o A minor FOI receive error occurred that affects data received from the DS1 facility and transmitted to the fiber link. Replace the DS1 converter circuit pack.

p A minor on-board hardware failure exists on the processor/control hardware on the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

q For TN574 DS1 converter boards, this error indicates that the facility masks or the clock reference masks do not match between the two DS1 converter circuit packs in the DS1 converter complex.

For TN1654 DS1 converter boards, this error indicates that the facility masks do not match between the two DS1 converter circuit packs in the DS1 converter complex.

Alarm should clear in 15 minutes.

1. If the problem persists, reset both DS1 converter circuit packs in the DS1 converter complex via the **reset board** command.
2. If the problem persists, replace this DS1 converter circuit pack.
3. If the problem persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

r The two TN574 DS1 converter circuit packs in the DS1 converter complex do not have the same firmware vintage. The TN574 DS1 converter with the older vintage should be replaced. This error does not apply to TN1654 boards.

s Fiber Loss of Frame Alignment (LFA) alarm occurred at the other end of the DS1 converter complex. The DS1 converter circuit pack at the other end of the DS1 converter complex cannot frame up on the signal coming into the circuit pack from the fiber. (The neighbor DS1 converter circuit pack detected the LFA and relayed this information to this DS1 converter circuit pack via the DS1 control channel.) The amber LED will flicker at a 5-Hz rate (on for 0.1 second, off for 0.1 second).

1 Execute the **list fiber-link** command to determine the Fiber Endpoint that is connected to the DS1 converter circuit pack. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints. Enter **display errors** and follow the associated repair procedures for any FIBER-LK errors for this fiber link.

2 If the problem still persists, check for excessive slips and synchronization problems. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.

3 If the problem still persists, run the Far-End DS1 converter Circuit Pack Loopback test (#788) on this DS1 converter circuit pack via the **test board *UUCSS* long** command. This test will indicate if the neighbor DS1 converter circuit pack hardware is functioning. If this test fails, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

4 If the problem still persists, run the Far-End Fiber Optic Terminator (lightwave transceiver) Loopback test (#789) on this DS1 converter circuit pack via the **test board *UUCSS* long** command. If this test fails, replace the lightwave transceiver that is connected to the neighbor DS1 converter circuit pack at the other end of the DS1 converter complex. (If the neighbor board is connected to the Fiber Endpoint via metallic cable, then this test will abort.)

5 If the problem still persists, replace connectors and the cable between the neighbor DS1 converter circuit pack and the Fiber Endpoint at the other end of the DS1 converter complex. The cable may be a fiber or a metallic cable.

t Fiber Loss of Signal (LOS) alarm occurred at the other end of the DS1 converter complex. The DS1 converter circuit pack at the other end of the DS1 converter complex does not detect a signal coming into the circuit pack from the fiber. (The neighbor DS1 converter circuit pack detected the LOS and relayed this information to this DS1 converter circuit pack via the DS1 channel.) The amber LED will flicker at a 5-Hz rate (on for 0.1 second, off for 0.1 second).

1 Execute the **list fiber-link** command to determine the Fiber Endpoints that are connected to both ends of this DS1 converter complex. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints that are administered on this fiber link, and Enter **display errors** and follow the associated repair procedures for any FIBER-LK errors for this fiber link.

2 If the problem still persists, run the Far-End DS1 converter circuit pack loop-back test (#788) on this DS1 converter circuit pack via the **test board *UUCSS* long** command. This test will show if the neighbor DS1 converter circuit pack hardware is functioning. If this test fails, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

3 If the problem still persists, run the Far-End Fiber Optic Terminator (lightwave transceiver) Loopback test (#789) on this DS1 converter circuit pack via the **test board *UUCSS* long** command. If this test fails, replace the lightwave transceiver that is connected to the neighbor DS1 converter circuit pack. (If the neighbor board is connected to the Fiber Endpoint via metallic cable, then this test will abort.)

4 If the problem persists, replace connectors and the cable between the neighbor DS1 converter circuit pack and the Fiber Endpoint at the other end of the DS1 converter complex. The cable may be fiber or metallic.

u This error indicates that excessive slips have occurred on the fiber link between the DS1 converter board and the Fiber Endpoint. See MO SYNC for diagnosing slip problems.

System Technician-Demanded Tests: Descriptions And Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the Failure Audit, for example, you may also clear errors generated from other tests in the testing sequence. Tests 788 and 789 are executed by the TN574 DS1 Converter circuit pack only.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Failure Audit (#949)	X	X		ND
DS1 Facilities Connectivity test (#790)		X		D
Far-End DS1 converter circuit pack loop back test (#788) (Executed by TN574 only)		X		D
Far-End Lightwave Transceiver Loopback test (#789) (Executed by TN574 only)		X		D
Board Options Audit (#795)	X	X		ND
Reset test (#787)			X	D

1 D = Destructive; ND = Nondestructive

NOTE:
Test #984 is not an actual demand maintenance test. This test number is used to report results of the **clear firmware-counters** command. Refer to the table for Test #949 to interpret ABORT codes for Test #984.

Reset Test (#787)

This test is **destructive**.

DS1 converter circuit pack is reset via the **reset board** command. When the circuit pack is reset, firmware executes a series of diagnostic tests on the circuit pack. The results of these tests are queried from the board when the board is inserted after completion of the reset sequence. If any of the diagnostic tests fail, the error log will have an entry of Error Type #1 for this circuit pack's location, and the alarm log will have an entry of ON-BOARD MAJOR alarm.

The reset sequence will take about one minute to complete.

Table 357: Test #787 Reset Board

Error Code	Test Result	Description / Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Use **add fiber-link** to administer the DS1 converter fiber link.
2321	ABORT	DS1 converter circuit pack is not busied out. Use **busyout board** to busyout the DS1 converter circuit pack.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	PASS	Reset sequence was executed successfully. (However, this test result does not indicate whether the firmware diagnostic tests passed.) **1** Enter **display errors** to check the error log for any failed diagnostic firmware tests. (This is indicated by an entry of Error Type #1 for this circuit pack's location.) **2** Enter **display alarms** to check the alarm log for any ON-BOARD MAJOR alarms.
0	NO BOARD	The system software found no board. **1** Reset the board. **2** Remotely retry the command.

Far-End DS1 Converter Circuit Pack Loopback Test (#788)

This test is **destructive**.

This test is executed by the TN574 DS1 Converter circuit pack only. See Test #790 for testing for the TN1654 DS1 Converter.

This test starts at the DS1 converter circuit pack whose equipment location was entered, and loops all fiber time slots at the far edge Fiber Optic Interface of the DS1 converter circuit pack at the other end of the DS1 converter complex. See Figure 58.

This test is executed under firmware control, and the result is sent back to the maintenance software. The test is executed by sending digital data through every administered DS1 facility channel. Two different test patterns are used: hexadecimal values 55 and AA.

For a standard-, duplex-, or high-reliability system (no PNC duplication), this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack, because of its impacts on the system control links, The completion of the test is delayed in this configuration to wait for the recovery of the system control links. For a critical-reliability system (PNC duplication), test can be executed at any DS1 converter circuit pack.

Figure 58: Far-End DS1 Converter Loop-Back Test (#788)

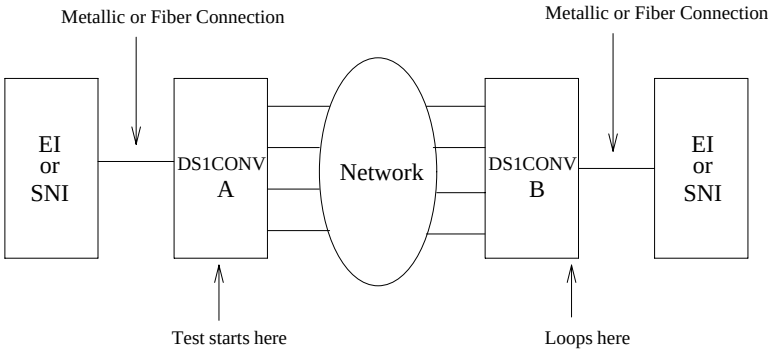

Table 358: Test #788 Far-End DS1 Converter Board Loop-Back Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Timed out while waiting for a response from the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent to the selected DS1C board.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Administer the DS1 converter fiber link via the **add fiber-link** command.
2321	ABORT	DS1 converter circuit pack is not busied out. Busyout the DS1 converter circuit pack via the **busyout board** command.
2332	ABORT	With this system configuration (unduplicated PNC), the test was aborted because it cannot be run at the far end when there is only one DS1-FAC available. (The link would be lost, and no test results would be seen at the media server). Run the test at the other end of the DS1C complex.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

Table 358: Test #788 Far-End DS1 Converter Board Loop-Back Test

Error Code	Test Result	Description / Recommendation
	FAIL	Far-end DS1 converter loop back failed. A problem exists between the DS1 converter A and the DS1 converter B (see previous diagram). **1** If there are facilities that are not digital-data compatible, busyout the facilities via the **busyout ds1-facility** command. **2** If the test is executed as a part of an error analysis, then return back to the related section. **3** Enter **display errors** and follow the associated repair procedures for any on-board DS1C-BD errors on this DS1 converter circuit pack and the DS1 converter circuit pack at the other end of the DS1 converter complex. Enter **display errors** and follow the associated repair procedures for any DS1-FAC errors on the DS1 facilities. **4** Check the DS1 Converter Measurements Report to see if there are facilities with excessive errors. Use **list measurements ds1-facility summary**. If there are facilities with excessive errors, execute the Far-End Internal Loopback test (#797) on those facilities, and follow repair procedures described for the test. **5** If the test still fails, replace the DS1 converter circuit pack at the other end of the DS1 converter complex. **6** If the test still fails, replace this DS1 converter circuit pack.
	PASS	Transmission through the path of the loop back is successful.
0	NO BOARD	The system software found no board. **1** Reset the board. **2** Remotely retry the command.

2 of 2

Far-End Lightwave Transceiver Loopback Test (#789)

This test is **destructive**.

This test is executed by the TN574 DS1 Converter circuit pack only. Test #790 covers this testing for the TN1654 DS1 Converter.

This test starts at the DS1 converter circuit pack whose equipment location was entered and loops at the Fiber Optic Terminator (lightwave transceiver) that is connected to the DS1 converter circuit pack at the other end of the DS1 converter complex. See the following diagram.

Every part of this test is executed under firmware control and the result is sent back to the maintenance software. The test is executed by sending digital data through every DS1 facility channel. Two different test patterns are used, these are hexadecimal values 55 and AA.

For a standard-, duplex-, or high-reliability system (no PNC duplication), this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack because of its impacts on the system control links, also the completion of the test will be delayed in this configuration to wait for the recovery of the system control links. For a critical-reliability system (PNC duplication), the test can be executed at any DS1 converter circuit pack.

Figure 59: Far-End Lightwave Transceiver Loop-Back Test

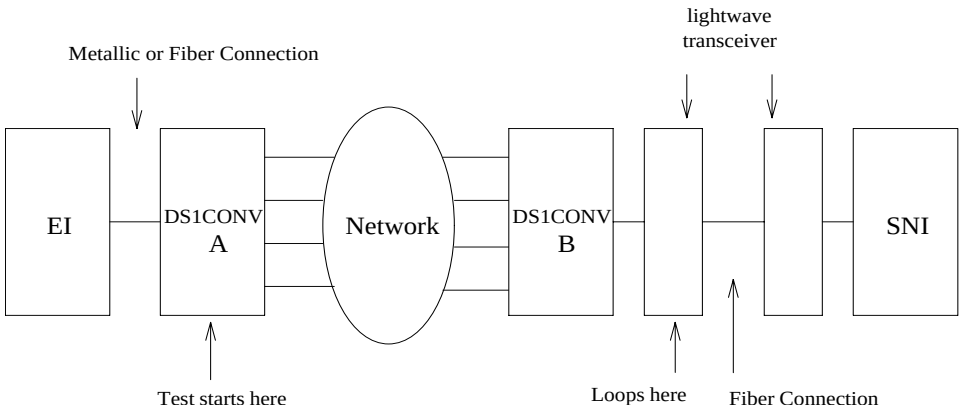

Table 359: Test #789 Far-End FOT (Lightwave Transceiver) Loop-Back Test

Error Code	Test Result	Description / Recommendation
1410	ABORT	The test aborted because no lightwave transceiver is present. The neighbor DS1 converter circuit pack and the fiber endpoint are connected via metallic cable. This abort may be ignored.
2000	ABORT	Timed out while waiting for a response from the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Administer the DS1 converter fiber link via the **add fiber-link** command.
2321	ABORT	DS1 converter circuit pack is not busied out. Busyout the DS1 converter circuit pack via the **busyout board** command.
2332	ABORT	With this system configuration (unduplicated PNC), the test was aborted because it cannot be run at the far end when there is only one DS1-FAC available. (The link would be lost, and no test results would be seen at the media server). Run the test at the other end of the DS1C complex.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

1 of 2

Table 359: Test #789 Far-End FOT (Lightwave Transceiver) Loop-Back Test

Error Code	Test Result	Description / Recommendation
	FAIL	Far-end lightwave transceiver loop back failed. A problem exists between the DS1 converter A and the lightwave transceiver connected to the DS1 converter B (see previous diagram). **1** If there are facilities that are not digital-data compatible, busyout the facilities via the **busyout ds1-facility** command. **2** If the test is executed as a part of an error analysis, then return back to the related section. **3** Enter **display errors** and follow the associated repair procedures for any on-board DS1C-BD errors on this DS1 converter circuit pack and the DS1 converter circuit pack at the other end of the DS1 converter complex. Enter **display errors** and follow the associated repair procedures for any DS1-FAC errors on the DS1 facilities. **4** Check the DS1 Converter Measurements Report to see if there are facilities with excessive errors. Use **list measurements ds1-facility summary**. If there are facilities with excessive errors, execute the Far-End Internal Loopback test (#797) on those facilities, and follow repair procedures described for the test. **5** If the test still fails, replace the lightwave transceiver device that is connected to the DS1 converter circuit pack at the other end of the DS1 converter complex. **6** If the test still fails, replace the DS1 converter circuit pack at the other end of the DS1 converter complex. **7** If the test still fails, replace this DS1 converter circuit pack.
	PASS	Transmission through the path of the loop back is successful.
0	NO BOARD	The system software found no board. **1** Reset the board. **2** Remotely retry the command.

2 of 2

DS1 Facilities Connectivity Test (#790)

This test is **destructive**.

The DS1 facilities connectivity test will check the correct connectivity of the DS1 facilities at opposite ends of the DS1 converter complex. Every part of this test is executed under firmware control and the result is sent back to the maintenance software.

For TN574 DS1 Converter circuit packs, this test is executed by sending digital data through each time slot of every DS1 facility channel. Two different test patterns are used, these are hexadecimal values 55 and AA.

For TN1654 DS1 Converter circuit packs, this test has been enhanced to provide error codes that point to the exact fault. Rather than simply reporting a failure of the connectivity test, the TN1654 test specifically identifies the two DS1 facilities that are cross-connected at the near and far ends of the DS1

converter complex. In addition, a fault code will indicate the condition of not being able to loop-up the far end, as required to run the test, due to the packet DS1 facility being down.

The TN1654 connectivity test sends digital data through only one time slot. Instead of looping back the facility to itself, the TN1654 version of the test loops-up the other three facilities. If the test pattern comes back, the firmware fails the test due to an incorrect connection between DS1 facilities. It should be noted that this test will pass and give no indication of problems if the non-packet facilities are down.

For a standard-, duplex-, or high-reliability system (no PNC duplication), this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack because of its impacts on the system control links. In addition, for TN574 DS1 converter boards, the completion of the test will be delayed in this configuration to wait for the recovery of the system control links. For a critical-reliability system (PNC duplication), test can be executed at any DS1 converter circuit pack.

Table 360: Test #790 DS1 Facilities Connectivity Loop-Back Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Timed out while waiting for a response from the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Use **add fiber-link** to administer the DS1 converter fiber link.
2321	ABORT	DS1 converter circuit pack is not busied out. Use **busyout board** to busyout the DS1 converter circuit pack.
2332	ABORT	With this system configuration (unduplicated PNC), the test was aborted because it cannot be run at the far end when there is only one DS1-FAC available. (The link would be lost, and no test results would be seen at the media server.) Run the test at the other end of the DS1C complex.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

1 of 2

Table 360: Test #790 DS1 Facilities Connectivity Loop-Back Test

Error Code	Test Result	Description / Recommendation
	FAIL	TN574 DS1 facilities connectivity loop-back test failed.
1	FAIL	TN1654 near-end DS1 facility A is connected to far-end DS1 facility B.
2	FAIL	TN1654 near-end DS1 facility A is connected to far-end DS1 facility C.
3	FAIL	TN1654 near-end DS1 facility A is connected to far-end DS1 facility D.
10	FAIL	TN1654 near-end DS1 facility B is connected to far-end DS1 facility A.
12	FAIL	TN1654 near-end DS1 facility B is connected to far-end DS1 facility C.
13	FAIL	TN1654 near-end DS1 facility B is connected to far-end DS1 facility D.
20	FAIL	TN1654 near-end DS1 facility C is connected to far-end DS1 facility A.
21	FAIL	TN1654 near-end DS1 facility C is connected to far-end DS1 facility B.
23	FAIL	TN1654 near-end DS1 facility C is connected to far-end DS1 facility D.
30	FAIL	TN1654 near-end DS1 facility D is connected to far-end DS1 facility A.
31	FAIL	TN1654 near-end DS1 facility D is connected to far-end DS1 facility B.
32	FAIL	TN1654 near-end DS1 facility D is connected to far-end DS1 facility C.
55	FAIL	TN1654 DS1 converter packet facility is down and can't send loop-up message to the far end. **1** Enter **display errors** and follow the associated repair procedures for any DS1-FAC errors on the DS1 facilities at both ends of the DS1 converter complex. If an alarm exists on a DS1 facility, then this test will fail. **2** Check the DS1 connections, both circuit packs should have their DS1 facilities connected identically. **3** Check the DS1 Converter Measurements Report to see if there are facilities with excessive errors. Use **list measurements ds1-facility summary**. If there are facilities with excessive errors, execute the Far-End Internal Loopback test (#797) via **test ds1-facility *UUCSSf* long** on those facilities, and follow repair procedures described for the test. **4** Both circuit packs may not have the same translation information. Run the Board Options Audit test (#795) via **test board *UUCSS* short** for both circuit packs in the DS1 converter complex to send the options. Check the results of this audit test. This test does not pass until the audit test problems are resolved.
	PASS	DS1 facility connections are correct.
0	NO BOARD	The system software found no board. **1** Reset the board. **2** Remotely retry the command.

2 of 2

Board Options Audit (#795)

This test is **non**destructive.

This test sends the administered circuit pack options to the DS1 converter circuit pack. Options are sent to both DS1 converter circuit packs at the same time to prevent any transitional mismatch of options.

The following data is sent to the TN574 DS1 converter circuit pack:

- system-reliability configuration
- master and slave endpoints for framing (determined by the relative position of the circuit pack to the media server)
- facility mask (whether each facility is installed)
- clock reference mask (whether:
  - each facility can be used as a clock-reference source
  - the board is being used as a network-timing source)
- packet compatible mask (whether each facility is packet compatible)
- facility information for line coding, framing mode, and line compensation

The following data is sent to the TN1654 DS1 converter circuit pack:

- system-reliability configuration
- master and slave endpoints for framing (determined by the relative position of the circuit pack to the media server)
- facility mask (whether each facility is installed)
- idle code
- CRC-enabled/-disabled flag (sent in E1 mode only)
- facility information for line coding and line compensation (sent in T1 mode only).

Failure Audit (#949)

This test is **non**destructive.

This test queries the DS1 converter circuit pack for any existing circuit pack or facility failures and any unacknowledged cleared failure messages for auditing purposes. Upon receiving the query request, DS1 converter firmware sends failure reports to the maintenance software for every error in its failure database.

This test operates on both MOs DS1C-BD and DS1-FAC. Error counts of both MOs (DS1C-BD and DS1-FAC) that are displayed in the error log will be incremented when this test is executed. This test is also executed internally by the maintenance software when an alarm is resolved

Table 361: Test #949 Failure Audit

Error Code	Test Result	Description / Recommendation
2000	ABORT	Timed out while waiting for a response from the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2316	ABORT	Fiber link is not administered. Administer the DS1 converter fiber link via the **add fiber-link** command.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	FAIL	The DS1 converter circuit pack reported failures or retransmitted a cleared failure message. **1** Enter **display errors** and follow the associated repair procedures for any DS1C-BD and DS1-FAC errors.
	PASS	The DS1 converter circuit pack has no failures.
0	NO BOARD	The system software found no board. **1** Reset the board. **2** Remotely retry the command.

DT-LN-BD (Data Line Circuit Pack)

S8700 / S8500 / S8100

MO's Name (in Alarm Log	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DT-LN-BD	MINOR	**test board *location* sh**	Data Line circuit pack
DT-LN-BD	WARNING	**test board *location* sh**	Data Line circuit pack

1 For information on specifying a ***location***, see Command Syntax on page 179.

See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 for circuit pack-level errors. See also "DAT-LINE (Data Line Port)" for related line information.

DTMR-PT (Dual-Tone Multifrequency Receiver Port)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DTMR-PT	MAJOR	**test port *location* sh**	Dual-Tone Multifrequency Receiver port (TTR)
DTMR-PT	MINOR	**test port *location* sh**	Dual-Tone Multifrequency Receiver port (TTR)
DTMR-PT	WARNING	**release port *location***	Dual-Tone Multifrequency Receiver port (TTR)

1 For information on specifying a ***location***, see Command Syntax on page 179.

Dual-Tone Multifrequency Receiver ports (DTMR), also known as Touch-Tone Receivers (TTRs), reside on the following circuit packs:

- TN748
- TN420
- TN756
- TN744B and TN744C
- TN2182
- TN2312AP

There are four Dual-Tone Multifrequency Receiver (DTMR-PT) ports and two General Purpose Tone Detector (GPTD-PT) ports on the TN748, TN420 and TN756 Tone Detector packs. There are eight GPTD-PT ports on each TN744, TN2182 and TN2312AP circuit packs. The GPTD ports can be used for TTR, call progress tone detection, call prompting, MF signaling, dial tone detection, CO answer detection and OCM call classification. The DTMR port is used to detect touch-tone digits that are placed on the Time Division Multiplex (TDM) bus. Examples of touch-tone digits are digits 0 through 9, digit #, and digit *. The ability of the DTMR port to detect touch-tone digits is essential for maintenance of other circuit packs (for example, IPSI circuit pack) and in placing a station-to-station call. Calls originating from a hybrid station *do not* require a DTMR port.

The DTMR-PT MO implements a set of tests to ensure that detection of touch-tone digits by the DTMR port is functioning properly. For any Tone Detector circuit-level error (DETR-BD), see XXX-BD (Common Port Circuit Pack/Media Module) on page 2086.

Error Log Entries and Test to Clear Values

Table 362: Dual-Tone Multifrequency Receiver Port (TTR) Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
1 **S8100**: 1 (c)	17664	Tone Detector Audit/ Update test (#43)	MAJOR MINOR (a)	ON	**test port** *UUCSSpp* **r 2**
18	0	**busyout port** *UUCSSpp*	WARNING	ON	**release port** *UUCSSpp*
130 (d)		None	WARNING	ON	**test port** ***UUCSSpp*** **sh r 2**
257 (b)	17666	Tone Detector Audit/ Update test (#43)	MAJOR MINOR (a)	ON	**test port** *UUCSSpp* **r 3**
513 (c) **S8100**: 513	Any	Tone Detection Verification test (#42)	MAJOR MINOR (a)	ON	**test port** *UUCSSpp* **r 3**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

Error Notes:

a There are two possible alarm levels for this error: Major alarm and Minor alarm. A Major alarm is raised if the total number of DTMR ports currently in service is less than or equal to 1/2 of the administered threshold number. Otherwise, a Minor alarm is raised. In either case, run the short test sequence against the DTMR port and follow the error code procedures for the individual tests.

The threshold number of DTMR ports for service is administered using the **change system-parameters maintenance** command.

b The DTMR port lost its translation. Testing the DTMR port is sufficient to reload its translation. If testing the DTMR port does not clear the error, then the IPSI or Tone Detector circuit pack containing the defective DTMR port should be replaced.

c This error indicates the DTMR port is having problems detecting touch-tone digits. If this error is being constantly logged, then the IPSI or Tone Detector circuit pack containing the defective DTMR port should be replaced.

d This error type indicates that the circuit pack has been removed or has been insane for at least 11 minutes. To clear the error, reinsert or replace the circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the *Tone Detection Verification* test, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Tone Detection Verification test (#42)	X	X	ND
Tone Detector Audit/Update test (#43)	X	X	ND

1 D = Destructive; ND = Nondestructive

Tone Detection Verification Test (#42)

This test checks the touch-tone digits detection capability of the DTMR port.

Table 363: Test #42 Tone Detection Verification Test

Error Code	Test Result	Description / Recommendation
	ABORT	The system could not allocate enough resources for this test, or there was an Internal system error.
1	ABORT	The system could not allocate enough resources to test the DTMR port.
1001	ABORT	The system was unable to put the DTMR port in the mode to test it.
1002	ABORT	The system could not allocate time slots for the test connection. This could happen when the system is heavily loaded. If the system is not heavily loaded, then test the TDM Bus via the **test tdm [a|b]** command. **1** Retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a Tone Generator for the test connection. This may be caused by a heavy load on the system or by a faulted Tone-Clock. **S8100** **1** Make sure there is a Tone-Clock circuit pack in the same port network. **2** If a Tone-Clock circuit pack is missing, install one in the same port network. **1** Check to see if there are any alarms against the Tone-Clock in the PN where the test aborted. If so, see the recommended procedures for TONE-BD (Tone-Clock Circuit) on page 1902 or TONE-PT (Tone Generator) on page 1927. **2** If a new Tone-Clock has been inserted, allow about 1 minute for maintenance to run on the newly inserted circuit pack. **3** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test **1** Retry the command at 1-minute intervals up to 5 times.

Table 363: Test #42 Tone Detection Verification Test

Error Code	Test Result	Description / Recommendation
2006	ABORT	DTMF detection failed. Make sure that the companding mode administered for the system matches that of the Tone Detector: mu-law for TN748, A-law for TN420.
1-3	FAIL	DTMF digits were not correctly detected. **1** Run the short test sequence: **test port *UUCSSpp* sh r 1**. **2** If the problem persists, the system is still operating properly but system capacity will be reduced. In order to restore the system performance to normal, replace the Tone Detector or IPSI circuit pack containing the defective DTMR port.
	PASS	The DTMR port is able to detect every touch-tone digit.

2 of 2

Tone Detector Audit/Update Test (#43)

The DTMR port is refreshed with all time-slot information, and sanity audit is performed on the DTMR port.

Table 364: Test #43 Tone Detector Audit/Update Test

Error Code	Test Result	Description / Recommendation
None	ABORT	The system was not able to allocate all the resources needed for this test. **1** Wait 1 minute and try again.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
	FAIL	Hardware audit failed. **1** Run the short test sequence: **test port *UUCSSpp* sh r 1**. **2** If the problem persists, the system is still operating properly but system capacity will be reduced. In order to restore the system performance to normal, replace the Tone Detector or IPSI circuit pack containing the defective DTMR port.
	PASS	The DTMR port has been successfully refreshed with its translation.

E-DIG-BD (Multi Application Platform Board)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
DIG800-BD	MINOR	**test board *location* sh**	MO800DIG-BD
DIG800-BD	WARNING	**test board *location* sh**	MO800DIG-BD

1 For information on specifying a ***location***, see Command Syntax on page 179.

The maintenance strategy for DIG800-BD is the same as the one described for MO-XXX-BD [XXX-BD (Common Port Circuit Pack/Media Module) on page 2086]. Maintenance testing of the common circuit pack is handled by on-board firmware and server-controlled tests. Maintenance software queries the firmware for error and alarm information, status, and test results. The firmware automatically reports error conditions that will result in server-controlled testing.

Board Insertion

The switch makes an additional board query if any of the following circuit packs are inserted:

Circuit Pack	Vintage
TN754	49
TN556	49, 80 or greater
TN800	any

For any of the previous initial board up-links, the switch sends queries requesting additional data from the board for administration purposes, while also telling the board the switch software release and the system type.

For the native mode, the response to the board query downlink messages consists of several CCMS uplink messages that identify the true board code, vintage, suffix, emulation type, and the number of reserved slots it needs.

Hyperactivity

The common circuit pack is considered "hyperactive" if the service dispatcher receives 200 up-link messages from the circuit pack in a 10-second period. Since MAPD has 32 ports, the hyperactivity limit is increased to 500 up-link messages per 10 seconds. An alarm is issued, and the board is taken out of service when the limit reaches 400 or when it hits 500 up-link messages in 10 seconds.

LED Use

The LED Control message 038x requests the Angel to drive the red, yellow, and green LEDs on the face plate of typical port board on or off. On the MAPD, only the red LED is controlled by this message. Yellow and green change requests received from the switch by the MAPD drive LCD behavior rather

than LED behavior. The switch continues to send the same LED control messages to the MAPD that it currently sends to every other port board. The MAPD handles proper interpretation of these messages. You should note that the PC on the MAPD, as well as the switch itself, can control the LEDs and the LCD on the MAPD.

Port Administration

In administration without hardware, the switch allows administration of up to 32 MAPD ports of any port type. If the port type later reported by the board does not match the existing type, the switch assumes the board is a MAPD board with a different configuration and rejects the board. MAPD_DCP_STA and MAPD_ASAI_STA are the only two types of terminals are allowed on a MAPD board. Therefore, while administering ports on MAPD using **add station**, it will allow only the previously mentioned terminals.

NOTE:
See XXX-BD (Common Port Circuit Pack/Media Module) on page 2086 for circuit pack-level errors. See DIG-LINE (Digital Line) on page 716 for related line information.

E-DIG-RES (TN800 reserve slot)

S8700 / S8500 / S8100

See ASAI-RES/E-DIG-RES (TN800 reserve slot) on page 350.

E-DIG-STA (Emulated Digital Line)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1] (a) (b)	Full Name of MO
E-DIG-STA	MINOR	**test port *location* l**	Emulated Digital Station
E-DIG-STA	WARNING	**test port *location* sh**	Emulated Digital Station

1 For information on specifying a ***location***, see Command Syntax on page 179.

There are 4 tests in the Emulated Digital Line station maintenance test sequence and only one test path in the test sequence. Once the test sequence begins, every test in the test sequence is executed.

E-DIG-ST maintenance monitors and tests ports on the TN800 MAPD circuit pack and the hardware connected to those ports for lines administered as a digital station. These include stations with an emulated digital voice terminal and stations with an emulated digital voice terminal and a linked data module. Stand-alone data modules and data adaptors in stand-alone mode are not supported by the TN800 circuit pack. Circuit pack maintenance is covered by E-DIG-BD.

Hardware Error Log Entries and Test to Clear Values

Table 365: Digital Line Error Log Entries – E-DIG-STA

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **sh r 1**
18 (a)	0	**busyout port** *UUCSSpp*	WARNING	OFF	**rel port** *UUCSSpp*
130 (b)		None	WARNING	ON	**test port** *UUCSSpp* **sh**
257 (c)	40971	None			
1537 (d)	40968	None	WARNING	OFF	
1793 (e)		Voice and Control Local Loop test (#13)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 3**
2049 (f)		NPE Crosstalk test (#9)	MINOR WARNING[2]	ON	**test port** *UUCSSpp* **l r 3**
2305 (g)	32770	None			
3840 (h)	40965	None			
3841 (i)	41029	None			
2304 (j)		None			

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2 Major alarms may be downgraded to Warning alarms based on the value used in the **set options** command.

Error Notes:

a Maintenance personnel have busied out the port in question. Make sure that the port is released from busyout by using the **release port *UUCSSpp*** command.

b The circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the circuit pack.

> **NOTE:**
> **S8100**: Error Types 257 and 1537 not present.

c Problems transmitting to the voice terminal. This problem can be caused by defective wiring that can cause varying degrees of problems on different types of sets. Sets such as the 7410 appear to be more susceptible to wiring problems than others.

d An in-link maintenance error has generated an off-board warning due to some problem with the link to the voice terminal. This can be ignored if no user complaints are received. Otherwise, make sure the voice terminal is connected, check for defective wiring, check for a defective voice terminal, and move voice terminal to a jack that is closer to the switch (number of feet of wiring between the jack and the switch). If the problem still exists, replace the circuit pack. Once the problem has been resolved, the alarm is retired after a predetermined amount of time.

e The local loop test failed. Each failure increments the counter by 1 when the local loop test fails. The counter is decremented when the loop test passes. When the counter reaches a threshold of 3, an on-board MINOR alarm is raised.

f The NPE Crosstalk test failed. The counter is incremented by 1 when the NPE Crosstalk test fails. The counter is decremented by 1 when the NPE Crosstalk test passes. When the counter reaches a threshold of 3, an on-board MINOR alarm is raised and the board is taken out of service.

g The station went off-hook while it was in the ready-for-service state. Use the **status station** command to determine the state of the station. The off-hook should have moved the station to ready-for-service. No technician action is necessary.

h No terminal is connected to the Digital Line board. No maintenance action is required.

i The circuit pack's message buffer is full. This may be caused by having many display phones with heavy traffic connected to the circuit pack. No action is necessary.

j Internal system error; no action is necessary. The error counters 1, 2, 3, 4, 5, 6, 10, 11, 12, 13, 14, 15, and 16 do not have any significance for this MO.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *Voice and Control Channel Local Loop Around* test (#13), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Voice and Control Channel Local Loop Around test (#13)		X	D
NPE Crosstalk test (#9)		X	ND
Station Lamp Updates test (#16)		X	ND

1 D = Destructive; ND = Nondestructive

Digital Line NPE Crosstalk Test (#9)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM-bus interface. The NPE controls port connectivity and gain and provides conferencing functions on a per-port basis. The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is part of a port's long test sequence and takes about 20 to 30 seconds to complete. Crosstalk testing occurs on both the primary information channel (voice) and the secondary information channel (data) associated with each digital station port. If this test fails on either channel, the station and the DTDM are taken out of service.

Table 366: Test #9 Digital Line NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1	ABORT	During testing of the primary information channel, system resources may not have been available or the port was busy during the test. **1** Check the port status. **2** Use **display port *UUCSSpp*** to determine the station extension of the port. Use **status station** to determine the service state of the port. If the port is in use, wait until it is idle before retesting. **3** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
2	ABORT	During testing of DTDM, system resources may not have been available or he port was busy during the test. **1** Check if port is being used. If possible, disconnect by toggling the disconnect button on DTDM. Retry the command after 1 minute. **CAUTION:** This action drops the call in progress.

Table 366: Test #9 Digital Line NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1001	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system is under heavy traffic conditions or has time slots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. **1** Use **display port *UUCSSpp*** to determine the station extension or attendant number of the port. **2** Use **status station** or **status attendant** to determine the service state of the port. **3** If the service state indicates that the port is in use, then the port is unavailable for certain tests. Wait until the port is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out.
1020	ABORT	Test disabled by background testing. Use the **status station** command to determine when the station is available for testing.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
1, 2	FAIL	The Network Processing Element (NPE) of the tested port is transmitting in error. This causes noisy and unreliable connections. Error code 1 = Crosstalk test failed on the primary channel. Error code 2 = Crosstalk test failed on the secondary channel. **1** Replace the circuit pack.

Table 366: Test #9 Digital Line NPE Crosstalk Test

Error Code	Test Result	Description / Recommendation
	PASS	The port is correctly using its allocated time slots. **1** To ensure that this is not an intermittent problem, repeat this test up to 10 times. **2** If complaints persist, examine the station, connections, and wiring.

3 of 3

Voice and Control Channel Local Loop Test (#13)

These tests check the information and control channels between the media server and the Digital Line port circuit. The media server sends a message to loop around both the information and control channels for the port. First, the primary information (voice) channel loop-back test sends a digital count from the Tone-Clock circuit pack on the primary information channel time slot and receives the same digital count with a General-Purpose Tone Detector.

While the primary information channel is still looped around, the Control Channel Loop-around test sends four different transparent patterns to the on-board microprocessor, receives them back, and compares them.

The Loop Around test for the secondary information (data) channel is the same as the primary information channel loop around test and is performed only if a DTDM is administered.

Next, a Conference test checks the primary information channel. This is the same test as Conference test (#6).

The four tests generate only one result: Pass, Fail, or Abort. If any test fails or aborts, the test sequence stops.

Table 367: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the station extension or attendant number of the port. Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **2** If the port status is idle, then retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 367: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
1001	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system is under heavy traffic conditions or it has time slots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. **1** Resolve any TTR-LEV errors. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABORT	The port was seized by a valid call during the test. **1** Use **display port *UUCSSpp*** to determine the station extension or attendant number of the port. **2** Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **3** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Rerun the test at 1-minute intervals up to 5 times.
7	FAIL	Conference test failed on primary channel. In some cases, users may not notice disruption in service. In extreme cases, conferencing feature may not work at all.
14	FAIL	The primary voice channel is not transmitting properly. User impact may range from noticing nothing to not being able to use this port.
15	FAIL	The control channel between the Processor and Digital circuit pack is not transmitting properly. User impact may range from noticing nothing to not being able to use the port. This could disrupt other users.
16	FAIL	The secondary voice channel is not transmitting properly. User impact may range from noticing nothing to not being able to use this port. **1** Run circuit pack tests to check the Tone Generator circuit pack and the Tone Detector circuit pack using the **test board *UUCSSpp*** command. **2** Resolve any problems that are detected on the Tone Generator circuit pack or Tone Detector circuit pack. **3** If the test still fails, replace the Digital Line circuit pack.

Table 367: Test #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description / Recommendation
	PASS	The test passed, and every channel is transmitting properly. **1** To ensure that this is not an intermittent problem, repeat this test up to 10 times. **2** If noisy connections for voice or corrupted data for data transfer persist, examine the station, connections, and wiring.

3 of 3

Station Lamp Updates Test (#16)

This test lights every lamp on the terminal as specified. The lamp updates will run only if the station is in service. The status of the station is checked and the lamp updates are blocked from taking place if the station is not in the in-service state. This test does not affect the status of the Message Waiting lamp.

Table 368: Test #16 DIG-LINE Station Lamp Updates Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
1	ABORT	System technician may have busied out the port. **1** Look for Error Type 18 (port busied out) for this port. If this error type is present, then release the port (**release station *extension***) and run the test again. **2** Make sure that the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
3	ABORT	Station may be in ready-for-service or out-of-service state. **1** Use the **status station** command to verify state of station. **2** Make sure the terminal is connected. **3** Retry the command at 1-minute intervals up to 5 times.
1000	ABORT	System resources required to run this test are not available. The port is busy with a valid call. **1** Use **display port *UUCSSpp*** to determine the station extension or attendant number of the port. **2** Use **status station** or **status attendant** to determine the service state of the port. If the port is in use, wait until it is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. **3** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 368: Test #16 DIG-LINE Station Lamp Updates Test

Error Code	Test Result	Description / Recommendation
1392	ABORT	This is currently a TTI port, and the test cannot execute on it. **1** Verify that the port is a TTI port using either the **display port** command (the display shows that the port is a TTI port) or the **list config** command (the display shows a `t` for the port). **2** If either **list config** or **display port** indicates that the port is *not* a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct, and no action is necessary.
	FAIL	Internal system error. **1** Retry the command at 1-minute intervals up to 5 times.
	PASS	The message to light every station lamp was successfully sent to the port. **1** Observe the station lamps being lit when running the test. If every lamps does not light, the other Digital Line test results may indicate related problems that are causing the unlit lamps. **2** Investigate by using other Digital Line port tests and by examining the station, wiring, and connections.

2 of 2

EMG-XFER (Emergency Transfer)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
EMG-XFER	MAJOR	**test environment *UU***	Emergency Transfer
EMG-XFER	WARNING	**test environment *UU***	Emergency Transfer

1 ***UU*** is the universal cabinet number as listed in the PORT field of the Alarm or Error Log.

S8100

Emergency Transfer (SCC Cabinets)

The system provides the ability to cut designated analog phones through to CO trunks if the switch cannot provide even minimal phone service. This ability is known as Emergency Transfer. The EMG-XFER MO tracks the control of Emergency Transfer. There is one EMG-XFER MO for the port network. Emergency Transfer can be controlled by the system or can be manually controlled via the Emergency Transfer switch located on the Processor circuit pack. A manual ON position (up) generates a Major alarm. A manual OFF position (down) generates a Warning alarm. Unless a technician is currently working on the system, the switch should be left in the auto position.

Error Log Entries and Test to Clear Values

Table 369: Emergency Transfer Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any	Any	test environment sh r 1
1 (a)	0	Emergency Transfer Query (#124)	MAJOR	ON	test environment r 3
257 (b)	0	Emergency Transfer Query (#124)	WARNING	ON	test environment r 3

Notes:

a Error Type: 1 - This error type indicates that the Emergency Transfer switch located on the Processor circuit pack is set to the **manual ON** position (up). When the Emergency Transfer switch is in this position it generates a Major alarm.

b Error Type: 257 - This error type indicates that the Emergency Transfer switch located on the Processor circuit pack is set to the **manual OFF** position (down). When the Emergency Transfer switch is in this position it generates a Warning alarm.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables. By clearing error codes associated with the *Cabinet Query Test*, for example, you may also clear errors generated from other tests in the testing sequence. For example, you may also clear errors generated from other tests in the testing sequence.

Single Carrier System

Table 370: Emergency Transfer System Technician-Demanded Tests

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Cabinet Query Test (#122) (a)	X	X	ND
Emergency Transfer Query Test (#124)	X	X	ND
External Alarm Lead Query Test (#120) (b)	X	X	ND
Analog Ring Generator Initialization Test (#117) (c)	X	X	ND
Analog Ring Generator Query Test (#118) (c)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a Refer to CABINET (Cabinet Sensors) on page 564 for a description of this test.

b Refer to EXT-DEV ADMIN? Y (External Device Alarm) on page 972 for a description of this test.

c Refer to RING-GEN (Analog Ring Generator) on page 1587 for a description of this test.

Emergency Transfer Query Test (#124)

This test queries the hardware for the state of the Emergency Transfer switch and reports the result. If the switch is in a position where the system software can control Emergency Transfer, then the test passes. If the switch is in a position where the system software cannot control Emergency Transfer, then the test fails. The Processor controls Emergency Transfer. The system software does not have control of Emergency Transfer within a cabinet if the switch is in the manual ON or manual OFF state.

Table 371: TEST #124 Emergency Transfer Query Test

Error Code	Test Result	Description/Recommendation
1000	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals a maximum of 5 times. **2** If the test continues to ABORT with error code 2000, check for system powering problems with the A carrier. Resolve all CABINET alarms. Then, repeat the test.
2029	ABORT	Internal system error **1** Retry the command at 1-minute intervals a maximum of 5 times.
1	FAIL	Emergency Transfer is manually turned OFF via the Emergency Transfer switch. **1** Place the switch in the AUTO position.
2	FAIL	Emergency Transfer is manually turned ON via the Emergency Transfer switch. **1** Place the switch in the AUTO position.
	PASS	The system software has control of Emergency Transfer. If Emergency Transfer is invoked, then there can be a Major alarm in the system that is invoking Emergency Transfer. Table 372, Test #124 Error Log Entries That Cause Emergency Transfer, on page 887 lists the error types and MOs that may cause Emergency Transfer. If any or all of these errors appear in the log, then refer to the appropriate Maintenance documentation and resolve those problems first. If none of these errors appear in the log, then check the Emergency Transfer hardware.

Table 372: Test #124 Error Log Entries That Cause Emergency Transfer

MO Name	Error Type	Aux Data
SW-CTL	1	
SW-CTL	2	
TONE-BD	1	0
TONE-BD	2305	0

S8700 / S8500

The Emergency Transfer MO monitors the position of the Emergency Transfer switch(es) on the EPNs' Maintenance circuit packs. It does not monitor whether the system is actually in Emergency Transfer.

Emergency Transfer (ET) provides the ability to connect designated analog phones to CO trunks when the switch cannot provide minimal phone service. Each EPN's cabinet has its own ET capability, and there is one EMG-XFER MO for each cabinet or stack of single-carrier cabinets.

ET is controlled either automatically by the system, or manually, depending on the setting of the ET switches as described in the following section.

Emergency Transfer Status

The **status cabinet *UU*** command shows the location of the ET switches and the current status of ET in the designated cabinet as follows:

auto+	ET is invoked and under system control.
auto-	ET is not in effect and is under system control (normal operating state).
unavailable	The switch setting(s) is not available.

Error Log Entries and Test to Clear Values

Table 373: EMG-XFER Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test environment** *UU*
1	0	Emergency Transfer query (#124)	MAJOR	ON	**test environment** *UU* **r 3**
257	0	Emergency Transfer query (#124)	WARNING	ON	**test environment** *UU* **r 3**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes (Multicarrier)

Always investigate tests in the order presented in the following table. For example, by clearing error codes associated with the Battery and Battery Charger Query test (#5), you may also clear errors generated from other tests in the testing sequence.

Table 374: System Technician-Demanded Tests: EMG-XFER (Multicarrier Cabinets)

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery & Battery Charger Query test (#5) (a)	X	X	ND
AC Power Query test (#78) (b)	X	X	ND
OLS Query test (Carrier E) (#127) (c)	X	X	ND
OLS Query test (Carrier D) (#127) (c)	X	X	ND
OLS Query test (Carrier A) (#127) (c)	X	X	ND
OLS Query test (Carrier B) (#127) (c)	X	X	ND
OLS Query test (Carrier C) (#127) (c)	X	X	ND
Emergency Transfer Query test (#124)	X	X	ND
Cabinet Sensors Query test (#122) (d)	X	X	ND
External Alarm Lead Query test (#120) (e)	X	X	ND
Analog Ring Generator Initialization test			
Analog Ring Generator Initialization test (#117) (f)	X	X	ND
Analog Ring Generator Query test (#118) (f)	X	X	ND

1 D = Destructive, ND = Nondestructive

Notes:

a See POWER on page 1493 for a description of this test.

b See AC-POWER on page 183 for a description of this test.

c See CARR-POW (Carrier Power Supply) on page 578 for a description of this test.

d See CABINET (Cabinet Sensors) on page 564 for a description of this test.

e See EXT-DEV ADMIN? Y (External Device Alarm) on page 972 section for a description of this test.

f See RING-GEN (Analog Ring Generator) on page 1587 section for a description of this test. These tests show up in the test sequence only if there is a TN768 or TN780 Tone-Clock circuit pack in the EPN being tested.

System Technician-Demanded Tests: Descriptions and Error Codes (Single-Carrier)

Always investigate tests in the order presented in the following table. For example, by clearing error codes associated with the *Power Query* test (#79), you may also clear errors generated from other tests in the testing sequence.

Single-Carrier System

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Power Query test (#79) (a)	X	X	ND
Emergency Transfer Query test (#124)	X	X	ND
External Alarm Lead Query test (#120) (b)	X	X	ND
Analog Ring Generator Initialization test (#117) (c)	X	X	ND
Analog Ring Generator Query test (#118) (c)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a See DC-POWER (Single-Carrier Cabinet Environment) on page 679 for a description of this test.

b See EXT-DEV ADMIN? Y (External Device Alarm) on page 972 for a description of this test.

c See RING-GEN (Analog Ring Generator) on page 1587 for a description of this test.

NOTE:
These tests only show up in the test sequence if there is a TN768 Tone-Clock Board in the EPN being tested.

Emergency Transfer Query Test (#124)

The Emergency Transfer Query test queries the hardware for the state of the Emergency Transfer switch and reports the result. If the position of the switch in a PN cabinet is such that the system software can control Emergency Transfer (auto), then the test passes. If the position of the switch or switches is such that the system software cannot control Emergency Transfer (manual “on” or manual “off”), then the test fails. Maintenance Tone-Clock controls Emergency Transfer.

Table 375: Test #124 Emergency Transfer Query Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times. **2** If the test continues to ABORT with Error Code 2000, check for system powering problems with the PN’s A carrier. Resolve every AC-POWER and CARR-POW alarm in a multicarrier cabinet system or DC-POWER alarm in a single-carrier cabinet system. Then, repeat the test. **3** If the test continues to ABORT with a 2000 Error Code, resolve every or MAINT (Maintenance circuit pack) error in a PN. Then, repeat the test.

1 of 2

Table 375: Test #124 Emergency Transfer Query Test

Error Code	Test Result	Description / Recommendation
2029, 2319, 2320, 2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
17, 18, 20, 33, 65, 289	FAIL	Emergency Transfer is manually turned OFF (Emergency Transfer switch off). **1** Place the switch in the AUTO position.
34, 290	FAIL	Emergency Transfer is manually turned ON (Emergency Transfer switch on). **1** Place the switch in the AUTO position.
	PASS	System software has control of Emergency Transfer within this cabinet. If Emergency Transfer is currently invoked (the emergency transfer LED is on), the cause could be a major alarm. **1** The following list shows the error types that can cause Emergency Transfer. If any of these errors appear in the log, then see TONE-BD (Tone-Clock Circuit) on page 1902, and resolve these error types first: • Error Type 3585, Aux Data 121 • Error Type 2305, Aux Data 40800 **2** If none of the previous errors appear in the log, then check the Emergency Transfer hardware. **3** On an EPN, if Emergency Transfer is invoked while call processing is permitted, verify that the current limiter card (982LS) is in the correct slot on the backplane. If the current limiter card is not in the correct slot, move it to the correct location, and rerun Test #124.

2 of 2

EPN-SNTY (PN Sanity Audit)

S8700 / S8500

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
EPN-SNTY	None	None	EPN Sanity Audit

The EPN Sanity Audit feature enhances the system's ability to recover from failure conditions that disable an entire PN. In such situations, not only is the affected PN unable to provide service to the system, but the system itself has not detected the condition. The EPN Sanity Audit feature recognizes a PN as unable to provide service when the software cannot receive control messages from PN circuit packs. When such a failure is detected by the EPN Sanity Audit, a sequence of recovery actions is triggered to restore the PN to service.

For a standard-reliability system (unduplicated server), the recovery sequence is:

1. TDM bus switch
2. EPN WARM reset
3. EPN COLD reset

The recovery sequence is:

1. TDM bus switch
2. Tone-Clock switch within the PN
3. PNC interchange
4. PN WARM reset
5. PN COLD reset

The EPN Sanity Audit feature activates only when every existing maintenance operation has failed to detect the PN problem. The EPN Sanity Audit serves as a safety net for the PN.

NOTE:
It is not clear why certain types of PN problems activate this feature. Thus, error log entries related to these problems do not specify which hardware to replace. The error log entries only indicate that some drastic recovery action occurred due to an unknown problem. However, clues as to the root cause of the PN outage may be present in the Error Logs and the Alarm Logs of the following MOs: TDM-BUS (TDM Bus) on page 1832, "EXP-INTF (Expansion Interface Circuit Pack)", and TDM-CLK (TDM Bus Clock) on page 1847, "EXP-PN (Expansion Port Network)", and PNC-DUP (PNC Duplication) on page 1477. You should refer to these maintenance sections during troubleshooting operations.

Error Log Entries and Test to Clear Values

Table 376: EPN-SNTY Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any			None
8801 (a)	Any	None			
8803 (b)	Any	None			
9901 (c)	Any	None			
9902 (d)	Any	None			
9903 (e)	Any	None			
9904 (f)	Any	None			
9905 (g)	Any	None			

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

Notes:

a Error 8801 — the PN is unable to send up-link control messages, and the control channel of the PN's TDM bus is swapped as part of the recovery procedure.

b Error 8803 — the PN is unable to send up-link control messages and the PN's Tone-Clock is swapped as part of the recovery procedure.

c Error 9901 — the PN is unable to send up-link control messages, but recovers after the control channels of the PN's TDM bus are swapped.

d Error 9902 — the PN is unable to send up-link control messages, but recovers after the PN's active Tone-Clock is swapped.

e Error 9903 — the PN is unable to send up-link control messages, but recovers after a PNC interchange has taken place.

f Error 9904 — the PN is unable to send up-link control messages, but recovers after a PN WARM reset.

g Error 9905 — the PN is unable to send up-link control messages, but recovers after a PN COLD reset.

ERR-LOG (Error Log)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ERR-LOG	none	none	Error Log

The ERR-LOG MO is responsible for the sanity of the Alarm Log, the Hardware Error Log, and the Software Error Log. If an inconsistency is detected in any one of these logs, every log will be re-initialized and a hardware error will be logged against ERR-LOG indicating the time of inconsistency. There are no tests and no alarms for the Error Log MO. This MO exists solely for the purpose of allowing errors to be logged against it.

Hardware Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
510 (a)	See Note	none	none	none	none

Error Notes:

a An inconsistency was detected in either the Alarm Log, the Hardware Error Log, or the Software Error Log. The system attempts to recover the logs but, depending on the extent of the corruption, some or all entries in the logs may be lost. Any alarms that were active at the time of this error have been cleared. There is no associated test for this error.

The Aux Data value indicates when the inconsistency was found:

0	During a periodic audit of the Error Log
1	After an extended reboot
2	After a reboot
S8100: 3	After a Reset System 3 (Cold_1)
4	After a Level-3 System Reset (Cold_1)
S8100: 4	After a Reset System 2 (Cold_2)
8	After a Level-2 System Reset (Cold_2)
16	After a Level-1 System Reset (Warm Start)
100	After an internal software audit
2500	After a single-process (MDM) restart

ETH-PT (Control LAN Ethernet)

S8700 / S8500 / S8100 / S8300

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
ETH-PT	MAJOR	**test port *location* long**	MO_ETH_PT
ETH-PT	MINOR	**test port *location* long**	MO_ETH_PT
ETH-PT	WARNING	**test port *location* short**	MO_ETH_PT

1 For information on specifying a ***location***, see Command Syntax on page 179.

The TN799DP Control LAN (C-LAN) packet port circuit pack provides TCP/IP connection to adjuncts applications such as CMS, Intuity, and DCS Networking. The C-LAN circuit pack has one 10baseT Ethernet connection and up to 16 DS0 physical interfaces for PPP connections. Multiple C-LAN circuit packs in a system provide additional TCP/IP capacity.

NOTE:
S8300 / **G700**: Although the ETH-PT MO is provided for a G700 media gateway, this MO only partially supports the G700's MG-ANN virtual media module.

An RSCL (remote socket control link) links the C-LAN and the media server to pass call-control and other management information. Since one link serves every port on the circuit pack, maintenance of the RSCL is part of the C-LAN circuit pack's maintenance.

NOTE:
The TN799DP C-LAN circuit pack replaces the PGATE and PI circuit packs in the G3r and G3si/G3vs systems, respectively. The PGATE or PI can be used with the C-LAN to create an X.25-to-TCP/IP bridge for adjunct and DCS connections.

Control LAN Congestion Controls

The switch activates congestion controls on C-LAN when it detects buffers exceeding the threshold. The switch releases the congestion controls when the C-LAN reports that its buffers have returned to normal levels.

If congestion:	Then the switch:
Persists for a 14-minute interval	Raises MINOR alarm.
Exhausts buffers	Raises MINOR alarm.
Ceases for 12 minutes	Retires MINOR alarm.

Error Log Entries and Test to Clear Value

Table 377: ETH-PT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test port** *UUCSSpp* **s**
1 (a)	0	Ethernet Local Looparound test (#1278)	MINOR	ON	**test port** *UUCSSpp* **l r 3**
513 (b)	0	Link Integrity Inquiry (#1282)	MINOR	OFF	**test port** *UUCSSpp* **r 2**
769 (c)	0		WARNING	OFF	
1281 (d)	0				
1537, 1538 (e)		Session Status test (#1286)	MINOR	OFF	
1793–1920 (f)					
2305–2560 (g)					
2561–2816 (g)					
3329 (h)		TCP/IP Ping test (#1281)	WARNING	OFF	

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

Error Notes:

a **Error Type 1** — Ethernet Local Looparound test (#1278) failed.

1 Test the port (**test port *UUCSSpp* long**).

2 Refer to repair procedures for Test #1278.

b **Error Type 513** — Link Integrity Inquiry test (#1282) failed, or C-LAN port detected loss of Ethernet link integrity.

Possible causes:

- Cabling
- Ethernet transceiver

1 Test the port (**test port *UUCSSpp* long**).

2 If the Link Integrity Inquiry test (#1282) fails, refer to its repair procedure.

c **Error Type 769** — Port received invalid frame.

Invalid Ethernet frame errors occur when the frame:

- Contains a bad cyclic redundancy check (CRC)
- Is misaligned

1 Isolate the problem with the Ethernet Local Looparound test (#1278).

2 Test the port (**test port *UUCSSpp* long).**

3 Verify the repair with the Ethernet Local Looparound test (#1278).

4 Clear the alarm (**test port *UUCSSpp* long clear**).

d **Error Type 1281** — System software received an indication that the far end has requested a disconnect of a session on this link. This is a log-only error.

e **Error Type 1537–1538** — Some or all sessions on a port are down

If:	Then the switch raises:
Some sessions are down	WARNING alarm on circuit pack
Every session is down	MINOR alarm on circuit pack

1. Test the port (**test port *UUCSSpp* short**).
2. Refer to Session Status test (#1286) repair procedure to verify repair.

f **Error Type 1793–1920** — System software received an indication that a socket was closed due to an error.

The error type indicates the application associated with this socket. (Whereas, the Aux Data indicates the internal application number.)

Error Type	Application
1793	Unused
1794	DCS
1795	AUDIX
1796	CMS
1797	ISDN Gateway
1798–1920	Reserved for future

g **Error Type 2305–2816** — System software detected a session is down. Aux Data indicates the session number. These are log-only errors. Error types 2305–2560 are for session numbers 1–256. Error types 2561–2816 are for session numbers 257–512.

h **Error Type 3329** — TCP/IP Ping test failed.

1. Test port (**test port *UUCSSpp* short**).
2. Refer to TCP/IP Ping test (#1281) repair procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors in the order they appear in the following table.

Table 378: System Technician-Demanded Tests: ETH-PT

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Ethernet Local Loop-Around test (#1278)		X	D
TCP/IP Ping test (#1281)	X	X	ND
Session Status test (#1286)	X	X	ND
Link Integrity Inquiry test (#1282)	X	X	ND

1 D = Destructive, ND = Nondestructive

Ethernet Local Loop-around Test (#1278)

This test is **destructive**.

Use this test to check circuitry in the data path for an Ethernet call (from the on-board processor to the Ethernet Transceiver). This test fails if the data it receives does not match the data it transmits.

Table 379: Test #1278 Ethernet Local Loop-Around Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	The port is in use. **1** Determine status of port (**status clan-port *UUCSSpp***). **2** Retry the command when the port is idle. You can force the port to the idle state by executing **busyout port *UUCSSpp***. **NOTE:** The **busyout port** command is destructive, causing every call and link associated with the port to be torn down.
2000	ABORT	Did not receive circuit pack test response within the allowable time period. **1** If the problem persists, reset the circuit pack (**busyout board *UUCSS*, reset board *UUCSS*,** and **release board *UUCSS***). **2** If the problem persists, replace the circuit pack.
2012	ABORT	Internal system error. **1** Retry the command at 1-minute intervals, up to 3 times. **2** If the problem persists, escalate the problem.
2100	ABORT	Could not allocate the necessary resources to run test. **1** Retry the command at 1-minute intervals, up to 5 times. **2** If the problem persists, escalate the problem.

1 of 2

Table 379: Test #1278 Ethernet Local Loop-Around Test

Error Code	Test Result	Description / Recommendation
1	FAIL	Circuit pack detected failure in the Ethernet Local Looparound test (#1278). **1** If the problem persists, reset the circuit pack (**busyout board *UUCSS,* reset board *UUCSS,*** and **reset board *UUCSS***). **2** If the problem persists, replace the circuit pack.
	PASS	The circuitry tests properly.

2 of 2

TCP/IP Ping Test (#1281)

This nondestructive test fails if every endpoint fails to respond. Use this test to check the circuitry in the data path for a peer-to-peer IP layer connection.

Table 380: Test #1281 TCP/IP Ping Test

Error Code	Test Result	Description / Recommendation
1, 2, 11	ABORT	Internal error **1** Retry the command at 1-minute intervals up to 3 times. **2** If the problem persists, escalate the problem.
7	ABORT	Destination unreachable. **1** Verify that there is a destination to ping in the routing table (list ip-route and look for destinations reachable through this Ethernet port). **2** If there are no reachable destinations from this port (i.e., no routes administered on Ethernet), administer a route and retry. **3** Escalate if the problem persists.
1005	ABORT	Incorrect test configuration. **1** Verify Ethernet link is in service (**status port *UUCSSpp*** or **status link *n***). **2** Verify that Ethernet link is enabled (**status port *UUCSSpp*** or **status link *n*** or **display data-module**). **3** Verify routing table has reachable destinations. **4** Repeat the test. **5** If problem persists while the Ethernet link is in service and enabled, escalate the problem.

1 of 3

Table 380: Test #1281 TCP/IP Ping Test

Error Code	Test Result	Description / Recommendation
1124	ABORT	Ethernet link is not enabled. **1** Verify that the Ethernet link is enabled (**status port *UUCSSpp***, **status link *n***, or **display data-module**). **2** If the link is not enabled, enable the link (**change data-module**). **3** Repeat the test. **4** Escalate if the problem persists.
1125	ABORT	Ethernet link not in service. **1** Verify Ethernet link is in service (**status port *UUCSSpp*** or **status link *n***). **2** If the link is not in service, release the link using (**release link *n*** or **release port *UUCSSpp***). **3** Repeat the test. **4** Escalate if the problem persists.
2000	ABORT	Did not receive circuit pack test response within the allowable time period. **1** Reset the circuit pack (**busyout board *UUCSS*, reset board *UUCSS*,** and **release board *UUCSS***). **2** If the test fails again, replace the circuit pack.
2012	ABORT	Internal system error. **1** Retry the command at 1-minute intervals, up to 3 times. **2** Escalate if the problem persists.
2100	ABORT	Could not locate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals, up to 5 times. **2** Escalate if the problem persists.
2500	ABORT	Internal system error. **1** Retry the command at 1-minute intervals, up to 3 times. **2** Escalate if the problem persists.
1003	FAIL	Ping to the destination failed due to on-board problem. **1** Retry the command at 1-minute intervals, up to 3 times. **2** If the problem persists, reset the circuit pack (**busyout board *UUCSS***, r**eset board *UUCSS***, and **release board *UUCSS***). **3** If the problem persists, re-administer the Ethernet connection through a different Ethernet port, if available. **4** If the problem still persists, or if there are no other available Ethernet ports, replace the circuit pack.

Table 380: Test #1281 TCP/IP Ping Test

Error Code	Test Result	Description / Recommendation
1007	FAIL	Ping to the destination failed due to the destination down. **1** Verify that at least one destination reachable through this port is up. Ping this destination (**ping ip-address *xxx.xxx.xxx.xxx***). **2** If the ping to any destination is successful through this port, the link is up, although some destinations are unreachable. Ignore the failure. **3** If ping to every destination fails, test this port (**test port *UUCSSpp* short**), and follow the repair procedures for Session Status test (#1286) failures.
	PASS	TCP/IP Ping test (#1281) is successful.

3 of 3

Link Integrity Inquiry Test (#1282)

This **non**destructive test queries the C-LAN Ethernet port's physical connections.

If . . .	Then the test . . .
C-LAN connection is present,	Passes.
C-LAN connection is absent,	Fails.
There is no response,	Aborts.

Table 381: Test #1282 Link Integrity Inquiry Test

Error Code	Test Result	Description / Recommendation
1124	ABORT	Ethernet link is not enabled. **1** Verify that the Ethernet link is enabled (**status port *UUCSSpp***, **status link *n***, or **display data-module**). **2** If the link is not enabled, enable the link (**change data-module**). **3** Repeat the test. **4** Escalate if the problem persists.
1125	ABORT	Ethernet link not in service. **1** Verify whether Ethernet link is in service (**status port *UUCSSpp*** or **status link *n***). **2** If the Ethernet link is not in service, release the link (**release link *n*** or **release port *UUCSSpp***). **3** Repeat the test. **4** Escalate if the problem persists.

1 of 2

Table 381: Test #1282 Link Integrity Inquiry Test

Error Code	Test Result	Description / Recommendation
1959	ABORT	Downlink message error. **1** Retry the command at 1-minute intervals, up to 3 times. **2** Escalate if the problem persists.
2012	ABORT	Internal system error. **1** Retry the command at 1-minute intervals, up to 3 times. **2** Escalate if the problem persists.
2100	ABORT	Could not locate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals, up to 5 times. **2** Escalate if the problem persists.
2500	ABORT	Internal system error. **1** Retry the command at 1-minute intervals, up to 3 times. **2** Escalate if the problem persists.
	FAIL	Link integrity lost due to problem with attachment of Ethernet cable to the port. **1** Repeat the test. **2** If the test fails, verify that the cable properly is secured to Ethernet port and to the bus. **3** Verify the C-LAN circuit pack's link integrity LED is glowing. **4** Retry the test. **5** If problem persists, see Ethernet Local Loop-around test (#1278) repair procedures.
	PASS	The Ethernet Link Integrity test (#1282) detects good connections.

2 of 2

Session Status Test (#1286)

This **non**destructive test determines the status of every Ethernet port session. This test queries the system software on port session status.

If the system software indicates that. . .	Then the switch . . .
Every port session is up (ALL UP)	Raises no alarm, or retires alarm
Some port sessions are up (SOME UP)	Raises WARNING alarm
Every port session is down (ALL DOWN)	Raises MINOR alarm

Table 382: Test #1286 Session Status Test

Error Code	Test Result	Description / Recommendation
1124	ABORT	Ethernet link is not enabled. **1** Verify that the Ethernet link is enabled (**status port UUCSSpp**, **status link *n***, or **display data-module**). **2** If the link is not enabled, enable the link (**change data-module**). **3** Repeat the test. **4** Escalate if the problem persists.
1125	ABORT	Ethernet link not in service. **1** Verify whether Ethernet link is in service (**status port *UUCSSpp*** or **status link *n***). **2** If the Ethernet link is not in service, release the link (**release link n** or **release port *UUCSSpp***). **3** Repeat the test. **4** Escalate if the problem persists.
2000	ABORT	Did not receive circuit pack test response within the allowable time period. **1** If the problem persists, reset the circuit pack (**busyout board *UUCSSpp*, reset board *UUCSS***, and **release board *UUCSS***). **2** If the problem persists, replace the circuit pack.
2100	ABORT	Could not locate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals, up to 5 times. **2** Escalate if the problem persists.
2500	ABORT	Internal system error. **1** Retry the command at 1-minute intervals, up to 3 times. **2** Escalate if the problem persists.
1	FAIL	System software indicates at least one Ethernet link session is down (SOME UP). **1** Isolate downed sessions (**status port *UUCSSpp*** or **status link *n***). **2** Follow actions based on session information.
2	FAIL	System software indicates every Ethernet session is down (ALL DOWN). **1** Test the port (**test port *UUCSSpp***) to verify the Ethernet Local Looparound test (#1278) result. **2** If test passes, wait for system software to indicate ALL UP. If not, check the destination and other components in the path. **3** If the destination and other components in the path are in service, take action based on session information.
	PASS	Every session is up.

ETR-PT (Enhanced Tone Receiver Port)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
ETR-PT	MAJOR	**test port *location* sh**	Enhanced Tone Receiver Port
ETR-PT	MINOR	**test port *location* sh**	Enhanced Tone Receiver Port
ETR-PT	WARNING	**test port *location* sh**	Enhanced Tone Receiver Port

1 For information on specifying a ***location***, see Command Syntax on page 179.

NOTE:
Replacing the Tone-Clock circuit pack requires a special procedure which is described in TONE-BD (Tone-Clock Circuit) on page 1902. That section also describes the LED display for this board.

The ETR-PT MO is supported by TN2182 and TN2312AP circuit packs.

S8100

The TN744D circuit pack is the only tone detector board used in the S8100. The TN744D provides mu-law or A-law tone detection capability.

TN2312AP IPSI Circuit Pack's Tone-Clock

For a PN with a TN2312AP IPSI, the TONE-BD MO is a module located on the IPSI circuit pack. It provides tone generation, tone detection, call classification, and clock generation and synchronization. The TN2312AP replaces the TN2182B Tone-Clock board and is inserted into each PN's Tone-Clock slot. For a non-IPSI PN, the TN2182B Tone-Clock circuit packs provide the previous functions.

The TN2312AP IPSI circuit pack (for PNs equipped with IPSIs) or the Tone-Clock circuit packs (for non IPSI PNs) both house two independent components:

- Tone Generator that provides every tone needed by the system
- Clock that generates clocks for both the system's Time Division Multiplex (TDM) bus and the LAN bus. It also aids in monitoring and selecting internal synchronization references.

When resolving errors/alarms on an IPSI or Tone-Clock circuit pack, the following sections should also be consulted:

- For a non-IPSI PN, use the **set tone-clock *UC*** command to establish the tone and synchronization resources for the system.
- For an IPSI PN, uUse the **set ipserver-interface *UC*** command to establish the tone and synchronization resources for the system.

- TONE-PT (Tone Generator)
- TDM-CLK (TDM Bus Clock)
- SYNC (Synchronization)
- TONE-BD
- PKT-INT (IPSI only)

TN2182 Tone-Clock Circuit Pack (for Non-IPSI Connected PNs)

A TN2182 is a combined Tone Generator/Tone Detector board. It provides eight Enhanced Tone receiver (ETR) ports. Each of these ports provides the functions previously found individually on DTMR-PTs, GPTD-PTs and CLAS-PTs ports. Each port on the TN2182 may be used for any tone-detection function that was previously done by TN748, TN420, or TN744 Tone Detection boards.

The TN2182 provides Mu-law or A-law tone-detection capability.

Since the TN2182 also provides Tone-Clock function, only one TN2182 circuit pack may reside in a PN (or two if your system is duplicated). If more tone-detection resources are needed, the additional resources must be provided by TN748, TN420, or TN744 circuit packs.

Error Log Entries and Test to Clear Values

Table 383: ETR-PT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	any	‘‘Test #43 Tone Detector Audit/Update Test’’	MAJ/ MIN	ON	**test port** *UUCSSpp* **r 2**
18		**busyout port**	WARNING	OFF	**release port** *UUCSSpp*
257 (a)(b)	17666	‘‘Test #43 Tone Detector Audit/Update Test’’	MAJ/ MIN	ON	**test port** *UUCSSpp* **r 3**
513 (a)(c)	any	‘‘Test #42 Tone Detection Verification Test’’	MAJ/ MIN	ON	**test port** *UUCSSpp* **r 3**

Notes:

a There are two possible alarm levels for this error type: major alarm and minor alarm. These alarm levels are dependent on the administered thresholds for TTR, CPTR, and CCTR. Each ETR port is capable of operating an any of these.

A major alarm is raised if the total number of ports capable of TTR, CPTR or CCTR detection currently in service is less than or equal to one-half of the administered TTR, CPTR, or CCTR threshold number. Otherwise, a minor alarm is raised. In either case, run the short test sequence against the port (ETR-PT) and follow the error code procedures for the individual tests.

The threshold number of ports for service is administered using the **change system-parameters maintenance** command.

If a major or minor alarm occurs, follow this repair procedure.

1. Use **list configuration carrier** to get the board type and location. If the board is TN744, then do steps 2–4; if it is TN2182 or TN2312AP, do steps 5–12.
2. Execute three commands: **busyout board *UUCSS***, **reset board *UUCSS***, and **release board *UUCSS***. Reset is required to reload RAM associated with the TN744's DSPs. This will take all eight tone detector ports out of service for a few seconds. Only four of the eight would be out of service due to the alarm. (There are four tone detectors on each of the two DSPs.) Other than the unlikely potential of running out of tone detector resources in the switch, there is no other effect when the board is reset.
3. Test the board (**test board *UUCSS* long**).
4. If the test passes, terminate the repair process. If the test fails, replace the board.
5. Check to see if the board is duplicated (**list cabine**t and **status port-network** on the affected PN).
6. If the board is not duplicated, use **test tone *UUCSS* long** to resolve the error. The long test resets the board and is required to reload on-board RAM associated with the DSPs. The effect is that tone detectors are taken out of service momentarily and tones are removed from the TDM bus for about 10 seconds. This means no dial pulses or touch tones during this interval, which probably will not affect calls in progress but could cause a call origination to abort or cause a user to not get dial tone when going off hook.
7. If every test passes and the alarm does not resolve, retest (**test tone *UUCSS* long clear**).
8. If the test passes, terminate the repair process. If it fails, replace the circuit pack at the customer's convenience.
9. If the board is duplicated, switch to the standby side (**set tone/set ipserver-interface**).
10. Test the alarmed board (**test tone *UUCSS* long**). This resets the board and is required to reload on-board RAM associated with the circuit pack's DSPs.
11. If every test passes and the alarm does not resolve, retest with **test tone UUCSS long clear**.
12. If the test passes, terminate the repair process. If it fails, replace the board.

b The ETR-PT lost its translation. Testing the ETR-PT is sufficient to reload its translation. If testing the ETR port does not clear the error, then the circuit pack containing the defective ETR port should be replaced at a time when it is convenient to remove a clock board from the system. Follow the procedures described in TONE-BD (Tone-Clock Circuit) on page 1902 for replacing a Tone-Clock circuit pack.

c This error indicates the (ETR-PT) Enhanced Tone Receiver is having problems detecting touch tones, call-progress tones, or MFC tones. If this error type is persistently logged, then the circuit pack containing the defective ETR-PT should be replaced at a time it is convenient to remove a clock board from the board from the system. Follow the procedures described in the TONE-BD (Tone-Clock Circuit) on page 1902 section for replacing a Tone-Clock circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the Tone Detection Verification test, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Tone Detection Verification test (#42)	X	X	ND
Tone Detection Audit/Update test (#43)	X	X	ND

1 D = Destructive; ND = Nondestructive

Tone Detection Verification Test (#42)

This test checks out a single ETR port's touch-tone receiver mode, MFC tone-detection/generation mode, and general-purpose tone-detection mode. During the test sequence, these modes are tested in the following order:

1 Touch-tone receivers

2 General-purpose, call-progress, and maintenance tones

3 MFC tones

Table 384: Test #42 Tone Detection Verification Test

Error Code	Test Result	Description / Recommendation
none	ABORT	The system was not able to allocate every resource needed for this test, **or** there was an internal system error.
1	ABORT	The system could not allocate every resource needed to test the tones.
1001	ABORT	The system was unable to put the ETR-PT in the appropriate mode to test it.
1002	ABORT	The system could not allocate time slots for the test connection. This situation could occur when the system is heavily loaded. If the system is not heavily loaded, test the TDM-BUS with **test tdm**. **1** Retry the command at 1-minute intervals up to 5 times.
1003	ABORT	The system could not allocate a Tone-Clock for the test connection. This may be caused by a heavy load on the system or by a faulted Tone-Clock. **1** Check to see if there are any alarms against the TONE-BD or TONE-PT in the PN where the test aborted. **2** If a new Tone-Clock has been inserted, allow about 1 minute for maintenance to run on the newly inserted circuit pack. **3** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 384: Test #42 Tone Detection Verification Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Circuit pack's response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times.
2006	ABORT	This abort code indicates that the active Tone-Clock circuit pack or a Tone Detector circuit pack may not be functioning properly. **1** Test the *active* Tone-Clock circuit pack in the PN with **test tone-clock *UUC***. **2** Retry the command at 1-minute intervals up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.
1–122	FAIL	DTMF digits were not detected correctly. **1** Run the short test sequence with **test port *UUCSSpp* sh r 1**. **2** If the problem persists, the system is still operating properly but capacity is reduced. To restore performance to normal, replace the circuit pack with the defective ETR-PT.
102	FAIL	2225-Hz Modem Answer Tone was not detected correctly. This impacts call-classification operation. **1** Run the short test sequence via **test port *UUCSSpp* sh r 1**. **2** If the problem persists, the system can still operate properly but capacity is reduced. In order to restore performance to normal, replace the circuit pack containing the defective port. Follow the procedures described in TONE-BD (Tone-Clock Circuit) on page 1902 for replacing a Tone-Clock circuit pack.
130	FAIL	Forward or Backward MFC signals were not correctly generated or detected. This will impact MFC calls. **1** Run the short test sequence via **test port *UUCSSpp* sh r 1**. **2** If the problem persists, the system can still operate properly but capacity will be reduced. In order to restore performance to normal, replace the TN2182/TN2312AP circuit pack (**S8100**: TN744) containing the defective ETR-PT. Follow the procedures described in TONE-BD (Tone-Clock Circuit) on page 1902 for replacing a Tone-Clock circuit pack.
	PASS	Tone detection verification is successful. The ETR port is able to detect/generate every necessary tone.

Tone Detector Audit/Update Test (#43)

A Digital Signal processor sanity audit is performed on the ETR-PT.

Table 385: Test #43 Tone Detector Audit/Update Test

Error Code	Test Result	Description / Recommendation
none	ABORT	The system could not allocate every resource needed for this test.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 5 times.

1 of 2

Table 385: Test #43 Tone Detector Audit/Update Test

Error Code	Test Result	Description / Recommendation
	FAIL	Hardware audit failed. **1** Use **list configuration carrier** to get the board type and location. If the board is TN744, then do steps 2–4; if it is TN2182/TN2312AP, do steps 5–12. **2** Execute three commands: **busyout board *UUCSS***, **reset board *UUCSS***, and **release board *UUCSS***. Reset is required to reload RAM associated with the TN744's DSPs. This will take all eight tone detector ports out of service for a few seconds. Only four of the eight would be out of service due to the alarm. (There are four tone detectors on each of the two DSPs.) Other than the unlikely potential of running out of tone detector resources in the switch, there is no other effect when the board is reset. **3** Test the board (**test board *UUCSS* long**). **4** If the test passes, terminate the repair process. If the test fails, replace the board. Follow the procedures in TONE-BD. **5** Check to see if the board is duplicated (**list cabinet** and **status port-network** on the affected PN.) **6** If the board is not duplicated, use test tone UUCSS long to resolve the error. The long test resets the board and is required to reload on-board RAM associated with the TN2182's/TN2312AP's DSPs. The effect is that tone detectors are taken out of service momentarily and tones are removed from the TDM bus for about 10 seconds. This means no dial pulses or touch tones during this interval, which probably will not affect calls in progress, but could cause a call origination to abort or cause a user to not get dial tone when going off hook. **7** If every test passes and the alarm does not resolve, retest (**test tone *UUCSS* long clear**). **8** If the test passes, terminate the repair process. If it fails, replace the circuit pack at the customer's convenience. Follow the procedures in TONE-BD. **9** If the board is duplicated, switch to the standby side (**set tone/set ipserver-interface**). **10** Test the alarmed board (test tone UUCSS long). This resets the board and is required to reload on-board RAM associated with the TN2182's/TN2312AP's DSPs. **11** If every test passes and the alarm does not resolve, retest with **test tone *UUCSS* long clear**. **12** If the test passes, terminate the repair process. If it fails, replace the board. Follow the procedures in TONE-BD.
	PASS	The ETR port has passed the sanity inquiry.

EXP-INTF (Expansion Interface Circuit Pack)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
EXP-INTF	MAJOR	**test board *location* s**	Expansion Interface circuit pack
EXP-INTF	MINOR	**test board *location* s**	Expansion Interface circuit pack
EXP-INTF	WARNING	**test board *location* s**	Expansion Interface circuit pack

1 For information on specifying a ***location***, see Command Syntax on page 179.

WARNING:

If the Expansion Interface (EI) circuit pack you are troubleshooting is associated with a Survivable Remote EPN (SREPN), before the SREPN can be returned to normal service, every LAPD EI link problem must be cleared, and the SREPN slide switch on the TN2301 (located in the SREPN carrier) must be **manually** set to the normal position. See Restoring Normal Service to the SREPN on page 917 in this section.

Refer also to *Avaya MultiVantage™ Solutions Installation and Maintenance for Survivable Remote EPN, 555-233-121*.

Following this introductory description of the Expansion Interface (EI) circuit pack are sections on the following topics:

- "EI In-Service Mechanism"
- "Survivable Remote EPN"
- "LEDs"
- "EI and Tone-Clock Interactions"
- "Replacing an EI Circuit Pack—Unduplicated PNC"
- "Replacing an EI Circuit Pack— Duplicated PNC"
- "Expansion Interface Manual Loop-Back Procedure"

The TN570 or the TN776 Expansion Interface (EI) circuit pack provides a TDM- and packet bus-to-fiber interface for the communication of signaling information, circuit-switched connections, and packet-switched connections between endpoints residing in separate PNs. EI circuit packs are connected via optical fiber links. An EI can be connected to:

- Another EI — in a direct-connect configuration
- A DS1 converter in a DS1 converter complex — used to remote a PN
- A Switch Node Interface (SNI) — in a center stage switch (CSS) configuration
- A survivable remote EPN (SREPN)

In a CSS configuration with duplicated Port Network Connectivity (PNC), EI circuit packs reside in the Switch Node Carrier (see Figure 63, Center Stage Switch Configuration with Duplicated PNC, on page 915). In this case, the EI and SNI circuit packs may be connected via a metallic cable instead of an optical fiber link. Metallic cable should be tested and replaced in the same manner as optical fiber.

A PN-to-PN connection can be extended through a DS1 converter complex. (See Figure 64, Fiber Link with DS1 Converter Complex, on page 916). When discussing problems that may be related to fiber links, the DS1 converter is considered part of the fiber link. If diagnosis of the problem points to fiber connectivity **and** a DS1 converter circuit pack is part of the connectivity, problems with the DS1 converter circuit pack should be investigated (see DS1C-BD on page 840). The DS1 converter circuit pack enters into diagnostics for the EI circuit pack via such tests as the Neighbor Query test (#237), the Fiber Out-of-Frame test (#238), the Two-Way Transmission test (#241), and the Packet Transmission test (#589).

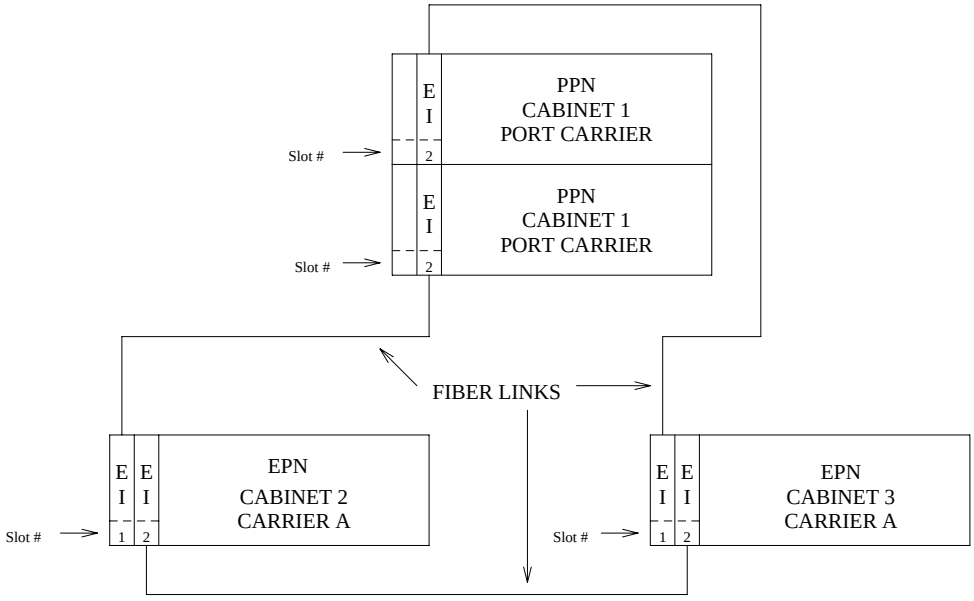
In a critical-reliability system, the fiber link's are duplicated as part of PNC duplication. In a high-reliability system with a CSS (Center Stage Switch) and unduplicated PNC, a single point of failure between the media server and the CSS is eliminated by duplicating each link, consisting of:

- SNI in the CSS to which the PN's EI connects
- Physical fiber paths between them

These dual connections normally share the call-processing load. Should one of these links fail, the entire load can be shifted to the operational link.

Figure 60, Direct Connect Configuration with Unduplicated PNC, on page 912 shows the location of the EI circuit packs in a typical unduplicated PNC, direct connect configuration.

Figure 60: Direct Connect Configuration with Unduplicated PNC

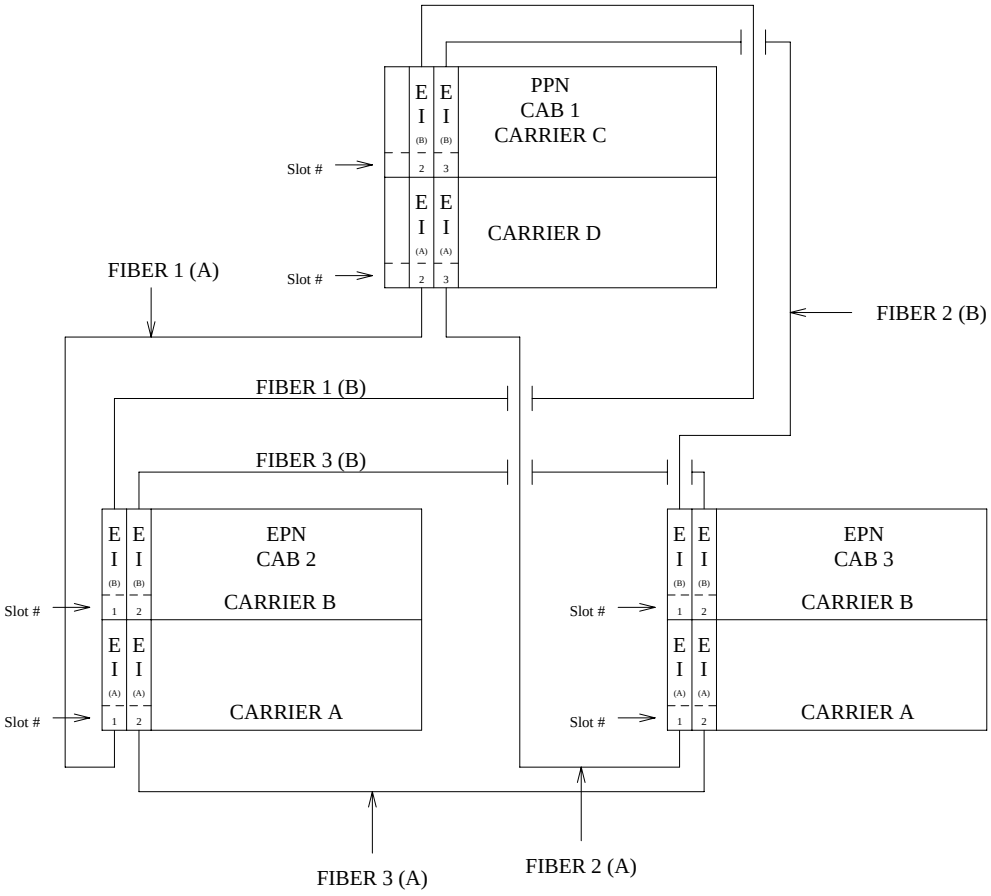


Each PN in a direct-connect configuration must be connected to the other PNs through a fiber link. Each PN has one EI that functions as an Archangel. This EI must be connected with fiber to an EI. If an EI is

functioning as an Archangel (bus master), its amber LED will be flashing at a rate of 2 seconds on and 200 ms off.

Figure 61, Direct Connect Configuration with Duplicated PNC, on page 913 shows the location of EI circuit packs in a typical duplicated PNC, direct-connect configuration.

Figure 61: Direct Connect Configuration with Duplicated PNC



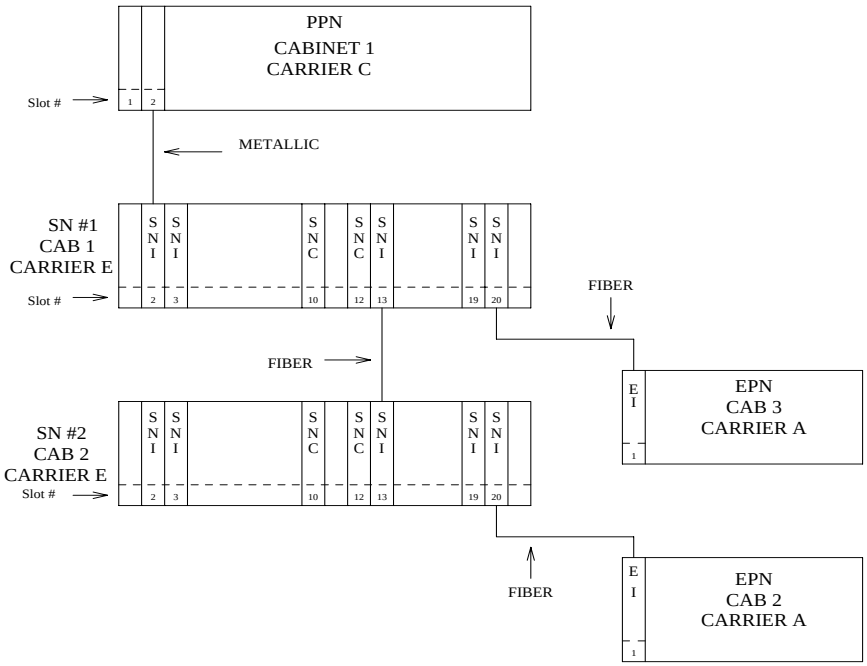
In a duplicated PNC there is an A-side and a B-side PNC. Every EI in this diagram is labeled with an A or a B designating to which PNC it belongs. Note that a PNC's designation (A or B) does not relate directly to the carrier where its EIS reside. Again, only one of a PN's EIs can function as the Archangel (TDM-bus master). A PN's EI that is:

- On the active PNC
- Logically connected to the media server

is the only one that can function in this mode. In normal operation, its amber LED should be blinking at a rate of 2 seconds on and 200 ms off.

Figure 62, Center Stage Switch Configuration with Unduplicated PNC, on page 914 shows the location of EIs in a typical center stage switch configuration with unduplicated PNC.

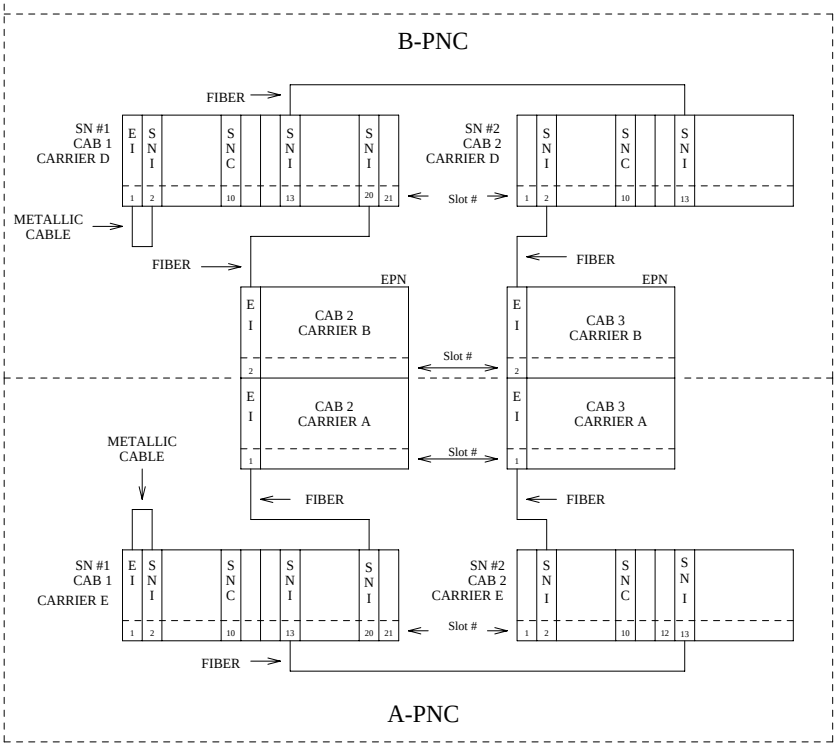
Figure 62: Center Stage Switch Configuration with Unduplicated PNC



For an unduplicated stage switch configuration, only one EI is needed in each PN. Notice that there is no direct connection between the PNs, rather every inter-PN connection is made through the center stage switch. Each SNI in the switch node carriers can be connected to a PN through an EI circuit pack.

Figure 63, Center Stage Switch Configuration with Duplicated PNC, on page 915 shows the location of EIs in a typical two Switch Node Center Stage Switch configuration with duplicated PNC.

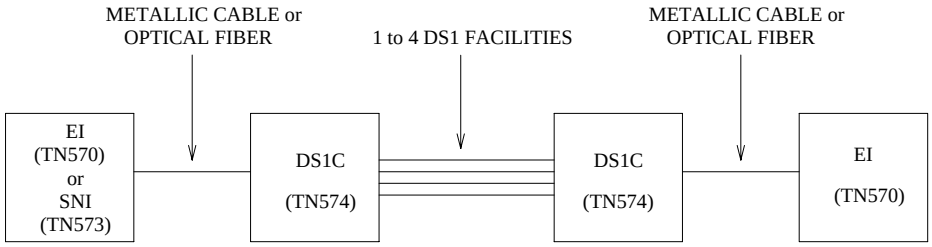
Figure 63: Center Stage Switch Configuration with Duplicated PNC



In a duplicated center stage switch configuration, two EIs are needed in each PN. One resides in the PNC's A side and one in the B side. Note that a PNC designation (A or B) does not directly designate the carrier where an EI resides. The active PNC's EI is the one acting as the PN's Archangel (TDM bus master). This EI's amber LED should be blinking at a rate of 2 seconds on and 200 ms off. Whereas, the amber LED on standby PNC's EI should be off.

A PN (and thus, the EIs contained within it) can be remoted via a DS1 Converter complex. This requires that a fiber link (providing connectivity to the remoted PN) be administered with an associated DS1 Converter complex. This complex consists of two TN574 DS1 Converter (DS1C-BD) circuit packs connected by from 1 to 4 DS1 facilities. Figure 64, Fiber Link with DS1 Converter Complex, on page 916 shows where the DS1 converter complex fits into an EI-to-SNI or EI-to-EI fiber link. For more information, see DS1C-BD on page 840.

Figure 64: Fiber Link with DS1 Converter Complex



EI In-Service Mechanism

In order for calls to be routed through a given PN, the EI that is part of the connectivity to that PN must be put into service. In order for an EI to be put into service, the following criteria must be met:

1. The EI must be recognized by software (inserted). Use **list config carrier** to verify that the board is recognized by software.
2. The EI must have a fiber link administered to it. Use **list fiber-link** to verify that this EI circuit pack has a fiber administered to it.
3. The EI must have established a LAPD link to its neighbor (the circuit pack on the "other end" of the fiber link). This neighbor can be another EI or an SNI.

CAUTION:
If previous requirements 1 and 2 have been met, and the amber LEDs are flashing in a manner that appears to confirm that the EI circuit pack has established a LAPD link to its neighbor, the circuit pack still may not be "in service". The requirement is that it must have the CORRECT neighbor on the other end of the fiber. Care must be taken when connecting the fibers to the back of the carriers so that fibers are connected to the correct circuit packs. In a Center Stage Switch configuration, run the "configuration audit" test against the SNI circuit pack that is the neighbor of the EI circuit pack in question (see SNI-BD (SNI Circuit Pack) on page 1667 for more details).

Once an EI has been put into service, if any of the previously listed in-service criteria become untrue, the EI is taken out of service, and service to that PN is not available.

In a system that is configured with PNC duplication active, taking an EI out of service that is on the active PNC will, if all other things on the active and standby PNC are equal (i.e., both PNCs are equally healthy, the standby PNC is not busied out, the PNC is not locked by software), result in a PNC interchange.

Survivable Remote EPN

The Survivable Remote EPN (SREPN) feature allows a S8700 Multi-Connect EPN (either MCC or SCC) to provide service to the customer when:

- Its fiber (or T1/E1 EI link to the S8700 Multi-Connect processor) fails or is severed
- The S8700 Multi-Connect processor or center stage fails.

NOTE:
This feature is viewed as a “disaster recovery operation” capability rather than as an additional reliability option.

The SREPN allows a remote EPN cabinet to provide processor capabilities to the EPN in the event of a failure. A logic switch circuit pack (TN2301) located in the SRPPN detects when the link to the S8700 Multi-Connect is down and switches to a link from the local SRPPN (TN790-based processor). When the links to the S8700 Multi-Connect are restored and verified to be stable, the logic switch is ***manually reset***, and the EPN is reconnected to the links from the S8700 Multi-Connect.

NOTE:
The SREPN feature is not available when an ATM-PNC/EI circuit pack is used to replace the TN570 EI circuit pack in a direct-connect configuration, or an ATM Switch is providing the Center Stage (PNC) connectivity.

NOTE:
If you suspect a problem with the TN790B-based R6si SRPPN use the R6si maintenance documentation supplied with the SREPN feature to resolve any alarms/errors associated with the SRPPN carrier.

SREPN Feature Active

WARNING:
Every call within the SREPN is terminated when the SREPN feature is activated, and the R6si SRPPN takes control of the SREPN.

The SREPN feature is activated when the Maintenance circuit pack (TN775C or later and located in the SREPN) detects a problem with the SREPN’s EI (TN570B) LAPD link to its counterpart in a S8700 Multi-Connect EPN. The TN775C Maintenance circuit pack notifies the co-located SRPPN of the problem, and the TN2301 SRSwitch circuit pack in the SRPPN carrier switches the EI LAPD link connection from the S8700 Multi-Connect PPN to its counterpart in the S8300 Media Server with G700 Media Gateway SRPPN. The SREPN is now in the Survivable Remote mode and has the capabilities of an S8300 Media Server with G700 Media Gateway EPN that has been pre-translated with a *Disaster Recovery* configuration.

NOTE:
When SREPN feature is active, the EI circuit pack that is assigned to the SREPN and located in the S8700 Multi-Connect PN is put in loop-back mode.

Restoring Normal Service to the SREPN

WARNING:
Every call within the SREPN is terminated when the SREPN feature is returned to normal service.

To restore normal connections to the SREPN EI circuit pack in the S8700 Multi-Connect PN, you must:

1. Clear every error logged against the S8700 Multi-Connect SREPN EI circuit pack by using the suggested repair procedures outlined in this MO.

2 At the SRP flip the 3-position switch on the TN2301 to the RSTR (restore) or top position for at least 1 second and return the switch to the AUTO, or middle position.

3 After the SREPN slide switch has been restored to the normal position, test the connectivity to S8700 Multi-Connect EI LAPD link, by using the suggested procedures outlined in this MO.

4 After normal service is returned to the S8300 Media Server with G700 Media Gateway SREPN, the SRPPN will be in an *alarmed state*. This is *normal* for an SRPPN and indicates that the:

- SRSwitch (TN2301) has disconnected it from its neighbor (EI in the SREPN)
- SRPPN is no longer in control.

Connectivity has been reestablished between the EI in the SREPN and its counterpart EI circuit pack in the S8700 Multi-Connect PN. The system is now in a normal S8700 Multi-Connect EI configuration.

LEDs

SREPN Expansion Interface

The EI circuit pack has red, green, and amber LEDs. The red and green LEDs show the standard conditions:

- Red indicates an alarm condition.
- Green indicates maintenance testing in progress.

The amber LED is used to provide useful visual status information:

- Active EI circuit packs:
  - — Have their amber LED on solid (for an inter-EPN EI in a direct connect system)
  - — Blink a pattern of 2 seconds on and 200 ms off.
- The standby PNC EI circuit packs should have their amber LEDs off.

Another way to determine which PNC (and therefore, which EIs in an EPN) is active and which is standby, use the **status port-network** and **status PNC** commands.

See Table 386, Expansion Interface Circuit Pack Amber LED Flashing States, on page 918 for the possible EI amber LED states.

Table 386: Expansion Interface Circuit Pack Amber LED Flashing States

Condition	LED On	LED Off
Fiber Out-of-Frame (a)	0.1 second	0.1 second
In Frame-No Neighbor (b)	0.5 second	0.5 second
Expansion Interface Active (c)	2 second	0.2 second
Expansion Interface Active (d)	solid on	never off
Expansion Interface Standby (e)	never on	solid off

Notes:

a This flashing state corresponds to error codes 769 and 770 from the Hardware Error Log and indicates a failure of Test #238. These error codes are usually accompanied by error code 1281 (no EI or SNI detected on opposite end of fiber). This condition may be caused by the absence of the neighbor EI or SNI circuit pack, a broken or missing fiber, or a missing lightwave transceiver on either endpoint (EI or SNI circuit packs).

b This corresponds to error code 1281 from the Hardware Error Log and indicates a failure of Test #237. This condition is usually due to the failure of this EI circuit pack or a failed EIEI or SNI circuit pack counterpart.

c This is the normal state for an active PN EI circuit pack that is also the bus master (Expansion Archangel) in the EPN.

d This is the normal state for an active EI circuit pack that is not the bus master (Expansion Archangel) for a PN. This applies only in the direct-connect configuration where the EI circuit pack in a PN is connected via a fiber link to an EI circuit pack in the other PN.

e This is the normal state for a standby EI circuit pack in a PN.

NOTE:
In a PN, its TN775C Maintenance (MAINT) circuit pack monitors the sanity of the EI circuit pack. If the EI circuit pack should cycle between sane and insane several times, the Maintenance circuit pack will hold the EI circuit pack reset. If a new EI circuit pack is installed in the PN, and the red LED remains lit, the PN's Maintenance circuit pack should be removed because it may be holding the new EI circuit pack reset. This condition could present itself if there is a link problem to the PN, and the PN experiences several PN restarts. The Maintenance circuit pack may be reinstalled after the EI circuit pack has been physically inserted and the EI circuit pack's red LED has gone off.

The link between two active EI circuit packs or between an active EI circuit pack and an active SNI circuit pack is involved in synchronization. The EI circuit pack reports slip errors if synchronization is not operating properly. When diagnosing synchronization problems, the EI circuit packs should be examined as a possible cause.

Expansion Interface LEDs

The EI circuit pack has the standard red, green, and amber LEDs. The red and green LEDs have the traditional uses: red means some alarm condition and green indicates maintenance testing in progress. The amber LED is used to provide useful visual status information. The state of the amber LED is very important when executing the Expansion Interface Manual Loop-Back Procedure. The possible amber LED states are shown in Table 387, Expansion Interface Circuit Pack Amber LED Flashing States, on page 920.

Upon power-up, the red and green LEDs turn on and off. The amber LED goes to its appropriate state.

To determine which PNC (and which EIs in a PN) is active and which is standby, use the **status port-network** and **status pnc** commands. Alternately, visual inspection will show that the active EI circuit packs will have their amber LED on solid (for an inter-PN EI in a direct connect system) or blink a pattern of 2 seconds on and 200 ms off. The standby PNC EI circuit packs will have their amber LEDs off. See Table 387, Expansion Interface Circuit Pack Amber LED Flashing States, on page 920 for the possible EI amber LED states.

Table 387: Expansion Interface Circuit Pack Amber LED Flashing States

Condition	LED On	LED Off
Fiber Out-of-Frame (a)	0.1 second	0.1 second
In frame-No Neighbor (b)	0.5 second	0.5 second
Expansion Interface Active (c)	2 second	0.2 second
Expansion Interface Active (d)	solid on	never off
Expansion Interface Standby (e)	never on	solid off

Notes:

a Fiber Out-of-Frame - This flashing state corresponds to error codes 769 and 770 from the Hardware Error Log and indicates a failure of Test #238. These error codes will usually be accompanied by error code 1281 (no Expansion Interface or SNI detected on opposite end of fiber). This condition may be caused by the absence of the neighbor EI or SNI circuit pack, a broken or missing fiber, or a missing lightwave transceiver on either endpoint (EI or SNI circuit pack).

b In frame-No Neighbor - This flashing state corresponds to error code 1281 from the Hardware Error Log and indicates a failure of Test #237. This condition is usually due to the failure of this EI circuit pack or a failed EI or SNI circuit pack neighbor.

c This is the normal state for an active PN EI circuit pack that is also the bus master (Expansion Archangel) in the PN.

d This is the normal state for an active EI circuit pack that is not the bus master (Expansion Archangel) for a PN. This applies only in the Direct Connect configuration where the EI circuit pack in a PN is connected via a fiber link to an EI circuit pack in the other PN.

e This is the normal state for a standby EI circuit pack in a PN.

NOTE:
In a PN, its TN775C Maintenance (MAINT) circuit pack monitors the sanity of the EI circuit pack. If the EI circuit pack should cycle between sane and insane several times, the Maintenance circuit pack will hold the EI circuit pack reset. If a new EI circuit pack is installed in the PN, and the red LED remains lit, the PN's Maintenance circuit pack should be removed because it may be holding the new EI circuit pack reset. This condition could present itself if there is a link problem to the PN, and the PN experiences several PN restarts. The Maintenance circuit pack may be reinstalled after the EI circuit pack has been physically inserted and the EI circuit pack's red LED has gone off.

The link between two active EI circuit packs or between an active EI circuit pack and an active SNI circuit pack is involved in synchronization. The EI circuit pack will report slip errors if synchronization is not operating properly. When diagnosing synchronization problems, the EI circuit packs should be examined as a possible cause.

EI and Tone-Clock Interactions

The viability of the EI fiber link depends upon the system clock that is provided by the active Tone-Clock circuit pack on each network (see TDM-CLK (TDM Bus Clock) on page 1847 and TONE-BD (Tone-Clock Circuit) on page 1902). Each EI circuit pack transmits over the fiber at a rate derived from the system clock on its network. If the active Tone-Clock is defective in such a way that the frequency of system clock it produces is out of the specified range ("out of spec"), an EI fiber link might go down.

This affects an Expansion Archangel Link (EAL), a Remote Neighbor Link (RNL), and/or a Local Neighbor Link (LNL), even though the EI circuit packs are healthy. When the PNC is duplicated, both fiber links could go down if there is a defective active Tone-Clock.

Whether or not a fiber link goes down, depends on certain characteristics of the EI circuit packs. An EI circuit pack should not be replaced if the fiber link on which it resides goes down because of a defective active Tone-Clock circuit pack. The defective Tone-Clock circuit pack should be replaced instead. The EI circuit packs are more sensitive to a defective system clock than the rest of the components of the system. Therefore, testing of the Tone-Clock circuit pack might not reveal a problem.

The symptoms of the problem in which an invalid system clock causes an Expansion Link to go down are as follows:

- If the Tone-Clock in the PN provides the current on-line synchronization reference (see **status synchronization**), is providing an invalid system clock:

  Any EI or SNI circuit pack has a Fiber Out-of-Frame condition or a No Neighbor condition.

  An EI circuit pack amber LED blinks quickly when a Fiber Out-of-Frame condition exists (0.1 seconds on, 0.1 seconds off) and Test #238 fails on the EI circuit pack that is out-of-frame.

  An SNI circuit pack with a Fiber Out-of-Frame condition blinks its amber LED quickly (0.1 seconds on, 0.1 seconds off) and Test #989 fails on the SNI circuit pack that is out-of-frame.

  An EI circuit pack amber LED blinks slowly when a No Neighbor condition exists (0.5 seconds on, 0.5 seconds off) and Test #237 fails on this EI circuit pack, but Test #238 passes.

  An SNI circuit pack with a no neighbor condition blinks its amber LED slowly (0.5 seconds on, 0.5 seconds off) and Test #759 fails on this SNI circuit pack, but Test #989 passes.

- If a Tone-Clock in a PN that does not provide the current on-line synchronization reference (see **status synchronization**) is providing an invalid system clock:

  In a direct connect configuration, the PN EI circuit pack amber LED will blink quickly (Fiber Out-of-Frame condition – 0.1 seconds on, 0.1 seconds off).

  Test #238 fails on this EI circuit pack.

  In a CSS configuration, the SNI connected to the PN EI circuit pack blinks its amber LED quickly (Fiber Out-of-Frame condition – 0.1 seconds on, 0.1 seconds off).

  The PN EI circuit pack amber LED blinks slowly (In-frame, No Neighbor condition – 0.5 seconds on, 0.5 seconds off).

  If the PN is in service, Test #237 fails on this EI circuit pack, but Test #238 passes.

These symptoms can also be the result of other problems (for example, one half of the fiber being unable to transmit data). If the system exhibits these symptoms, execute the following procedure:

1 Verify that the PN stays down for at least 1 minute.

If the EAL comes back in service after a short time, without switching the active Tone-Clock, the problem was probably that the on-line synchronization source became invalid (See SYNC Maintenance documentation for more information).

However, if the EAL(s) have not come back into service after a minute, the synchronization source is not the cause of the problem. Proceed to step 2.

2 Check for errors via the **display errors** command with the `Category` field set to **tone** and the Active Alarms field set to **n**. Some of the alarms on PN objects might have been resolved if the PN went down. Refer to the appropriate MO Maintenance documentation for descriptions of any of the errors occurring at about the same time as the EXP-PN errors, SYS-LINK errors against EAL s, RNLs, or LNLs, or FIBER-LK (769, 1025, or 1281) errors. Resolve any active alarms.

Also, if Error Type 18 was logged against the SYNC MO when the PN went down, the problem was probably that the synchronization on-line reference became invalid. Since reference switching was disabled, the Tone-Clock did not switch from the invalid reference. Therefore, the Tone-Clock circuit pack put out a system clock that was “out of spec.” Issue the **enable synchronization-switch** command. If the PN is down, reseat the Tone-Clock circuit packs on the PN. This action should restore the PN to service.

Execute Steps 3 and 4 in the order most convenient to you and least destructive to the customer.

3 Check to see if the fiber-optic cable is transmitting properly via the following procedure on one of the out-of-service links, or use the Fiber link fault isolation in *Maintenance Procedures (555-245-103)*.

a Carefully record the symptoms (amber LED pattern and test failing) that were occurring on the PN EI circuit pack and the PN EI circuit pack or the connected CI circuit pack in the case of a Center Stage system. Clearly indicate what symptoms are occurring on which EI/SNI circuit pack.

CAUTION:

Before proceeding, note which is the current transmit fiber and which is the current receive fiber for proper reconnection.

b Disconnect the transmit and receive fiber pair from the lightwave transceiver behind one of the EI circuit pack slots that is exhibiting symptoms.

c Connect what was formerly the transmit fiber to the receive jack.

d Connect what was formerly the receive fiber to the transmit jack.

e Perform steps b, c, and d on the opposite end of the fiber and the lightwave transceiver behind the connected EI or SNI circuit pack slot.

f If the symptoms that were formerly occurring on the EI circuit pack that was exhibiting these symptoms are now occurring on the connected EI or SNI circuit pack and vice versa, the fiber is defective and should be replaced.

4 Determine whether the problem is due to a defective active Tone-Clock circuit pack. Refer to the preceding list of symptoms to decide which network contains the suspect active Tone-Clock.

CAUTION:

If you remove the PN EI circuit pack that is active or that was active when the PN was last in service, the Tone-Clock lead will revert to the default value which will cause the Tone-Clock circuit pack located in the A carrier to become the active Tone-Clock. This characteristic can be deceiving. Replacing or reseating the active PN EI circuit pack might restore the link(s) temporarily. However, if the Tone-Clock circuit pack located in the B carrier was really the source of the problem and not the EI circuit pack, then the link(s) will go down again the next time a Tone-Clock switch to the Tone-Clock in the B carrier is attempted (probably when the scheduled Tone-Clock switch occurs).

CAUTION:

If, after every link is restored, you suspect the problem might have been due to a defective Tone-Clock circuit pack, switch to this Tone-Clock at an appropriate time. If the Tone-Clock circuit pack was the cause of the problem and the same EI circuit packs are in place, the same link(s) will go down again.

a When the suspect Tone-Clock circuit pack resides in an in-service pot network (PN) with duplicated Tone-Clock circuit packs:

Switch to the standby Tone-Clock in this PN. If the suspect Tone-Clock is defective, the link(s) should be restored at this point. (Switching back to the defective Tone-Clock should take the same link(s) out of service.) This Tone-Clock is defective and should be replaced as soon as possible. If switching Tone-Clocks does not bring up the PN, then this Tone-Clock is not the source of the problem. Be sure to switch back to the original Tone-Clock.

CAUTION:
If a defective Tone-Clock circuit pack is left as the standby Tone-Clock, then a scheduled Tone-Clock switch will cause the same link(s) go out of service again.

b When the suspect Tone-Clock resides in an out-of-service PN:

Replace the active Tone-Clock circuit pack in this PN. In a PN with duplicated Tone-Clock circuit packs, the active Tone-Clock's amber LED is flashing. If both amber LEDs are flashing, the active Tone-Clock's LED is blinking slower.

CAUTION:
If a defective Tone-Clock circuit pack is left as the standby Tone-Clock, then a scheduled Tone-Clock switch will cause the same PN to go out of service again.

If replacing this circuit pack restores the link(s), then the circuit pack should be replaced as soon as possible. If not, then it was not the source of the problem.

Replacing an EI Circuit Pack—Unduplicated PNC

WARNING:
Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:
Replacing a Switch Node Interface, Switch Node Clock, Expansion Interface, or DS1 Converter circuit pack in a standard-, duplex-, or high-reliability system disrupts service. This service effect can range from an outage of a single PN to an outage of the entire system.

Step	Action	Explanation / Caution
1	Enter **busyout board UUCSS**.	UUCSS = cabinet-carrier-slot address of the circuit pack to be replaced.
2	Replace the circuit pack.	
3	Wait for the circuit pack to reset.	Red and green LEDs light and then go out. If the red LED remains lit, see the previous note under "Expansion Interface LEDs".
4	Enter **release board *UUCSS***.	**CAUTION:** *Do not busyout any EI circuit packs after this point.*
5	Enter **test alarms long clear** for category **exp-intf**.	
6	Wait 5 minutes for SNI-BD, FIBER-LK, **and** DS1C-BD alarms to clear, or enter **clear firmware-counters a-pnc.**	

Replacing an EI Circuit Pack— Duplicated PNC

WARNING:

On a system with duplicated PNC, synchronization may be provided over a combination of active and standby components. This condition is indicated by an OFF-BOARD WARNING alarm against TDM-CLK with error type 2305. Repairs to standby PNC in this state may disrupt service. Otherwise, if the active PNC is functional, replacement of a standby component will not disrupt service.

Step	Action	Explanation / Caution
1	Enter **status pnc**.	Verify that the component to be replaced is on the standby PNC.
2	Enter **busyout pnc**.	
3	Enter **busyout board *UUCSS***.	UUCSS represents the cabinet-carrier-slot address of the circuit pack to be replaced.
4	Replace the circuit pack.	
5	Enter **release board *UUCSS***.	**CAUTION:** *Do not busyout any EI circuit packs after this point.*
6	Enter **test alarms long clear** for category **exp-intf**.	
7	Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK, and DS1C-BD alarms to clear, or enter **clear firmware-counters a-pnc** or **b-pnc**.	Use the letter designation of the PNC that holds the replaced component (the standby PNC).
8	Enter status pnc.	If either PNC's state of health (SOH) is not "functional," consult PNC-DUP (PNC Duplication) on page 1477.
9	Enter **release pnc**.	

If the red LED remains lit, see the previous note under ‘‘Expansion Interface LEDs’’.

Expansion Interface Manual Loop-Back Procedure

This procedure is to be used when an EI circuit pack cannot be tested by software. This occurs when the EI circuit pack resides in an out-of-service PN. A short length of optical fiber is required for this procedure.

If this procedure is run on both endpoints of a fiber link (EI circuit packs or SNI circuit packs), and both check out fine, then the failure is most likely in the fiber itself, assuming neither endpoint circuit pack is busied out and the link remains inactive.

1. Busyout the circuit pack (EI or SNI) with the **busyout board *UUCSS***.
2. Disconnect the transmit and receive fiber pair from the lightwave transceiver behind the circuit pack (EI or SNI) slot.

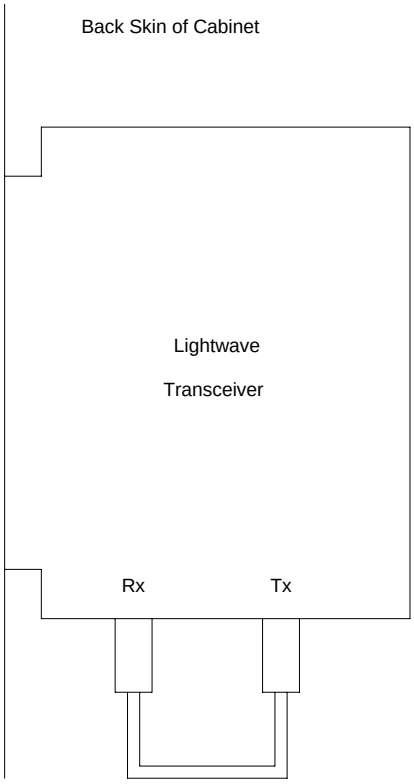
   NOTE:
   The fiber connected to the transmit side of the lightwave transceiver on one EI circuit pack should be connected to the receive side of the lightwave transceiver on the circuit pack on the opposite end of the fiber.

3. Using a fiber jumper cable, interconnect the transmit and receive jacks of the lightwave transceiver as shown in Figure 65, Interconnection of Lightwave Transceiver Transmit/Receive Jacks, on page 926.

   NOTE:
   Make sure that the total length of the fiber jumper cable does not exceed the maximum length recommended for the fiber link connections between cabinets. Using cable lengths not within connectivity guidelines can adversely affect test results.

4. Go to the front of the cabinet and inspect the amber LED.
   - If the amber LED flashes on at a rate of once per second, the (EI or SNI) circuit pack or transceiver should be replaced.
   - If the amber LED flashes on at a rate of five times per second, the circuit pack (EI or SNI) or the lightwave transceiver may need replacement. This condition may also be due to a faulty system clock on the network containing this EI circuit pack.
   - If the amber LED is not blinking, this circuit pack (EI or SNI) and the lightwave transceiver are functioning properly.
5. Replace faulty components and reconnect the original fiber. Be sure to reconnect the fibers properly as noted in step 3. If there is a problem with the PN after re-connecting the fiber, and the PN is connected to a Center Stage Switch, run the Configuration Audit via the **test board** command on the SNI circuit pack to which the intervening fiber is connected. See the SNI-BD section for instructions on interpreting results.
6. Release EI circuit pack or SNI circuit pack with the **release board *UUCSS*** command.

Figure 65: Interconnection of Lightwave Transceiver Transmit/Receive Jacks



Error Log Entries and Test to Clear Values

1 Aux Data 32767 for any error log entry indicates that an alarmed EI was busied out and then released. When this occurs, existing service affecting alarms must be preserved. As is typical, when the EI is released every alarm is resolved. Therefore the alarm and error logs must be repopulated with the alarms present at time of busyout. This error code is an indication that existing aux data and error log time stamps are no longer valid because they were lost when the alarms were resolved upon release of the circuit pack.

2 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

Notes:

a This error indicates that the EI circuit pack has been busied out via **busyout board *UCSS***. To resolve this error, release the EI circuit pack via **release board *UCSS***.

b EI circuit pack has been administered on the Circuit Pack screen, but has not been physically inserted into the system. Insert the circuit pack.

c A different circuit pack occupies the slot where this circuit pack is logically administered. To resolve this problem, either:

- Replace the incorrect circuit pack with the logically assigned circuit pack.
- Use **change circuit-pack** to reassign the slot to match the existing circuit pack. (If a fiber is assigned for the existing circuit pack, remove the fiber from translations before changing the circuit pack's translations.)

d This alarm is raised after an EI circuit pack has been removed from a slot for 5 minutes. The alarm will be resolved when the EI circuit pack is physically inserted into this slot and becomes recognized by software.

Another way to resolve or prevent this alarm is to use **change circuit pack** to remove the EI circuit pack administrative entry for this slot after the EI circuit pack has been removed from the slot.

It is also possible that the EI could be held in reset by the PN's Maintenance board (MAINT) and is not inserted in the system. Try issuing the **test maint *P* long** command on the Maintenance board in the same PN.

e Error Type 257—Indicates that this EI circuit pack is detecting incorrect data on the incoming fiber bit stream. The data is originating at the connected circuit pack (DS1 converter circuit pack, EI circuit pack, or SNI circuit pack).

1. Enter **display errors** and save a copy of the error log for use in later steps. Intervening repair procedures are likely to alter the contents of the error log and this information may be needed in later steps.
2. Perform the Fiber link fault isolation in *Maintenance Procedures (555-245-103)*.
3. If errors are still present or if this error occurs intermittently, replace the EI circuit packs, SNI circuit packs, DS1 converter circuit packs, or the transceivers on this link.
4. These errors could result from a bad timing reference on the network or switch node that contains the DS1 converter circuit pack, the EI circuit pack or SNI circuit pack on the opposite end of the fiber. Refer to the error log that was saved in step 1 and follow the associated repair procedure for EXP-INTF error 2305 to resolve this error. If there are any TONE-BD, TDM-CLK, or SYNC errors, resolve these errors as well.

f Error Type 513 with Aux Data 5–7— Indicates an ON BOARD hardware failure of the circuit packs RAM or ROM.

1. Replace the EI circuit pack.

g Besides running the test sequence and following procedures outlined for Test #238, perform the Fiber link fault isolation in *Maintenance Procedures (555-245-103)*.

h Error type 1281—The link to the neighbor circuit pack is broken or that the fibers have been connected incorrectly. Enter **test board *UUCSS*** and follow repair procedures for the tests.

i Error Type 1538—Indicates a hyperactive EI circuit pack that is generating an abnormal amount of control messages to the Processor. When this error was generated, the EI was automatically reset by the system. If this system does not have duplicated Port Network Connectivity, service to the PN will have been disrupted. If this system does have duplicated Port Network Connectivity, the system should have switched to the standby Port Network Connectivity.

1. Enter the **reset board *UUCSS*** command for this EI circuit pack.
2. If error 1538 is detected again, replace the EI circuit pack.

j Error Type 2305 with Aux Data 118—Indicates that the EI circuit pack has detected slips on the incoming fiber data stream. That is, a PN in a Direct Connect configuration, or a PN and a Switch Node in a Center Stage Switch configuration, are not synchronized.

1. Enter **display errors** and follow the repair procedures for *non-slip* errors against any SYNC, TDM-CLK, TONE-BD, DS1C-BD, EXP-INTF, SNC-BD, and SNI-BD. Non-slip errors are those *not* listed below:

Circuit Pack's Name	Name in Error Log	Log Entry (for Slips)
DS1 Interface	DS1-BD	3073 to 3160
Expansion Interface	EXP-INTF	2305
SNI	SNI-BD	1537
Tone-Clock	TDM-CLK	1025
UDS1 Interface	UDS1-BD	3073 to 3160
DS1 converter circuit pack	DS1C-BD	3329

2. For slip errors, see SYNC (Port-Network Synchronization) on page 1751.

Error Type 2306—Indicates on-board failures related to system timing and synchronization. Perform the Fiber link fault isolation described in Chapter 6, "Troubleshooting" of *Maintenance Procedures (555-245-103)*.

k Error Type 2561—Indicates an on-board failure of EI circuitry related to handling packet data from the fiber interface and from the packet-bus interface.

1. If this error has generated a minor alarm, the EI circuit pack should be replaced.

l Error Type 2817—Indicates an on-board failure of EI circuitry related to transmission of data to the fiber interface.

1. If this error has generated a minor alarm, the EI circuit pack or transceiver should be replaced.

m Perform the following steps for error type 3073:

1. Execute the **display errors** command and resolve any errors on the following: PKT-BUS, PKT-INT, PDATA-BD, PGATE-BD, BRI-BD, BRI-PT, BRI-SET/ASAI, UDS1-BD.
2. Enter the **test board *UUCSS* r3** command for this circuit pack. If this error continues to appear, replace the EI circuit pack.

n Error Types 3074 and 3075—Failures of the EI circuit pack Packet Path test. This packet path test exercises circuitry on the EI circuit pack, the neighbor EI or SNI circuit pack, and any intervening DS1 converter circuit packs (if the PN is remoted).

1. Certain packet-bus faults can cause these errors without the EI being defective. Check to see if PKT-BUS errors are also present. If they are, use the PKT-BUS (Packet Bus - S8100) on page 1414 section of this chapter and Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in *Maintenance Procedures (555-245-103)* to diagnose the problem.
2. If Error Type 3075 is present without Error Type 3074, replace the EI circuit pack.
3. If Error Type 3074 exists with or without 3075, run **test board *UUCSS*** on the EI, and follow the repair procedures for any test that does not pass.

4 If PKT-BUS errors are absent and replacing the EI does not resolve the problem, there is still the possibility of a packet-bus fault. See Isolating and repairing packet-bus faults (or S8100 packet bus fault isolation and repair for **S8100**) in *Maintenance Procedures (555-245-103)*.

o Error Type 3330—Indicates a failure of a diagnostic component on the EI circuit pack. The failed component will not impair service, but it may leave the EI circuit pack in a state where the EI circuit pack cannot detect errors.

1 Replace the EI circuit pack at a time when it is most convenient for the customer (this may cause service outages).

p Error Type 3585—Indicates that the EI circuit pack experienced a series of very short out-of-frame conditions within several minutes. This may indicate transmission difficulties over the fiber link. If this condition ceases, the warning alarm should be resolved within 15 minutes.

1 Enter **display errors** and resolve any SNC-BD, TDM-BUS, TDM-CLK or SYNC errors.

2 Perform the “Fiber Fault Isolation Procedure” described in Chapter 5.

3 If the alarm is not resolved within the next 15 minutes, replace the lightwave transceiver on the EI circuit pack reporting the problem and on the connected EI circuit pack, SNI circuit pack, or DS1 converter circuit pack.

4 If the alarm is not resolved within the next 15 minutes, replace the EI circuit pack reporting the alarm.

5 If the alarm is not resolved within the next 15 minutes, replace the connected EI circuit pack, SNI circuit pack or DS1 converter circuit pack.

q Error Type 3841—Indicates the EI has reported a loss of lock with the backplane system clock.

r Error Type 3842—Indicates that the test that queries the EI for the state of the lock to the system clock has failed. This means that a loss of lock condition is present.

s The counter associated with Error Types 3841 and 3842 is cleared when the query for the state of the clock-to-system-clock passes. Once the alarm is raised, this test is run every five minutes. However, the test is not part of any sequence that can be run on demand. See previous Note “p” for repair procedure.

t Error Type 10001 is a report that the EI circuit pack dropped one control message to the PN. This condition may have been observed as a call that did not complete correctly. No system technician action is required.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in Table 389. For example, by clearing error codes associated with the Expansion Interface Reset test (#336), you may also clear errors generated from other tests in the testing sequence.

Table 389: System Technician-Demanded Tests: EXP-INTF

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Expansion Interface Reset test (#336)			X	D
Expansion Interface Fiber Out-of-Frame Query test (#238)	X	X		ND
Expansion Interface Lightwave Transceiver Looparound test (#242)		X		D
Expansion Interface Control Channel test (#316)	X	X		ND
Expansion Interface Neighbor Query test (#237)	X	X		ND
Expansion Interface Local Looparound test (#240)	X	X		ND
Expansion Interface 2-way Transmission test (#241)	X	X		ND
Expansion Interface Packet Interface test (#589)	X	X		ND

1 D = Destructive, ND = Nondestructive

When testing EI circuit packs to investigate problems, tests should always be run on both circuit packs on the associated fiber link, whether the circuit packs are both EI circuit packs, or one is a SNI circuit pack. This will provide a better indication of where a problem is located.

When testing of the EI is not possible, (for example, when the PN is down), see the previous EI Manual Loop-Back procedure.

Expansion Interface Neighbor Query Test (#237)

This test is **non**destructive.

The Expansion Interface Neighbor Query test is a request to an EI circuit pack to determine whether it has established communication with its neighbor EI or SNI circuit pack.

Table 390: Test #237 Expansion Interface Neighbor Query Test

Error Code	Test Result	Description / Recommendation
1033	ABORT	The EI circuit pack does not have a fiber link administered to it. There is not sufficient data to run test. **1** Issue **list fiber-link** to verify that there is no fiber link administered to this circuit pack. **2** If there is no fiber administered to this circuit pack, but there should be add the correct fiber using **add fiber-link**. **3** Retry the command.
2000	ABORT	Response to the test was not received within the allowable time period.
2031	ABORT	The attempt to send the message to the EI circuit pack, asking it who it's neighbor is, was not successful.
2100	ABORT	System resources required to run this test are not available. Someone may be doing something on this Port Network Interface.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
1033	FAIL	The EI circuit pack under test cannot make contact with its neighbor EI or SNI circuit pack. Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*.
2027	FAIL	The EI circuit pack has contact with the neighboring EI or SNI circuit pack, but it is the incorrect EI or SNI circuit pack. **1** Enter **list fiber-link** and verify that every fiber link cable is installed as it is administered. **2** Repeat the command.
	PASS	The EI circuit pack has successfully established a link with the neighbor EI or SNI circuit pack. If **status port-network** still indicates that this link is down, one or both of the EI and/or SNI circuit packs may have been busied out. **1** If the link still does not come up, reset one or both EI and/or SNI circuit packs on the link.
0	NO BOARD	No board was detected by the test. **1** Check the error log for wrong board (Error 125) or no board (error 131). Resolve either of these issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use **reset board *UUCSS***. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Expansion Interface Fiber Out-of-Frame (FOOF) Query Test (#238)

This test is nondestructive. This test is a request to an EI circuit pack to determine whether it is currently detecting the framing sequence on the incoming fiber data stream. If it cannot detect this framing signal, the EI circuit pack will not be able to establish a link with the neighbor EI or SNI circuit pack.

Table 391: Test #238 Expansion Interface Fiber Out-of-Frame Query Test

Error Code	Test Result	Description / Recommendation
1033	ABORT	The EI circuit pack does not have a fiber link administered to it. There is not sufficient data to run test. **1** Issue **list fiber-link** to verify that there is no fiber link administered to this circuit pack. **2** If there is no fiber administered to this circuit pack, but there should be add the correct fiber using **add fiber-link**. **3** Retry the command.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	FAIL	EI circuit pack could not detect framing sequence. **1** If the EI circuit pack that is failing Test #238 is in the PN, and the red LEDs are ON on a large number of circuit packs, then reseat any Tone-Clock circuit packs in the PN. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. **3** Enter **display errors** and resolve any SNC-BD, TDM-BUS, TDM-CLK, or SYNC errors.
	PASS	The EI circuit pack has detected the valid framing signal on the fiber. **1** Refer to errors from other EI circuit pack, SNI tests, or DS1 converter tests (if present) if the link is still not functioning.
0	NO BOARD	No board was detected by the test. **1** Check the error log for wrong board (error 125) or no board (error 131). Resolve either of these issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (error 1538). If hyperactive, use **reset board *UUCSS***. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Expansion Interface Local Looparound (#240)

This test is nondestructive. The EI local loop around is similar to the Lightwave Transceiver Looparound test (#242). A test tone is received by the EI being tested, but is not transmitted out to the fiber interface before being looped back. The loop back is internal to the circuit pack. Thus, this test does not interfere with the normal fiber data stream.

Table 392: Test #240 Expansion Interface Local Looparound

Error Code	Test Result	Description / Recommendation
1	ABORT	Could not allocate time slot on TDM Bus A. Loop back passed on TDM Bus B.
2	ABORT	Could not allocate time slot on TDM Bus B. Loop back passed on TDM Bus A. **1** If there is no reason to doubt that the EI circuit pack can transfer data to or from a TDM Bus, then since the test passed on one bus, assume that the test passes on the other bus. **2** If this test continues to abort with the same error, rerun test at 1-minute intervals up to 3 times. **3** If the test still does not pass on the other TDM Bus, follow the procedure for ABORT Error Code 3.
3	ABORT	The system could not allocate time slots for the test on either TDM Bus. The system may be under heavy traffic conditions or it may have time slots out of service due to TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out of service. **1** Enter **display errors** and follow associated repair procedures for TTR-LEV errors in the error log. Even if there are not TTR-LEV errors, there may not be a tone detector available on the network that contains the circuit pack being tested. Verify that there is at least one tone detector on the network. If not, this test always aborts for this EI circuit pack. This does not harm the system. **2** Resolve any TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 3 times.
1031	ABORT	A query of the EI circuit pack aborted. The purpose of this query was to see if the EI circuit pack could detect the framing signal. **1** If Test #238 aborted, follow the procedure associated with this abort code. **2** If Test #238 did not abort, rerun Test #240 at 1-minute intervals up to 3 times.

Table 392: Test #240 Expansion Interface Local Looparound

Error Code	Test Result	Description / Recommendation
1032	ABORT	The EI cannot detect the framing signal and cannot run the test. **1** Refer to the errors for Test #238 to determine why the EI circuit pack is out of frame.
1033	ABORT	The EI circuit pack does not have a fiber link administered to it. There is not sufficient data to run test. **1** Issue the **list fiber-link** command to verify that there is no fiber link administered to this circuit pack. **2** If there is no fiber administered to this circuit pack, but there should be add the correct fiber using the **add fiber-link** command. **3** Retry the command.
1394	ABORT	The EI circuit pack is out of service and the test cannot be run. This condition is due to a change in the EI circuit pack's ability to communicate with the EI or SNI circuit pack on the other end of the fiber. **1** Run Test #237, and check the Error Log for EXP-INTF error type 1281. If error type 1281 is present or if Test #237 does not pass, see repair procedures for Test #237, in Table 390, Test #237 Expansion Interface Neighbor Query Test, on page 932.
1395	ABORT	This test cannot be run on an EI circuit pack if it is part of the B-side PNC and duplicated PNC is not enabled. **1** If this test needs to run on this EI circuit pack, enable PNC with the **change system-parameters duplication** command. **2** Prevent the system from doing a PNC interchange by executing the **set pnc lock** command. **3** Repeat this test.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

2 of 3

Table 392: Test #240 Expansion Interface Local Looparound

Error Code	Test Result	Description / Recommendation
1	FAIL	Loop back on TDM Bus A failed. Loop back on TDM Bus B passed.
2	FAIL	Loop back on TDM Bus B failed. Loop back on TDM Bus A passed.
3	FAIL	Loop back on both TDM Buses failed.
12	FAIL	Loop back on TDM Bus B failed. Loop back on TDM Bus A aborted because the system could not allocate time slots.
21	FAIL	Loop back on TDM Bus A failed. Loop back on TDM Bus B aborted because the system could not allocate time slots.
None	FAIL	The test tone was not detected correctly after being looped through the EI circuit pack. **1** If Error Type 2305 has been logged against the EI circuit pack in the last 5 minutes, this test could have failed due to the associated slips. If so, first resolve the 2305 error, and then repeat the test. **2** Run the tests for the active Tone-Clock on the PN that contains the indicted EI circuit pack to verify that dial-tone is supplied. **3** If the tone-clock is healthy, repeat the short test on the EI board. **4** If this test continues to fail, replace the EI circuit pack.
	PASS	Test tone was correctly detected after internal EI loop back on both TDM buses. **1** Refer to other EI circuit pack tests if the links between this EI circuit pack and the EI or SNI circuit pack on the other end of the fiber is not functioning correctly.
0	NO BOARD	No board was detected by the test. **1** Check the error log for wrong board (error 125) or no board (error 131). Resolve either of these issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (error 1538). If hyperactive, use the **reset board *UUCSS*** command. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Expansion Interface 2-Way Transmission Test (#241)

This test is nondestructive. The EI 2-way transmission test is a basic connectivity test between two PNs. The test first sends dialtone from the cabinet of the EI circuit pack under test through the Center Stage Switch, through the DS1 converter circuit packs, and through another EI circuit pack to a tone detector in the other cabinet. The connections are then reversed and the tone is passed in the opposite direction. If the system is equipped with a Center Stage Switch, and this test either fails or aborts with the above connection, a second PN is chosen (if one is available and the EI circuit pack is In-Service) and the same

test is run on this new connection. This helps in the isolation of the fault. Since two EI circuit packs are involved in the connection, either one of them could be at fault and this repeated test can help determine which one is actually at fault.

The path used in this test is represented in Figure 66, Two-Way Circuit Switch Transmission Test, on page 937.

Figure 66: Two-Way Circuit Switch Transmission Test

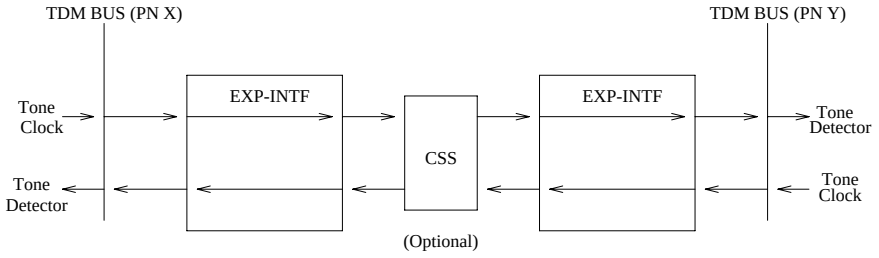

Table 393: Test #241 Expansion Interface 2-Way Transmission Test

Error Code	Test Result	Description / Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out of service due to TDM-BUS errors. Enter **display errors** and follow the repair procedures for TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out of service. **1** Enter **display errors** and follow the repair procedures for TTR-LEV errors in the error log. Even if there are not TTR-LEV errors, there may not be a tone detector available on the network that contains the circuit pack being tested. Verify that there is at least one tone detector on this network. If not, this test will always abort for this EI circuit pack. This will not harm the system in any way. S8700 Multi-Connect systems require that Tone Detector circuit packs (TN768) must be of vintage "B" or newer. If older Tone Detector circuit packs are installed in the system, this test will always abort with this code. **2** Enter **display errors** and follow the repair procedures for TONE-PT errors. **3** If neither condition exists, retry the command at 1-minute intervals up to 3 times.

Table 393: Test #241 Expansion Interface 2-Way Transmission Test

Error Code	Test Result	Description / Recommendation
1033	ABORT	The test cannot run because either the EI board does not have a fiber link administered to it and there is not sufficient data to run the test, or there were no other PNs administered that had its EI board In-Service. **1** Check fiber administration to insure that there is a fiber link administered to this EI circuit pack. **2** If there is a fiber administered to this EI circuit pack, then some change in the status of the ability of the EI circuit pack in the other PNs to communicate with the EI or SNI circuit pack on the other end of its fiber has occurred. **3** Test #237 and check for EXP-INTF circuit pack Error Type 1281 in the Error Log for the EI circuit packs in these other PNs. If Error Type 1281 is present and/or Test #237 does not pass, see repair procedures for Test #237, in Table 390, Test #237 Expansion Interface Neighbor Query Test, on page 932. **4** If Test #237 passes, reseat the EI circuit pack. This is not destructive since the circuit pack cannot be serving as the Expansion Archangel if it is not in service.
1394	ABORT	The EI circuit pack is out of service and the test cannot be run. This condition is due to a change in the EI circuit pack's ability to communicate with the EI or SNI circuit pack on the other end of the fiber. **1** Run Test #237, and check the Error Log for EXP-INTF Error Type 1281. If Error Type 1281 is present or if Test #237 fails, see repair procedures for Test #237, in Table 390, Test #237 Expansion Interface Neighbor Query Test, on page 932.
1395	ABORT	This test cannot be run on an EI circuit pack if it is part of the B-side PNC and duplicated PNC is not enabled. **1** If this test needs to run on this EI circuit pack, enable PNC with the **change system-parameters duplication** command. **2** Prevent the system from doing a PNC interchange by executing the **set pnc lock** command. **3** Repeat this test.
1413	ABORT	This test requires the use of a Tone-Clock circuit pack in each of the PNs used in this test. This abort code indicates that there are none of these circuit packs located in one of the PNs. **1** Verify that there is a Tone-Clock circuit pack in the PN where the EI circuit pack under test resides. **2** In a Direct Connect configuration, verify that there is a Tone-Clock circuit pack in the PN where the neighbor EIEI circuit pack circuit pack resides. **3** In a Center Stage Switch configuration, verify that there is at least one other PN, besides the PN where the EI circuit pack under test resides, with a Tone-Clock circuit pack.

Table 393: Test #241 Expansion Interface 2-Way Transmission Test

Error Code	Test Result	Description / Recommendation
1414	ABORT	This test requires the use of an active Tone-Clock circuit pack in each of the PNs used in this test that does not have a MAJOR or MINOR alarm logged against it. This abort code indicates that the active Tone-Clock circuit pack in one of the PNs being used for the test has a MAJOR or MINOR alarm logged against it. **1** Enter **display alarms** and resolve every TONE-BD and TONE-PT alarm.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	FAIL	The test tone was not detected correctly in either direction. **1** Run the test for the active Tone-Clocks on the PNs for which the EI circuit pack under test provides a link. This will determine whether dial tone is being supplied. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*.
1 or 2	FAIL	The test tone was detected correctly in one direction, but not the opposite direction. **1** Test for the active Tone-Clocks on the PNs for which the defective EI board provides a link. This determines if the dial tone is supplied. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. **Center Stage:** These failure codes are possible on a Center Stage Switch configuration only when there is just one other PN available for looping back the test tone. **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*.
3 or 4	FAIL	The failure codes only apply to a system equipped with a Center Stage Switch. They indicate that the test aborted or failed for the first connection from the EI board under test to another PN, and that the test tone was detected correctly in one direction, but not the opposite direction when the connection was between the EI board under test and a different PN than was used in the first connection. **1** Run the test for the active Tone-Clocks on the PNs for which the defective EI board provides a link. This determines if the dial tone is being supplied. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*.
	PASS	The tone was successfully transmitted in both directions. Both EI boards, SNI boards, DS1 converter circuit packs, and their lightwave transceivers are functioning properly.

Table 393: Test #241 Expansion Interface 2-Way Transmission Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	No board was detected by the test. **1** Check the error log for wrong board (error 125) or no board (error 131). Resolve either of these issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (error 1538). If hyperactive, use the **reset board *UUCSS*** command. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

4 of 4

Expansion Interface Lightwave Transceiver Loop-Around Test (#242)

This test is **destructive**.

This test requires that the EI circuit pack first be busied out. If the system has a duplicated Port Network Connectivity, this test cannot be run on an EI circuit pack that resides on the current active PNC due to restrictions that prohibit the busying-out of certain components that are part of the active PNC. If this test is run on an EI circuit pack that is part of the standby PNC, this test is not destructive and no service outages will take place.

In a system without duplicated Port Network Connectivity, where this EI circuit supports an IPSI to PN link, this test will disrupt service to one or more PN's. If the EI circuit pack is part of a PN-to-PN link in a Direct Connect system, service between the two PNs will be disrupted.

This is a 2-part connectivity test. In the first part of the test, a digital count is transmitted from the cabinet of the EI circuit pack under test, through the EI circuit pack under test, out to its lightwave transceiver. The connection then loops back into the lightwave transceiver, through the same EI circuit pack again, and into the originating cabinet. If the test tone is detected by a tone detector, the first part of the test passes. The path used for this part of the test is represented in Figure 67, TDM BUS Lightwave Transceiver Looparound, on page 941.

In the second part of the test, a data packet is sent from the TN1655 Packet Interface circuit pack to the EI circuit pack under test, the packet is looped back through the lightwave transceiver and is sent back to the Packet Interface circuit pack. If the Packet Interface circuit pack receives the same packet it transmitted, the second part of the test passes. If the entire test has passed, the EI circuit pack, its backplane wiring, and the electrical portion of the lightwave transceiver are healthy. The path used for this test is represented in Figure 68, Packet Bus Lightwave Transceiver Looparound—PN only, on page 941. The path used for this test if the EI resides in a PN is represented in Figure 69, Packet Bus Lightwave Transceiver Looparound—PN only, on page 942.

When the EI circuit pack under test is in a PN, the data packet must also pass through the active EI circuit packs and the active DS1 converter circuit packs (and the active SNI circuit pack(s) in a Center Stage Switch system) of the active PNC link connecting the PN.

This test requires the EI circuit pack to ignore incoming data from its neighbor EI circuit pack or SNI circuit pack. Thus this test will:

- Disturb any inter-PN connections that currently exist over the link provided by the EI under test and its neighbor
- Disrupt signaling between the two circuit packs

Figure 67: TDM BUS Lightwave Transceiver Looparound

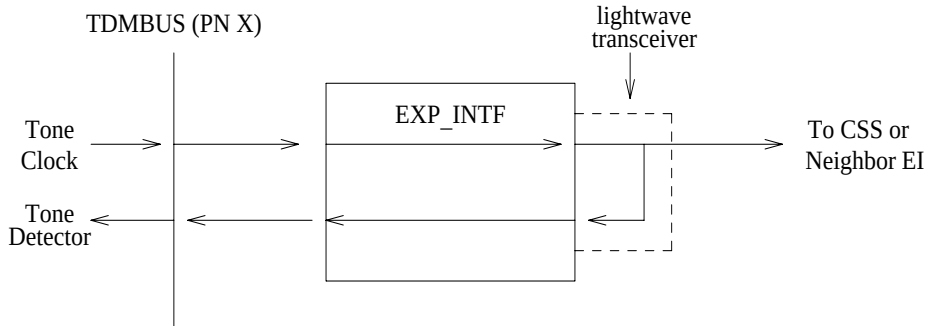

Figure 68: Packet Bus Lightwave Transceiver Looparound—PN only

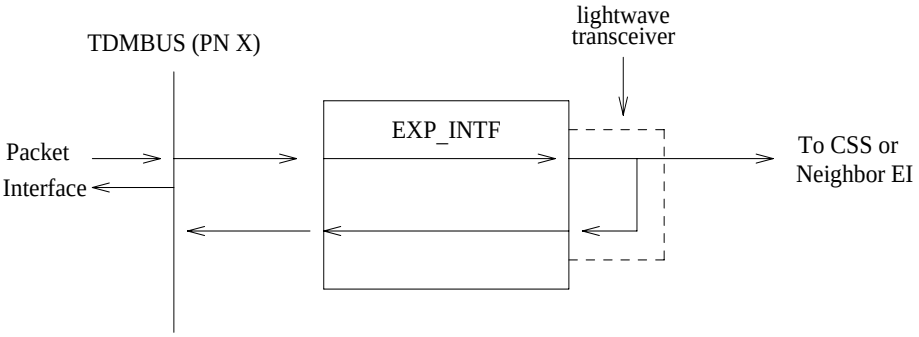

Figure 69: Packet Bus Lightwave Transceiver Looparound—PN only

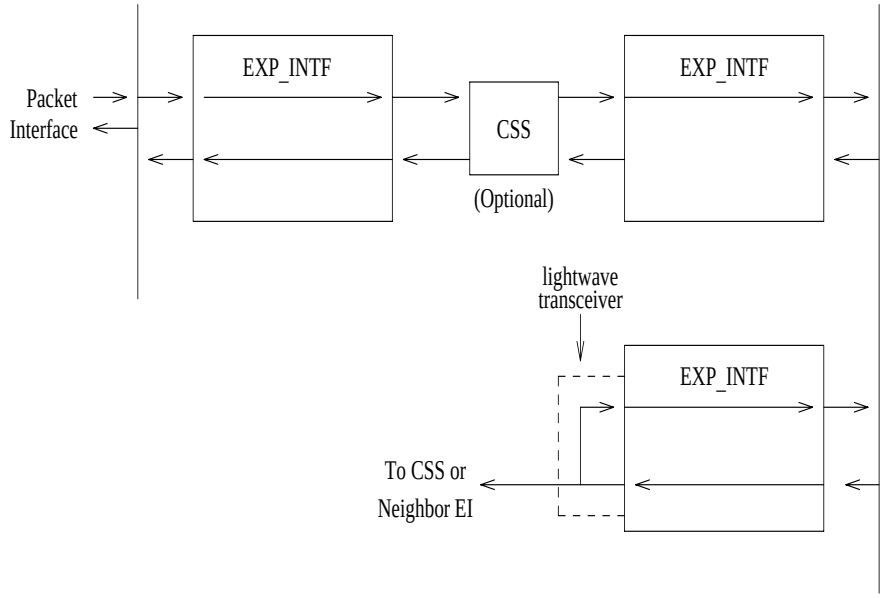

Table 394: Test #242 Expansion Interface Lightwave Transceiver Looparound

Error Code	Test Result	Description / Recommendation
1002	ABORT	The system could not allocate timeslots for the test. The system may be under heavy traffic conditions, or it may have timeslots out of service due to TDM-BUS errors. Enter **display errors** and resolve any TDM-BUS errors. **1** If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out of service. **1** Enter **display errors** and follow associated repair procedures for TTR-LEV. Even if there are no TTR-LEV errors, there may not be a Tone Detector available on the network that contains the circuit pack being tested. Verify that there is at least one Tone Detector on this network. If there is not at least one Tone Detector, this test always aborts for this EI board. This will not harm the system. **2** Enter **display errors** and follow associated repair procedures for TONE-PT. **3** If neither condition exists, retry the command at 1-minute intervals up to 3 times.
1015	ABORT	The system will not allow this test to be run because the EI circuit pack has not been busied out. **1** Busyout the EI circuit pack. Repeat **test board *UUCSS* long**.

Table 394: Test #242 Expansion Interface Lightwave Transceiver Looparound

Error Code	Test Result	Description / Recommendation
1031	ABORT	If the EI circuit pack is in a PN and is on the active PNC, and is not part of a PN-to-PN link, this test *cannot* be executed. If the lightwave transceiver looparound is activated, it is impossible to deactivate it. **1** If PNC Duplication is enabled, attempt to make the standby PNC active through the **reset pnc interchange** command. **2** If the PNC Interchange is successful, the Lightwave Transceiver Looparound test may now be executed on the original EI circuit pack.
1033	ABORT	The test cannot run because the EI circuit pack does not have a fiber link administered to it and there is not sufficient data to run the test. **1** Issue **list fiber-link** to verify that there is no fiber link administered to this circuit pack. **2** If there is no fiber administered to this circuit pack (but should be), add the correct fiber using **add fiber-link**. **3** Retry the command.
1139	ABORT	The packet bus in the PN where this EI board resides has a major alarm against it. This test needs to use the alarmed PN's packet bus. **1** Enter **display alarms** and **display errors** and resolve any PKT-BUS alarms. **2** Retry the command.
1141	ABORT	The Packet Interface circuit pack is out of service. **1** See PKT-INT (Packet Interface) on page 1421.
1144	ABORT	The PN's packet bus has a major alarm against it. This test needs to use the alarmed PN's packet bus. **1** Enter **display alarms** and **display errors** and resolve any PKT-BUS alarms. **2** Retry the command.
1394	ABORT	The EI board is out of service and the test cannot be run. This condition is due to a change in the EI board's ability to communicate with the EI or SNI circuit pack on the other end of the fiber. **1** Run Test #237 and check the Error Log for EXP-INTF Error Type 1281. If Error Type 1281 is present or if Test #237 fails, see repair procedures for Test #237, in Table 390, Test #237 Expansion Interface Neighbor Query Test, on page 932.
1395	ABORT	This test cannot be run on an EI circuit pack if it is part of the B-side PNC and duplicated PNC is not enabled. **1** If this test needs to run on this EI circuit pack, enable PNC with **change system-parameters duplication**. **2** Prevent the system from doing a PNC interchange by executing the **set pnc lock** command. **3** Repeat this test.

Table 394: Test #242 Expansion Interface Lightwave Transceiver Looparound

Error Code	Test Result	Description / Recommendation
1407	ABORT	This test cannot be run on an EI board that is on the active PNC because it cannot be busied out. This error code indicates that PNC duplication is enabled. **1** Attempt to perform a PNC interchange via **reset pnc interchange**. **2** If the PNC interchange is successful, busyout the original EI circuit pack via **busyout board *UUCSS*** (address of the original EI board). **3** Retry the command.
2000	ABORT	Response to the test was not received in the allowable time period. **1** Retry the command at 1-minute intervals up to 3 times.
2060	ABORT	The link on the packet bus being used to perform the test has failed. **1** Retry the command at 1-minute intervals up to 3 times. **2** If the test continue to abort, enter **display errors** and resolve any PKT-INT errors.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
1	FAIL	The test did not detect the test tone through the loop-around connection. The packet portion of this test was not run since the circuit portion failed. **1** Test the active Tone-Clock on the PN that contains the defective EI circuit pack to verify that dial tone is being supplied. **2** If the Tone-Clock is healthy, issue **test board *UUCSS* long** on the EI circuit pack. **3** If this test continues to fail, replace the EI circuit pack or transceiver. Then reissue **test board *UUCSS* long** on the new EI circuit pack.
2	FAIL	The test tone was transmitted and detected correctly, but the correct data packet was not detected by the TN1655 Packet Interface circuit pack. **1** Test the TN1655 Packet Interface circuit pack to verify that it is functioning properly. If any tests fail, investigate those tests and repair the Packet Interface circuit pack. **2** If the Packet Interface circuit pack checks out OK, enter **display errors** and **display alarms** and resolve any SNI-BD and FIBER-LK alarms or errors (Center Stage Switch only) and DS1C-BD alarms or errors (if present). **3** Issue **test board *UUCSS* long** on the EI board. **4** If Test #242 continues to fail, replace the EI board. Then issue **test board *UUCSS* long** on the new EI board. **5** If Test #242 continues to fail, replace the lightwave transceiver, reset the circuit pack and issue **test board *UUCSS* long** on the EI circuit pack.

Table 394: Test #242 Expansion Interface Lightwave Transceiver Looparound

Error Code	Test Result	Description / Recommendation
	PASS	When this test (#242) and the EI Local Looparound test (#240) pass, this indicates that the EI board is functioning properly, but it does not verify that the optical portion of the lightwave transceiver is functioning. **1** Issue **test board *UUCSS*** on the EI board on both ends of fiber. If this test passes from both sides, but other tests fail, such as #241, this condition indicates either a faulty lightwave transceiver or the fiber itself has failed. To determine whether a lightwave transceiver or the fiber itself has failed, execute the EI Manual Loop-Back procedure described in a previous section. Test #242 can only be run from both EIs if they are the standby pair and the active pair is working properly. **2** If this EI board is failing other tests, execute the EI Manual Loop-Back Test. **3** If problems still exist after the EI Manual Loop-Back Procedure indicates both EI boards and both lightwave transceivers are healthy, manually check out the building fiber. Verify that each optical fiber connects to a transmitter at one end and a receiver at the other.
0	NO BOARD	No board was detected by the test. **1** Check the error log for wrong board (Error 125) or no board (Error 131). Resolve either of these issues, if applicable. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use **reset board *UUCSS***. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

4 of 4

Expansion Interface Control Channel Test (#316)

This test is nondestructive. If an EI circuit pack is a standby EI circuit pack (amber LED off) or if the EI is active in the PN (amber LED on), this test queries the EI circuit pack for its circuit pack type and vintage information. If the EI circuit pack is an active EI circuit pack in the PN (amber LED on long off short) the Expansion Interface Control Channel test checks to see if the EI circuit pack can communicate with other circuit packs in the PN using the PN TDM bus.

Table 395: Test #316 Expansion Interface Control Channel Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

1 of 2

Table 395: Test #316 Expansion Interface Control Channel Test

Error Code	Test Result	Description / Recommendation
Any	FAIL	The EI circuit pack responded incorrectly or if it is the PN active EI circuit pack, it could not talk to PN circuit packs. **1** If the active EI circuit pack in the PN is failing and duplicated PNC is enabled, attempt to switch to the standby PNC using **reset PNC interchange**. **2** Repeat the short test sequence. **3** If test continues to fail, reset the EI circuit pack via the **reset board *UUCSS*** command. **4** If the EI circuit pack in the PN is failing, enter **display errors** and **display alarms**, and resolve any TDM-CLK, TONE-BD, or SYNC alarms or errors. **5** Repeat the short test sequence. **6** If test continues to fail, replace the circuit pack or transceiver.
	PASS	The EI circuit pack did respond correctly to test. Communication from software to the EI circuit pack is functioning. **1** Refer to other EI circuit pack tests if the link is not functioning correctly.
0	NO BOARD	No board was detected by the test. **1** Resolve either wrong board (Error 125) or no board (Error 131) issues. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use **reset board *UUCSS***. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

2 of 2

Expansion Interface Reset Test (#336)

This test is **destructive**.

This test is potentially very destructive and requires the EI circuit pack to be busied out prior to execution of this test.

The Expansion Interface Reset test, which is not part of either the Short or the Long test sequences test, is executed via the **reset board *UUCSS*** command where UUCSS is the address of the EI circuit pack to be reset.

If the system does not have duplicated PNC, and is a Direct Connect system, and one of the EI circuit packs must be reset, the action of busying out the desired EI circuit pack will deny calls to the PN until the EI circuit pack is released from the busyout state. If the EI circuit pack is part of a PN-to-PN link, new connections to the PN will be denied. If the EI circuit pack is part of a PN-to-PN link, calls between the two PNs will be denied.

In a non-duplicated PNC system with a Center Stage Switch, if the EI circuit pack in the PN is busied out, new service to that PN only will be denied. However, if the EI circuit pack resides in the PN, new service to every PN will be denied until the EI circuit pack is released from the busyout state.

If the system does not have duplicated PNC, the reset of any EI is allowed, but it will result in the resetting of every PN board and loss of service to the PN(s) for a few minutes.

If the system does have duplicated PNC, and the EI circuit pack to be reset is part of the active PNC, the system will not allow the busyout and the system technician will be required to interchange the PNCs via the **reset pnc interchange** command. After executing the PNC interchange, it will be possible to busyout and then reset the original EI circuit pack.

If the PN's Maintenance (MAINT) circuit pack determines that the EI (EXP-INTF) circuit pack is cycling between sane and insane several times within several minutes, MAINT may inhibit operation of the EXP-INTF by holding the EI circuit pack in a reset state. This condition may result in an unsuccessful reset of the EI circuit pack.

If the reset command returns "PN is unavailable," execute the following steps:

1. Use the **change circuit-pack P** (PN's number) command.
2. For the EI circuit pack you wish to reset, add an entry to the Circuit Pack screen for the TN570 EI circuit pack. Be sure to enter the appropriate carrier and slot.
3. Enter the screen.
4. Issue the **busyout board *UUCSS*** command.
5. Repeat the **reset board** command

Table 396: Test #336 Expansion Interface Reset Test

Error Code	Test Result	Description / Recommendation
4	ABORT	Could not reset the PN EI circuit pack over the optical fiber since the neighbor EI circuit pack or SNI circuit pack is not recognized by software (inserted). **1** Insert neighbor EI circuit pack or SNI circuit pack and perform reset again.
1015	ABORT	The system will not allow this test to be run because the EI circuit pack has not been busied out. Busyout the EI circuit pack. Enter **reset board *UUCSS***.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.

1 of 3

Table 396: Test #336 Expansion Interface Reset Test

Error Code	Test Result	Description / Recommendation
1	FAIL	The EI did not successfully reset. **1** If the EI circuit pack is in the PN, the PN's Maintenance board may be holding the EI circuit pack reset. Attempt to rectify this condition by executing **test maint *P* long** on the Maintenance board in the same PN. **2** If step 1 was not successful in releasing the EI circuit pack, temporarily remove the PN's Maintenance circuit pack. **3** Repeat the **reset board *UUCSS*** command. **4** If reset continues to fail, replace circuit pack. **5** Insert PN's Maintenance circuit pack if it was removed.
2	FAIL	The EI circuit pack was successfully reset, but it did not begin running after the reset. **1** If the EI circuit pack is in the PN, temporarily remove the PN's Maintenance circuit pack. **2** Use **reset board *UUCSS***. **3** Reinsert the PN's Maintenance circuit pack if it was removed.
3	FAIL	The reset over the optical fiber failed. **1** Execute the **test board *UUCSS*** command on the PN neighbor EI circuit pack located on the opposite end of the fiber from this EI circuit pack. If Test #238 fails, follow the maintenance procedure associated with this test result. Then perform the reset again. **2** If the EI circuit pack is in the PN, temporarily remove the PN's Maintenance circuit pack. **3** Repeat the **reset board *UUCSS*** command. **4** Reinsert PN's Maintenance circuit pack if it was removed. **5** If the symptoms match those described in the "EI and Tone-Clock Interactions" section, follow those guidelines. **6** Check the Error Log for the PN Tone-Clock errors that were resolved when the PN went down. These errors may have been resolved BECAUSE the PN went down. When there is no Tone-Clock generating the system clock on a PN, then an EI circuit pack can only be reset once. Every subsequent reset attempt fails. It is also possible that the system itself may have already tried to reset the EI circuit pack. Refer to TONE-BD (Tone-Clock Circuit) on page 1902 for Tone-Clock problems. **7** If the reset still fails, execute the Manual Loop Back Procedure on the opposite PN EI circuit pack. This procedure is described in the section preceding the Error Log Entries and Test to Clear Values table for this MO. If the EI circuit pack and the lightwave transceiver are healthy, the problem is the EI circuit pack and its lightwave transceiver on the PN end of the fiber or the fiber itself. Test the PN EI circuit pack with the manual loop back procedure and investigate the test results.

Table 396: Test #336 Expansion Interface Reset Test

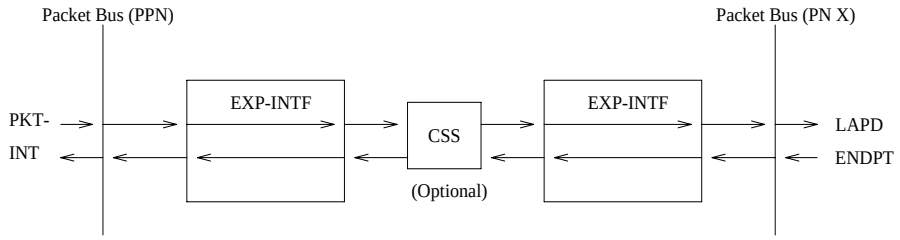
Error Code	Test Result	Description / Recommendation
	PASS	The EI was successfully reset. Remove the EI circuit pack from the busyout state by using the **release board *UUCSS*** command. **1** Execute **test board *UUCSS* short** command. Refer to errors for each test.
0	NO BOARD	No board was detected by the test. **1** Resolve either wrong board (error 125) or no board (error 131) issues. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (error 1538). If hyperactive, use the **reset board *UUCSS*** command. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

3 of 3

Expansion Interface Packet Interface Test (#589)

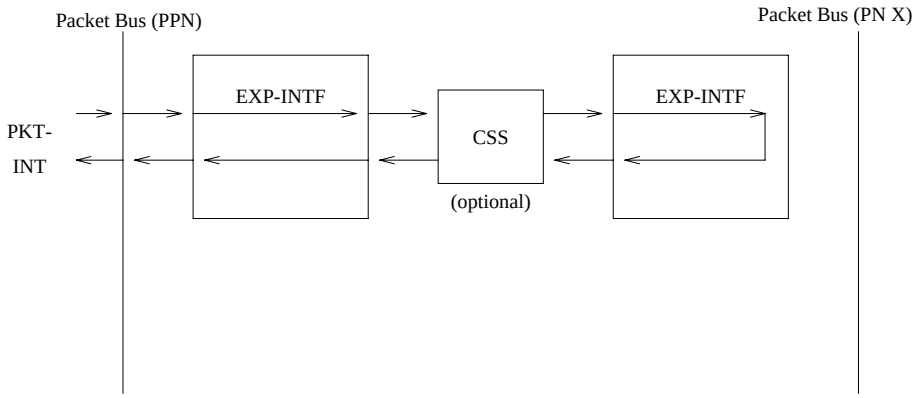
This test is nondestructive. This test attempts to send a data packet from the TN1655 Packet Interface circuit pack through any intervening EI circuit packs and/or SNI circuit packs and through the EI circuit pack to be tested. The path the data packet takes is dependent on the location of the EI circuit pack to be tested and whether the system has duplicated PNC. The following diagrams and short discussion of each describe the different paths the test uses.

Figure 70: Expansion Interface Packet Interface Test—Packet Endpoint Loop



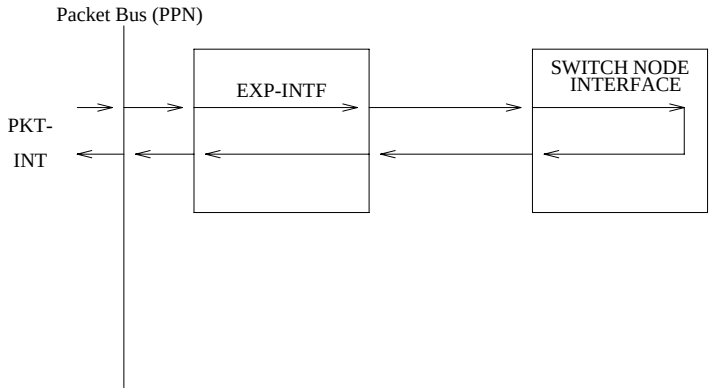
The path shown in Figure 70, Expansion Interface Packet Interface Test—Packet Endpoint Loop, on page 949 is used when testing a PN EI that is on the active PNC.

Figure 71: Expansion Interface Packet Interface Test — PN-to-PN loop



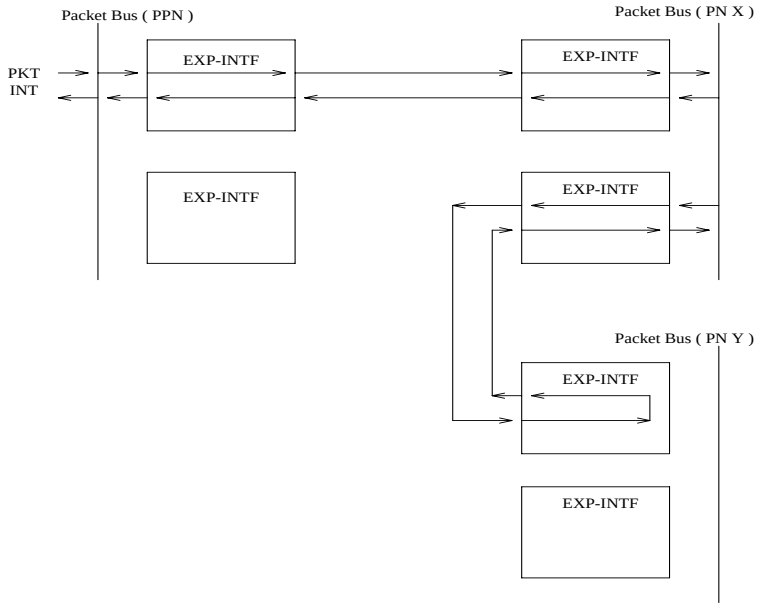
In a Center Stage configuration the path shown in Figure 71, Expansion Interface Packet Interface Test — PN-to-PN loop, on page 950 is used when testing a PN EI that is on the standby PNC. In a Direct Connect configuration, this path is used on any PN EI or on a PN EI that is on the standby PNC.

Figure 72: Expansion Interface Packet Interface Test—PN to CSS Loop



The path shown in Figure 72, Expansion Interface Packet Interface Test—PN to CSS Loop, on page 950 is used when running the test on a PN EI in a Center Stage configuration.

Figure 73: Expansion Interface Packet Interface Test — PN-to-PN link



The path shown in Figure 73, Expansion Interface Packet Interface Test — PN-to-PN link, on page 951 is used when the EI under test is one that provides connectivity between the two PNs in a Direct Connect configuration.

Table 397: Test #589 Expansion Interface Packet Interface Test

Error Code	Test Result	Description / Recommendation
1033	ABORT	The test cannot run because the EI circuit pack does not have a fiber link administered to it and there is not sufficient data to run the test or because EI circuit packs on other port networks needed for this test are out of service. **1** Execute **list fiber-link** and determine whether the EI circuit pack under test is an endpoint of one of the administered fiber links. If so, then proceed to step 2. If not, then this is considered to be a spare board, and the test should not be attempted on this EI circuit pack. **2** Follow procedures for applicable configuration: **Direct Connect:** **1** Issue **list config** for the cabinet and carrier where the neighbor EI circuit pack resides. If the results reveal that the board is not recognized by software, the board is out of service because of this condition. Perform the following steps: **a** If this test is being executed on an EI circuit pack located in the PN, enter **display errors** and resolve any EXP-PN errors for the port network where the neighbor EI circuit pack resides. Re-execute this test. **b** If this test continues to abort with this abort code reset the DS1 converter circuit pack (if so equipped) or the neighbor EI circuit pack. This will not be destructive since the circuit pack cannot be serving as the Expansion Archangel if it is not in service. **2** Run Test #237 and check for EXP-INTF circuit pack Error Type 1281 in the Error Log. If Error Type 1281 is present and/or Test #237 does not pass, see repair procedures for Test #237, in Table 390, Test #237 Expansion Interface Neighbor Query Test, on page 932. **3** If Test #237 passes, reseat the EI circuit pack. This will not be destructive since the circuit pack cannot be serving as the Expansion Archangel if it is not in service. **4** Repeat Test #237. **Center Stage:** *If the EI circuit pack under test resides in the PN:* None of the EI circuit packs located in the PNs (on the same PNC side) are in service (for PN EIs see the next case). **1** Issue **list fiber-link** to determine whether any of the PN's EI circuit packs are administered as endpoints of a fiber link. If not, then ignore the results of this test. **2** Issue **list conf** for the cabinets and carriers where the EI circuit packs reside in every other PN. If the results returned indicated that the circuit packs are not recognized by software, they are out of service for this reason.

1 of 5

Table 397: Test #589 Expansion Interface Packet Interface Test

Error Code	Test Result	Description / Recommendation
1033 *(cont'd.)*	ABORT *(cont'd.)*	**3** Issue the **display errors** command, and resolve any EXP-PN errors. Re-execute this test. **4** If the test continues to abort with this error code, reseat the EI circuit packs (or DS1 converter circuit pack if so equipped) on the PNs. This will not be destructive since the circuit pack cannot be serving as the Expansion Archangel if it is not in service. **5** Run Test #237 on each of the PN EI circuit packs, and check for EXP-INTF circuit pack Error Type 1281 in the error log. If Error Type is present and/or Test #237 does not pass, see repair procedures for Test #237, in Table 390, Test #237 Expansion Interface Neighbor Query Test, on page 932. **6** Repeat this test. *If the EI circuit pack under test resides in the PN:* The EI circuit located in the PN is out of service. **1** Run Test #237 on each of the PN EI circuit packs and check for EXP-INTF circuit pack Error Type 1281 in the error log. If Error Type is present and/or Test #237 does not pass, see repair procedures for Test #237, on page 932. **2** Repeat this test.
1139	ABORT	The packet bus in the PN where this EI circuit pack resides has a major alarm against it. This test needs to use the alarmed port network's packet bus. **1** Enter **display alarms** and resolve any PKT-BUS alarms. **2** Retry the command.
1141	ABORT	The Packet Interface circuit pack is out of service. **1** See PKT-INT (Packet Interface) on page 1421 for the recommended repair procedure.
1144	ABORT	The PN's packet bus has a major alarm against it. This test needs to use the alarmed PN's packet bus. **1** Enter **display alarms** and resolve any PKT-BUS alarms. **2** Retry the command.

Table 397: Test #589 Expansion Interface Packet Interface Test

Error Code	Test Result	Description / Recommendation
1394	ABORT	The EI circuit pack is out of service and the test cannot be run. This condition is due to a change in the EI circuit pack's ability to communicate with the EI or SNI circuit pack on the other end of the fiber. **1** Run Test #237 and check the Error Log for EXP-INTF Error Type 1281. If Error Type 1281 is present or if Test #237 does not pass, see the repair procedures for Test #237, in Table 390, Test #237 Expansion Interface Neighbor Query Test, on page 932. **2** If Test #237 passes, rest the EI pack. Note that this will not be destructive to the port network where EI circuit pack resides because it will not be serving as the expansion Archangel if it is not in service. **3** Repeat this test.
1395	ABORT	This test cannot be run on an EI circuit pack if it is part of the B-side PNC and duplicated PNC is not enabled. **1** If this test needs to run on this EI circuit pack, enable PNC with the **change system-parameters duplication** command. **2** Prevent the system from doing a PNC interchange by executing the **set pnc lock** command. **3** Repeat this test.
1421	ABORT	This abort code appears only when the EI circuit pack addressed in the test command is one that terminates a fiber link between two PNs in a direct connect system. It indicates that the test failed, but that this test was run on the PN EI board that is: a) in the same PN as the board under test b) on the active PNC (if duplicated) c) terminates the fiber from the PN The EI tested is probably not at fault. **1** Enter **display alarms** and follow the EXP-INTF repair procedures for any alarms against the PN EI that is: **a** In the same PN as the board just tested **b** On the active PNC **c** Terminates the fiber link from the PN **2** If there are no alarms logged against that EI, run Test #589 on it and follow procedures for this test. **3** Try this command again.

Table 397: Test #589 Expansion Interface Packet Interface Test

Error Code	Test Result	Description / Recommendation
1422	ABORT	This abort code is valid and will only appear when the EI circuit pack under test resides in a PN of a system with a Center Stage Switch configuration. It means that the test failed, but that this test was then run on the PN EI on the same PNC as the EI under test and that test failed. This means that the EI originally tested is probably not at fault. **1** Resolve any alarms that are logged against the PN EI that is on the same PNC as the EI under test. **2** If there are no alarms logged against the PN EI, run Test #589 against the PN EI and follow procedures for this test. **3** Try this command again.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 3 times.
2060	ABORT	The link on the packet bus being used to perform the test has failed. **1** Retry the command at 1-minute intervals up to 3 times. **2** If the test continues to abort, enter **display errors** and resolve any PKT-INT errors.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
ANY	FAIL	The transmitted data packet was not received correctly by the Packet Interface circuit pack. The failure may be in the EI under test, the DS1 converter circuit packs, or the intervening Center Stage components. **1** Test the Packet Interface circuit with the **test packet-interface *CS*** command where "C" is the IPSI's carrier in a high- or critical-reliability system, and "S" is the slot number where the IPSI's Packet Interface resides. If the Packet Interface circuit fails any tests, seePKT-INT (Packet Interface) on page 1421. **2** If the EI under test resides in a high-reliability system's PN, (2 PN-to-CSS fibers in an unduplicated PNC), run the short test sequence on both of the PN's EI boards, and follow procedures for Test #589. **3** Enter **display errors** and resolve any PKT-BUS errors. **4** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*.
	PASS	Although this test has passed, there may be related problems on other EIs used in connectivity to and from this EI. Software may have conducted tests on these other components and determined that this board was functioning properly and any problems were probably due to a problem with some other connectivity component. Check the error and alarm logs for problems with other EI circuit packs and resolve these errors. **1** Refer to other EI board tests if the link is not functioning correctly.

Table 397: Test #589 Expansion Interface Packet Interface Test

Error Code	Test Result	Description / Recommendation
0	NO BOARD	No board was detected by the test. **1** Resolve either wrong board (Error 125) or no board (Error 131) issues. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the **reset board *UUCSS*** command. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

5 of 5

Expansion Interface Test (#244)

This test is potentially very **destructive** and requires the EI circuit pack to be **busied out** prior to execution of this test.

The Expansion Interface test, which is not a part of either the short or long test sequences, is executed via the **reset board *PCSS*** command where PCSS is the address of the EI circuit pack to be reset.

If the system only has one working EI link between a pair of port networks and one of the EI circuit packs must be reset, the action of busying out the desired EI circuit pack WILL DISRUPT SERVICE TO THE PN until the circuit pack is released from the busyout state. If the circuit pack is part of a PN-to-PN link, the PN WILL BE WITHOUT SERVICE. If the circuit pack is part of a PN-to-PN link CALLS BETWEEN THE TWO PNs WILL BE DENIED.

If the system has working duplicate EI links, and the EI circuit pack to be reset is part of the active EI link, the system does not allow the busyout and instructs system technician to switch EI links via the **set expansion-link *PCSS*** command where PCSS is the address of either standby EI circuit pack on the standby link. After executing the EI link switch, it is possible to busyout and then reset the original EI circuit pack.

However, if the PN's Maintenance (MAINT) circuit pack determines that the EI (EXP-INTF) circuit pack is cycling between sane and insane several times within several minutes, MAINT may inhibit operation of the EXP-INTF by holding the EI circuit pack in a reset state. This condition may result in an unsuccessful reset of the EI circuit pack.

If the reset command returns with `PN is unavailable`, execute the following:

1. Use the **change circuit-pack *P*** (PN's number) command.
2. For the EI circuit pack you wish to reset, add an entry to the Circuit Pack screen for the TN776 EI circuit pack. Be sure to enter the appropriate carrier and slot (that is, A01 or B02).
3. Repeat the **reset board** command.

Table 398: Test #224 Expansion Interface Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error. **1** Retry the command at 1-minute intervals up to 3 times.
4	ABORT	Could not reset PN EI circuit pack over optical fiber since PN EI circuit pack on opposite end of fiber is not inserted. **1** Insert opposite EI circuit pack and perform reset again.
1015	ABORT	The system does not allow this test to be run because the EI circuit pack has not been busied out. **1** Busyout the EI circuit pack. Enter **reset board *PCSS***.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 3 times.
9999	ABORT	EI circuit pack reset successfully. Could not perform initialization test results query because link to PN is not up. **1** Execute **release board *PCSS***. Wait one minute. Issue **display error**. If you see Error Type 2049 logged against this EI circuit pack, then the EI Test has failed with an error code equal to the aux data of this entry. Otherwise, the initialization tests have passed.
12000	ABORT	EI circuit pack reset successfully. Response to the initialization test results query was not received within the allowable time period.
12100	ABORT	EI circuit pack reset successfully. System resources required to run initialization test are not available. **1** Retry the command at 1-minute intervals up to 3 times.
12026	ABORT	EI circuit pack reset successfully. It responded with an unknown reply to the query for the results of its initialization tests. **1** Retry the command at 1-minute intervals up to 3 times. **2** If the test continues to abort, replace the circuit pack or transceiver.
1	FAIL	The EI did not successfully reset. **1** If the EI circuit pack is in the PN, the PN's Maintenance board may be holding the EI circuit pack reset. Attempt to rectify this condition by executing **test maint *P* long** on the Maintenance board in the same PN. **2** If step 1 was not successful in releasing the EI circuit pack, temporarily remove the PN's Maintenance circuit pack. **3** Enter **reset board *PCSS***. **4** If reset continues to fail, replace circuit pack. **5** Insert PN's Maintenance circuit pack if it was removed.

Table 398: Test #224 Expansion Interface Test

Error Code	Test Result	Description / Recommendation
2	FAIL	The EI circuit pack was successfully reset, but it did not begin running after the reset. **1** If the EI circuit pack is in the PN, temporarily remove the PN's Maintenance circuit pack. **2** Repeat the **reset board *PCSS*** command. **3** Re-insert the PN's Maintenance circuit pack if it was removed.
3	FAIL	The reset over the optical fiber failed. **1** Execute the **test board *PCSS*** command on the PN neighbor EI circuit pack located on the opposite end of the fiber from this EI circuit pack. If Test #238 does not pass, follow the maintenance procedure associated with this test result. Then perform the reset again. **2** If the EI circuit pack is in the PN, temporarily remove the PN's Maintenance circuit pack. **3** Repeat the **reset board *PCSS*** command. **4** Reinsert PN's Maintenance circuit pack if it was removed. **5** Follow the procedure described in the "Relationship Between Expansion Interface and Tone-Clock Circuit Packs" section if the symptoms match those described there. **6** Check the Error Log for the PN Tone-Clock errors that were resolved about the same time when the PN went down. These PN Tone-Clock errors may have been resolved *because* the PN went down. When there is no Tone-Clock generating the system clock on a PN, then an EI circuit pack can only be reset once. Every subsequent reset attempt fails. It is also possible that the system itself may have already tried to reset the EI circuit pack. See TONE-BD (Tone-Clock Circuit) on page 1902 for recommended maintenance strategy for Tone-Clock problems.
		7 If the reset still fails, execute the Manual Loop Back Procedure on the opposite PN EI circuit pack. This procedure is described in the section preceding the Hardware Error Log Entries and Test to Clear Values table for this MO. If the EI circuit pack and the lightwave transceiver are healthy, the problem must lie with the EI circuit pack and its lightwave transceiver on the PN end of the fiber or with the fiber itself. Test the PN EI circuit pack with the manual loop back procedure and investigate the test results.

Table 398: Test #224 Expansion Interface Test

Error Code	Test Result	Description / Recommendation
5001	FAIL	Initialization failure: the EI circuit pack reset successfully and restarted execution, but the EI circuit pack could not synchronize itself during hardware initialization. **1** Issue the **reset board *PCSS*** command. If the circuit pack is in the active link, this procedure can be very destructive. If a **test board *PCSS*** shows every test passing, and there is no standby link to which you can switch, perform this reset at a time when service is least disrupted by losing use of the PN. **2** If the reset fails with the same error code, execute the **test tone-clock *PC*** command where P is the network that contains this EI circuit pack and C is the carrier that contains the active Tone-Clock on network P. Also look for SYNC and TONE-BD errors. Resolve any SYNC and TONE-BD errors by following the Maintenance documentation for these MOs. Then reissue the **reset board *PCSS*** command. **3** If the EI circuit pack still fails to reset with the same error code, replace the EI circuit pack.
5002	FAIL	**Initialization failure:** EI circuit pack reset successfully and restarted execution. But the EI circuit pack has determined that a lightwave transceiver was not attached to the backplane connector when the EI circuit pack was last reset. If this system does not have duplicate EI links, every user in the PN will be without service until this problem is resolved. If this system does have duplicate links, the backup EI link is unavailable until this problem is resolved. **1** Attach lightwave transceiver to 25-pair backplane connector **in slot belonging to EI circuit pack**. **2** Reset the circuit pack again. **3** If the reset fails with an Error Code other than 5002, refer to the appropriate maintenance section. **4** If the reset fails again with Error Code 5002, replace the lightwave transceiver, reset the circuit pack, and execute the **reset board *PCSS*** command again. **5** If the reset fails again with Error Code 5002, the new lightwave transceiver may be defective, or the EI circuit pack may need to be replaced.

Table 398: Test #224 Expansion Interface Test

Error Code	Test Result	Description / Recommendation
5016, 5017, 5018, 5019, 5032, 5033, 5048, 5064, 5080, 5096, 5112	FAIL	Initialization failure: the EI circuit pack reset successfully and restarted execution, but the EI circuit pack detected communication errors during hardware initialization. The nature of the failure may prevent the EI circuit pack from communicating with its neighbor EI circuit pack on the opposite end of the fiber. The fault itself may be either on the EI circuit pack or on the lightwave transceiver. **1** If every other test on this EI circuit pack is passing and no other errors have been logged against this circuit pack, replacement of the lightwave transceiver or the circuit pack is recommended, but not critical. **2** If some tests on this EI circuit pack are failing or other errors have been logged against this circuit pack, replace the lightwave transceiver and/or the EI circuit pack.
	PASS	The EI was successfully reset, and it restarted execution. It also passed all of its initialization tests and detected a lightwave transceiver. Remove the EI circuit pack from the busyout state by using the **release board *PCSS*** command. **1** Execute **test board *PCSS* short** command. Refer to errors for each test.
0	NO BOARD	No board was detected by the test. **1** Resolve either wrong board (Error 125) or no board (Error 131) issues. **2** Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the **reset board *UUCSS*** command. **3** Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

4 of 4

EXP-PN (Expansion Port Network)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run[1]	Full Name of MO
EXP-PN	MAJOR	**display errors**[1]	Expansion Port Network

1 Investigate errors against EXP-PN and EXP-INTF.

The EXP-PN MO is responsible for overall maintenance of an Expansion Port Network (EPN). The focus of EPN maintenance is on the EI or on the ATM's EI circuit pack that is acting as the Expansion Archangel in an EPN. EXP-INTF or ATM-EI covers maintenance of the EI or ATM EI circuit pack, while EXP-PN covers a much broader area of activities and problems on an EPN. The alarming strategy for EXP-PN is fairly simple and does not make use of any failure analysis routine for spawning maintenance actions. EXP-PN alarming is based on the availability of an EPN for service and the EPN's response to various recovery actions.

When investigating alarms logged against an EPN, problems involving the EI, an ATM EI circuit pack acting as the Expansion Archangel, and problems that may involve loss of communication between the EPN and the media server should be investigated. This could ultimately include fiber links (FIBER-LK), DS1 converter circuit packs (DS1C-BD), SNI circuit packs (SNI-BD) and Switch Node Configurations (SN-CONF) for CSS. For ATM, this could include the PN ATM EI (ATM-EI) circuit pack, the ATM switch (ATM-NTWK), and EPN ATM EI (ATM-EI) circuit pack.

PN Restarts

While not an exhaustive discussion of PN recovery actions, this section describes at a high level the causes and effects of PN restarts so that these Error Log events can be understood.

PN Warm Restarts

PN Warm Restart (PN Reset Level 1) is generally performed on a PN when the recovery of that PN can be accomplished in less than 30 seconds. When possible, Warm Restart minimizes the work required to reinitialize a PN, and reduces the impact of a PN failure by avoiding the longer and highly destructive PN Cold Restart. The primary cause of PN restarts is failure of the link from the media server to the PN due to a hardware fault in the link's path. For most hardware failures, this link (and thus the PN) cannot be recovered until the failed hardware is replaced. However, several failures modes provide hardware redundancy allowing the link to be recovered quickly. For instance (in a duplex-, high-, or critical-reliability system), the failure of a Packet Interface circuit pack causes a media server interchange that allows the link to be recovered quickly over the newly active Packet Interface. Or on a Center Stage Switch (with multiple fibers interconnecting the switch nodes), a link carried on one fiber can be rerouted over another fiber.

If the EAL is recovered quickly, the PN Warm Restart returns the PN to service with minimal effects on user service. If the EAL cannot be recovered quickly, the PN is taken out of service and a PN Reset Level 2 (PN Cold Restart) is required to return it to service.

PN Cold Restarts

If the PN-to-PN link has failed and has not been recovered within 30 seconds, the PN is taken out of service and can be brought back into service only with a PN Reset Level 2 (PN Cold Restart). Effects of a PN Cold Restart include a reset of every circuit pack in the PN and the disconnection of every call to or from the PN. Calls with both endpoints within the PN are dropped upon recovery.

PN Restart Escalation

PN restarts follow an escalation strategy controlled by maintenance software. Whenever a request for a PN Reset Level 1 (PN Warm Restart) is made, software checks to see if the restart should be escalated to a PN Reset Level 2 (PN Cold Restart). If any of the following are true, the restart is escalated:

- At least two level 1 restarts have occurred and less than two hours has elapsed since the last occurrence.
- Current PN conditions do not allow a level 1 restart, such as when the PN is out of service.
- Less than 3 minutes has elapsed since the last PN Cold Restart, indicating that the PN is unstable.

If two PN Cold Restarts have been executed in less than an hour and the link is functional, but the PN has not recovered to an in-service state, a MAJOR alarm is raised against EXP-PN, and the PN is put into Emergency Transfer by system software. (Software can invoke PN Emergency Transfer only when the link to the PN is up. If the link is down, the hardware automatically invokes Emergency Transfer 1 minute after it detects a link failure).

Connectivity Alarming

When a PN is out of service, a MAJOR EXP-PN alarm is raised against that PN. A PN can only be alarmed if it is out of service *and* the fiber between the PN and PN is up. If the fiber from the PN to the Center Stage Switch is down (by removing it from administration, for example), every PN is lost but not alarmed, since they are not the cause of the problem. If, however, connectivity is restored and the PN fails to recover, the PN is alarmed.

For ATM, a PN can only be alarmed if it is out of service and the connections to the PN, ATM switch, and PN are up. If the connection from the PN to the ATM switch is down (by removing it from administration, for example), every PN is lost but not alarmed, since they are not the cause of the problem. As for CSS, if connectivity is restored and the PN fails to recover, the PN is alarmed.

Error Log Entries and Test to Clear Values

Table 399: Expansion Port Network (EXP-PN) Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	0	None	None		
257 (b)	0	None	None		
513 (c)	0	None	MAJOR	OFF	
769 (d)	0	None	MAJOR	OFF	

Notes:

a Error Type 1: informational entry only, indicating that a PN Reset Level 1 (PN Warm Restart) has been executed on this PN.

b Error Type 257: informational entry only, indicating that a PN Reset Level 2 (PN Cold Restart) has been executed on this PN. This does not include restarts done at system initialization time.

c Error Type 513: indicates that a PN is not in service when it is expected to be. The value specified in the port field of the error log, is the PN number of the affected PN. When this condition occurs, examine every system link error and EXP-INTF or ATM-PNC error to aid in resolving the alarm (examples of system link errors are errors logged against PKT-INTF, EXP-INTF, SNI-BD, FIBER-LK, and PKT-BUS and for ATM, PKT-BUS, ATM-EI, ATM-NTWK). Also check that all fiber connectivity matches that have been administered for the system. This alarm and error is resolved and removed from the logs only when the PN comes back into service, or after fiber administration is changed to remove a fiber such that there is no connectivity from the PN to this PN.

d Error Type 769: This alarm is raised when PN maintenance has attempted to execute a Cold Restart recovery action two times, and both restarts failed. This will cause the PN to be placed in Emergency Transfer. Examine every EXP-INTF or ATM-EI error that, when cleared, may aid in resolving this alarm. Also check for any SNI-BD, SNI-PEER, FIBR-LK, SN-CONF, or DS1C-BD errors or for ATM, ATM-EI or ATM-NTWK errors that may indicate a communication problem between the processor and the PN. Make sure that the physical fiber connectivity matches that of system administration.

System Technician-Demanded Tests: Descriptions And Error Codes

EXP-PN does not support demand testing. A demand reset can be executed to perform a demand reset on a PN by using the **reset port-network *P* level 1** or **2** command (P is the port network's number, and 1 or 2 specifies the reset level).

PN Cold Restart (#955)

PN Cold Restart, or PN Reset Level 2, using the command **reset port-network *P* level 2** is used as a recovery mechanism for a PN that has been taken out of service. It is executed as a result of PN recovery escalation when a Warm Restart is not possible, or as a result of a system technician demanded PN restart. Once a PN has gone out of service, a PN Cold Restart is required to bring it back into service.

This is the most severe of the PN restarts, and users will experience a service outage. For the first 30 seconds after the occurrence of an event that requires a restart, every stable call is preserved (although new calls will be denied). All calls terminating in the PN are then dropped, and PN users are not able to place new phone calls during the restart. All PN hardware will also be re-initialized during this restart. The restart takes no longer than 2 minutes with service being restored much quicker in a typical restart situation.

Table 400: Test #955 PN Cold Restart

Error Code	Test Result	Description / Recommendation
1386	ABORT	The system link to this PN is unavailable and cannot be used. This reset cannot be executed without the link being operational. **1** Refer to SYS-LINK and resolve the link problem.
2100	ABORT	Could not allocate the necessary system resources to execute this reset.
2000	ABORT	Response to a request made in the internal portion of this reset procedure was not received within the allowable time period.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	FAIL	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	PASS	The PN Cold Restart procedure completed successfully.

PN Warm Restart (#956)

The PN Warm Restart, or PN Reset Level 1, using the command **reset port-network *P* level 1** is used to restart a PN that has not been taken out of service. It is the least severe of the PN restart levels and is used in an attempt to preserve the state of the system as much as possible, thereby reducing user impact. This restart is attempted on a PN if it is still in service, or as a result of a system technician-demanded PN Warm Restart.

During a PN Warm Restart all calls are preserved including voice, data, and packet calls. Once an event has occurred that requires a warm restart, service is fully restored within 35 seconds.

Table 401: Test #956 PN Warm Restart

Error Code	Test Result	Description / Recommendation
2100	ABORT	Could not allocate the necessary system resources to execute this reset. **1** Retry the command at 1-minute intervals up to 3 times.
1386	ABORT	The system link to this PN is unavailable and cannot be used. This reset cannot be executed without the link being operational. **1** See SYS-LINK and resolve the link problem.
1387	ABORT	This PN is not in a state where it is possible to perform a Warm Restart on the PN. It is necessary to perform a PN Cold Restart (PN Reset Level 2) because of one of the following reasons: • The PN is in an out-of-service state. • Insufficient time has elapsed since the last PN Cold Restart was performed on this PN.

Table 401: Test #956 PN Warm Restart

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to a request made in the internal portion of this reset procedure was not received within the allowable time period.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	FAIL	Internal system error **1** Retry the reset command at 1-minute intervals up to 3 times.
	PASS	The PN Warm Restart procedure completed successfully.

2 of 2

EXT-DEV (External device alarm)

G650

MOs name (in alarm log)	Alarm level	Initial SAT command to run[1]	Full name of MO
EXT-DEV	MINOR	**test environment *location***	External Device Alarm
EXT-DEV	MAJOR	**test environment *location***	External Device Alarm
EXT-DEV	MINOR	**test eda-external-device-alm *location* minor**	External Device Alarm
EXT-DEV	MAJOR	**test eda-external-device-alm *location* major**	External Device Alarm

1 For information on specifying a ***location***, see Command Syntax on page 179.

A TN2312BP IPSI, in a G650 with a carrier address set to A, has two alarm ports that connect to external devices. An example of an external device is an uninterruptible power supply (UPS). Refer to Figure 119, G650 Cabinet Environmental Hardware Components, on page 1599 for further information.

Conditions can occur on the external device that close the contacts on the alarm leads. This notifies the switch to originate an EXT-DEV alarm. One set of leads generates a major alarm, the other set generates a minor alarm.

In this case, the designation of major or minor refers to the port, not to the severity of the alarm associated with the connection. For example, the major port can be administered as a major, minor, or warning alarm, and the minor port can be administered as a major, minor, or warning alarm. Analog line ports can also be administered as external device alarms in the same manner.

Error log entries and test-to-clear values

Table 402: Test to clear with external device alarm administration enabled

Error type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
1	—	Alarm query test (#120)	MAJOR/MINOR	OFF	**test eda-external-device-alm *location* major**

Table 403: Test-to-clear without external device alarm administration enabled

Error type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
1	—	Alarm query test (#120)	MAJOR/MINOR	OFF	**test environment *location***

System technician-demanded test: Descriptions and error codes

Order of investigation	Short test sequence	Long test sequence	D/ND[1]
Alarm query test (#120)	X	X	ND

1 D = Destructive, ND = Nondestructive

Alarm query test (#120)

The external device alarm test requests the status of the external device alarm from a maintenance circuit pack and reports the results. The test has no affect on the external device itself. The **test environment** command will report an error against Test #120 if there is a short on one or both of the pairs of leads connecting the external device.

CAUTION:
Alarms can be generated on adjunct equipment, sent to the Avaya system, and recorded and reported as "external alarms". The adjunct equipment must provide an isolated contact closure across the alarm leads provided by the Avaya system. The contact must be rated at a minimum of 60 V DC, with a current carrying capacity of 5 mA minimum.

Table 404: Test #120 Alarm query

Error code	Test result	Description and Recommendation
1000	ABORT	This is an internal system error. **1** Repeat the command at one-minute intervals 1 to 3 times.
1035	ABORT	The port network is not available. **1** Use the **status port-network** command to verify that the network is not up. **2** Look for alarms against EXP-PN, EXP-INT, PK-INT, etc. **3** Use diagnostic procedures for those MOs to clear the problem.
2000	ABORT	A response to the test request was not received within the time allowed. **1** Repeat the command at one-minute intervals 1 to 3 times.

1 of 2

Table 404: Test #120 Alarm query

Error code	Test result	Description and Recommendation
ANY	FAIL	The external device alarm has been activated by the external device. **1** Clear the major alarm on the external device and repeat the test. **2** If the test fails, disconnect the external device alarm leads from the TN2312BP IPSI circuit pack and repeat the test. **3** If the test fails, there is a problem with the analog external device alarm port, the TN775 Maintenance circuit pack, or TN2312BP IPSI circuit pack that reports the alarm. There are failures that can occur on the TN775 and TN2312BP IPSI circuit pack that *are not* detected by their respective maintenance, but cause many environment tests to fail. If many environment tests fail, replace the circuit pack and repeat the test.
	PASS	If there is a problem with the external device, but none of the following report an alarm, the external device might not be reporting the problem correctly or the external device might not be properly connected to the external device alarm leads: • The administered analog line external device alarm • TN775D or later circuit pack • TN2312BP IPSI circuit pack

2 of 2

EXT-DEV ADMIN? N (External Device Alarm)

S8700 / S8500 / S8100

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
EXT-DEV	MAJOR	**test environment *UU***	External Device Alarm
EXT-DEV	MINOR	**test environment *UU***	External Device Alarm

1 Where ***UU*** is an appropriate cabinet number determined via the PORT field from the Alarm or Error Log.

NOTE:
Use this Maintenance Object when the `External Device Alarm Admin?` field on the *change system-parameters customer-options* form is set to **n**.

S8700 / **S8500**: The IPSI monitors the EXT-DEV alarm leads. **S8100**: The Processor in carrier A monitors the EXT-DEV alarm leads.

The system only recognizes pairs connected to the 1M and 1m (ALARM MONITOR) leads. Refer to the *DEFINITY® Communications System Generic 1 and Generic 3i Wiring (*555-204-111) for more details.

Hardware Error Log Entries and Test to Clear Values

Table 405: EXT-DEV ADMIN?N Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test environment UU r 2 or 6
1 or 5	Any	External Device Alarm Test (#120)	MAJOR MINOR[2]	OFF	test environment UU r 2 or 6

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 One port generates a MAJOR alarm; the other port generates a MINOR alarm.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Cabinet Query Test*, you may also clear errors generated from other tests in the testing sequence.

Table 406: EXT-DEV ADMIN?N System Technician-Demanded Tests

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Cabinet Query Test (#79)	X	X	ND
Emergency Transfer Query Test (#124) (a)	X	X	ND
External Device Alarm Test (MAJOR port) (#120)	X	X	ND
External Device Alarm Test (MINOR port) (#120)	X	X	ND
Analog Ring Generator Initialization Test (#117) (b)	X	X	ND
Analog Ring Generator Query Test (#118) (b)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a Refer to EMG-XFER (Emergency Transfer) on page 885 for a description of this test.

b Refer to RING-GEN (Analog Ring Generator) on page 1587 for a description of this test.

External Device Alarm Test (#120)

The External Device Alarm Test requests the state of the External Device Alarm from the Maintenance circuit pack and reports the results. The test has no effect on the external device itself.

Table 407: TEST #120 External Device Alarm Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals a maximum of 5 times. **2** If the test continues to ABORT with error code 2000, check for system powering problems with the A carrier. Look for and resolve all AC-POWER alarms. Then, repeat the test. **3** If the test continues to ABORT with a 2000 error code, check for and resolve all SYSAM errors. Then, repeat the test.
2029 2319 2320 2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals a maximum of 5 times.

Table 407: TEST #120 External Device Alarm Test *Continued*

Error Code	Test Result	Description/ Recommendation
ANY	FAIL	The External Device Alarm has been activated by the external device. **1** Clear the major alarm on the external device, and rerun the test. **2** If the test still fails, then disconnect the External Device Alarms from the Maintenance circuit pack and rerun the test. **3** If the test still fails, then there is a problem with the Maintenance circuit pack that is reporting the alarm. This circuit pack should be replaced. There are failures that can occur on Maintenance circuit pack's that *will not* be detected by their respective maintenance, but which will cause many environment tests to fail. If many environment tests are failing, the suspect circuit pack should be replaced and the test rerun.
	PASS	If there is a problem with the external device, but the Maintenance circuit pack connected to the device reports no alarm, then the External Device may not be properly reporting the problems or the External Device may not be properly connected to the External Device.

2 of 2

EXT-DEV ADMIN? Y (External Device Alarm)

S8700 / S8500 / S8100

MO's Name (in Alarm Log)	Alarm Level	Initial SAT Command to Run [1]	Full Name of MO
EXT-DEV	MAJOR	**test eda-external-device-alrm *UU***	External Device Alarm
EXT-DEV	MINOR	**test eda-external-device-alrm *UU***	External Device Alarm
EXT-DEV	WARNING	**test eda-external-device-alrm *UU***	External Device Alarm

1 ***UU*** is a cabinet number determined in the `Port` field of the Alarm or Error Log.

NOTE:
Use this MO when the `External Device Alarm Admin?` field on the ***change system-parameters customer-options*** screen is set to **y**. You must have INADS or INIT login permissions to administer EXT-DEV Alarm.

S8700 / S8500

Each PN's Maintenance circuit pack has two alarm ports that connect to such external devices as uninterruptible power supplies (UPSs) or adjuncts (e.g., AUDIX).

Certain conditions on the external device close the contacts on the alarm leads to notify the switch that in turn originates an EXT-DEV alarm. One set of leads generates a major alarm; the other set generates a minor alarm.

The special locations UUmajor and UUminor are used to designate the major or minor Maintenance board's alarm connection for cabinet UU. The major/minor designation specifies the port, not the alarm level associated with the connection; *for example*, the "major" port can be administered as a major, minor, or warning alarm, and the "minor" port can be administered as a major, minor, or warning alarm. In addition Analog line ports can also be administered as external device alarms.

NOTE:
An unadministered Maintenance board's external device alarm port, that is sensing a contact closure will have an entry in the Error Log and in the Alarm Log. The alarm receiver will not receive warning alarms.

S8100

For S8100, an EXT-DEV alarm can be generated from a contact closure on an analog station port on a Virtual Alarm board plugged into the virtual port location 1A11, from an analog station port administered for External Device Alarms (EDA), or from a contact closure on the Major or Minor alarm leads on the TN2314.

The Virtual Alarm board is used to pass PC and AUDIX alarm information between the Global Alarm Manager (GAM) process and the other processes within Communication Manager. These virtual alarm leads are administered on the *add eda* screen, when the ALT Name field is set to ECSPLAT. An OFF HOOK generates an alarm condition (Alarm LED on the Attendant console and the CMC1 cabinet are on), an ON HOOK is a non-alarm condition (Alarm LED on the Attendant console and the CMC1 cabinet are off). The alarm is not forwarded to INADS.

NOTE:
For S8100, the PR-AL-BD MO is used for board insertion of the virtual alarm board. There is no hardware associated with this MO. The virtual board is required in order to assign external device alarm ports for non-Communication Manager alarms (for example, PC level alarms or AUDIX alarms) in order to enter non-Communication Manager alarms in the Communication Manager alarm log.

The external name used by maintenance for the virtual alarm board is PR-AL-BD. This appears on the screen displayed for the results of the ***test board*** command. The external name used by administration for the board is VIRTUAL ALARM BD. This appears on the screen for the *list configuration* and *change circuit pack* commands. The TN number assigned to this board is VIRALM.

Alarm leads can be connected to external devices such as Uninterruptible Power Supplies (UPS) or adjuncts. Certain conditions on the external device close the contacts on the alarm leads to notify the switch which in turn originates an EXT-DEV alarm.

The special locations *major* and *minor* are used to designate the major or minor processor board alarm connection. The major/minor designation specifies the port, not the alarm level associated with the connection; for example, the “major” port can be administered as a major, minor, or warning alarm, and the “minor” port can be administered as a major, minor or warning alarm. In addition Analog line ports can also be administered as external device alarms.

NOTE:
For S8100, the major lead is always assigned to an external Uninterruptible Power Supply even if a UPS is not provided since that lead also causes a system shutdown after one minute.

Error Log Entries and Test to Clear Values

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any	Any	**test eda-external-device-alrm *physical-location* r 2 | 6**
1 or 5	Any	External Device Alarm test (#120)	Any	OFF	**test eda-external-device-alrm *physical-location* r 2 | 6**

NOTE:
The loss of -48 volt power prevents detection of an external device alarm. AC-POWER, CARR-POW, and DC-POWER alarms could indicate the loss of the external device alarm -48 volt power source. ALARM-PT alarms may also indicate a loss of power. When analog line ports are administered as analog line external device alarms loss of -48 volts prevents detection of an external device alarm.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. For example, by clearing error codes associated with the *Battery & External Device Alarm* test (#120), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
External Device Alarm test (MAJOR port) (#120)	X	X	ND
External Device Alarm test (MINOR port) (#120)	X	X	ND
External Device Alarm test (WARNING port) (#120)	X	X	ND

1 D = Destructive; ND = Nondestructive

External Device Alarm Test (#120)

The External Device Alarm Test requests the state of the External Device Alarm from a Maintenance circuit pack and reports the results. The test has no effect on the external device itself.

Table 408: Test #120 External Device Alarm Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. **1** Retry the command at 1-minute intervals up to 5 times.
1035	ABORT	The PN containing this equipment is not available. Resolve every PN problem with this cabinet.

Table 408: Test #120 External Device Alarm Test

Error Code	Test Result	Description / Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Retry the command at 1-minute intervals up to 5 times. **2** (Maintenance Board) If the test continues to ABORT with Error Code 2000, check for system powering problems with the A carrier. Resolve every AC-POWER and CARR-POW alarm in a multicarrier cabinet or DC-POWER alarms in a single-carrier cabinet. Then, repeat the test. **3** (Maintenance Board) If the test continues to ABORT with a 2000 Error Code, resolve every maintenance circuit pack error. Then, repeat the test.
2029, 2100, 2319, 2320, 2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	**S8100** If this is an S8100 system and the port location is 1A1101 or 1A1102, the failure is associated with a non-Communication Manager alarm generated by AUDIX or the Global Alarm Manager (GAM). Follow the steps below: Start up a bash session and enter the **alarmstat** command to determine which subsystem generated the alarm. See Alarms in the S8100 Media Server and Windows 2000 Log Events on page 140for more information. If the alarm is from the GAM, use the **gamalarmstat** command to identify the source of the problem. Follow the procedures presented in Alarms in the S8100 Media Server and Windows 2000 Log Events on page 140 to identify and clear the problem. If the alarm is from AUDIX, start up an AUDIX terminal session using DSA, enter the **display alarm** command, and follow the AUDIX maintenance procedures to identify and clear the problem. The External Device Alarm has been activated by the external device. **1** Clear the major alarm on the external device, and rerun the test. **2** If the test still fails, then disconnect the External Device Alarm Leads from the Maintenance circuit pack and rerun the test. **3** If the test still fails, then there is a problem with the analog external device alarm port or the Maintenance circuit pack that is reporting the alarm. This circuit pack should be replaced. There are failures that can occur on the Maintenance circuit pack that *will not* be detected by their respective maintenance, but that will cause many environment tests to fail. If many environment tests are failing, the suspect circuit pack should be replaced and the test rerun.

Table 408: Test #120 External Device Alarm Test

Error Code	Test Result	Description / Recommendation
	PASS	If there is a problem with the external device, but the administered analog line external device alarm, or the administered Maintenance circuit pack connected to the device reports no alarm, then the External Device may not be properly reporting the problems or the External Device may not be properly connected to the External Device Alarm Leads.

3 of 3

FIBER-LK (Fiber Link)

S8700 MC only

MO's Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
FIBER-LK	MAJOR	**test fiber-link *F pnc* s**	Fiber Link
FIBER-LK	MINOR	**test fiber-link *F pnc* s**	Fiber Link
FIBER-LK	WARNING	**test fiber-link *F pnc* s**	Fiber Link

1 ***F*** is the fiber link number; ***pnc*** is either "a-pnc" or "b-pnc" (always "a-pnc" for a standard-, high-, or critical-reliability system).

A fiber link consists of the endpoint boards that are connected via the optical fiber, the lightwave transceivers or metallic connections on the endpoint boards, and, if administered, the DS1 Converter (DS1 converter) complex that exists between the two fiber endpoints. The fiber endpoints are EI circuit packs and/or SNI (SNI) circuit packs.

Three types of fiber links exist in G3r systems:

EI-to-EI fiber	This type of fiber is an EI-to-EI connection and is only used in direct connect PNC.
EI-SNI fiber	This type of fiber is an EI-to-SNI connection and is only used in Center Stage Switch (CSS) PNC.
SNI-SNI fiber	This type of fiber is an SNI-to-SNI connection and is only used in CSS PNC when two switch node carriers are connected in a 2- or 3-switch node configuration.

Fiber link errors and alarms are generated only on fibers that have at least one SNI endpoint. Fiber errors for fibers that have EIs as both endpoints are detected by the EI circuit pack, thus generating off-board EXP-INTF errors and alarms. Fiber errors and alarms on EI-SNI fiber links generate FIBER-LK and/or off-board EXP-INTF errors and alarms.

Fiber links are administered via **add fiber-link *F*** or **add fiber-link next**, where F is the fiber link's number. The 2 endpoints of the fiber are administered (EI and EI, EI and SNI, or SNI and SNI). In a duplicated PNC configuration, both the A- and B-PNC's fiber links are assigned with the same fiber link's number. The fiber links are designated by ***F P***, where F is the fiber link's number and P is the PNC, A-PNC or B-PNC. In addition, a DS1 converter complex may be assigned to the fiber link. In a duplicated PNC configuration, both the A- and B-PNC's DS1 converter complexes are administered with the same fiber link's number. DS1 facilities and parameters can be modified via **change fiber-link *F P***.

An individual fiber link can be displayed with the **display fiber-link *F*** command. Every fiber link can be listed using the **list fiber-link** command.

The following terms are used in the error descriptions:

Control Path	The path between the two fiber endpoints that is necessary for the two endpoint circuit packs to communicate.
Circuit Path	The path between the two fiber endpoints that is necessary for circuit switched phone calls to work.
Neighbor	The circuit pack on the other end of the fiber.
Out of Frame	A circuit pack reports fiber out of frame if it cannot detect valid data coming from the fiber.
Packet Path	The path between the two fiber endpoints that is necessary for packet-switched messages to be sent between the two fiber endpoints.

LEDs for Circuit Packs on a Fiber Link

The amber LEDs on the three types of boards, SNI (TN573), EI (TN570), and DS1 Converter (TN574 or TN1654), that may be a part of the fiber link can help in diagnosing problems with the fiber link. The amber LED states are as follows. The flashing LED patterns take precedence over the active or standby LED patterns.

If both endpoints of a fiber link (EI and/or SNI) are flashing with a fiber out of frame pattern, a fast amber LED pattern (0.1 second on and 0.1 second off), check the lightwave transceivers (if present). Both lightwave transceivers on the fiber link must be of the same type. The 9823a shortwave transceiver and the 9823b longwave transceiver must never be combined on the same fiber link because a fiber out-of-frame condition will exist. The 9823a lightwave transceiver should be used for distances up to 4900 feet and the 9823b lightwave transceiver should be used for distances up to 25,000 feet.

Table 409: SNI Amber LED Flashing Codes

Condition	LED on	LED off
Fiber out of Frame	0.1 second	0.1 second
In Frame, No Neighbor[1]	0.5 second	0.5 second
SNI active	Solid on	Never off
SNI standby	Never on	Solid off

1 The fiber is in frame, but no communication exists to the neighbor

Table 410: Expansion Interface Circuit Pack Amber LED Flashing Codes

Condition	LED on	LED off
Fiber Out-of-Frame	0.1 second	0.1 second
(a) In frame-No Neighbor	0.5 second	0.5 second
(b) Expansion Interface Active	2 second	0.2 second
(c) Expansion Interface Active	Solid on	Never off
(d) Expansion Interface Standby	Never on	Solid off

Notes:

a The fiber is in frame, but no communication exists to the neighbor.

b This is the normal state for an active PN EI circuit pack that is also the bus master (expansion Archangel) in the PN.

c This is the normal state for an active EI circuit pack that is not the bus master (expansion Archangel) for a PN. This applies only in the direct connect configuration where the EI circuit pack in a PN connects via a fiber link to an EI circuit pack in the other PN. This state also applies for an active EI circuit pack located in the PN.

d This is the normal state for a standby expansion Interface circuit pack in the PN.

For more details about how the EI circuit pack error codes relate to the LED states, see EXP-INTF (Expansion Interface Circuit Pack) on page 911.

Table 411: DS1 Converter Amber LED Flashing Codes

Condition	LED on	LED off
(a) Fiber out of Frame	0.1 second	0.1 second
(b) In frame, fiber channel is down	0.5 second	0.5 second
(c) In frame, DS1 channel down	1 second	1 second
(d) DS1 converter, no response from media server	2 second	0.2 second
DS1 converter active	Solid on	Never off
DS1 converter standby	Never on	Solid off

Notes:

a A Fiber is out of frame or a fiber loss-of-signal condition exists.

b DS1 converter/fiber endpoint communication is down.

c The DS1 channel is down between the two DS1 converters in the DS1 converter complex.

d The media server is not acknowledging messages from the DS1 converter circuit pack or the DS1 converter circuit pack does not have a processor route. This pattern indicates a probable software problem.

In addition to the traditional red, green, and amber LEDs, the DS1 converter circuit pack has four green LEDs that indicate whether a receive signal is present for each DS1 facility.

Error Log Entries and Test to Clear Values

Table 412: Fiber Link Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	**test fiber-link** *F P* **r 1**
1 (b)	any	failure audit (#777) (a)	MAJOR, MINOR, WARNING	OFF	**test fiber-link** *F P* **r 1**
18 (c)	0	**busyout fiber** *F P*	WARNING	OFF	**release fiber** *F P*
257 (d)	any	failure audit (#777) (a)	MAJOR, MINOR, WARNING	OFF	**test fiber-link** *F P* **r 1**
513 (e)	any	failure audit (#777) (a)	MAJOR, MINOR, WARNING	OFF	**test fiber-link** *F P* **r 1**
76 9(f)	any	failure audit (#777) (a)	MAJOR, MINOR, WARNING	OFF	**test fiber-link** *F P* **r 1**
1025 (g)	any	failure audit (#777) (a)	MAJOR, MINOR, WARNING	OFF	**test fiber-link** *F P* **r 1**
1281 (h)	any	failure audit (#777) (a)	MAJOR, MINOR, WARNING	OFF	**test fiber-link** *F P* **r 1**

1 Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

Notes:

a The failure audit test (#777) should be run to confirm whether the error still exists.

b This error indicates problem with the control path to the neighbor.

c This error indicates that the fiber link has been busied out via the **busyout fiber-link *F P*** command. To resolve this error, release the fiber link with the **release fiber-link *F P*** command.

d This error indicates problem with the circuit path to the neighbor.

e This error indicates problem with the packet path to the neighbor.

f This error indicates problem with the control path from the neighbor.

g This error indicates problem with the circuit path from the neighbor.

h This error indicates problem with the packet path from the neighbor.

For note b and notes d through h, perform the following steps:

1 Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*.

2 Enter **display errors** and if any of the listed slip errors exist, follow the associated repair procedures in the SYNC section for slip errors.

Table 413: Error Log Entries for Slip Errors

Circuit Pack's Name	Error Log Name	Error Log Entry (for Slips)
DS1 Interface	DS1-BD	3073 to 3160
Expansion Interface	EXP-INTF	2305
SNI	SNI-BD	1537
Tone-Clock	TDM-CLK	1025
UDS1 Interface	UDS1-BD	3073 to 3160

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the following order when inspecting errors in the system. For example, by clearing error codes associated with the EI Out-of-Frame Query test (#238), you may also clear errors generated by other tests later in the sequence.

Table 414: Tests Run for an EI-to-EI Fiber Link

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Fiber Sequence	D/ND[1]
EI Out-of-Frame Query test (#238)	X	X		ND
EI Neighbor Query test (#237)	X	X		ND
Fiber Link Reset test (#768)			X	D

1 D = Destructive; ND = Nondestructive

Table 415: Tests Run for an EI-to-SNI Fiber Link

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Fiber Sequence	D/ND[1]
EI Out-of-Frame Query test (#238)	X	X		ND
EI Neighbor Query test (#237)	X	X		ND
Configuration audit (#759)	X	X		ND
Failure audit (#777)	X	X		ND
Fiber Out of Frame query (#989)	X	X		ND
Destructive Facility test (#757)		X		D
Off-Board Destructive Facility test (#756)		X		D
Fiber Link Reset test (#768)			X	D

1 D = Destructive, ND = Nondestructive

Table 416: Tests Run for an SNI-to-SNI Fiber Link

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Fiber Sequence	D/ND[1]
Configuration audit (#759)	X	X		ND
Failure audit (#777)	X	X		ND
Fiber Out of Frame query (#989)	X	X		ND
Destructive Facility test (#757)		X		D
Off-Board Destructive Facility test (#756)		X		D
Fiber Link Reset test (#768)			X	D

1 D = Destructive; ND = Nondestructive

Expansion Interface Neighbor Query Test (#237)

This test is nondestructive. The Expansion Interface Neighbor Query test is a request to an EI circuit pack to determine whether it has established communication with the EI or SNI circuit pack at the opposite end of the fiber.

For EI-to-EI fiber links, this test is run on both EI circuit pack endpoints of the fiber link.

Table 417: Test #237 Expansion Interface Neighbor Query Test

Error Code	Test Result	Description / Recommendation
1033	ABORT	The EI circuit pack does not have a fiber link administered to it. There is not sufficient data to run test. Because **test fiber-link** was run, the expansion interface should be administered on a fiber link, and this must be a software problem.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link, and follow the procedures for this test in EXP-INTF (Expansion Interface Circuit Pack) on page 911.
2031	ABORT	The attempt to send the message to the EI circuit pack, asking it who it's neighbor is, was not successful. **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link, and follow the procedures for this test in EXP-INTF (Expansion Interface Circuit Pack) on page 911.
2100	ABORT	System resources required to run this test are not available. **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link, and follow the procedures in EXP-INTF (Expansion Interface Circuit Pack) on page 911.

Table 417: Test #237 Expansion Interface Neighbor Query Test

Error Code	Test Result	Description / Recommendation
2500	ABORT	Internal system error **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link, and follow the procedures in EXP-INTF (Expansion Interface Circuit Pack) on page 911.
1033	FAIL	The EI circuit pack under test cannot make contact with opposite end EI or SNI circuit pack. **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link, and follow the procedures in EXP-INTF (Expansion Interface Circuit Pack) on page 911.
2027	FAIL	The EI circuit pack has contact with the opposite EI or SNI circuit pack, but it is the incorrect EI or SNI circuit pack. **1** Run **test board UUCSS** separately for each EI endpoint on this fiber link, and follow the procedures in EXP-INTF (Expansion Interface Circuit Pack) on page 911.
	PASS	The EI circuit pack(s) have successfully established a link with the opposite EI or SNI circuit pack. **1** If **status port-network** still indicates that this link is down, it is possible that one or both of the EI and/or SNI circuit packs have been busied out. **2** If the link still does not come up, reset one or both EI and/or SNI circuit packs on the link.

2 of 2

Expansion Interface Fiber Out-of-Frame (FOOF) Query Test (#238)

This test is nondestructive.

This test is a request to an EI circuit pack to determine whether it is currently detecting the framing sequence on the incoming fiber's data stream. If it cannot detect this framing signal, the EI circuit pack will not be able to establish a link with the opposite EI or SNI circuit pack.

For EI-to-EI fiber links, this test is run on both EI circuit pack endpoints of the fiber link.

Table 418: Test #238 Expansion Interface Fiber Out-of-Frame Query Test

Error Code	Test Result	Description / Recommendation
	ABORT	Internal system error (software). **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link and follow the procedures for this test in the EXP-INTF (Expansion Interface Circuit Pack) on page 911 section of the maintenance manual. **2** If the test continues to abort or fail, escalate the problem.

1 of 2

Table 418: Test #238 Expansion Interface Fiber Out-of-Frame Query Test

Error Code	Test Result	Description / Recommendation
1033	ABORT	The EI circuit pack does not have a fiber link administered to it. There is not sufficient data to run test. Because **test fiber-link** was run, the expansion interface should be administered on a fiber link, therefore this must be a software problem.
2000	ABORT	Response to the test request was not received within the allowable time period. **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link and follow the procedures in EXP-INTF (Expansion Interface Circuit Pack) on page 911.
2100	ABORT	System resources required to run this test are not available. **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link and follow the procedures in EXP-INTF (Expansion Interface Circuit Pack) on page 911.
2500	ABORT	Internal system error **1** Run **test board *UUCSS*** separately for each EI endpoint on this fiber link and follow the procedures in EXP-INTF (Expansion Interface Circuit Pack) on page 911.
	FAIL	EI circuit pack can't frame up to incoming signal. Several fail codes may be returned depending on which endpoint can't frame up. Error codes 2326, 2327, and 2328 denote Endpoint 1, Endpoint 2, and both endpoints, respectively. **1** Clear any SYNC and TDM-CLK errors listed in the error log. **2** Run **test board *UUCSS*** for each EI board on this fiber link and follow the appropriate repair sequence for any failing tests. **3** If the EI circuit pack fails Test #238 and is in the PN, and the red LEDs are ON for a large number of circuit packs, then reseat any Tone-Clock circuit packs in the PN. See the "How to replace Tone-Clock circuit packs" section of TDM-CLK (TDM Bus Clock) on page 1847 Maintenance documentation. **4** Enter display errors and follow the associated repair procedures for any SNC-BD (if applicable to this fiber link configuration) or TDM-BUS errors. **5** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*", described in Chapter 5. **6** If the test continues to abort, follow normal escalation procedures.
	PASS	The EI circuit pack(s) have detected the valid framing signal on the fiber. **1** Refer to errors from other EI circuit packs, SNI (SNI) tests, or DS1 Converter tests (if present) if the link is still not functioning.

2 of 2

SNI Off-Board Destructive Facility Test (#756)

This test is **destructive**.

The SNI runs a destructive loop around of the on- and off-board looparounds. This test returns the result of the off-board loop around, while Test 757 returns the result of the on-board loop around. For SNI-to-SNI fiber links, this test is run on both SNI circuit pack endpoints of the fiber link.

Table 419: Test #756 SNI Off-Board Destructive Facility Test

Error Code	Test Result	Description / Recommendation
1015	ABORT	The system will not allow this test to be run because the fiber link has not been busied out. Busyout the fiber link with **busyout fiber-link *F P***. Run **test fiber-link *F P* long**.
1415	ABORT	The lightwave transceiver is absent from Endpoint 1 of the fiber link. Use**list fiber-link** to display fiber link endpoints. **1** If a lightwave transceiver should not be present, do nothing. For example, an SNI connected to a DS1 converter circuit pack or an SNI with a metallic connection does not have a lightwave transceiver. This test can only be run when a lightwave transceiver exists. **2** Otherwise, continue with the following steps. **3** Check the lightwave transceiver connections. **4** Replace the lightwave transceiver. If a fiber out-of-frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type (both are 9823a or both are 9823b). If they are not the same type, replace one of the lightwave transceivers. **5** Replace the SNI circuit pack.
1416	ABORT	The lightwave transceiver is absent from Endpoint 2 of the fiber link. Use **list fiber-link** can be used to display fiber link endpoints. **1** If a lightwave transceiver should not be present, do nothing. For example, an SNI connected to a DS1 converter circuit pack or an SNI with a metallic connection does not have a lightwave transceiver. This test can only be run when a lightwave transceiver exists. **2** Check the lightwave transceiver connections. **3** Replace the lightwave transceiver. If a fiber out-of-frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type (both are 9823a or both are 9823b). If they are not the same type, replace one of the lightwave transceivers. **4** Replace the SNI circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test.

Table 419: Test #756 SNI Off-Board Destructive Facility Test

Error Code	Test Result	Description / Recommendation
2304	ABORT	SNI circuit pack responded that it is not able to run the test requested by software. **1** Retry the command at 1-minute intervals up to 3 times.
2306	ABORT	A fiber link's SNI circuit pack is not responding to test requests sent by software. **1** Run **test led switch-node** for the switch node where the SNI board(s) reside to verify whether their LEDs light. If not, continue with the following steps. **2** If LEDs light on other boards in the same carrier (but not on this board), issue **test board *UUCSS* l** (#760) for the active SNC in this carrier. Wait 5 minutes, and try step 1 again. If the board's LEDs still do not light, replace the board. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) **3** If no LEDs light on any board in the same carrier, fix any connectivity problems between this carrier and the media server. Use **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on every SNI and EI, and fix any fiber problems. Enter **display errors**, and resolve any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
127	FAIL	The data is not correctly looped around on Endpoint 1 of the fiber link. Use **list fiber-link** to display fiber link endpoints. **1** Check the lightwave transceiver. **2** Replace the lightwave transceiver. If a fiber out-of-frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type (both are 9823a or both are 9823b). If they are not the same type, replace one of the lightwave transceivers. **3** Replace the SNI circuit pack.
227	FAIL	The data is not correctly looped around on Endpoint 2 of the fiber link Use **list fiber-link** can be used to display fiber link endpoints. **1** Check the lightwave transceiver. **2** Replace the lightwave transceiver. If a fiber out-of-frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type (both are 9823a or both are 9823b). If they are not the same type, replace one of the lightwave transceivers. **3** Replace the SNI circuit pack.
	PASS	No problems associated with this test are detected on the SNI(s).

2 of 2

SNI Destructive Facility Test (#757)

This test is **destructive**.

The SNI runs a destructive loop around of the on- and off-board looparounds. This test returns the result of the on-board loop around, while Test 756 returns the result of the off-board loop around.

For SNI-to-SNI fiber links, this test is run on both SNI circuit pack endpoints of the fiber link.

Table 420: Test #757 SNI Destructive Facility Test

Error Code	Test Result	Description / Recommendation
1015	ABORT	The system will not allow this test to be run because the fiber link has not been busied out. Busyout the fiber link with **busyout fiber-link *F P***. Enter **test fiber-link *F P* long**.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test.
2304	ABORT	SNI circuit pack responded that it is not able to run the test requested by software. **1** Retry the command at 1-minute intervals up to 3 times.
2306	ABORT	A fiber link's SNI circuit pack is not responding to test requests sent by software. **1** Run **test led switch-node** for the switch node where the SNI board(s) reside to verify whether their LEDs light. If not, continue with the following steps. **2** If LEDs light on other boards in the same carrier (but not on this board), issue **test board *UUCSS* l** (#760) for the active SNC in this carrier. Wait 5 minutes, and try step 1 again. If the board's LEDs still do not light, replace the board. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) **3** If no LEDs light on any board in the same carrier, fix any connectivity problems between this carrier and the media server. Use **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on every SNI and EI, and fix any fiber problems. Enter **display errors**, and resolve any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
127	FAIL	The data is not correctly looped around on Endpoint 1 of the fiber link. Use **list fiber-link** to display fiber link endpoints. **1** Replace the SNI circuit pack.
227	FAIL	The data is not correctly looped around on Endpoint 2 of the fiber link. Use **list fiber-link** to display fiber link endpoints. **1** Replace the SNI circuit pack.
	PASS	No problems associated with this test are detected on the SNI(s).

Configuration Audit (#759)

This test is **non**destructive.

This test is run via the **test board short** or **test board long** command for SNI circuit packs or via **test fiber-link** for fiber links with SNI endpoint(s).

This test queries the SNI for SNCs in the same switch node carrier, SNI peers, DS1 converter s, and EI or SNI neighbors that the SNI can communicate with and compares this data to the administered data.

Failures of this test cause entries in the error and alarm logs against Switch Node Configuration (SN-CONF) with the board location of the SNI.

This test is unable to detect the case where an SNI is connected to the same type of board (EI or SNI) as administered but located in a different cabinet but the same carrier and same slot as the administered fiber endpoint. The administered fiber endpoint can be viewed with the **list fiber-link** command. This test can only detect if the fiber endpoint connected to the SNI is in a different carrier, slot location than the administered fiber endpoint.

If the SNI is connected to the same type of fiber endpoint as the administered fiber endpoint, but the location is the same as administered except for the cabinet, no phone calls will work correctly; some phone calls will not go through and some phone calls will ring the wrong phone.

The **test led** command can be used in this case to check connectivity.

1. Run the **test led port-network** command for each administered PN, and verify that the LEDs on the correct PN are lit.

   If not, check that the fiber connections to the PN are consistent with the administered fibers (**list fiber-link**) that do not light the LEDs as expected.

2. Run the **test led switch-node** command for each administered switch node carrier (SNC), and verify that the LEDs on the correct SNC are lit.

   If not, check the connectivity to the SNC that does not light the LEDs as expected.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test for endpoint 1 of the fiber link. Use **list fiber-link** to display a fiber link's endpoints. If this fiber link has two SNI endpoints, run **test board *UUCSS*** separately for each SNI and follow the repair procedures in section SNI-BD.
2300	ABORT	The downlink message necessary to run this test could not be sent. If this fiber link has two SNI endpoints, run **test board *UUCSS*** separately for each SNI and follow the repair procedures in section SNI-BD. Use **list fiber-link** to display fiber link endpoints.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. If this fiber link has two SNI endpoints, run **test board *UUCSS*** separately for each SNI and follow the repair procedures in section SNI-BD. Use **list fiber-link** to display fiber link endpoints. **1** Retry the command at 1-minute intervals up to 3 times.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
2306	ABORT	An SNI circuit pack on the fiber link is not responding to test requests sent by software. **1** Run the **test led switch-node** for the switch node(s) where the SNI(s) reside to verify whether the LEDs on the board(s) light. Follow the steps below for the SNI(s) that had no LEDs light. **2** If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run Test #760 via **test board *UUCSS* l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace the board. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) **3** If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the media server. Use **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on every SNI and EI, and fix any fiber problems. Enter **display errors** and resolve any EXP-INTF error entries associated with the PN. Also, resolve any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
2500	ABORT	Internal system error If this fiber link has two SNI endpoints, run **test board *UUCSS*** separately for each SNI and follow the repair procedures in section SNI-BD. (The **list fiber-link** command displays a fiber link's endpoints.) Otherwise: **1** Retry the command at 1-minute intervals up to 3 times.
102	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 2. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1, replace the SNI in slot 2.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
103	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 3. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 257, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 257, replace the SNI in slot 3.
104	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 4. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 513, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested has SNI-PEER Error Type 513, replace the SNI in slot 4.
105	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 5. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 769, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested has SNI-PEER Error Type 769, replace the SNI in slot 5.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
106	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 6. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1025, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1025, replace the SNI in slot 6.
107	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 7. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1281, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1281, replace the SNI in slot 7.
108	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 8. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1537, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1537, replace the SNI in slot 8.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
109	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 9. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1793, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1793, replace the SNI in slot 9.
112	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the active SNC. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Check the error log for other SNI circuit packs in the same carrier with a 257 SNI-BD error. Use **display errors** with category PNC to view SNI-BD errors. If other SNI circuit packs in the same switch node carrier have Error 257, then replace the active SNC in this switch node carrier. Replacing an SNC may be service interrupting. Refer to the SNC-BD section for the procedure for replacing an SNC. **2** Replace this SNI. **3** Replace the active SNC in the same switch node carrier.
113	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 13. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 2049, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 2049, replace the SNI in slot 13.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
114	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 14. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 2305, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 2305, replace the SNI in slot 14.
115	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 15. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 2561, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 2561, replace the SNI in slot 15.
116	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 16. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 2817, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 2817, replace the SNI in slot 16.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
117	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 17. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 3073, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 3073, replace the SNI in slot 17.
118	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 18. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 3329, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 3329, replace the SNI in slot 18.
119	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 19. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 3585, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 3585, replace the SNI in slot 19.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
120	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with the equipped SNI in slot 20. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 3841, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 3841, replace the SNI in slot 20.
133	FAIL	No neighbor link is assigned, but the SNI (Endpoint 1) has an EI neighbor. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Administer the SNI on a fiber link to the EI neighbor it is connected to via the **add fiber-link next** command. Or remove both fiber endpoints (i.e., this SNI and its EI neighbor) and remove the fiber endpoints from circuit pack administration via **change circuit-pack**.
134	FAIL	No neighbor link is assigned, but the SNI (Endpoint 1) has an SNI neighbor. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Administer the SNI on a fiber link to the SNI neighbor it is connected to via the **add fiber-link next** command. Or remove both fiber endpoints (i.e., this SNI and its SNI neighbor) and remove the fiber endpoints from circuit pack administration via **change circuit-pack**.
135	FAIL	The SNI circuit pack (Endpoint 1) cannot communicate with its assigned neighbor. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Check if the administered neighbor is inserted. If not, insert the neighbor circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*.
136	FAIL	The Endpoint 1 SNI's administered neighbor does not match the physical neighbor connected. (The **list fiber-link** command displays a fiber link's endpoints.) The SNI's assigned neighbor is another SNI, but the SNI is physically connected to an EI. Enter **list fiber-link**, and verify that the fiber-optic and metallic cables are installed as administered.
137	FAIL	The Endpoint 1 SNI's administered neighbor does not match the physical neighbor connected. (The **list fiber-link** command displays a fiber link's endpoints.) The SNI's assigned neighbor is an EI, but the SNI is physically connected to another SNI. Enter **list fiber-link,** and verify that the fiber-optic and metallic cables are installed as administered.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
138	FAIL	The physical location of SNI Endpoint 1's neighbor does not match its administered location. (Enter **list fiber-link** to display a fiber link's endpoints.) One location (carrier and slot) is assigned for the endpoint's neighbor, but it physically resides in another location. **1** Enter **list fiber-link**, and verify that the fiber-optic and metallic cables are installed as administered. **2** If the problem does not seem to be caused by either a physical-connection or an administration problem, replace the neighbor circuit pack. The neighbor circuit pack may have a hardware problem causing it to report a wrong angel address (physical carrier/slot address) to software.
139	FAIL	The Endpoint 1 SNI is administered to be connected to a DS1 converter, but is not physically connected to one. (The **list fiber-link** command displays a fiber link's endpoints.) If a DS1 converter should be connected to this SNI, enter **list fiber-link**, and verify that the fiber-optic and/or metallic cables are installed as assigned. If not, change administration to remove the DS1 converter complex from the SNI's fiber link by: **1** Entering **list fiber-link** to locate the fiber with this SNI as an endpoint **2** Entering **remove fiber-link** to remove the fiber **3** Entering **add fiber-link** to add the fiber back, without assigning the DS1 converter complex
140	FAIL	The Endpoint 1 SNI is physically connected to a DS1 converter but is not administered to be connected to a DS1 converter. (The **list fiber-link** command displays a fiber link's endpoints.) Either add the DS1 converter complex to the fiber that this SNI is associated with by: **1** Check for the fiber that this SNI is an endpoint of by checking **list fiber-link.** **2** **Remove fiber-link** for the fiber that this SNI is an endpoint of. **3** Add the fiber back via **add fiber-link** and this time administer the DS1 converter complex also. Or, remove the DS1 converter connection and connect the SNI directly to its administered fiber endpoint by entering **list fiber-link** and verifying that the fiber-optic and metallic cable connections are installed as administered.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
202	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 2. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1, replace the SNI in slot 2.
203	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 3. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in Maintenance Procedures (555-245-103). This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 257, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 257, replace the SNI in slot 3.
204	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 4. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 513, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 513, replace the SNI in slot 4.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
205	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 5. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in Maintenance Procedures (555-245-103). This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 769, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 769, replace the SNI in slot 5.
206	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 6. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1025, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1025, replace the SNI in slot 6.
207	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 7. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1281, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1281, replace the SNI in slot 7.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
208	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 8. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1537, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1537, replace the SNI in slot 8.
209	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 9. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 1793, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 1793, replace the SNI in slot 9.
212	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the active SNC. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Check the error log for other SNI circuit packs in the same carrier with a 257 SNI-BD error. Use **display errors** with category PNC to view SNI-BD errors. If other SNI circuit packs in the same switch node carrier have error 257, then replace the active SNC in this switch node carrier. Replacing an SNC may be service interrupting. Refer to the SNC-BD section for the procedure for replacing an SNC. **2** Replace this SNI. **3** Replace the active SNC in the same switch node carrier.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
213	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 13. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 2049, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 2049, replace the SNI in slot 13.
214	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 14. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 2305, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 2305, replace the SNI in slot 14.
215	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 15. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 2561, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 2561, replace the SNI in slot 15.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
216	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 16. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 2817, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 2817, replace the SNI in slot 16.
217	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 17. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 3073, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 3073, replace the SNI in slot 17.
218	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 18. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 3329, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 3329, replace the SNI in slot 18.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
219	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 19. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 3585, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 3585, replace the SNI in slot 19.
220	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with the equipped SNI in slot 20. (The **list fiber-link** command displays a fiber link's endpoints.) **1** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*. This should resolve multiple SNI-PEER errors. **2** If the SNI being tested has SNI-PEER Error Type 3841, replace the SNI being tested. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. **3** If the SNI being tested still has SNI-PEER Error Type 3841, replace the SNI in slot 20.
233	FAIL	No neighbor link is assigned, but the SNI (Endpoint 2) has an EI neighbor. (The **list fiber-link** command can be used to display a fiber link's endpoints.) If the SNI should have an EI neighbor: **1** Issue **add fiber-link next** to assign the fiber link's SNI to its physically connected EI neighbor. If not: **1** Remove both fiber endpoints (i.e., this SNI and its EI neighbor). **2** Issue **change circuit-pack** to remove the fiber endpoints from circuit-pack administration.
234	FAIL	No neighbor link is administered, but the SNI (Endpoint 2) has an SNI neighbor (The **list fiber-link** command can be used to display a fiber link's endpoints). **1** Administer the SNI on a fiber link to the SNI neighbor it is connected to via the **add fiber-link next** command. Or remove both fiber endpoints (i.e., this SNI and its SNI neighbor) and remove the fiber endpoints from circuit pack administration via **change circuit-pack**.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
235	FAIL	The SNI circuit pack (Endpoint 2) cannot communicate with its neighbor. (The **list fiber-link** command can be used to display fiber link endpoints.) The SNI has an administered neighbor, but cannot communicate with its neighbor. **1** Check if the administered neighbor is inserted. If not, insert the neighbor circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)*.
236	FAIL	The Endpoint 2 SNI's administered neighbor does not match the physical neighbor connected. (The **list fiber-link** command displays a fiber link's endpoints.) The SNI's assigned neighbor is another SNI, but the SNI is physically connected to an EI. Enter **list fiber-link**, and verify that the fiber-optic and metallic cables are installed as administered.
237	FAIL	The Endpoint 2 SNI's administered neighbor does not match the physical neighbor connected. (The **list fiber-link** command displays a fiber link's endpoints.) The SNI's assigned neighbor is an EI, but the SNI is physically connected to another SNI. Enter **list fiber-link,** and verify that the fiber-optic and metallic cables are installed as administered.
238	FAIL	The physical location of SNI Endpoint 2's neighbor does not match its administered location. (Enter **list fiber-link** to display a fiber link's endpoints.) One location (carrier and slot) is assigned for the endpoint's neighbor, but it physically resides in another location. **1** Enter **list fiber-link**, and verify that the fiber-optic and metallic cables are installed as administered. **2** If the problem does not seem to be caused by either a physical-connection or an administration problem, replace the neighbor circuit pack. The neighbor circuit pack may have a hardware problem causing it to report a wrong angel address (physical carrier/slot address) to software.
239	FAIL	The SNI Endpoint 2 is assigned to be connected to a DS1 converter, but is not physically connected to one. (Enter **list fiber-link** to display a fiber link's endpoints.) If this SNI endpoint should be connected to a DS1 converter: **1** Issue **list fiber-link** to verify that the fiber-optic cable and/or metallic cable connections are installed as assigned. If not, change administration to remove the DS1 converter complex from the SNI's fiber link by: **1** Issuing **list fiber-link** to locate this SNI endpoint's fiber **2** Issuing **remove fiber-link** for this SNI endpoint's fiber **3** Issuing **add fiber-link** to replace the fiber **without** assigning the DS1 converter complex.

Table 421: Test #759 Configuration Audit

Error Code	Test Result	Description / Recommendation
240	FAIL	The SNI Endpoint 2 is physically connected to a DS1 converter, but is not assigned to be connected to one. . Use **list fiber-link** to display a fiber link's endpoints. Either, replace the DS1 converter with fiber by: **1** Issuing **list fiber-link** to verify that the fiber-optic and metallic cable connections are installed as assigned **2** Disconnecting the SNI endpoint from the DS1 converter **3** Issuing **add fiber-link** to reconnect the SNI to its assigned fiber Or, add a DS1 converter complex to the SNI's fiber by: **1** Issuing **list fiber-link** to locate this SNI endpoint's fiber **2** Issuing **remove fiber-link** for this SNI endpoint's fiber **3** Issuing **add fiber-link**, both to replace the fiber **and** to assign the DS1 Converter complex
	PASS	The administered data and the circuit packs the SNI(s) can communicate with match.

Fiber Link Reset Test (#768)

This test is **destructive**.

This test resets both endpoints of the fiber link and is executed via the **reset fiber-link *F P*** command. Any DS1 converter circuit packs on the fiber link are not reset. The **reset fiber-link** command should almost never be used. It may be necessary to use it when the endpoint circuit packs enter a mode in which they cannot communicate with software. When necessary, always reset fiber endpoints with the command instead of reseating the endpoint circuit packs.

For EI-to-EI fibers that connect an IPSI PN, the EI on the PN is reset first followed by the EI on the IPSI PN. For EI-to-EI fiber links that connect two PNs, one EI is reset first followed by the other.

For an EI-SNI fiber link in which the EI is on the PN, the SNI is reset first followed by the EI.

For an EI-SNI fiber link in which the EI is on a PN, the SNI is reset first followed by the EI.

For an SNI-to-SNI fiber link, the SNI farthest from the PN is reset first followed by the SNI nearest to the PN.

When an EI endpoint is reset, the Expansion Interface Reset test (#336) is executed. When an SNI endpoint is reset, the SNI Reset test (#761) is executed. These tests are described in the EXP-INTF and SNI-BD sections.

This test starts the other reset test mentioned above and returns PASS without waiting for the results of the other reset test. For a better indication of how the other reset tests are running, use the **reset board *UUCSS*** command on each individual fiber link endpoint.

Table 422: Test #768 Fiber Link Reset Test

Error Code	Test Result	Description / Recommendation
1703	ABORT	Both fiber endpoints are in the hardware path for INLs to their respective switch node carriers and, thus, cannot get a response from this test because the INLs response should come on will go down as a result of the reset. **1** Reset the individual fiber-link endpoints via **reset board**.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
	PASS	The reset of both fiber endpoints successfully completed.

Failure Audit (#777)

This test is nondestructive.

This test queries the SNI(s) on the fiber link for any existing failures and any unacknowledged cleared failure messages. Each failure generates an error and alarm entry against SNI-BD, SNI-PEER, or FIBER-LK. An unacknowledged cleared failure message is a message the SNI circuit pack sent to software indicating a previous failure is now gone and the SNI circuit pack did not receive a message from software indicating that the failure message was received by software.

If no failures are detected by the SNI circuit pack, this test will pass.

If this test reports failures, the results screen for the **test fiber-link** command will show **FAIL** with no FAIL code. The error log must then be displayed via **display errors** with category PNC to view SNI-BD and FIBER-LK errors and **display errors** with category PNC-PEER to view SNI-PEER errors.

For EI-to-EI fiber links, this test is not run. For EI-to-SNI fiber links, this test is run on the SNI circuit pack endpoint of the fiber link. For SNI-to-SNI fiber links, this test is run on both SNI circuit pack endpoints of the fiber link.

Table 423: Test #777 Failure Audit

Error Code	Test Result	Description / Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test.
2300	ABORT	The downlink message necessary to run this test could not be sent.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test.
2302	ABORT	The SNI circuit pack claims that it received a bad message from software.
2303	ABORT	The SNI circuit pack claims that the test requested by software is invalid.
2304	ABORT	SNI firmware is not able to run the test. **1** Retry the command at 1-minute intervals up to 3 times.

1 of 2

Table 423: Test #777 Failure Audit

Error Code	Test Result	Description / Recommendation
2306	ABORT	An SNI circuit pack on the fiber link is not responding to test requests sent by software. **1** Run the **test led switch-node** for the switch node(s) where the SNI(s) reside to verify whether the LEDs on the board(s) light. Follow the steps below for the SNI(s) from step 1 that had no LEDs light. **2** If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board *UUCSS* l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) **3** If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the media server. Use **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on every SNI and EI, and fix any fiber problems. Enter **display errors** and resolve any EXP-INTF error entries associated with the PPN. Also, resolve any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
	FAIL	The SNI circuit pack reported failures or retransmitted a cleared failure message. **1** If this is the first time this test was run, run the test again. If there were any previous failure messages that software did not acknowledge, this test will FAIL even if the failure messages indicate a FAIL to PASS transition, i.e., a problem has gone away. If this test is run twice and FAILs both times, then at least one problem still exists. **2** Resolve any errors or alarms (**display errors** and **display alarms**) for SNI-BD, SNI-PEER, and FIBER-LK entries. **3** If no SNI-BD, SNI-PEER, or FIBER-LK entries exist in the error and alarm logs, retry the command.
	PASS	No problems are detected on the board.

2 of 2

SNI Fiber Out of Frame Query (#989)

This test is nondestructive.

The SNI circuit pack reports whether a fiber out-of-frame condition exists, whether a loss-of-signal condition exists, and whether the lightwave transceiver is present.

Table 424: Test #989 SNI Fiber Out of Frame Query

Error Code	Test Result	Description / Recommendation
1415	ABORT	The lightwave transceiver is absent from Endpoint 1 of the fiber link. Use **list fiber-link** to display fiber link endpoints. **1** If a lightwave transceiver should not be present (for example, an SNI connected to a DS1 converter circuit pack), do nothing. **2** Otherwise, continue with the following steps. **3** Check the lightwave transceiver connections. **4** Replace the lightwave transceiver. **5** Replace the SNI circuit pack.
1416	ABORT	The lightwave transceiver is absent from Endpoint 2 of the fiber link. Use **list fiber-link** to display fiber link endpoints. **1** If a lightwave transceiver should not be present (for example, an SNI connected to a DS1 converter circuit pack), do nothing. **2** Otherwise, continue with the following steps. **3** Check the lightwave transceiver connections. **4** Replace the lightwave transceiver. **5** Replace the SNI circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. **1** Retry the command at 1-minute intervals up to 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. **1** Retry the command at 1-minute intervals up to 3 times.
2304	ABORT	The SNI circuit pack responded that it is not able to run the test requested by software. **1** Retry the command at 1-minute intervals up to 3 times.

Table 424: Test #989 SNI Fiber Out of Frame Query

Error Code	Test Result	Description / Recommendation
2306	ABORT	A fiber link's SNI circuit pack is not responding to test requests sent by software. **1** Run the **test led switch-node** for the switch node where the SNI board(s) reside to verify whether their LEDs light. If not, continue with the following steps. **2** If LEDs light on other boards in the same carrier (but not on this board), issue **test board *UUCSS* long** (#760) for the active SNC in this carrier. Wait 5 minutes, and try step 1 again. If the board's LEDs still do not light, replace the board. (Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure to replace an SNI.) **3** If no LEDs light on any board in the same carrier, fix any connectivity problems between this carrier and the media server. (Use **list fiber-link** to determine the fiber connections to this carrier.) Check the LEDs on every SNI and EI, and fix any fiber problems. Enter **display errors**, and resolve any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
2500	ABORT	Internal system error **1** Retry the command at 1-minute intervals up to 3 times.
141	FAIL	The SNI circuit pack (Endpoint 1 of the fiber link) has a fiber out-of-frame condition, but no loss-of-signal condition. Also, a lightwave transceiver is connected to the SNI circuit pack. **1** Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber link if no DS1 converter complex is administered (check via **list fiber-link**). Otherwise, if a DS1 converter complex is administered, the connected circuit pack is the DS1 converter circuit pack connected to the SNI circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)* in Chapter 5. **3** Replace this SNI circuit pack. **4** Replace the connected circuit pack.

Table 424: Test #989 SNI Fiber Out of Frame Query

Error Code	Test Result	Description / Recommendation
142	FAIL	The SNI circuit pack (Endpoint 1 of the fiber link) has a fiber out-of-frame condition, but no loss-of-signal condition. Also, no lightwave transceiver is connected to the SNI circuit pack. **1** Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber link if no DS1 converter complex is administered (check via **list fiber-link**). Otherwise, if a DS1 converter complex is administered, the connected circuit pack is the DS1 converter circuit pack connected to the SNI circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)* in Chapter 5. **3** Replace this SNI circuit pack. **4** Replace the connected circuit pack.
143	FAIL	The SNI circuit pack (Endpoint 1 of the fiber link) has a loss-of-signal condition, but no fiber out-of-frame condition. Also, a lightwave transceiver is connected to the SNI circuit pack. **1** Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber link if no DS1 converter complex is administered (check via **list fiber-link**). Otherwise, if a DS1 converter complex is administered, the connected circuit pack is the DS1 converter circuit pack connected to the SNI circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)* in Chapter 5. **3** Replace this SNI circuit pack. **4** Replace the connected circuit pack.
144	FAIL	The SNI circuit pack (Endpoint 1 of the fiber link) has a loss-of-signal condition, but no fiber out-of-frame condition. Also, no lightwave transceiver is connected to the SNI circuit pack. **1** Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber link if no DS1 converter complex is administered (check via **list fiber-link**). Otherwise, if a DS1 converter complex is administered, the connected circuit pack is the DS1 converter circuit pack connected to the SNI circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)* in Chapter 5. **3** Replace this SNI circuit pack. **4** Replace the connected circuit pack.

Table 424: Test #989 SNI Fiber Out of Frame Query

Error Code	Test Result	Description / Recommendation
145	FAIL	The SNI circuit pack (Endpoint 1 of the fiber link) has a fiber out-of-frame condition and a loss-of-signal condition. Also, a lightwave transceiver is connected to the SNI circuit pack. **1** Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber-link if no DS1 converter complex is administered (check via **list fiber-link**). Otherwise, if a DS1 converter complex is administered, the connected circuit pack is the DS1 converter circuit pack connected to the SNI circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)* in Chapter 5. **3** Replace this SNI circuit pack. **4** Replace the connected circuit pack.
146	FAIL	The SNI circuit pack (Endpoint 1 of the fiber link) has a fiber out-of-frame condition, and a loss-of-signal condition. Also, no lightwave transceiver is connected to the SNI circuit pack. **1** Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber link if no DS1 converter complex is administered (check via **list fiber-link**). Otherwise, if a DS1 converter complex is administered, the connected circuit pack is the DS1 converter circuit pack connected to the SNI circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)* in Chapter 5. **3** Replace this SNI circuit pack. **4** Replace the connected circuit pack.
241	FAIL	The SNI circuit pack (Endpoint 2 of the fiber link) has a fiber out-of-frame condition, but no loss-of-signal condition. Also, a lightwave transceiver is connected to the SNI circuit pack. **1** Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber link if no DS1 converter complex is administered (check via **list fiber-link**). Otherwise, if a DS1 converter complex is administered, the connected circuit pack is the DS1 converter circuit pack connected to the SNI circuit pack. **2** Perform the Fiber link fault isolation in Chapter 6, "Troubleshooting" in *Maintenance Procedures (555-245-103)* in Chapter 5. **3** Replace this SNI circuit pack. **4** Replace the connected circuit pack.

Table 424: Test #989 SNI Fiber Out of Frame Query

Error Code	Test Result	Description / Recommendation
242	FAIL	The SNI circuit pack (Endpoint 2 of the fiber link) has a fiber out-of-frame condition, but no loss-of-signal condition. Also, no lightwave transceiver is connected to the SNI circuit pack. **1** Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber link if no DS1 converter complex is administered (check via **list fiber-link**). 	PASS	No problems associated with this test are detected on the SNI.

FW-DWNLD (Firmware Download)

S8700 / S8500 / S8100

MO Name (in Alarm Log)	Alarm Level	Full Name of MO
FW-DWNLD	MINOR[1]	Firmware Download

1 MINOR alarms can be down-graded to a WARNING level per local instructions by using the **set options** command.

Firmware Download Procedures

Firmware Download gives you the capability to download new firmware to one or more programmable circuit packs of the same type residing within the same system. Programmable circuit packs have a “P” in their suffix. For example TN799DP is programmable, but TN799C is not. This programmable capability reduces the need to physically remove circuit packs and return them to Avaya for firmware updates.

NOTE:
This description contains the most accurate information available at the time of production. Go to the Avaya Support Web site (http://avaya.com/support) and look under **Software & Firmware Downloads** for the most recent information about downloading firmware.

During this firmware download process, a firmware image is installed on a circuit pack in three steps:

1. The image is copied from an Avaya server over the Web to a local “staging area” — a PC or server on the customer LAN.
2. The image is copied from the local staging area to the **source** circuit pack or media server.
3. The image is downloaded from the **source** to the **target** with one of these methods:
   - **Self-download (**Self and C-LAN-distributed download procedure on page 1015) - image downloaded directly from RAM (the **source**) to flash memory (the **target**) on the same circuit pack
   - **C-LAN-distributed download (**Self and C-LAN-distributed download procedure on page 1015) - image downloaded from RAM (the **source**) on a C-LAN circuit pack to flash memory (the **target**) on one or more separate circuit packs of the same type
   - **IPSI download (**IPSI download procedure on page 1026**)** - image downloaded from a **source** media server to one or all **target** IPSI circuit packs

Although different circuit packs have different potential roles in a firmware download, currently the following circuit packs can participate in a firmware-download procedure. Additional packs will be added in the future.

- Control LAN (C-LAN) – TN799C or TN799DP
- 2-Wire Digital Line (DIG-LINE) – TN2214CP or TN2224CP
- IP Media Processor (IPMEDPRO) – TN2302AP
- Maintenance/Test (M/T-ANL) – TN771DP
- UDS1 – TN464GP, TN2464BP, and TN2313AP

- Voice Announcements over LAN (VAL) – TN2501AP
- IP Server Interface (IPSI) – TN2312AP

In a firmware download to IPSIs, the media server is the source and the IPSIs are the targets. For downloads to all other circuit packs, see Table 425 for each circuit pack's roles in a firmware download.

Table 425: Non-IPSI Circuit-Pack Roles in Firmware Downloads

Circuit Pack	TN Code	Role in Self Download	Role in C-LAN-distributed Download
C-LAN	TN799C[1]		Source
	TN799DP[2]	Source and Target	Source
VAL	TN2501AP	Source and Target	
IP Media Processor	TN2302AP[3]		Target
DIG-LINE (2-wire)	TN2214CP		Target
	TN2224CP		Target
Maintenance/Test	TN771DP		Target
UDS1	TN464GP		Target
	TN2464BP		Target
	TN2313AP		Target

1 The TN799C C-LAN circuit pack can be the "source" for a C-LAN-distributed download but cannot be the "target" circuit pack for either a self or C-LAN-distributed download since it is not a programmable circuit pack (no "P" suffix).

2 The TN799DP can be both source and target for a self download and can be the source for a C-LAN-distributed download.

3 For TN2302AP circuit packs with a vintage less than 22, a different download procedure is required that is not described here. Go to the Avaya Support Web site under **Software & Firmware Downloads**, DEFINITY ECS, TN2302AP firmware downloads. On the page titled "Retired - (OLD Do Not Use) DEFINITY Firmware Downloads", scroll down to the TN2302AP section and click on TFTP_Firmware_download_procedure.pdf.

If you need to download new firmware to an IPSI, use the IPSI download procedure on page 1026. Otherwise, use the Self and C-LAN-distributed download procedure on page 1015.

Self and C-LAN-distributed download procedure

This section describes the procedures for either a self or C-LAN-distributed firmware download. These procedures will help you determine which method to use. The main differences between the two methods are:

C-LAN-distributed download	• The “source” circuit pack is always a C-LAN, either TN799DP or TN799C. • Multiple “target” circuit packs of the same TN code can be scheduled for download at a time.
self download	• The “source” and “target” circuit packs are the same. • Each circuit pack must be scheduled for download individually.

The high-level steps you will use to perform a self or C-LAN-distributed firmware download are:

1. Prepare for download on page 1015
2. Upload image file from Web to staging area on page 1018
3. FTP the image file to source on page 1018
4. Schedule a download to target(s) on page 1019
5. Monitor download progress on page 1023
6. Disable file system on page 1025

NOTE:
If you have any trouble with this procedure, refer to Troubleshooting firmware downloads on page 1030.

Prepare for download

The following sub-sections contain procedures to prepare for the firmware downloads to target circuit packs. These sub-sections are:

- Verify hardware/software requirements on page 1015
- Get circuit pack information on page 1017
- Set up source circuit pack’s file system on page 1018

Verify hardware/software requirements

Follow these steps to make sure you know which download procedure to use and that you have all hardware and software that is necessary to proceed:

1. Given the type of target circuit pack to be upgraded, choose an appropriate source circuit pack from the following table (Table 426). The last column indicates which download method must be used with the target and chosen source.

Table 426: Download Method by Circuit Pack

Target Circuit Pack(s)	Source Circuit Pack	Download Method
TN464GP, TN2464BP, and TN2313AP (UDS1)	TN799C or TN799DP	C-LAN-distributed
TN2214CP or TN2224CP (DIG-LINE)	TN799C or TN799DP	C-LAN-distributed
TN771DP (Maintenance/Test)	TN799C or TN799DP	C-LAN-distributed
TN2302AP (IP Media Processor)[1]	TN799C or TN799DP	C-LAN-distributed
TN799DP (C-LAN)	TN799DP	Self
TN2501AP (VAL)	TN2501AP	Self

1 For TN2302AP circuit packs with a vintage less than 22, a different download procedure is required that is not described here. Go to the Avaya Support Web site under **Software & Firmware Downloads**, DEFINITY ECS, TN2302AP firmware downloads. On the page titled “Retired - (OLD Do Not Use) DEFINITY Firmware Downloads”, scroll down to the TN2302AP section and click on TFTP_Firmware_download_procedure.pdf.

2 Make sure you have the following:

- Superuser or Services login and password to DEFINITY or Communication Manager
- PC or other server with the following:
  - IP connectivity to the source board
  - Web browser that the media server web interface supports
  - IP connectivity to the World-Wide Web
  - File transfer protocol (FTP) software program

NOTE:
Some GUI-based FTP applications are incompatible with Communication Manager/DEFINITY. Command-line FTP applications launched from a UNIX shell or DOS prompt work best.

NOTE:
If you need to distribute firmware from a source C-LAN to target boards on a DS1-C (DS1 converter complex) remote port network, then make sure there is a clear channel between the source C-LAN and those target boards:

- At the SAT, enter **list fiber-link** and find the link between the source C-LAN and the target boards.
- Enter **display fiber-link *n***, where ***n*** is the fiber link’s number.

- Go to the second page of the Fiber Link Administration screen and verify that the `Line Coding` fields are set to **b8zs** for T1 facilities and **hdb3** for E1 facilities.
- If they are not, then escalate before proceeding with the firmware download.

Get circuit pack information

1 At the SAT, enter **list configuration all**.

The System Configuration screen (Screen 74) appears.

Figure 74: System Configuration screen

```
list configuration all

                            SYSTEM CONFIGURATION

                                                   u  u  u  u  u  u  u  u
                                                   u  u  u  u  u  u  u  u
                                                   u  u  u  u  u  u  u  u

01A10  VAL-ANNOUNCEMENT        TN2501AP HW01 FW004 01 02 03 04 05 06 07 08
                                                   09 10 11 12 13 14 15 16
                                                   17 18 19 20 21 22 26 24
                                                   25 26 27 28 29 30 31 32
                                                   33
```

2 Look for the target circuit pack(s). If the suffix in the `Code` field does not have a “P” (e.g., TN2302AP), a firmware download is not possible.

3 Look for the firmware vintage(s) in the `Vintage` field of the target circuit pack(s) to see if a firmware download is needed.

4 Record the UUCSS address in the `Board Number` field of each source and target circuit pack.

5 If a C-LAN is the source, make sure port 17 is assigned on that C-LAN. If it is not assigned, administer the port using the SAT command **add data-module *UUC17***.

6 For a self download to a VAL board, make sure that port 33 is assigned on the VAL board. If it is not assigned, administer the port using the SAT command **add data-module *UUC*33**.

7 Determine the IP address of the source circuit pack. You can either ask the data systems administrator or enter the following SAT command sequence:

a Type **display ip-interfaces**. Find the source circuit pack’s `Slot` location and write down its `Node Name`.

b Type **display node-names ip**. Find the source circuit pack's `Node Name` and write down its `IP Address`.

Set up source circuit pack's file system

Before files can be copied to the source circuit pack, you must set up a file system on the source circuit pack to accept the files.

1. Log into the SAT using a superuser or services login and password.
2. Enter **enable filesystem board *UUCSS* login *ftplogin ftppassword***, where:
   - ***UUCSS*** is the location of the source circuit pack.
   - ***ftplogin*** is any temporary login ID that you choose for this FTP session (for example, ***denver***).
   - ***ftppassword*** is any password that you choose for this FTP session (for example, ***broncos***). The password must be at least 7 characters long.

   Later, you will use this same ***ftplogin*** and ***ftppassword*** in the following section, FTP the image file to source.

This completes the preparation for a firmware download.

Upload image file from Web to staging area

For an upload from the Web, you need a temporary staging area to store the firmware images before downloading them to a circuit pack. Although the staging area is often on a PC platform, you can also use other server types, such as a UNIX platform or a Linux-based media server.

1. Go to the Avaya Support Web site (http://avaya.com/support). Follow the **Software & Firmware Downloads** link and the subsequent links for your product and the target circuit pack TN code.
2. Find the section for the firmware vintage you want. Unless otherwise instructed, choose the highest vintage.
3. Be sure to read that vintage's ReadMe file before downloading the image file(s).
4. For each image file that the ReadMe file indicates should be downloaded for that circuit pack and vintage, do the following:
   a Click on the image file name.
   b Save this file to disk in a local staging area directory.
   c Write down the path to the local staging area and the filename of the firmware image. You will need to enter this information later.

FTP the image file to source

The following steps are generic to most FTP programs.

1. From the laptop, PC, UNIX, or Linux system where the local staging area is, bring up a DOS interface or UNIX/Linux shell.
2. Ensure that the new firmware image file is in the local staging area directory:
   a Change the directory to the staging area:

   cd *lyour-staging-area*

b List the contents of the directory showing the most recent files last using **ls -ltr** on Linux/UNIX or **dir /od** on DOS.

3 Use FTP to copy the firmware image file(s) to the source:

a Enter **ping ip_address** to verify a communication link to the source board, where ***ip_address*** is the IP address of the source board.

b Enter **ftp ip_address** to enter the FTP interface with a link to the source.

c Log into the FTP session with the same ***ftplogin*** and ***ftppassword*** that you set up in the Set up source circuit pack's file system section.

d Enter **binary**. This requests that files be transferred in binary format.

CAUTION:
Files will be corrupted during transfer if you don't enter this **binary** command.

e If you are self downloading to a TN2501AP (VAL) circuit pack, enter:

cd /

This command moves you from the announcement directory (default for an FTP session on the VAL board) to the root directory ("/"), where firmware and other files reside. This will keep the firmware image file separate from the announcement files.

f Enter **put *filename.ext***. This command copies the new firmware image file to the source directory in RAM.

g Enter **ls** to verify that the new firmware image file is on the circuit pack.

h Enter **bye**. This ends the FTP session.

Schedule a download to target(s)

You can schedule the download to occur immediately or at a later date and time. The procedures for self and CLAN-distributed download methods differ at this step.

1 Enter **change firmware download** and fill in the fields as described in Table 427.

If you are performing a self download, you will be entering only one target board location and it will be the same as the source board location. Screen 75 provides an example of self download.

If you are performing a CLAN-distributed download, you will be entering a C-LAN location as the source and 1 - 50 target locations, where the target boards are all of the same type. Screen 76 provides an example of a C-LAN-distributed download.

a Example screen for a self download to a VAL board.

Table 427, Firmware Download fields and descriptions, on page 1021 gives the field descriptions for the Firmware Download screen.

Table 427: Firmware Download fields and descriptions

Field	Description	Notes
Source Board's Location	The UUCSS address of the source circuit pack.	For a self download, the same board is the source board and target board. For a C-LAN-distributed download, this is the source C-LAN location.
Firmware Image File Name	The complete filename of the new firmware image file. If **list directory board** showed that the file had an extension, such as .bin, include the extension.	
Target Board Code	The circuit pack ID. For example, TN2501 Do not type the suffix, such as AP, D", or GP.	Enter the TN code of the target circuit pack(s). For a self download, this is the same as for the source circuit pack.
Suffix	Examples: • For VAL (TN2501AP), **AP**. • For C-LAN (TN799DP), **DP**. • For DS1 (TN464GP), **GP**.	
Firmware Vintage	This is blank. It shows a value in the Firmware Download screen of a **display firmware download** or a **status firmware download**.	
Schedule Download	Type **y** to schedule the firmware download for another time. Type **n** to start the firmware download immediately after completing the screen.	Once the firmware download begins, you cannot make any changes to this screen. You can only disable this schedule using **disable firmware download** and then start a new one. (See Aborting a firmware download on page 1030 for instructions.) If you answer **n**(o), then the Start Date/Time and Stop Date/Time fields disappear. The download begins as soon as you press Enter.

1 of 2

Table 427: Firmware Download fields and descriptions

Field	Description	Notes
`Remove Image File After Successful Download`	Type **y** if you want the procedure to automatically remove the new firmware image file [default]. Type **n** if you do not want the new firmware image file removed.	At the completion of a successful download, the procedure automatically removes the new firmware image file from the source file system, freeing up the memory on the source circuit pack. We recommend using the default setting. If field is set to **n**, you must manually remove the new firmware image file from the source file system after the download has completed. (See Disable file system on page 1025 for instructions.)
`Start Date/Time`	Type the date and time that you want the firmware download to begin.	
`Stop Date/Time`	Type the date and time that you want the firmware download to end.	If the scheduled stop time is reached before the new firmware image file has been downloaded to every circuit pack, the system finishes downloading to the circuit pack in progress before aborting the remainder of the download schedule.
`Target Location`	Type the UUCSS address of the circuit pack that you are updating.	For a self download, this circuit pack must reside in the same location as the source pack. For a C-LAN-distributed download, enter up to 50 locations — these must all be the same type of circuit pack.

2 of 2

2 Submit the schedule.

If you set the `Schedule Download` field to **n**, the download starts as soon as you submit the schedule.

NOTE:
If you are scheduling firmware downloads for a circuit pack that is designated as primary/secondary sync (timing) source (for example, TN464GP), this procedure automatically redesignates a local timing source during the download. After the download is complete and the circuit pack is returned to service, the procedure designates the original circuit pack as the timing source.

NOTE:
The target circuit packs are automatically removed from service while the firmware is downloaded to them and automatically returned to service after the download is completed. While a circuit pack is removed from service, any active calls through that circuit pack are dropped.

NOTE:
If you receive a SAT error message asking you to use the command, **test firmware download**, this means that there was a problem with a previous firmware download. Run the test before proceeding.

CAUTION:
Unless the `Remove Image File After Successful Download` field is set to **y**, the ***ftplogin*** and ***ftppassword*** remain on the TN799DP or TN799C (C-LAN) circuit packs either until they are reset or until you issue the **disable filesystem board *UUCSS*** command. The same is true for the TN2501AP (VAL) circuit pack, except as noted below.

NOTE:
In systems running on DEFINITY R9.5, or R10 software loads older than R10 field trial load 40 (R010.01.040.0), or any Communication Manager 1.1, the TN2501AP circuit pack must be re-seated in the carrier/slot in order for the new firmware image to take effect. Re-seating of the circuit pack is NOT necessary in any Communication Manager 1.2 or later systems.

3 If the download is scheduled for later, ensure that the download will run as you intend.

a Enter **test firmware download**.

If the download has already begun, the test will be denied.

The Figure 77, Test Results screen, on page 1023 appears.

Figure 77: Test Results screen

```
test firmware download                                          SPE A

                                TEST RESULTS

Port        Maintenance Name  Alt. Name Test No. Result          Error Code

            FW-DWNLD                    1413     PASS
```

b Look in the `Result` field for `FAIL` conditions.

c If the test does not pass, refer to Test Firmware Download (#1413) in *Maintenance Alarms Reference (555-245-102)*. Resolve every error and re-run the test (**test firmware download**).

When the test passes, every specified resource is *currently* available for the scheduled download. Note, however, that this does *not* guarantee the resource will still be available at the time of the download.

Monitor download progress

You can check the progress of a firmware download with this procedure.

1 Enter **status firmware download**.

The Status Firmware Download screen displays.

2 If this screen is blank after issuing the command, the download has completed; go to Step 4.

3 Check the `St` (status) field immediately to the right of the `Target Location` field to view the progress of the firmware update:

- **(P)**ending
- **(C)**ompleted
- **(F)**ailed
- **(A)**borted

4 Enter **status firmware download last**.

This allows you to view the progress of the last completed firmware update or the entire schedule if it is completed. Notice in Figure 78, Status Firmware Download Last screen, on page 1024 that the `Start` and `Stop` times now reflect the actual start and stop times of the download schedule and the `Firmware Vintage` now reflects the vintage that was downloaded.

Figure 78: Status Firmware Download Last screen

```
status firmware download last

                          STATUS FIRMWARE DOWNLOAD

   Source Board Location: 01A04

 1. 01B04   C   11.             21.             31.             41.
 2. 01B05   C   12.             22.             32.             42.
 3.             13.             23.             33.             43.
 4.             14.             24.             34.             44.
 5.             15.             25.             35.             45.
 6.             16.             26.             36.             46.
 7.             17.             27.             37.             47.
 8.             18.             28.             38.             48.
 9.             19.             29.             39.             49.
10.             20.             30.             40.             50.
Status: Pending(P) Completed(C) Failed(F) Aborted(A)
```

5 If one or more downloads fail, enter **test firmware download** to resolve the errors and clear the alarms. For more information about the test that is run and the troubleshooting procedures to use if the test does not pass, see Test Firmware Download (#1413) in *Maintenance Alarms Reference (555-245-102)*.

6 For TN2501AP (VAL) circuit packs running Communication Manager Release 1.1 (see Note below), reseat the TN2501AP to reset the board after the download is complete by following these steps:

NOTE:
In systems running on DEFINITY R9.5, or R10 software loads older than R10 field trial load 40 (R010.01.040.0), or any Communication Manager 1.1, the TN2501AP circuit pack must be re-seated in the carrier/slot in order for the board firmware upgrade to take effect. Re-seating of the circuit pack is NOT necessary in any Communication Manager 1.2 or later systems.

WARNING:
To prevent electrostatic discharge (ESD), be sure to wear a grounding strap while handling the circuit pack.

CAUTION:
Ensure that both the top green and top amber LEDs on the TN2501AP are out.

a Release the latch handle to free the TN2501AP from the carrier.

b Pull the circuit pack out approximately 1 – 2 inches (~ 3 – 5 cm).

c Re-insert the circuit pack into the carrier.

d Close the latch securely.

7 If you set the `Remove Image File After Successful Download?` field on the ***Firmware Download*** screen to **y**, then the download procedure is now complete.

If you set it to **n**, then proceed to the next section, Disable file system on page 1025, to manually remove the firmware image and disable the file system on the source circuit pack.

Disable file system

Performing the following steps on the TN799DP (C-LAN) or TN2501AP (VAL) circuit packs removes only the ***ftplogin*** *and the* ***ftppassword****. The allocated memory for the file system remains reserved for the session.*

To free up resources on the source circuit pack, you must delete the new firmware image files and disable the file system.

1 From the SAT, enter **remove file board *UUCSS filename.ext*** to remove the image file from the source board.

2 Enter **list directory board *UUCSS***. The List Directory screen appears.

3 Verify that the new firmware image file is ***not*** listed in the `File/Directory Name` field.

4 Enter **disable filesystem board *UUCSS*** to disable the file system on the source circuit pack.

NOTE:
This command is successful only if no files remain on the source circuit pack.

This completes the self and C-LAN-distributed download procedures.

IPSI download procedure

This procedure allows you to update either one or every IPSI target circuit pack using a new firmware image file obtained from the Web and copying it to a local staging area, then to a media server, then to the IPSI(s).

To update firmware on an IPSI, follow these procedures:

1. Prepare for IPSI download on page 1026
2. Copy firmware from Web to staging area on page 1027
3. Upload firmware from staging area to server on page 1027
4. Download firmware from server to IPSI on page 1028
5. Activate new firmware on IPSI on page 1028.

NOTE:
If you have trouble with any of these procedures, refer to Troubleshooting firmware downloads on page 1030.

Prepare for IPSI download

Do the following before beginning the download:

1. Make sure you have the following:
   - Superuser or Services login and password
   - PC or other server with the following:
     - IP connectivity to the media server
     - IP connectivity to the World-Wide Web
     - Web browser supported by the media server Web interface
2. Determine what the latest available IPSI vintage is:
   a. From your browser, go to the Avaya Support website at http://avaya.com/support. Follow the **Software & Firmware Downloads** link and the subsequent links for your product and the TN2312AP.
   b. From the list of available TN2312AP vintages, find the latest (highest) vintage.
   c. Keep this browser window up. You will need it for another step.
3. Determine what vintage the IPSIs have now:
   a. Bring up another browser window.
   b. Go to either media server's Web interface and log in.
   c. Under the IPSI Firmware Upgrade section, select **View IPSI Version**.
   d. Select **Query All** and click **View IPSI Version**.
   e. Write down the IPSI Name of each IPSI whose version (**FW#**) is not up to date, or print the whole page.
4. Determine the board location of each IPSI that needs to be upgraded. For high- and critical-reliability configurations, also determine which of the IPSIs are active and which are standby:
   a. Open up a SAT interface to the active media server.

b Enter **list ipserver-interface**. The results will give you a mapping between the `IPSI Name` obtained in the previous step and the board locations of the IPSIs (`Bd Loc`).

NOTE:
The `IPSI Name` on the ***View IPSI Version*** Web page and the `Host Name` on the ***IP Server Interface Information*** SAT screen are different names for the same data.

c Write down the board locations (`Bd Loc`) and, for a high- or critical-reliability configuration, which IPSIs are active and which are standby (`Control State`), or print the whole page.

5 Keep both browser windows up for the steps that follow.

You are now ready to begin the download procedure.

Copy firmware from Web to staging area

The new firmware image file needs to be copied from the Avaya Support Web site to a local staging area. Although the staging area is often on a PC platform, you can also use other server types, such as a UNIX workstation or a Linux-based media server.

1 Return to the Avaya Support Web site with the TN2312AP firmware images.

2 From the list of available IPSI firmware vintages, find the desired IPSI vintage.

3 Read that vintage's ReadMe file for important notices.

4 Click on the firmware image file name and save it to disk on your PC or workstation.

5 Remember the path of this local staging area and the name of the file. They will be used in the next set of steps.

6 You may close the Avaya Support Web site window if you wish.

The IPSI firmware image is now in a local staging area.

Upload firmware from staging area to server

Upload the firmware image from the local staging area to the active media server by following these steps:

1 From the media server's Web interface under the Miscellaneous section, select **Upload Files to Server**.

2 Enter the full path of the firmware image file in the staging area, or browse to the image file. Then click **LOAD FILE**. This step places the file in the default path on the server (/var/home/ftp) as required for the next step.

For help in filling out the fields or for troubleshooting problems, click **About This Screen**.

3 The results screen appears. Confirm that the image file was uploaded successfully to the media server.

You can also double check that the file is on the server by bringing up a Linux shell on the server and entering **ls /var/home/ftp -ltr**. This will list the files in the default directory with the most recent file listed last.

The IPSI firmware image is now on the active media server.

Download firmware from server to IPSI

Copy the new firmware image from the media server to one or more IPSIs by using the media server's Web interface as described in the procedure below. If you have trouble with these recommended procedures, there is an alternative Linux procedure described in Linux procedure to download IPSI firmware on page 1031.

CAUTION:
This set of steps will *not* disrupt call service unless a reset (e.g. power failure) of the active IPSI occurs. A reset would activate the new firmware image and may disrupt call service. To avoid that possibility, perform these steps during a low traffic period or, on a high- or critical-reliability system, perform these and the next section's steps on the standby IPSIs only, interchange the IPSIs, then perform them on the remainder of the IPSIs.

Perform this procedure for each IPSI individually or once for all:

1. Under the ***IPSI Firmware Upgrade*** section, select **Download IPSI Firmware.**
2. Select the start time for download, the target IPSI or all IPSIs, and **Use This File**. Enter the full path of **/var/home/ftp/filename.ext**, where ***filename.ext*** is the name and extension of the IPSI firmware image file.

   CAUTION:
   Do **not** select **Use Default File Name and Default Location**. Although the file is in the default directory, the file name is not the default, so it must be specified in **Use This File**.

   For more help on this page's selections, click **About This Screen**.
3. Click **Download Firmware**. You will see a results screen which will say:

   ```
   IPSI firmware download started
   ```
4. View the download status while the download is active or after the download is complete by selecting **View Download Status** under the ***IPSI Firmware Upgrade*** section. This page will tell you the current status, the schedule of future downloads, and the history of previous downloads. When the download is done, it will say:

   ```
   An IPSI firmware download is not currently active
   ```

   From the **View Download Status** page you can also cancel the download with the **Cancel Downloads** button. This button will finish the currently active download to an IPSI and then cancel the remainder of the IPSI download schedule.

   To backout of a completed IPSI download and revert to a previous IPSI version, follow the steps in Reverting to an older TN2312AP vintage on page 1034.

Activate new firmware on IPSI

Activate the new firmware on the IPSI(s) by using Web interface "activate" procedure described below. If you have trouble with this recommended procedure, there is an alternative Linux procedure described in Linux procedure to activate new IPSI firmware on page 1033.

CAUTION:
In a duplex-reliability system (one IPSI per PN), activating/resetting IPSI circuit packs can disrupt service. To minimize this disruption, schedule IPSI resets to execute during off-peak usage.

NOTE:
In a high- or critical-reliability system (two IPSIs per PN), service disruption can be avoided by activating/resetting only the *standby* IPSIs, interchanging the active and standby IPSIs, and then activating/resetting the new standby IPSIs.

For a duplex-reliability system, schedule the following for all IPSIs at once during off-peak so as to minimize disruption to call service. For a high- or critical-reliability system, perform the following for each *standby* IPSI individually.

1. From the media server's Web interface under the ***IPSI Firmware Upgrades*** section, select **Activate IPSI Upgrade**.
2. For a duplex-reliability system, select **All IPSIs** and **Start At** and specify a low traffic period in the date and time fields.

   For a high- or critical-reliability system, select **IPSI cabinet number __ carrier ID __** and enter a standby IPSI's location. Also select **Begin Activation Now**.

   For help on this screen, click **About This Screen**.
3. Click **Activate IPSI Upgrade**. It displays:

   ```
   IPSI Firmware Activation started
   ```
4. Monitor the progress of the activation by repeatedly selecting **View Firmware Activation Status** from the ***IPSI Firmware Upgrade*** section until it says

   ```
   Not currently active
   ```

   This indicates that the activation is complete.
5. Confirm that the IPSIs are now running the new firmware by selecting **View IPSI Version** from the ***IPSI Firmware Upgrade*** section.

For a duplex-reliability system, the IPSI download procedure is now complete.

For a high- or critical-reliability system, you still need to upgrade the active IPSIs. Follow the steps outlined in Interchange IPSIs and upgrade remainder on page 1029.

Interchange IPSIs and upgrade remainder

In high- and critical-reliability configurations, the previous steps will have only upgraded the standby IPSIs. This section will upgrade the remainder of the IPSIs by interchanging the IPSIs and performing the same download and activation procedures on the newly standby IPSIs.

Do the following from the SAT:

1. Enter **list ipserver-interface**. Make sure that each standby IPSI has a `State of Health` of `0.0.0`.

   If any have something other than `0.0.0`, view the active alarms by entering **display alarms** and resolve them before proceeding.

   CAUTION:
   If an IPSI has health problems, you should **not** interchange to that IPSI. Interchanging to an unhealthy IPSI could bring down all the calls on that PN.

2. For each healthy *standby* IPSI listed, do the following:

   a. Set the standby IPSI as the new active IPSI by entering **set ipserver-interface *UUC***, where ***UUC*** is the location of the standby IPSI. This will force an interchange from the active to the standby IPSI.

   b. Make sure the new active IPSI is still healthy by entering **list ipserver-interface** again. The `State of Health` field should still be `0.0.0`.

3. All the IPSIs should now be interchanged so that the active IPSIs are running the new version of firmware and the standby IPSIs are still running the old version.

4. Upgrade the standby IPSIs by performing the steps in both of these preceding sections on each standby IPSI:

   - Download firmware from server to IPSI on page 1028
   - Activate new firmware on IPSI on page 1028

This completes the IPSI download procedure for high- and critical-reliability configurations.

Troubleshooting firmware downloads

This section contains these troubleshooting subsections:

- Aborting a firmware download
- Testing firmware download
- Linux procedure to download IPSI firmware
- Linux procedure to activate new IPSI firmware
- Backing out of firmware download

Aborting a firmware download

You can only abort (disable/cancel) a scheduled download that has not yet started. Any download currently in progress to a circuit pack will finish. For example, if you had scheduled a C-LAN distributed download to multiple targets and the download was in progress to the first circuit pack when you disabled the download, then the download would stop after the completion of the first circuit pack's download and the remainder of the circuit packs would not receive the download.

To abort a self or C-LAN-distributed firmware download, enter the SAT command **disable firmware download**.

To abort an IPSI firmware download, select **View Download Status** from the Web interface under the ***IPSI Firmware Upgrades*** section and click **Cancel Downloads**.

Testing firmware download

To test a self or C-LAN-distributed firmware download either before a scheduled download has begun or after an attempted download has reported errors:

1 At the SAT, enter **test firmware download**.

Figure 79, Test Results screen, on page 1031 appears.

Figure 79: Test Results screen

```
test firmware download                                          SPE A

                                TEST RESULTS

Port        Maintenance Name  Alt. Name Test No. Result          Error Code

            FW-DWNLD                    1413     PASS
```

The example in Test Results screen shows PASS in the `Result` field, indicating a successful test of the firmware download circuitry.

2 If the test does not pass, refer to Test Firmware Download (#1413) in *Maintenance Alarms Reference (555-245-102)*.

Linux procedure to download IPSI firmware

The recommended method for downloading firmware from a media server to IPSIs is via the media server Web interface procedure described in Download firmware from server to IPSI on page 1028. If you have trouble using that procedure, you can follow this alternate procedure that uses Linux commands instead:

1 At the SAT, enter **go shell** to access the Linux command line.

2 Log into the media server's Linux shell with a services- or superuser-level login ID and password.

3 Change directory to the default location using **cd /var/home/ftp**.

4 Enter the **woodpiles** command to invoke FTP either to:

— Copy the firmware image from its default location on the server to *one* IPSI circuit pack using:

loadipsi -f *./filename* -c *UUC*

or to *every* IPSI (one at a time, in the order recorded in the server's `/etc/hosts` file) using:

loadipsi -f *./filename* -a

— Schedule an IPSI copy operation using the **-s** option:

loadipsi -f *./filename* -a -s *mmddyyyyhh:mm*

NOTE:
Enter **loadipsi -?** for more information about this command's syntax and options.

5 You will first see:

```
Burning flash may take several minutes...
```

When the download is complete, you will see:

```
Burning flash may take several minutes......done

All done: Success
```

If the download failed, you may see one of the errors listed in Table 428, IPSI firmware download error messages, on page 1032:

Table 428: IPSI firmware download error messages

Error Message from loadipsi Command	Description/Recommendation
IPSI Related Error: Higher/same version for ipsi board. Download Stop.	Occurs after trying to download a file with a lower firmware version than the file currently on the IPSI board. Only a higher or the same version is allowed unless the **-r** option is used with the **loadipsi** command. **1** If you intended to download an older vintage, then use the **-r** option with the **loadipsi** command as described in Reverting to an older TN2312AP vintage on page 1034. **2** If you did not intend to download an older vintage, then perform the steps again using the vintage you intended.

1 of 2

Table 428: IPSI firmware download error messages

Error Message from loadipsi Command	Description/Recommendation
IPSI Related Error: copy2flash: FAIL	The file could be corrupted perhaps due to forgetting to use FTP's binary mode. If you used **Upload Files to Server** on the Web interface, then the **binary** command is automatically used. **1** Upload the files from the server to the IPSI again. If you think that the image files on the server may also be corrupted, then redo all the steps starting with copying firmware from the Web to the staging area. **2** If you are *not* using **Upload Files to Server** on the Web interface, but are manually FTP'ing the files to the server, then be sure to use the **binary** command before the **get** command.
System Error: Connect to check IPSI board version: Error firmware version xx, board version: yy	Occurs when the IPSI is resetting. **1** Wait until the IPSI comes back up. **2** Reissue the **loadipsi** command
System Error: Image file: No such file or directory. System Error: Image file error.	Occurs when the specified file is not in the specified directory. **1** Make sure the current directory is /var/home/ftp or type **cd /var/home/ftp** to change to that directory. **2** Make sure the image file is in /var/home/ftp. Type **ls -ltr** on Linux or **dir /od** on DOS to list the files in the current directory with the most recent file last. **3** Reissue the **loadipsi** command.

2 of 2

Linux procedure to activate new IPSI firmware

The recommended method for activating new firmware on the IPSIs is via the media server Web interface procedure described in Activate new firmware on IPSI on page 1028. If you have trouble using that procedure, you can follow this alternate procedure that uses Linux commands instead:

For a duplex-reliability configuration, perform the following for all IPSIs during a low traffic period. For high- and critical-reliability configurations, perform the following on each of the standby IPSIs only.

1. At the SAT, enter **go shell** to access the Linux command line.
2. Log into the media server's Linux shell with a services- or superuser-level login ID and password.
3. Enter a Linux **resetipsi** command to reset either:
   - One standby IPSI at a time, using **resetipsi -c *UUC***
   - Every IPSI, using **resetipsi -a**

— Schedule a reset of all IPSIs using the **-s** option:

resetipsi -a -s *mmddyyyyhh*:*mm*

CAUTION:
On duplex-reliability systems, stable calls will be moved to an EI EAL fallback configuration, but unstable calls will be dropped.

NOTE:
Enter **resetipsi -?** for more information about this command's syntax and options.

4 Check that the IPSI has the new firmware version with

ipsiversion -c *UUC*

5 Check the health of the IPSI by entering at the SAT:

list ipserver-interface

The `State of Health` field should be `0.0.0`. Resolve any health problems.

This completes the IPSI download procedure for duplex-reliability configurations. For a high- or critical-reliability configuration, you still need to upgrade the active IPSIs. Follow the steps outlined in Interchange IPSIs and upgrade remainder on page 1029.

Backing out of firmware download

To back out of a completed firmware download and revert to the previous image, for all circuit packs except TN2312AP (IPSI), TN799DP (C-LAN) and TN2501AP (VAL), you follow the same download procedure you did before, except use the previous firmware vintage instead.

For backing out of an IPSI download, see Reverting to an older TN2312AP vintage on page 1034. For backing out of a C-LAN or VAL download, see Reverting to an older TN799DP or TN2501AP vintage on page 1035.

Reverting to an older TN2312AP vintage

As the server copies firmware to an IPSI during an IPSI download, its previous firmware is overwritten. Therefore, to restore the previous firmware image file the old firmware must be downloaded.

At a high level, copying, downloading and activating a previous image of firmware has the same steps as in IPSI download procedure on page 1026, *except* for:

1 When downloading a previous firmware image from the Web to a directory on the active media server, follow the steps described in Upload firmware from staging area to server on page 1027, but be sure to select the firmware image that was on the IPSI before the upgrade.

2 When copying the previous image from the server to the IPSI(s), follow the steps described in Download firmware from server to IPSI on page 1028, but also:

- If using the media server's Web interface, be sure to select on the ***Download IPSI Firmware*** page:

  Continue with download even if version is older than the version currently installed

- If using the alternate Linux command line method, be sure to use the **-r** option with the **loadipsi** command to download without comparing the new version with the existing version. For instance, to copy the previous image to every IPSI you would enter

  loadipsi -f /var/home/ftp/*filename* -a -r

The activate step is the same as described in Activate new firmware on IPSI on page 1028.

Reverting to an older TN799DP or TN2501AP vintage

To revert back to the old firmware image file on a *TN799DP (C-LAN) or TN2501AP (VAL) only*:

1 At the SAT, enter **get boot-image *UUCSS*** to check the status of the firmware images on the target circuit pack.

The Display Firmware Image(s) report (Figure 80, Display Firmware Image(s) screen, on page 1035) appears.

Figure 80: Display Firmware Image(s) screen

```
get boot-image 1C07

                          DISPLAY FIRMWARE IMAGE(S)

              Image 1         Image 2

  Board Type: TN2501          TN2501
  FW Vintage: 02              01
HW Signature: 02              02
      Suffix: A               A
        Date: 09/13/02        05/06/02
   Timestamp: 10:30:50        12:42:18
CRC Checksum: Good            Good
Active Image: Yes             No
Reboot Image: Yes             No
```

a Check Image 1 and Image 2 to see where the active image resides.

b Check the date and time stamps to determine whether to revert back to `Image 1` or `Image 2`.

In the following example, we are reverting back to Image 2, because it has the older date and time stamp.

NOTE:
In most cases, the image with the more recent date and time stamp is the new firmware image file.

2 At the SAT, enter **set boot-image board *UUCSS* image 1 | 2**.

Example: **set boot-image board 1C07 image 2**

The system responds with

```
Command Successfully Completed
```

3 At the SAT, enter **get boot-image *UUCSS*** to check the status of the firmware images on the target circuit pack.

Figure 81, Display Firmware Image(s) screen, on page 1036 appears.

Figure 81: Display Firmware Image(s) screen

```
get boot-image 1C07

                          DISPLAY FIRMWARE IMAGE(S)

              Image 1         Image 2

  Board Type: TN2501          TN2501
  FW Vintage: 02              01
HW Signature: 02              02
      Suffix: A               A
        Date: 09/13/02        05/06/02
   Timestamp: 10:30:50        12:42:18
CRC Checksum: Good            Good
Active Image: Yes             No
Reboot Image: No              Yes
```

Note that the values in the `Reboot Image` field has changed.

4 Reseat the circuit pack to activate the new firmware image:

NOTE:
In systems running on DEFINITY R9.5, or R10 software loads older than R10 field trial load 40 (R010.01.040.0), or any Communication Manager 1.1, the TN2501AP circuit pack must be re-seated in the carrier/slot in order for the new firmware image to take effect. Re-seating of the circuit pack is NOT necessary in any Communication Manager 1.2 or later systems.

WARNING:
To prevent electrostatic discharge (ESD), be sure to wear a grounding strap while handling the circuit pack.

CAUTION:
For a TN2501AP VAL circuit pack, ensure that both the top green and top amber LEDs are out.

- **a** Release the latch handle to free the circuit pack from the carrier.
- **b** Pull the circuit pack out approximately 1 – 2 inches (~ 3 – 5 cm).
- **c** Re-insert the circuit pack into the carrier.
- **d** Close the latch securely.

5 Wait until all three of the top LEDs (red, green, and amber) are out.

6 At the SAT, enter **get boot-image *UUCSS*** to check the status of the firmware images on the target circuit pack.

Figure 82, Display Firmware Image(s) screen, on page 1037 appears.

Figure 82: Display Firmware Image(s) screen

```
get boot-image 1C07

                          DISPLAY FIRMWARE IMAGE(S)

              Image 1        Image 2

  Board Type: TN2501         TN2501
  FW Vintage: 02             01
HW Signature: 02             02
      Suffix: A              A
        Date: 09/13/02       05/06/02
   Timestamp: 10:30:50       12:42:18
CRC Checksum: Good           Good
Active Image: No             Yes
Reboot Image: No             Yes
```

7 Ensure that both the `Active Image` and the `Reboot Image` fields are as you expect.

Error Log Entries and Test to Clear Values

The following error log entries and tests apply to self and C-LAN-distributed downloads, not to IPSI downloads.

Table 429: FW-DWNLD Maintenance Error Log Entries

Error Type	Aux Data	Cause of Error	Alarm Level	On/Off Board	Test to Clear Value
257 (a)	See associated note	Download failure	MINOR	OFF	test firmware download *UUCSS*
258 (b)	See associated note	Download failure	MINOR	OFF	test firmware download *UUCSS*
259 (c)	See associated note	Download failure	MINOR	OFF	test firmware download *UUCSS*
513 (d)	See associated note	Download failure	MINOR	OFF	test firmware download *UUCSS*
769 (e)	See associated note	Firmware download request	MINOR	OFF	test firmware download *UUCSS*

Error Notes:

a **Error Type 257** — A log-only error indicating that a certain software resource was not available. Such an error very seldom occurs and usually produces a proc_err. However, in the firmware download feature, the file cannot be downloaded and/or the schedule can also abort/fail. To resolve the error, use **test firmware download**. The Aux Data specifies the unavailable resource that caused the error. See Table 430 for more details.

Table 430: Aux Data for Error Type 257

Aux Data	Description of Failure
1	Source board query failed **1** Check for system-wide problems. **2** Clear every error, and retry the download.
2	Target board query failed **1** Check for system-wide problems. **2** Clear every error, and retry the download.
3	Allocating resources failed **1** Check for system-wide problems. **2** Clear every error, and retry the download.
4	Firmware Download Information table query failed **1** Check for system-wide problems. **2** Clear every error, and retry the download.

Table 430: Aux Data for Error Type 257

Aux Data	Description of Failure
5	Header message failed **1** Check for system-wide problems. **2** Clear every error, and retry the download.
6	Download Map timer expired **1** Check for system-wide problems. **2** Clear every error, and retry the download.

2 of 2

b **Error Type 258** — A log-only error indicating that a source board-related error occurred. The download schedule can also abort/fail. To resolve the error, use **test firmware download**. The Aux Data specifies the error. See Table 431 for more details.

Table 431: Aux Data for Error Type 258

Aux Data	Description of Failure
1	Download image file specified on the **change firmware download** screen not present on the source board. **1** Use **list directory board *UUCSS*** to verify file system's contents.
2	The image on the source board has an invalid header. **1** Retry the test. **2** If error recurs, then escalate.
3	Bad CRC on image file on source board. **1** Retry the test. **2** If error recurs, then escalate.
4	File name too long **1** Rename the file, and try again.
5	Invalid TN code on the **change firmware download** screen does not match TN code of image on the source board. **1** Verify screen, and make sure the correct image is being used.
6	Invalid suffix on the **change firmware download** screen does not match suffix of image on the source board. **1** Verify screen, and make sure the correct image is being used.
7	Source board is not present. **1** Compare board's entered location on the **change firmware download** screen with its actual location.
8	Incorrect source board **1** Verify that the source board has a valid TN code and suffix (for example, AP).

1 of 2

Table 431: Aux Data for Error Type 258

Aux Data	Description of Failure
9	PPP ports not available **1** Use another source board, or reschedule the download for off hours.
10	DL Setup message to source failed. **1** Retry the download. **2** If error recurs, then escalate.

2 of 2

c **Error Type 259** — A log-only error indicating that the target board failed to download. To resolve the error, use **test firmware download**. The Aux Data specifies the error. See Table 432 for more details.

Table 432: Aux Data for Error Type 259

Aux Data	Description of Failure
1	Target board is not present / responding. **1** Check board's location and translations, and retry download.
2	Incorrect target board for download schedule **1** Verify board's location and download schedule.
3	Target failed to go into DL Mode. **1** Retry the download.
4	Target received bad file header **1** Get a new image, and retry download.
5	Bad checksum on source board's image **1** Get a new image, and retry download.
6	TFTP protocol error – One reason for this type of failure may be that the target board is located in a DS1-C remote PN using ami-zcs line coding to communicate with the PPN. To have a successful firmware download you must have a clear channel between the source and target board, or the source and target must reside in the remote PN. Some examples of the correct type of line coding for this feature are: b8zs and hdb3.
7	File transfer timer expired. **1** Check the board's location and translations, and retry download.
8	Target failed to reset after transfer. **1** Check the board's location and translations, and retry download.
10	Download of target failed. **1** Check the board's location and translations, and retry download.

1 of 2

Table 432: Aux Data for Error Type 259

Aux Data	Description of Failure
13	The target board rejected the download image. **1** Check the board's translations. **2** Verify the image file. **3** Retry the download, and escalate if it still fails.
20	Could not open the requested file – Internal firmware error on target board **1** Retry the download, and escalate if it still fails.
21	Problem reading the requested file – Internal firmware error on target board **1** Retry the download, and escalate if it still fails.
22	The download file has a bad CRC – Internal firmware error on target board **1** Retry the download, and escalate if it still fails.
24	A download is already in progress – Internal firmware error on target board **1** Retry the download, and escalate if it still fails.
30	A start download sequence error – Internal firmware error on target board **1** Retry the download, and escalate if it still fails.
32	The file name is too long – Internal firmware error on target board **1** Retry the download, and escalate if it still fails.
40	FLASH programming failed on firmware – Internal firmware error on target board **1** Retry the download, and escalate if it still fails.
All other Aux Data values	TFTP protocol error **1** Retry the download and escalate if it still fails.

2 of 2

d **Error Type: 513** — Indicates that the schedule has failed. A schedule failure can result from:

- Any of the previously mentioned log-only errors (257 – 259)
- An expiration of the schedule timer
- An execution of **disable firmware download** command

To resolve the error and clear the alarm, use the **test firmware download** command. The Aux Data specifies the reason why the schedule failed. See Table 433, Error Type 513 Aux Data, on page 1041 for more details.

Table 433: Error Type 513 Aux Data

Aux Data	Description of Failure
1	Software resources not available; see Error Type 257 (a).
2	Source board-related failure; see Error Type 258 (b).

1 of 2

Table 433: Error Type 513 Aux Data

Aux Data	Description of Failure
3	A target board failed; see Error Type 259 (c). **1** Check image, translations and retry.
4	Two consecutive target boards failed, download schedule aborted. **1** Verify download image, translations, and retry.
5	Schedule timer expired **1** Schedule unfinished target boards, and retry.
6	**disable firmware download** command executed

2 of 2

e **Error Type: 769** — Indicates that a downloadable board image is bad and that a good image needs to be downloaded. This error may be a result of a failed download attempt or a board that is in an unstable condition. The Aux Data indicates the location of the circuit pack requesting the firmware download.

Aux Data is in the form of UUAAA, where:

— UU is the port network number (cabinet)

— AAA is the angel number

For example, for Aux Data 1080, the port network number is 1 and the angel number is 80.
