Notice

Every effort was made to ensure that the information in this document was complete and accurate at the time of printing. However, information is subject to change.

Warranty

Avaya Inc. provides a limited warranty on this product. Refer to your sales agreement to establish the terms of the limited warranty. In addition, Avaya's standard warranty language as well as information regarding support for this product, while under warranty, is available through the following Web site: <http://www.avaya.com/support>.

Preventing Toll Fraud

"Toll fraud" is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or is not working on your company's behalf). Be aware that there may be a risk of toll fraud associated with your system and that, if toll fraud occurs, it can result in substantial additional charges for your telecommunications services.

Avaya Fraud Intervention

If you suspect that you are being victimized by toll fraud and you need technical assistance or support, in the United States and Canada, call the Technical Service Center's Toll Fraud Intervention Hotline at 1-800-643-2353.

Disclaimer

Avaya is not responsible for any modifications, additions or deletions to the original published version of this documentation unless such modifications, additions or deletions were performed by Avaya. Customer and/or End User agree to indemnify and hold harmless Avaya, Avaya's agents, servants and employees against all claims, lawsuits, demands and judgments arising out of, or in connection with, subsequent modifications, additions or deletions to this documentation to the extent made by the Customer or End User.

How to Get Help

For additional support telephone numbers, go to the Avaya support Web site: <http://www.avaya.com/support>. If you are:

- Within the United States, click the *Escalation Management* link. Then click the appropriate link for the type of support you need.
- Outside the United States, click the *Escalation Management* link. Then click the *International Services* link that includes telephone numbers for the international Centers of Excellence.

Providing Telecommunications Security

Telecommunications security (of voice, data, and/or video communications) is the prevention of any type of intrusion to (that is, either unauthorized or malicious access to or use of) your company's telecommunications equipment by some party.

Your company's "telecommunications equipment" includes both this Avaya product and any other voice/data/video equipment that could be accessed via this Avaya product (that is, "networked equipment").

An "outside party" is anyone who is not a corporate employee, agent, subcontractor, or is not working on your company's behalf. Whereas, a "malicious party" is anyone (including someone who may be otherwise authorized) who accesses your telecommunications equipment with either malicious or mischievous intent.

Such intrusions may be either to/through synchronous (time-multiplexed and/or circuit-based), or asynchronous (character-, message-, or packet-based) equipment, or interfaces for reasons of:

- Utilization (of capabilities special to the accessed equipment)
- Theft (such as, of intellectual property, financial assets, or toll facility access)
- Eavesdropping (privacy invasions to humans)
- Mischief (troubling, but apparently innocuous, tampering)
- Harm (such as harmful tampering, data loss or alteration, regardless of motive or intent)

Be aware that there may be a risk of unauthorized intrusions associated with your system and/or its networked equipment. Also realize that, if such an intrusion should occur, it could result in a variety of losses to your company (including but not limited to, human/data privacy, intellectual property, material assets, financial resources, labor costs, and/or legal costs).

Responsibility for Your Company's Telecommunications Security

The final responsibility for securing both this system and its networked equipment rests with you - Avaya's customer system administrator, your telecommunications peers, and your managers. Base the fulfillment of

your responsibility on acquired knowledge and resources from a variety of sources including but not limited to:

- Installation documents
- System administration documents
- Security documents
- Hardware-/software-based security tools
- Shared information between you and your peers
- Telecommunications security experts

To prevent intrusions to your telecommunications equipment, you and your peers should carefully program and configure:

- Your Avaya-provided telecommunications systems and their interfaces
- Your Avaya-provided software applications, as well as their underlying hardware/software platforms and interfaces
- Any other equipment networked to your Avaya products

TCP/IP Facilities

Customers may experience differences in product performance, reliability and security depending upon network configurations/design and topologies, even when the product performs as warranted.

Standards Compliance

Avaya Inc. is not responsible for any radio or television interference caused by unauthorized modifications of this equipment or the substitution or attachment of connecting cables and equipment other than those specified by Avaya Inc. The correction of interference caused by such unauthorized modifications, substitution or attachment will be the responsibility of the user. Pursuant to Part 15 of the Federal Communications Commission (FCC) Rules, the user is cautioned that changes or modifications not expressly approved by Avaya Inc. could void the user's authority to operate this equipment.

Product Safety Standards

This product complies with and conforms to the following international Product Safety standards as applicable:

Safety of Information Technology Equipment, IEC 60950, 3rd Edition, or IEC 60950-1, 1st Edition, including all relevant national deviations as listed in Compliance with IEC for Electrical Equipment (IECEE) CB-96A.

Safety of Information Technology Equipment, CAN/CSA-C22.2 No. 60950-00 / UL 60950, 3rd Edition, or CAN/CSA-C22.2 No. 60950-1-03 / UL 60950-1.

Safety Requirements for Customer Equipment, ACA Technical Standard (TS) 001 - 1997.

One or more of the following Mexican national standards, as applicable: NOM 001 SCFI 1993, NOM SCFI 016 1993, NOM 019 SCFI 1998.

The equipment described in this document may contain Class 1 LASER Device(s). These devices comply with the following standards:

- EN 60825-1, Edition 1.1, 1998-01
- 21 CFR 1040.10 and CFR 1040.11.

The LASER devices used in Avaya equipment typically operate within the following parameters:

Typical Center Wavelength	Maximum Output Power
830 nm - 860 nm	-1.5 dBm
1270 nm - 1360 nm	-3.0 dBm
1540 nm - 1570 nm	5.0 dBm

Luokan 1 Laserlaite

Klass 1 Laser Apparat

Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposures. Contact your Avaya representative for more laser product information.

Electromagnetic Compatibility (EMC) Standards

This product complies with and conforms to the following international EMC standards and all relevant national deviations:

Limits and Methods of Measurement of Radio Interference of Information Technology Equipment, CISPR 22:1997 and EN55022:1998.

Information Technology Equipment - Immunity Characteristics - Limits and Methods of Measurement, CISPR 24:1997 and EN55024:1998, including:

- Electrostatic Discharge (ESD) IEC 61000-4-2
- Radiated Immunity IEC 61000-4-3
- Electrical Fast Transient IEC 61000-4-4
- Lightning Effects IEC 61000-4-5
- Conducted Immunity IEC 61000-4-6

- Mains Frequency Magnetic Field IEC 61000-4-8
- Voltage Dips and Variations IEC 61000-4-11

Power Line Emissions, IEC 61000-3-2: Electromagnetic compatibility (EMC) - Part 3-2: Limits - Limits for harmonic current emissions.

Power Line Emissions, IEC 61000-3-3: Electromagnetic compatibility (EMC) - Part 3-3: Limits - Limitation of voltage changes, voltage fluctuations and flicker in public low-voltage supply systems.

Federal Communications Commission Statement

Part 15:

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Part 68: Answer-Supervision Signaling

Allowing this equipment to be operated in a manner that does not provide proper answer-supervision signaling is in violation of Part 68 rules. This equipment returns answer-supervision signals to the public switched network when:

- answered by the called station,
- answered by the attendant, or
- routed to a recorded announcement that can be administered by the customer premises equipment (CPE) user.

This equipment returns answer-supervision signals on all direct inward dialed (DID) calls forwarded back to the public switched telephone network. Permissible exceptions are:

- A call is unanswered.
- A busy tone is received.
- A reorder tone is received.

Avaya attests that this registered equipment is capable of providing users access to interstate providers of operator services through the use of access codes. Modification of this equipment by call aggregators to block access dialing codes is a violation of the Telephone Operator Consumers Act of 1990.

REN Number

For MCC1, SCC1, CMC1, G600, and G650 Media Gateways:

This equipment complies with Part 68 of the FCC rules. On either the rear or inside the front cover of this equipment is a label that contains, among other information, the FCC registration number, and ringer equivalence number (REN) for this equipment. If requested, this information must be provided to the telephone company.

For G350 and G700 Media Gateways:

This equipment complies with Part 68 of the FCC rules and the requirements adopted by the ACTA. On the rear of this equipment is a label that contains, among other information, a product identifier in the format US:AAAEQ##TXXXX. The digits represented by ## are the ringer equivalence number (REN) without a decimal point (for example, 03 is a REN of 0.3). If requested, this number must be provided to the telephone company.

For all media gateways:

The REN is used to determine the quantity of devices that may be connected to the telephone line. Excessive RENs on the telephone line may result in devices not ringing in response to an incoming call. In most, but not all areas, the sum of RENs should not exceed 5.0. To be certain of the number of devices that may be connected to a line, as determined by the total RENs, contact the local telephone company.

REN is not required for some types of analog or digital facilities.

Means of Connection

Connection of this equipment to the telephone network is shown in the following tables.

For MCC1, SCC1, CMC1, G600, and G650 Media Gateways:

Manufacturer's Port Identifier	FIC Code	SOC/REN/A.S. Code	Network Jacks
Off premises station	OL13C	9.0F	RJ2GX, RJ21X, RJ11C
DID trunk	02RV2-T	0.0B	RJ2GX, RJ21X
CO trunk	02GS2	0.3A	RJ21X
	02LS2	0.3A	RJ21X
Tie trunk	TL31M	9.0F	RJ2GX
Basic Rate Interface	02IS5	6.0F, 6.0Y	RJ49C
1.544 digital interface	04DU9-BN	6.0F	RJ48C, RJ48M
	04DU9-IKN	6.0F	RJ48C, RJ48M
	04DU9-ISN	6.0F	RJ48C, RJ48M
120A4 channel service unit	04DU9-DN	6.0Y	RJ48C

For G350 and G700 Media Gateways:

Manufacturer's Port Identifier	FIC Code	SOC/REN/A.S. Code	Network Jacks
Ground Start CO trunk	02GS2	1.0A	RJ11C
DID trunk	02RV2-T	AS.0	RJ11C
Loop Start CO trunk	02LS2	0.5A	RJ11C
1.544 digital interface	04DU9-BN	6.0Y	RJ48C
	04DU9-DN	6.0Y	RJ48C
	04DU9-IKN	6.0Y	RJ48C
	04DU9-ISN	6.0Y	RJ48C
Basic Rate Interface	02IS5	6.0F	RJ49C

For all media gateways:

If the terminal equipment (for example, the media server or media gateway) causes harm to the telephone network, the telephone company will notify you in advance that temporary discontinuance of service may be required. But if advance notice is not practical, the telephone company will notify the customer as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe it is necessary.

The telephone company may make changes in its facilities, equipment, operations or procedures that could affect the operation of the equipment. If this happens, the telephone company will provide advance notice in order for you to make necessary modifications to maintain uninterrupted service.

If trouble is experienced with this equipment, for repair or warranty information, please contact the Technical Service Center at 1-800-242- 2121 or contact your local Avaya representative. If the equipment is causing harm to the telephone network, the telephone company may request that you disconnect the equipment until the problem is resolved.

A plug and jack used to connect this equipment to the premises wiring and telephone network must comply with the applicable FCC Part 68 rules and requirements adopted by the ACTA. A compliant telephone cord and modular plug is provided with this product. It is designed to be connected to a compatible modular jack that is also compliant. It is recommended that repairs be performed by Avaya certified technicians.

The equipment cannot be used on public coin phone service provided by the telephone company. Connection to party line service is subject to

state tariffs. Contact the state public utility commission, public service commission or corporation commission for information.
This equipment, if it uses a telephone receiver, is hearing aid compatible.

For the most current versions of documentation, go to the Avaya support Web site: <http://www.avaya.com/support>.

Canadian Department of Communications (DOC) Interference Information

This Class A digital apparatus complies with Canadian ICES-003.
Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.
This equipment meets the applicable Industry Canada Terminal Equipment Technical Specifications. This is confirmed by the registration number. The abbreviation, IC, before the registration number signifies that registration was performed based on a Declaration of Conformity indicating that Industry Canada technical specifications were met. It does not imply that Industry Canada approved the equipment.

Installation and Repairs

Before installing this equipment, users should ensure that it is permissible to be connected to the facilities of the local telecommunications company. The equipment must also be installed using an acceptable method of connection. The customer should be aware that compliance with the above conditions may not prevent degradation of service in some situations.
Repairs to certified equipment should be coordinated by a representative designated by the supplier. Any repairs or alterations made by the user to this equipment, or equipment malfunctions, may give the telecommunications company cause to request the user to disconnect the equipment.

Declarations of Conformity

United States FCC Part 68 Supplier's Declaration of Conformity (SDoC)
Avaya Inc. in the United States of America hereby certifies that the equipment described in this document and bearing a TIA TSB-168 label identification number complies with the FCC's Rules and Regulations 47 CFR Part 68, and the Administrative Council on Terminal Attachments (ACTA) adopted technical criteria.

Avaya further asserts that Avaya handset-equipped terminal equipment described in this document complies with Paragraph 68.316 of the FCC Rules and Regulations defining Hearing Aid Compatibility and is deemed compatible with hearing aids.

Copies of SDoCs signed by the Responsible Party in the U. S. can be obtained by contacting your local sales representative and are available on the following Web site: <http://www.avaya.com/support>.

All Avaya media servers and media gateways are compliant with FCC Part 68, but many have been registered with the FCC before the SDoC process was available. A list of all Avaya registered products may be found at: <http://www.part68.org> by conducting a search using "Avaya" as manufacturer.

European Union Declarations of Conformity

Avaya Inc. declares that the equipment specified in this document bearing the "CE" (*Conformité Européenne*) mark conforms to the European Union Radio and Telecommunications Terminal Equipment Directive (1999/5/EC), including the Electromagnetic Compatibility Directive (89/336/EEC) and Low Voltage Directive (73/23/EEC).

Copies of these Declarations of Conformity (DoCs) can be obtained by contacting your local sales representative and are available on the following Web site: <http://www.avaya.com/support>.

Japan

This is a Class A product based on the standard of the Voluntary Control Council for Interference by Information Technology Equipment (VCCI). If this equipment is used in a domestic environment, radio disturbance may occur, in which case, the user may be required to take corrective actions.

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

XXX-BD (Common Port Circuit Pack/Media Module)	2494
Index	2513

About this book

Overview

This document provides procedures to monitor, test, and maintain an Avaya Media Server or Gateway system. It covers many of the faults and troubles that can occur and provides simple procedures to correct them. Simple, traditional troubleshooting methods are sometimes sufficient to locate and clear faults. The traditional methods include substitution, visual inspections, continuity checks, and clarification of operating procedures with end users.

Using this documentation, the Avaya technicians and the technicians of their business partners and customers should be able to follow detailed procedures for:

- Monitoring, testing, and maintaining an Avaya Media Server, Media Gateway, and many other system components.
- Using troubleshooting methods to clear faults.
- Required replacements, visual inspections, continuity checks, and clarifying operating procedures with end users.

Document set

Although this maintenance book is published separately, it is part of a set:

- 03-300190 *Maintenance Alarms Reference* (formerly 555-245-102)
- 03-300191 *Maintenance Commands Reference* (formerly 555-245-101)
- 03-300192 *Maintenance Procedures Reference* (formerly 555-245-103)

Equipment/platforms

This book contains information about the following equipment/platforms

- Avaya S8700/S8710 Media Servers
- Avaya S8500 Media Servers
- Avaya S8300 Media Servers
- Avaya G700/G650/G600/MCC/SCC Media Gateways

About this book

It does not contain information about

- DEFINITY G3R (see 555-233-117: *Maintenance for DEFINITY R Servers* or 555-233-142: *Maintenance for Avaya S8700 Media Servers with G600 Media Gateway*)
- DEFINITY SI (see 555-233-119: *Maintenance for DEFINITY SI Servers* or 555-233-143: *Avaya S8700 Media Servers with MCC1/SCC1*)
- Avaya S8100 Media Server (see 555-233-123: *Maintenance for DEFINITY CSI Servers*)
- IBM eServer BladeCenter HS20 Type 8832
- G150/G250/G350 Media Gateways

Structure of book

The following document contains combined Maintenance Alarms information for:

- S8300, S8500, and S8700 media servers
- MCC1, SCC1, and CMC1 media gateways
- G600, G650, and G700 media gateways

The document includes new information developed for Communication Manager Release 2.0, and preexisting or modified information brought together from Release 1.3 maintenance documentation.

This document is the first of three reference documents:

- Maintenance Alarms Reference (03-300190)
- Maintenance Commands Reference (03-300191)
- Maintenance Procedures (03-300192)

The basis for these reference documents was the Release 1.3 S8700 media server with the MCC1 and SCC1 media gateways maintenance document. To this document were added Release 1.3 maintenance information for the S8300 media server, the G700, G600 and CMC1 media gateways, as well as new material developed for the S8500 media server and G650 media gateway.

In order to present maintenance information from all these sources side-by-side, when it was not clear from a chapter or section title, marking conventions were adopted to delineate material specific to a particular source. The markers act on three levels:

- [Chapters or Maintenance Objects \(MOs\)](#)
- [Major and minor sections](#)
- [Paragraphs or in-line comments](#)

Chapters or Maintenance Objects (MOs)

At the Chapter or MO level, bold names of the server(s) or gateway(s) that are represented within the sections to follow are inserted immediately after the Chapter title or MO title. For example, the heading for the SER-BUS (Serial communication bus) MO looks like:

SER-BUS (Serial communication bus)

G650

The **G650** after the title indicates that the material in this MO relates to the G650 media gateway.

Major and minor sections

At the Major and minor sections level, a similar bold name along with a ruled line delineates the beginning of a section of material specific to the media server or gateway identified. At the conclusion of the section, another ruled line marks the end of the specific material and a return to common text. For example, a section of material specific to the S8700 or S8500 media server looks like:

S8700 | 8710 / S8500

1. If only 1 analog circuit pack in the system has this problem, replace the circuit pack.
 2. If only analog circuit packs on a particular carrier have this error, the ringing generator may not be connected to this carrier.
 3. If analog circuit packs on many carriers have this error, it is probably a problem with the ringing generator.
-

Such sections can occasionally extend for several pages.

Paragraphs or in-line comments

At the paragraph level and for comments in-line, the specific media server or gateway is indicated by its bold name, and the parenthetical information follows immediately afterward. For example, a paragraph insert for the S8700 and S8500 media servers might look like:

1. If the Tone-Clock circuit is a slave clock, then the EI to which it is listening is providing a bad timing source. Follow the diagnostic procedures specified for TDM-CLK Error Code 2305.
2. **S8700 | 8710 / S8500**: If no problem can be found with the incoming synchronization signal, replace the IPSI or Tone-Clock circuit pack. See [Replacing the IPSI or Tone-Clock Circuit Pack](#) on page 2292.

In such cases, it is not necessary to delineate the beginning and end of the material.

An example of an in-line comment might look like:

3. **Error Type 1**: There is a serial number mismatch between the hardware serial number and installed license file (**S8700 | 8710 / S8500**: there is a serial-number mismatch of the reference IPSI and a subsequent License Error failure. **S8300**: there is a serial-number mismatch of the G700 motherboard on which the serial number resides and a subsequent License Error failure). This error is caused by the:
 - **S8700 | 8710 / S8500**: Reference IPSI not responding
 - **S8300**: G700 motherboard not responding
 - Expiration of the 10-day timer

The system enters No-License mode.

It is hoped that, by these techniques, material specific to several different sources can be combined and viewed side-by-side without confusion.

Audience

The information in this book is intended for use by:

Avaya technicians, provisioning specialists, business partners, and customers, specifically:

- Trained Avaya technicians
- A maintenance technician dispatched to a customer site in response to a trouble alarm or a user trouble report
- A maintenance technician located at a remote maintenance facility
- The customer's assigned maintenance technician

The technician is expected to have a knowledge of telecommunications fundamentals and of the particular Avaya Media Server and/or Media Gateway to the extent that the procedures in this book can be performed, in most cases, without assistance.

This book is not intended to solve all levels of troubles. It is limited to troubles that can be solved using:

- The Alarm Log
- The Error Log
- Trouble-clearing procedures
- Maintenance tests
- Traditional troubleshooting methods

If the trouble still has not been resolved, it is the maintenance technician's responsibility to escalate the problem to a higher level of technical support. Escalation should conform to the procedures in the Technical and Administration Escalation Plan.

Downloading this book and updates from the Web

You can download the latest version of this book *from the Avaya Web site*. You must have access to the Internet, and a copy of Acrobat Reader must be installed on your personal computer.

Avaya makes every effort to ensure that the information in this book is complete and accurate. However, information can change after we publish this book. Therefore, the Avaya Web site might also contain new product information and updates to the information in this book. You can also download these updates from the Avaya Web site.

Downloading this book

To download the latest version of this book:

1. Access the Avaya web site at <http://support.avaya.com>.

2. At the top center of the page, click **Product Documentation**.

The system displays the Welcome to Product Documentation page.

3. In the upper-left corner type the 9-digit book number in the Search Support field, and then click **Go**.

The system displays the Product Documentation Search Results page.

4. Scroll down to find the latest issue number, and then click the book title that is to the right of the latest issue number.

5. On the next page, scroll down and click one of the following options:

- **PDF Format** to download the book in regular PDF format
- **ZIP Format** to download the book in zipped PDF format

Safety labels and security alert labels

Observe all caution, warning, and danger statements to help prevent loss of service, equipment damage, personal injury, and security problems. This book uses the following safety labels and security alert labels:

CAUTION:

A caution statement calls attention to a situation that can result in harm to software, loss of data, or an interruption in service.

WARNING:

A warning statement calls attention to a situation that can result in harm to hardware or equipment.

DANGER:

A danger statement calls attention to a situation that can result in harm to personnel.

SECURITY ALERT:

A security alert calls attention to a situation that can increase the potential for unauthorized use of a telecommunications system.

Safety precautions

When performing maintenance or translation procedures on the system, users must observe certain precautions. Observe all caution, warning, and danger admonishments to prevent loss of service, possible equipment damage, and possible personal injury. In addition, the following precautions regarding electromagnetic interference (EMI) and static electricity must be observed:

Electromagnetic interference

This equipment generates, uses, and can radiate radio frequency energy. Electromagnetic fields radiating from the switch may cause noise in the customer's equipment. If the equipment is not installed and used in accordance with the instruction book, radio interference may result.

WARNING:

To maintain the EMI integrity of the system, maintenance personnel must ensure that all cabinet panels, covers, and so forth, are firmly secured before leaving the customer's premises.

How to use this Document

Most maintenance sessions involve analyzing the Alarm and Error Logs to diagnose a trouble source and replacing a component such as a circuit pack or media module. The information in [Chapter 5: Communication Manager Maintenance-Object Repair Procedures](#) of this reference will generally suffice to address these needs. Certain complex elements of the system require a more comprehensive approach. Special procedures for these elements appear in [Chapter 7: General troubleshooting](#) of *Maintenance Procedures (03-300192)*.

Note:

This document is designed to be read online and in paper format. Because of the large volume of information, additional cross-references have been added to make it easier to locate information when using the manual online.

Organization

[Chapter 1: Server Alarms](#), contains information on alarms generated on various platforms, including the S8300, S8500, and S8700 media server. These alarms cover such categories as process watchdog, environmental, login, translation monitoring, and power supply alarms. Alarm identifications, levels, and resolutions are given.

[Chapter 2: Denial Events](#), contains information about denial events that are generated by Avaya Communication Manager. Denial events are displayed via the Events Report (**display events** screen) of Avaya Communication Manager.

[Chapter 3: LEDs](#), contains information on the definition and interpretation of LED indicators to be found on various system components, including servers, gateways, circuit packs, and media modules.

[Chapter 4: G700 Media Gateway Traps](#), contains information on traps that can occur on media gateways. Trap identifications, alarm levels, trap descriptions, and recommended resolutions are given.

[Chapter 5: Communication Manager Maintenance-Object Repair Procedures](#), contains specific troubleshooting and repair instructions for every component in the system. The maintenance objects are listed alphabetically by name as they appear in the Alarm and Error Logs. Under each maintenance object appears a description of the object's function, tables for interpreting alarm and error logs, and instructions on how to use tests, commands, and replacements to resolve associated problems.

Conventions used in this document

[Table 2: Typography used in this book](#) on page 24 lists the typographic conventions in this document.

Table 2: Typography used in this book 1 of 2

To represent . . .	This typeface and syntax are shown as . . .	For example, . . .
SAT commands	<ul style="list-style-type: none"> ● Bold for literals ● Bold italic for <i>variables</i> ● Square brackets [] around optional parameters ● “ ” between exclusive choices 	refresh ip-route [all <i>location</i>]
SAT screen input and output	<ul style="list-style-type: none"> ● Bold for input ● Constant width for output (screen displays and messages) 	Set the Save Translation field to daily . The message Command successfully completed should appear.
Linux commands	<ul style="list-style-type: none"> ● Constant-width bold for literals ● Constant-width bold italics for <i>variables</i> ● Square brackets [] around optional arguments ● “Or” sign between exclusive choices 	testmodem [-s] [-t arg]
Linux output	Constant width	Linux returns the message almdisplay 4: Unable to connect to MultiVantage.

1 of 2

Table 2: Typography used in this book 2 of 2

To represent . . .	This typeface and syntax are shown as . . .	For example, . . .
Web interface	<ul style="list-style-type: none"> ● Bold for menu selections, tabs, buttons, and field names ● Right arrow > to separate a sequence of menu selections 	Select Alarms and Notification , the appropriate alarm, and then click Clear . Select Diagnostics > View System Logs , then click Watchdog Logs .
Keys	Special font for keyboard keys and SAT screen clickable buttons	Press Tab . Click Next Page .
		2 of 2

Other conventions used in this book:

- Physical dimensions are in English [Foot Pound Second (FPS)] units, followed by metric [Centimeter Gram Second (CGS)] units in parentheses.

Wire-gauge measurements are in AWG, followed by the diameter in millimeters in parentheses.

- Circuit-pack codes (such as TN790B or TN2182B) are shown with the minimum acceptable alphabetic suffix (like the “B” in the code TN2182B).

Generally, an alphabetic suffix higher than that shown is also acceptable. However, not every vintage of either the minimum suffix or a higher suffix code is necessarily acceptable.

Useful terms

[Table 3: Terminology summary](#) on page 26 summarizes some of the terms used in this book and relates them to former terminology.

Table 3: Terminology summary

Present Terminology	Former Terminology
Communication Manager	MultiVantage Avaya Call Processing
S8300 Media Server	ICC, Internal Call Controller
S8700 Media Server (or non-co-resident S8300)	ECC, External Call Controller
MGP, Media Gateway Processor	860T Processor
Layer 2 Switching Processor	P330 Stack Processor Cajun Stack Processor i960 Processor

Chapter 1: Server Alarms

S8700 | 8710 / S8500 / S8300

This chapter provides background information on server alarming. For detailed information on G700 Media Gateway Traps, refer to [Chapter 4: G700 Media Gateway Traps](#).

Introduction

During normal operations, software or firmware may detect error conditions pertaining to specific Maintenance Objects (MOs) or other subsystems. The system automatically attempts either to fix or circumvent these problems. Errors are detected in two ways:

- Firmware on the component during ongoing operations
- A “periodic test” or a “scheduled test” started by software

The technician can run tests on demand that are generally more comprehensive (and potentially disruptive) than are the "scheduled tests".

When an error is detected, the maintenance software puts the error in the Error Log and increments the error counter for that error. When an error counter is “active” (greater than 0), there is a maintenance record for the MO. If a hardware component incurs too many errors, an alarm is raised.

Alarms on the Linux media servers can occur in several areas:

- Media Modules, Media Servers, the Media Gateway Processor, and the Layer 2 Switching Processor are all capable of detecting internal failures and generating traps and alarms.
- Media gateways, such as the G700, detect faults and alert the Media Server; the Media Server then raises an alarm, and sends the alarm to an appropriate network management site.
- Communication Manager alarms reflect health status of network elements such as media gateways, circuit packs, media modules, and their associated links, ports, and trunks.
- Messaging alarms provide health status of embedded or external messaging systems.

Alarms may be viewed using the following:

- Maintenance Web Interface

Provides alarms information related to Communication Manager, the media server, and messaging.

Server Alarms

Note:

For non-Communication Manager alarms, use the Web Page header "Alarms and Notification" and "Diagnostics: View System Log". Choose the appropriate heading and, if necessary, call Avaya support.

- Media Server bash shell
Provides alarms information related to Communication Manager, the media server, and messaging.
- Media Server SAT CLI
Provides alarms information related to Communication Manager.
- MGP CLI (on the G700 Media Gateway)
Provides alarms and traps information related to the G700 platform and its subsystems.
- Layer 2 Switching Processor CLI (on the G700 Media gateway)
Provides information related to the media gateway stack.

Information related to Communication Manager, the media server, and messaging alarms can be displayed using either the Maintenance Web Interface or the media server bash shell; however, this document (*Maintenance Alarms Reference (03-300190)*) provides maintenance information only for Communication Manager ([Chapter 5: Communication Manager Maintenance-Object Repair Procedures](#)) and media server alarms ([Chapter 1: Server Alarms](#)). For messaging alarms and repair procedures, refer to the appropriate documentation for your messaging system.

Alarm Classifications

Alarms are classified depending on their effect on system operation:

- MAJOR alarms identify failures that cause a critical degradation of service. These alarms require immediate attention.
- MINOR alarms identify failures that cause some service degradation but that do not render a crucial portion of the system inoperable. Minor alarms require attention. However, typically a minor alarm affects only a few trunks, stations, or a single feature.
- WARNING alarms identify failures that cause no significant degradation of service or equipment failures external to the switch. These failures are not reported to INADS or to the attendant console.
- ON-BOARD problems originate in the circuitry on the alarmed Media Module.
- OFF-BOARD problems originate in a process or component that is external to the Media Module.

Background Terms

[Table 4: Alarming Background Terms](#) on page 29 gives a useful explanation of terms.

Table 4: Alarming Background Terms

Term	Explanation
TRAP	A trap is an event notification that is sent to the SNMP trap manager and received from the Media Gateway Processor, Layer 2 Switching Processor, or RTCP Monitor (Avaya VisAbility).
ALARM	Some traps are determined to be an alarm. If determined to be an alarm they are sent to an appropriate alarm management site, such as INADS.
INADS	Initialization and Administration System, a software tool used by Avaya services personnel to initialize, administer, and troubleshoot customer communications systems remotely.
SNMP	Simple Network Management Protocol, the industry standard protocol governing network management and the monitoring of network devices and their functions.
RTCP	Real Time Control Protocol, contained in IETF RFC 1889.
ISM	Intelligent Site Manager, a VPN gateway on the customer's LAN that provides a means for services personnel to access the customer's LAN in a secure manner via the Internet.
VPN	Virtual Private Network, a private data network that makes use of the public telecommunication infrastructure, maintaining privacy through the use of a tunneling protocol and security procedures.

Alarm-Related LEDs

[Table 5: Alarm-Related LEDs](#) on page 30 shows alarm-related LEDs on the faceplate of the G700 or on an attendant console, and shows how certain LEDs reflect specific alarm situations.

Table 5: Alarm-Related LEDs

LED	Location	Alarm-Related Cause
ALARM LED	Attendant Console	The system alarm causes the attendant console ALARM LED to light.
ACK LED	Attendant Console	The ACK LED on the attendant console reflects the state of acknowledgement of the alarm report from INADS. However, this is only possible for S8700-based Media Servers.
RED ALM or ALARM LED	LED Panel of G700 Media Gateway	The RED ALM or ALARM LED indicates the "health" of the G700 by lighting when there are impaired functions of the Media Gateway Processor, Layer 2 Switching Processor, or VOIP engine. It lights, for example, when the power supply voltage is out of bounds, if the G700 cannot locate a Media Servers, or when the unit is overheating. It also indicates when the system is in Power-up mode, or when a Media Module is resetting.

Alarm Content

Alarms logged by Communication Manager are stored in an alarm log. All alarms include a date and time stamp that reflects the date and time of the sending device. The alarm contains:

- Device type
- Component type
- Device name
- Current ip address
- Additional information necessary for identification of alarm origination
- Severity level to indicate the priority of the alarm

Alarms originating in a specific media server, such as an S8300, have a prefix denoting that of an S8300.

QoS Alarms

An RTCP monitor using the local SNMP agent generates traps to a pre-administered trap collector. The following QoS alarms are generated:

- The **voip-callqos** alarm is generated if a single session exceeds configured QoS levels. It can generate a warning or an SNMP trap. Warnings are used for less severe problems. They can be accumulated internally within Avaya VoIP Monitoring Manager for use by the alarms defined below.
- The **voip-systemqos** alarm is generated if the number of voip-callqos warnings from all terminals exceeds a configured count over a given period (e.g. 100 alarms over 24 hours). The alarm causes a SNMP trap to be sent.
- The **voip-terminalqos** alarm is like the voip-systemqos alarm except it applies to a single terminal. If any one terminal generates a number of voip-callqos warnings that exceed a threshold then the alarm is generated.

Alarm Management

This section describes methods to determine the source of alarms that are generated when an error occurs. The alarm log is viewable and follows that defined in *Maintenance for Avaya DEFINITY® Server R, 555-233-117*. Technicians can view alarms via the Web Interface, CLI, and SAT command-line interface.

SNMP management is a function of the Avaya MultiService Network Manager application. For additional information, including information on event logs and trap logs, please refer to the *Avaya P333T User's Guide*.

Alarm management follows the S8700 Media Server Alarming Architecture Design; see *Maintenance for the Avaya S8700 Media Server with an Avaya SCC1 Media Gateway or an Avaya MCC1 Media Gateway, 555-233-143*.

Connection Strategies to a Services Organization

A services organization, such as INADS, receives alarms from the Media Server and connects to the media server for troubleshooting. There are currently two product-connect strategies: dialup modem access and Virtual Private Network (VPN) access over the Internet.

For dialup modem access:

1. Connect a USB modem, connected to a telephone line, to the USB port on the faceplate of the media server.

Server Alarms

2. Enable the modem from the media server Web Interface. In addition, use the Setup Modem Interface under the Configure Server pages.
3. With this modem, a client PC uses the Point-to-Point Protocol (PPP) to access the media server and connect via telnet to a Linux shell.
4. Once logged into the media server, you can telnet out to media gateways, such as the G700, and other devices on the network.

Note:

Additionally, this modem can be used to allow the media server to call out to the INADS or other alarm receiving system to report alarms. When performing remote diagnostic tests, Services personnel should disable alarm call-outs to INADS to avoid generating unnecessary alarms. Alarm suppression is released after 30 minutes. If you are remotely logged in through the modem you prevent alarms from being sent because you are using the modem, but you do not prevent an alarm noting the absence of alarm reporting service being logged at the alarm receiving site.

The VPN alternative is achieved by the use of the Intelligent Site Manager (ISM) application. The ISM is a VPN gateway that resides on the customer's LAN and provides a means for services personnel to gain access to the customer's LAN in a secure manner over the Internet. Telnet is then used to access the media server and/or media gateways and other IP network equipment.

Alarms in Linux Media Servers

S8700 | 8710 / S8500 / S8300

A Linux-based media server can be configured so that it serves as the trap collector and provides external alarm notification.

A process called the Global Maintenance Manager (GMM) runs on the media server and collects events that are logged to the Linux syslog_d process. These events consist primarily of failure notification events logged by Communication Manager and INTUITY maintenance subsystems, or of traps sent by media gateways (**G700**). For events that require external notification, one option is to call the Avaya technical service center's INADS (Initialization and Administration System). However, other possible options include sending an e-mail to specified destinations, or sending an SNMP trap to a specified network management address.

The media server has an SNMP trap manager that collects traps from:

- Uploads and downloads to media modules
- VoIP Media Modules
- VoIP engines on G700 motherboards
- G700-associated UPS systems

Media server alarms perform a similar role to Communication Manager alarms in a traditional telephony context. Media Server alarms:

- Comprise related sets of alarms, known as MOs
- Create an internal record of actual or potential problems
- Notify maintenance personnel of a problem
- Help isolate the problem's source
- Point to and facilitate local and remote resolution of a problem

Note:

If a user is logged into a server by an analog modem that is also the server's only alarm-reporting interface, enter `almsuppress` to suppress alarm reporting. Otherwise, the other server logs an occurrence of SME Event ID #1 (see [SME Alarm in Media Server](#) on page 73).

Clearing Media Server Alarms

A media server is an open standards-based CPU in the *data-* communications context. Unlike a Communication Manager alarm, which cannot be cleared unless it is also resolved, a server alarm:

- Can be manually cleared from its log, with the `almclear` Linux command
- Should not be considered resolved until it is actually repaired

Displaying Media Server Alarms

In following sections, each server alarm is described, and its resolution procedure is provided. Like traditional Communication Manager MOs, the 3-column table for each server MO shows an alarm's:

1. Event ID
2. Severity
3. Definition, probable cause, and troubleshooting procedure

To help isolate a server problem, the 3rd column of these tables begins with quoted text for each event (unlike traditional Communication Manager MOs). The text consists of the verbose (-v) output of the `almdisplay -v` Linux command. For example, "interchange hand off failed" is the quoted text for Arbiter's Event ID #3.

If the `almdisplay` command returns a failure message, such as:

almdisplay: 4: Unable to connect to MultiVantage

enter the `man almdisplay` Linux command for command-related information.

S8300

Alarming on the S8300 Functioning as a Local Survivable Processor

The S8300 functioning as a Local Survivable Processor (LSP) logs an alarm when it becomes active. It also logs an alarm for every G700 Media Gateway that registers with it. It does NOT log alarms when IP phones register with it; rather, it logs a warning.

Communication Manager Hardware Traps

[Table 6: Communication Manager Hardware Traps](#) on page 34 illustrates hardware traps that apply to Communication Manager.

Table 6: Communication Manager Hardware Traps

Trap	Description
Media Server HW trap	Hardware faults are analyzed by maintenance software and correlate fault conditions to determine the appropriate action. If appropriate action requires attention, a trap of critical severity is sent.
Media Server HW clear trap	Hardware faults that have created traps send a clear trap upon clearing.
Media Server with administered MG that's not registered	If a Media Server has an administered G700 but it has not registered after an appropriate amount of time, send an alarm of major severity indicating such.

Note:

The Avaya S8300 Media Server on a G700 Media Gateway platform has several watchdog timers. If any one of them is not verified regularly, a trap of major severity is sent. The timer associated with the S8300 is the S8300 Software watchdog, which resets the S8300 processor if its connection is not verified regularly.

Backup and Restore Traps

The S8300 uses the LAN to backup a copy of its translation data. [Table 7: Backup and Restore Traps](#) on page 35 illustrates the backup and restore traps.

Table 7: Backup and Restore Traps

Trap	Description
Successfully stored backup	A trap of informational severity is sent when backup is successful. (REPLY_ACK) The trap reads "Successful backup of S8300 translation data," and names the backup location stored in the string "BACKUP_LOCATION." This information also goes to the local maintenance screen, since it is very possible that a backup is being requested as a result of an on-site attempt to replace the S8300.
No backup data stored	A trap of major severity is sent as soon as a REPLY_ERROR message is returned. The trap states "Translation Data backup not available," and names the backup location stored in the string "BACKUP_LOCATION."

Linux Media Server MOs and Alarms

Hardware MOs

The server's hardware MOs are described in the following sections:

- [DAJ1/DAL1 \(Duplication Memory Board\)](#) on page 48
- [RALM-SVC \(Remote Alarm Service\)](#) on page 71
- [USB1 \(Modem Testing\) Alarms](#) on page 90
- [UPS \(Uninterruptible Power Supply\)](#) on page 84
- [Remote Maintenance Board \(RMB\) Alarms](#) on page 111

Server-related alarms

Server-related alarms and their troubleshooting procedures are described in the following tables:

- [DAJ1/DAL1 Alarms in S8700 Media Server](#) on page 53
- [ARB \(Arbiter\)](#) on page 36
- [DUP \(Duplication Manager\)](#) on page 55
- [ENV \(Environment\)](#) on page 59
- [FSY \(File Synchronization\)](#) on page 66
- Login alarms, [Table 18: Login Alarms in Media Server](#) on page 69
- [NIC \(Network Interface Card\)](#) on page 70
- [SME Alarm in S8700 Media Server](#) on page 73
- [SVC_MON \(Service Monitor\)](#) on page 74
- [_TM \(Translation Manager\)](#) on page 83
- [UPS Alarms to the Media Server](#) on page 87
- [_WD \(Watchdog\) Alarms](#) on page 94
- [Login Alarms](#) on page 110
- [Virtual Alarms](#) on page 111

ARB (Arbiter)

S8700 | 8710 only

The Arbiter process runs on S8700 Media Servers to:

- Decide which server is healthier and more able to be active
- Coordinate data shadowing between servers, under the Duplication Manager's control

At the physical and data-link layers, an Ethernet-based duplication link provides an inter-arbiter UDP communication path to:

- Enable this arbitration between the active and standby servers
- Provide the necessary status signaling for memory refreshes

[Table 8: ARB Alarms in Media Server](#) on page 37 describes the Arbiter's alarms and their troubleshooting procedures. See [DUP \(Duplication Manager\)](#) on page 55 for more information.

Table 8: ARB Alarms in Media Server 1 of 12

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
3	MIN	<p>“Interchange hand off failed” — Standby server could not process active server’s interchange request.</p> <p>The interchange does not occur, and the active side remains active.</p> <ol style="list-style-type: none"> 1. See if the standby side is RESET, either from the: <ul style="list-style-type: none"> - Web interface’s Server section, by selecting View Summary Status - Linux command line, by entering <code>server</code> 2. Manually clear the alarm, either from the: <ul style="list-style-type: none"> - Web interface, by selecting Alarms and Notification, the appropriate alarm, and Clear - Linux command line, by entering <code>almclear -n #id</code> 3. If the problem persists, troubleshoot the standby server. <ol style="list-style-type: none"> a. See if the standby side is RESET, either from the: <ul style="list-style-type: none"> - Web interface’s Server section, by selecting View Summary Status - Linux command line, by entering <code>server</code> b. Check for application problems, either from the: <ul style="list-style-type: none"> - Web interface, by selecting View Process Status - Linux command line, by entering <code>statapp</code>, and restore any applications with problems. c. Check for problems with an Ethernet interface, either from the: <ul style="list-style-type: none"> - Web interface, by selecting the Execute Pingall diagnostic - Linux command line, by entering <code>pingall -a</code> <p>Check both sides of each failed link, and make any necessary repairs.</p> 4. If the applications and interfaces are okay but the problem persists, escalate the problem.

Back to: [Hardware MOs](#) [Server-related alarms](#)

DAJ1/DAL1 (Duplication Memory Board)

S8700 | 8710 only

This MO supports each S8700 media server’s Duplication Memory board (DAJ1) and the S8710 media server’s Duplication Memory board (DAL1). These Duplication Memory boards are a NIC (network interface card) serving as the physical and data-link interface for an Ethernet-based duplication link between the servers. This link provides a call-status data path for sending:

- TCP-based communication between each server’s Process Manager
- UDP-based communication between each server’s Arbiter to:
 - Enable arbitration between the active and standby servers
 - Provide status signaling for memory refreshes

Note:

The Duplication Memory cards are not interchangeable between media servers. The DAJ1 will only work in S8700 media servers and the DAL1 will only work in S8710 media servers.

Note:

This call-status data is separate from the translations and Linux files shadowed between servers. (See [FSY \(File Synchronization\)](#) on page 66.)

([Table 13: DAJ1/DAL1 Alarms in Media Server](#) on page 53 describes the Duplication Memory board's alarms and their troubleshooting procedures.) [See also, [ARB \(Arbiter\)](#) on page 36, [DUP \(Duplication Manager\)](#) on page 55, and [NIC \(Network Interface Card\)](#) on page 70.]

Both periodic and on-demand testing is provided for this MO. The periodic test runs the Read Error Register test at 15-minute intervals. On-demand testing includes the Read Error Register and Local Loop tests.

MO's Name (in Alarm Log)	Alarm Level	Initial Linux Command to Run	Full Name of MO
DAJ1 or DAL1	MAJ	<code>testdupboard</code> ¹	Server Dup Mem board
DAJ1 or DAL1	MIN	<code>testdupboard</code>	Server Dup Mem board
DAJ1 or DAL1	WRN	<code>testdupboard</code>	Server Dup Mem board

1. See [Table 9](#)

Table 9: Testdupboard command syntax and arguments

Argument	Description
Syntax: <code>testdupboard [-s] [-l] [-t arg] [-?]</code>	
no argument	Performs "short" test.
<code>-s</code>	Short test, performs <code>read_err_reg</code> test, this is also the default option.
<code>-l</code>	Performs "short" tests, and <code>localloop</code> test
<code>-t</code>	<i>arg</i> Specific test to perform. Possible values for <i>arg</i> are: <ul style="list-style-type: none"> ● <code>read_err_reg</code> ● <code>localloop</code>.
<code>-?</code>	Usage (this).

Alarm Log Entries

Table 10: DAJ1/DAL1 Alarm Log Entries

EVENT ID#	Associated Test	Alarm Level	On/Off Board	Linux Test to Clear Value
2 (a)	Read Error Register test (EDC single-bit errors)	WRN	ON	testdupboard
3 (b)	Read Error Register test (SDRAM multibit errors)	MAJ	ON	testdupboard
4 (c)	DAJ1/DAL1 Local Looparound test	MIN	ON	testdupboard
5 (d)	Read Error Register test (Link Receiver CRC errors)	MIN	ON	testdupboard
6 (e)	Read Error Register test (Link Receiver CRC errors)	MAJ	ON	testdupboard

Notes:

- a. **Event ID #2** Test failed — Error counter query for single-bit EDC (bad error register) on the SDRAM is pegging. If the test detects 20 consecutive failures, the following Warning alarm is logged:
 #1,ACT,[DAJ1|DAL1],A,2,WRN,Single-bit EDC test (bad SB err count)
- b. **Event ID #3** SDRAM has multiple bit errors — The [DAJ1|DAL1] board can also generate this event as an in-line error.
 If this test detects a failure, the media server’s state of health is lowered to its most critical level, and the following Major alarm is logged:
 #1,ACT,[DAJ1|DAL1],A,3,MAJ, SDRAM multibit errors
- c. **Event ID #4** Looparound test failed — Either a mismatched address or a mismatched bit pattern could have caused a failure.
 If this test detects 3 failures, the following Minor alarm is logged:
 #1,ACT,[DAJ1|DAL1],A,4,MIN,Local Looparound test failure
- d. **Event ID #5** Optical Line Receiver experiencing CRC errors — If this test detects 3 failures, the following Minor alarm is logged:
 #1,ACT,[DAJ1|DAL1],A,5,MIN,Link Receiver CRC errors
- e. **Event ID #6** Inability to open a communications link with the Duplication Memory board. The board is out of service if this failure occurs once, and a Major alarm is logged:
 #1,ACT,[DAJ1|DAL1],A,6,MAJ,Failed to open [DAJ1|DAL1] card

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order shown in. By clearing error codes associated with the first test, you may clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Read Error Register test	X	X	D
[DAJ1 DAL1] Board Local Loop test	X	X	D

1. D = Destructive; ND = Nondestructive

Read Error Register Test

The Read Error Register test queries three registers including the:

- Optical line receiver's CRC error register
CRC errors indicate problems with the optical interface between the active and standby servers.
- SDRAM's single-bit error register
Although the Duplication Memory board can "self heal" single-bit errors in the SDRAM's error register, chronic problems can indicate a more serious problem.
- SDRAM's multiple-bit error register
An SDRAM multiple-bit error condition indicates a problem in the Duplication Memory board's memory, and cannot be recovered.

Server Alarms

The following errors can be detected:

Table 11: TEST Read Error Register Test

Error Code	Test Result	Description / Recommendation
Open failed to MDD	ABRT	The Memory Duplication Driver (MDD) is the system driver that communicates with the [DAJ1 DAL1] board. If this driver cannot be opened, then the [DAJ1 DAL1] board's registers cannot be read. 1. This is a system type error, try again.
System Error – MDD failed to return data	ABRT	The test ran, but, for some reason the MDD could not return data. 1. This is a system type error, try again.
[DAJ1 DAL1] err count query, code=? ?= 1 to 7	FAIL	Test failed “[DAJ1 DAL1] err count query, code=?” — where “?” indicates which of the [DAJ1 DAL1] board's error counters had positive data. The failure code can be 1–7 and is determined by the bit vector, “0xxx”. (Every “x” bit could be set, indicating that every error register had errors.) Specifically, if bit: 1 is set (0xx1) – Single-bit errors occurred. 2 is set (0x1x) – CRC errors occurred. 3 is set (01xx) – Multibit errors occurred.

[DAJ1|DAL1] Local Loop Test

Note:

This is an on-demand test that only runs on the standby media server when it is busied out.

This test runs a local loop-around test on the standby media server's [DAJ1|DAL1] board. A 32-bit data number is written to an address and verified for correct transmission. The test reads the contents of the:

- Last data received registers
- Last address received register

and then compares the data. If the data matches, the test passes. If not, the test fails.

The following errors can be detected:

Table 12: TEST DAJ1/DAL1 Local Loop Test

Error Code	Test Result	Description / Recommendation
Open failed to MDD	ABRT	The MDD is the system driver that communicates with the Duplication Memory board. If this driver cannot be opened, the board's registers cannot be read. This is a system type error, try again.
System Error MDD failed to return data	ABRT	The test ran, but for some reason the MDD could not return data. This is a system type error, try again.
Loop-around test failed	FAIL	The last address received does not match the address that was written, or the last data received does not match the data that was written.

DUP (Duplication Manager)

S8700 | 8710 only

The Duplication Manager process, via coordination of the Arbiter process, runs on each S8700 Media Server to control data shadowing between them.

At the physical and data-link layers, an Ethernet-based duplication link provides a TCP communication path between each server's Duplication Manager to enable their control of data shadowing.

[Table 14: DUP Alarms in Media Server](#) on page 56 describes the Duplication Manager's alarms and their troubleshooting procedures.

See [ARB \(Arbiter\)](#) on page 36 and [DAJ1/DAL1 \(Duplication Memory Board\)](#) on page 48 for more information.

Table 14: DUP Alarms in Media Server 1 of 3

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MAJ	<p>“Duplication card error” — Duplication Manager determined that the duplication card is not functioning, but it cannot distinguish between a bad card, an unplugged card, or a bad fiber link.</p> <ol style="list-style-type: none"> 1. Check the physical fiber connectivity at each server. 2. Verify the alarm, by accessing the trace log, either from the: <ul style="list-style-type: none"> ● Web interface, by: <ol style="list-style-type: none"> a. Selecting the View System Logs diagnostic and Logmanager Debug trace b. Specifying the Event Range for the appropriate time frame c. FSY (File Synchronization)

[S8700](#) | [8710](#) / [S8500](#)

The File Synchronization (FSY) process uses TCP-based communication over 100Base-T Ethernet links to provide synchronized duplication of critical data-shadowed files, including translations and important Linux files.

Note:

This set of files is separate from the data shadowed between each server's [DAJ1/DAL1 \(Duplication Memory Board\)](#) on page 48.

[Table 16: FSY Alarm in Media Server](#) on page 67 describes the FSY MO's alarms and their troubleshooting procedures.

Table 16: FSY Alarm in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MIN	<p>“File sync failed” — File synchronization operation failed.</p> <ol style="list-style-type: none"> 1. See if the <code>filesyncd</code> (file sync daemon) process is up, either from the: <ul style="list-style-type: none"> - Web interface, by selecting View Process Status - Linux command line, by entering <code>statapp</code> 2. Check the trace log for more granular information. (The file sync daemon can report failures of synchronizing one or more files.) Access the trace log, either from the: <ul style="list-style-type: none"> - Web interface, by: <ol style="list-style-type: none"> a. Selecting the View System Logs diagnostic and Logmanager Debug trace b. Specifying the Event Range for the appropriate time frame c. Matching the “file sync failed” pattern - Linux command line, by entering <code>logv -t ts</code> 3. (Except S8500) Verify that the dup link is both “up” and “refreshed”, either from the: <ul style="list-style-type: none"> ● Web interface’s Server section, by selecting View Summary Status ● Linux command line, by entering the <code>server</code> command (Neither side should be “off-line” nor “down”.) 4. (Except S8500) Make sure that the Ethernet duplication link is up, either from the: <ul style="list-style-type: none"> - Web interface, by selecting the Execute Pingall diagnostic - Linux command line, by entering <code>pingall -a</code> <p>If not, check each side of this failed link, and make any necessary repairs.</p> 5. (Except S8500) Check the physical fiber connectivity at each server to verify that this alarm is not a consequence of other duplication-related problems. 6. If the problem persists, escalate the problem.

Back to: [Hardware MOs](#) [Server-related alarms](#)

KRN (Kernel)

[S8700](#) | [8710](#)

The KRN MO monitors the operating system Kernel. [Table 17: KRN Alarm in Media Server](#) on page 68 describes the MO's alarms and their troubleshooting procedures.

Table 17: KRN Alarm in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
10	MAJ	Failure in a Synchronous Dynamic Random Access Memory (SDRAM) Dual Inline Memory Module (DIMM). Error Correcting Code (ECC) memory detected a multi-bit error (MBE) but cannot correct it. 1. The SDRAM DIMM within the media server is not field replaceable. Replace the media server.

Back to: [Hardware MOs](#) [Server-related alarms](#)

Login

The Login MO monitors access to the server and alarms suspicious activity. [Table 18: Login Alarms in Media Server](#) on page 69 describes the Login MO's alarms and their troubleshooting procedures.

Table 18: Login Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
2	WRN	<p>“sat_Auth:Login for [inads] invalid password” — An SAT login to Communication Manager failed.</p> <ol style="list-style-type: none"> Verify the alarm, either from the: <ul style="list-style-type: none"> Web interface, by selecting View Current Alarms Linux command line, by entering <code>almdisplay -v</code> Since mis-typing a login sequence usually causes this alarm, enter <code>almclear -n #id</code> to clear the alarm. If this alarm is perceived as a security threat (often due to its persistence or frequent recurrence), notify the customer.
4	WRN	<p>“Login for [inads] – failed – password check” — A login to a server's Linux command line failed.</p> <ol style="list-style-type: none"> Verify the alarm, either from the: <ul style="list-style-type: none"> Web interface, by selecting View Current Alarms Linux command line, by entering <code>almdisplay -v</code> Since mis-typing a login sequence usually causes this alarm, enter <code>almclear -n #id</code> to clear the alarm. If this alarm is perceived as a security threat (often due to its persistence or frequent recurrence), notify the customer.
5	MAJ	<p>“Probation interval for login [inads] ends – lockout interval begins” — Multiple consecutive login failures.</p> <ol style="list-style-type: none"> If this alarm is perceived as a security threat, notify the customer.

NIC (Network Interface Card)

S8700 | 8710 / S8500

This MO supports the NICs in each S8700 media server providing the physical and data-link interfaces for Ethernet-based links.

[Table 19: NIC Alarms in Media Server](#) on page 70 describes NIC's alarms and their troubleshooting procedures. See [DAJ1/DAL1 \(Duplication Memory Board\)](#) on page 48 for more information.

Table 19: NIC Alarms in Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MIN	<p>“eth0 NIC Link is Down” — Ethernet link on native NIC 0 is down.</p> <ol style="list-style-type: none"> 1. Verify Ethernet connectivity, either from the: <ul style="list-style-type: none"> - Web interface, by selecting the Execute Pingall diagnostic - Linux command line, by entering <code>pingall -a</code> <p>Check both sides of each failed link, and make any necessary repairs.</p> 2. If the ping test fails, check the physical connections of NIC 0's Ethernet cable. <p>If not, manually clear the alarm, either from the:</p> <ul style="list-style-type: none"> - Web interface, by selecting Alarms and Notification, the appropriate alarm, and Clear - Linux command line, by entering <code>almclear -n #id</code>
		1 of 2

RALM-SVC (Remote Alarm Service)

S8700 | 8710 only

For the RALM-SVC MO, maintenance software performed special periodic testing every 60 seconds.

MOs Name	Alarm Level	Initial Command to Run	Full Name of MO
RALM-SVC	MAJOR	None	Remote Alarm Service
RALM-SVC	MAJOR	None	Remote Alarm Service

Alarm Log Entries

These tests verify that the standby media server's components are operating correctly.

Table 20: RALM-SVC Alarm Log Entries

EVENT ID#	Aux Data	Associated Test	Alarm Level	On/Off Board	Linux Test to Clear Value
1 (1)		SME_ARB test	MAJOR	ON	testdupboard
2 (2)		Standby_PN Check test	MAJOR	ON	testdupboard

Notes:

- Event ID #1** SME_ARB test failed — This test determines the other server's alarm-generation capability by querying the local server's Arbiter to report on the other server's Remote Alarm Service functionality. Both media servers must have their own alarm-generation utilities. If the test fails 3 consecutive times, the following Major alarm is logged:

#1,ACT,SME,A,1,MAJ,Far-end alarm service is down

- Event ID #2** Standby_PN_Check test failed — This periodic test:

1. Queries the standby media server about its PNs' state of health
2. Compares the acquired information to an administered value

A failure indicates that a mismatch occurred and that the standby media server is out of sync. If this test fails 2 consecutive times, the following Major alarm is logged:

#1,ACT,SME,A,2,MAJ,Standby Port-Network check failed

System Technician-Demanded Tests: Descriptions and Error Codes

This MO provides no on-demand tests for system technicians.

1. These events will degrade the server's state of health.

System Technician-Demanded Tests: Descriptions and Error Codes

This MO provides no on-demand tests for system technicians.

Back to: [Hardware MOs](#) [Server-related alarms](#)

UPS Alarms to the Media Server

[S8700 | 8710](#) / [S8500](#) / [S8300](#)

[Table 25: UPS Alarms to the Media Server](#) on page 87 describes the server's UPS-related alarms and their troubleshooting procedures.

Table 25: UPS Alarms to the Media Server 1 of 4

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1–8	MAJ	“upsEstimatedMinutesRemaining” — UPS does not have an AC-power source. 1. Restore AC power to the UPS.
12	MAJ	“upsAlarmShutdownPending” — A shutdown-after-delay countdown is underway (i.e., the UPS has been commanded off). 1. Stop countdown timer. (Can be done via SNMP messages.)
13	MAJ	“upsAlarmShutdownImminent” — The UPS will turn off power to the load in < 5 seconds. 1. Restore AC power to the UPS.
1 of 4		

Table 25: UPS Alarms to the Media Server 2 of 4

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
14	MAJ	<p>“upsAlarmDepletedBattery” — If primary power is lost, the UPS could not sustain the current load.</p> <ol style="list-style-type: none"> 1. Charge or replace the batteries in the UPS, according to procedures in its <i>Site Preparation, Installation, and Operator’s Manual, 167-405-035</i>.
15	MAJ	<p>“upsAlarmBatteryBad” — One or more batteries needs to be replaced.</p> <ol style="list-style-type: none"> 1. Replace any defective batteries in the UPS, according to procedures in its <i>Site Preparation, Installation, and Operator’s Manual, 167-405-035</i>.
16	MIN	<p>“upsAlarmInputBad” — An input condition is out of tolerance.</p> <ol style="list-style-type: none"> 1. Provide appropriate AC power to the UPS.
17	MIN	<p>“upsAlarmTempBad” — The internal temperature of a UPS is out of tolerance. (On the UPS, the “over temperature” alarm indicator flashes, and the UPS changes to Bypass mode for cooling. Either:</p> <ol style="list-style-type: none"> 1. Look for and remove any obstructions to the UPS’s fans. 2. Wait at least 5 minutes, and restart the UPS. 3. Check for and resolve any fan alarms (Event ID 25) against the UPS. 4. Either: <ul style="list-style-type: none"> ● Change (increase or decrease) the environment’s temperature. ● Change the alarming thresholds.
18	MIN	<p>“upsAlarmCommunicationsLost” — The SNMP agent and the UPS are having communications problems. (A UPS diagnosis may be required.)</p> <ol style="list-style-type: none"> 1. Behind the UPS in its upper left-hand corner, verify that an SNMP card (with an RJ45 connector) resides in the UPS — instead of a serial card with DB9 and DB25 connectors. 2. Verify that the server is physically connected to the UPS via the RJ45 connector. 3. Verify that the SNMP card is properly administered according to the procedures in its users guide, provided by the vendor. 4. If necessary, replace the SNMP card in the UPS. 5. If the problem persists, replace the UPS, and diagnose it later.
		2 of 4

Table 25: UPS Alarms to the Media Server 3 of 4

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
19	WRN	<p>“upsAlarmBypassBad” — The “source” power to the UPS, which (during a UPS overload or failure) also serves as “bypass” power to the load, is out of tolerance — incorrect voltage by $> \pm 12\%$ or frequency $> \pm 3\%$.</p> <p>This on-line UPS normally regenerates its source power into clean AC power for the load. However, the source power’s quality is currently unacceptable as bypass power to the load).</p> <ol style="list-style-type: none"> 1. Verify that the UPS expects the correct “nominal input voltage” from its power source. 2. If so, restore acceptable AC power to the UPS. <p>If not, reconfigure the UPS to expect the correct voltage, according to procedures in its <i>Site Preparation, Installation, and Operator’s Manual, 167-405-035</i>.</p>
20	WRN	<p>“upsAlarmLowBattery” — The battery’s remaining run time \leq specified threshold.</p> <ol style="list-style-type: none"> 1. Restore AC power to the UPS.
21	WRN	<p>“upsAlarmUpsOutputOff” — As requested, UPS has shut down output power. The UPS is in Standby mode.</p> <ol style="list-style-type: none"> 1. Turn on output power. (Can be done via SNMP messages.)
22	WRN	<p>“upsAlarmOutputBad” — A receptacle’s output is out of tolerance. (A UPS diagnosis is required.)</p> <ol style="list-style-type: none"> 1. Replace the UPS, and diagnose it later.
23	WRN	<p>“upsAlarmOutputOverload” — The load on the UPS exceeds its output capacity. The UPS enters Bypass mode.</p> <ol style="list-style-type: none"> 1. Reduce the load on the UPS. 2. Verify that the UPS returns to Normal mode.
24	WRN	<p>“upsAlarmChargerFailed” — The UPS battery charger has failed. (A UPS diagnosis is required.)</p> <ol style="list-style-type: none"> 1. Replace the UPS, and diagnose it later.
25	WRN	<p>“upsAlarmFanFailure” — One or more UPS fans have failed. Unless lightly loaded, the UPS enters Bypass mode.</p> <ol style="list-style-type: none"> 1. Replace the UPS, and diagnose it later.
3 of 4		

Table 25: UPS Alarms to the Media Server 4 of 4

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
26	WRN	“upsAlarmFuseFailure” — One or more UPS fuses have failed. 1. Replace the UPS, and diagnose it later.
27	WRN	“upsAlarmGeneralFault” — A general fault occurred in the UPS. (A UPS diagnosis is required.) 1. Replace the UPS, and diagnose it later.
4 of 4		

This MO provides periodic and on-demand testing. The periodic test runs the “handshake” test every 15 minutes. The on-demand tests include the “handshake”, “off-hook”, and “reset_usb” tests.

[Hardware MOs](#)

[Server-related alarms](#)

USB1 (Modem Testing) Alarms

S8700 | 8710 / S8500

This MO provides periodic and on-demand testing. The periodic test runs the “handshake” test every 15 minutes. The on-demand tests include the “handshake”, “off-hook”, and “reset_usb” tests.

MO’s Name (in Alarm Log)	Alarm Level	Initial Linux Command to Run	Full Name of MO
USB1	MAJ	<code>testmodem</code>	USB Port Modem Testing
USB1	MIN	<code>testmodem</code>	USB Port Modem Testing
USB1	WRN	<code>testmodem</code>	USB Port Modem Testing

Usage: <code>testmodem [-s] [-l] [-t arg] [-?]</code>	
no argument	Performs “short” test.
<code>-s</code>	Short test, performs handshake and off-hook tests this is also the default option.
<code>-l</code>	Performs “long” tests.

-t <i>arg</i>	Specific test to perform. Possible values for arg are: reset_usb handshake off-hook
-?	Usage (this).

Alarm Log Entries

Table 26: USB1 Alarm Log Entries

EVENT ID#	Aux Data	Associated Test	Alarm Level	On/Off Board	Linux Test to Clear Value
1 (1)		Handshake test	MIN	ON	testdupboard
2 (2)		Modem Off-Hook test	MAJ	ON	testdupboard

Notes:

- Event ID #1** Handshake Test failed — With 3 consecutive failures of either the periodic or on-demand test, the following Minor alarm is logged:

```
#1,ACT,USB1,A,1,MIN,USB Modem handshake test failed
```

- Event ID #2** Modem Off-Hook test failed — With 3 consecutive failures of this test, the following Major alarm is logged:

```
#1,ACT,USB1,A,2,MAJ,USB Modem Off-Hook test failed
```

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table. For example, by clearing error codes associated with the Handshake test, you may also clear errors generated by other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Handshake test	X	X	D
Off-Hook test	X	X	D
Reset USB test	X	X	D

1. D = Destructive; ND = Nondestructive

Handshake Test

This test is **destructive**.

This test verifies that modem’s hardware is attached and that the modem can “handshake” with the USB port. The test:

1. Tries to open the device
2. Sends a handshake string (ATZ) to the modem

The modem should return an “OK” string.

The following errors can be detected:

Table 27: TEST Handshake Test

Error Code	Test Result	Description / Recommendation
Modem in use, try again later	ABRT	Another application is currently using the modem. Try again later.
Could not open USB port	ABRT	System error: An attempt to open the USB device failed. <ol style="list-style-type: none"> 1. Retry the test in about 5 minutes. 2. If the test still fails, escalate the problem.
Read error, could not run test	ABRT	After the ATZ is sent, a read of the USB device is done. If the read fails, a probable system error aborted the test. <ol style="list-style-type: none"> 1. Retry the test in about 5 minutes. 2. If the test still fails, escalate the problem.
Modem Handshake test failed	FAIL	The modem did not return an “OK” string within a 15-second interval.

Off-Hook Test

This test is **destructive**.

This test runs an off-hook test for the modem attached to the USB port on the server. The test sends an ATH1 string to check that a line is connected to the modem. The following errors can be detected:

Table 28: TEST Off-Hook Test

Error Code	Test Result	Description / Recommendation
Modem in use, try again later	ABRT	Some other application is currently using the modem. Try again later.
Could not open USB port	ABRT	System error: An attempt to open the USB device failed. Try again later
Read error, could not run test	ABRT	After the ATZ is sent, a read of the USB device is done. If the read fails, a probable system error aborted the test. Try again.
Modem Off-Hook test failed	FAIL	Modem Off-Hook test failed: The modem did not return an "OK" string within a 15-second interval. This indicates that dial tone was not detected in the allotted time.

Reset USB Test

This test is **destructive**.

This test causes the modem to be reset, even if the modem is in use. Although no failures are produced by this test, the following error can be detected:

Table 29: TEST Reset USB

Error Code	Test Result	Description / Recommendation
Could not open USB port	ABRT	System error: An attempt to open the USB device failed. Try again later.

Back to: [Hardware MOs](#) [Server-related alarms](#)

_WD (Watchdog) Alarms

S8700 | 8710 / S8500 / S8300

The Watchdog MO is a media server process that:

- Creates other Communication Manager processes
- Monitors their sanity
- Can recover their failures

These applications come up and start heartbeats to the Watchdog. For more information about Watchdog, see [Table 30: _WD Alarms in Media Server](#) on page 95 that describes the _WD MO's alarms and their troubleshooting procedures.

Watchdog also starts up a script to monitor Linux services and daemons, and threads to communicate with a hardware-sanity device. For alarm-related information about these services, daemons, and threads, see [SVC_MON \(Service Monitor\)](#) on page 74.

Table 30: _WD Alarms in Media Server 1 of 15

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
4 S8300	MAJ	<p>“Application <name> (pid) TOTALLY FAILED” — An application is present, but not launching. The application could not start the maximum allowed number of times. (This alarm usually occurs with Event ID #20.)</p> <ol style="list-style-type: none"> 1. To verify the alarm, look for the application’s name or process ID (PID),” either using the: <ul style="list-style-type: none"> - Web interface, by selecting Diagnostics > View System Logs and Watchdog Logs - Linux command line, by entering <code>logv -w</code> or, directly, by examining <code>/var/log/ecs/wdlog</code>. 2. If the application is down, enter <code>start -s application</code> to start the application. 3. If the application comes up, continue with Step 7. <p>If not, check the trace log to further investigate why the application fails, either from the:</p> <ul style="list-style-type: none"> - Web interface by: <ol style="list-style-type: none"> a. Selecting the View System Logs diagnostic and Logmanager Debug trace b. Specifying the Event Range for the appropriate time frame c. Matching the application’s PID as the pattern - Linux command line, by entering <code>logv -t ts</code> <p>Look for a related core-dump file in <code>/var/crash</code>, and escalate for an analysis of this file.</p> <ol style="list-style-type: none"> 4. Verify that the executable file named in the log exists and is executable. <p>To locate the application’s executable file, enter the Linux command:</p> <pre>ls -l /opt/ecs/sbin/appl</pre> <p>If the executable is present, Linux returns a symbolic link to its location.</p>
		<i>1 of 15</i>

Virtual Alarms

S8300 only

The Virtual Announcement Media Module faults are managed as server alarms. In the S8300 Media Server, the Virtual Analog Angel (VAA) represents a messaging board. The VAA is a virtual board on the G700. When the G700 reboots, the VAA senses that it has lost connectivity with the G700, and triggers its "removal and re-insertion". The removal of the VAA causes the AUDIX ports to go out-of-service and to return back in service when the re-insertion is complete. An alarm of MAJOR severity is generated, indicating loss of connectivity with the G700, which must be cleared manually. [Table 32: Virtual Alarm in S8300 Media Server](#) on page 111 summarizes this server alarm.

Table 32: Virtual Alarm in S8300 Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MAJ	<p>Virtual Analog Angel (VAA) loss of connectivity with a G700, resulting in temporary Out of Service (OOS) of AUDIX ports. A G700 reboot caused VAA to "remove and re-insert" virtual board. Must be cleared manually.</p> <ol style="list-style-type: none"> Manually clear the alarm, either from the: <ul style="list-style-type: none"> Web interface, by selecting Alarms and Notification, the appropriate alarm, and Clear Linux command line, by entering <code>almclear -n #id</code> Execute <code>list configuration all</code> on SAT. <p>Verify that V8 MG MSG BOARD does not show no board against it. (no board means AUDIX ports OOS.)</p>

Remote Maintenance Board (RMB) Alarms

S8500 only

The Remote Supervisor Adapter (RSA) board is installed in PCI-X slot 1 of the S8500 Media Server. It monitors and reports alarms on S8500 components and software and provides control to power on and power off the server.

Note:

The S8500 has a set of alarms for the RSA card, which is also called the Remote Maintenance Board (RMB). The MO name is RMB.

Table 33: RMB Alarms in the S8500 Media Server 1 of 3

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
1	MIN	<p>"RMB driver missing - handshake Failed" - The driver for communicating with the RSA card cannot be found. Several failures can generate this fault:</p> <ul style="list-style-type: none"> ● the Linux bash command <code>/sbin/lsmo</code>d is missing ● the results from running <code>/sbin/lsmo</code>d could not be read ● <code>/sbin/lsmo</code>d returned nothing ● the RSA device driver was not loaded ● the RSA device driver does not exist <p>The recommendations are:</p> <ol style="list-style-type: none"> 1. Be sure <code>/sbin/ibmo</code>d exists and is executable. 2. Be sure <code>/tmp</code> exists as a directory and can be written. 3. Be sure <code>/lib/modules/ibmasm/ibmasm.o</code> exists and has read permission. 4. Run the bash command "service ibmasm start".
2	MIN	<p>"RMB cli is not loaded on the server." - The program that talks to the RSA card could not be found. Several failures generate this fault:</p> <ul style="list-style-type: none"> ● the Linux bash command <code>/bin/l</code>s is missing or not working properly ● the bash command <code>/opt/ecs/rmb/rsa/rsac</code>li is missing or is not executable <p>The recommendations are:</p> <ol style="list-style-type: none"> 1. Be sure all the above files and directories exist and have read and execute permissions. 2. Reload any missing files from the distribution.
		1 of 3

Table 33: RMB Alarms in the S8500 Media Server 2 of 3

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
3	MAJ	<p>"RMB reset command failed" - The RSA card did not respond to a reset command. Several failures generate this fault:</p> <ul style="list-style-type: none"> ● the bash command <code>opt/IBMmpcli/bin/mpcli</code> is missing or is not executable ● the directory <code>/usr/java/latest</code> is missing or not symbolically linked to the Java runtime environment (JRE) ● the file <code>/opt/ecs/rmb/rsareset</code> does not exist or cannot be read ● no response from the RSA card ● the RSA card did not execute the request <p>The recommendations are:</p> <ol style="list-style-type: none"> 1. Be sure all the above files and directories exist and have read and execute permissions. 2. Reload any missing files from the distribution. 3. Be sure the RSA card is installed by looking at the back and checking that the green power LED on the RSA card is on, and that the amber error LED is off. 4. Verify that the RSA card is working by dialing into it or logging on to it over the service's port of the RSA card. 5. Restart the RSA card from the RSA modem or service's port and check the LEDs on the back of the card. 6. Verify that the RSA card is plugged into the PCI-X slot of the server. 7. Verify that the flat ribbon cable from the RSA card to the server motherboard has been installed and is firmly seated in the connectors at both ends. 8. Replace the RSA card.
		2 of 3

Table 33: RMB Alarms in the S8500 Media Server 3 of 3

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
4	MAJ	<p>"RMB failed handshake test" - The RSA card did not respond to commands from the server. Several failures generate this fault:</p> <ul style="list-style-type: none"> ● the bash command <code>/opt/IBMmpcli/bin/mpcli</code> is missing or is not executable ● the directory <code>/usr/java/latest</code> is missing or not symbolically linked to the Java runtime environment (JRE) ● the file <code>/opt/ecs/rmb/rsagetip1</code> does not exist or cannot be read ● no response from the RSA card ● the RSA card did not execute the request <p>The recommendations are:</p> <ol style="list-style-type: none"> 1. Be sure all the above files and directories exist and have read and execute permissions. 2. Reload any missing files from the distribution. 3. Be sure the RSA card is installed by looking at the back and checking that the green power LED on the RSA card is on, and that the amber error LED is off. 4. Verify that the RSA card is working by dialing into it or logging on to it over the service's port of the RSA card. 5. Restart the RSA card from the RSA modem or service's port and check the LEDs on the back of the card. 6. Verify that the RSA card is plugged into the PCI-X slot of the server. 7. Verify that the flat ribbon cable from the RSA card to the server motherboard has been installed and is firmly seated in the connectors at both ends. 8. Replace the RSA card.

S8500B Augmentix Server Availability Management Processor™ (A+SAMP) Alarms

S8500B Only

The Augmentix Server Availability Management Processor (A+SAMP) board is installed in the S8500B media server. It monitors and reports alarms on S8500B components and software and provides control to power on and power off the server.

Table 34: A+SAMP Alarms in the S8500B Media Server

Event ID	Alarm Level	Alarm Text, Cause/Description, Recommendation
0	MIN	Test Alarm. Hardware Platform Interface (HPI) User Event
1	MIN	Loss of power to host. Hardware Platform Interface (HPI) Sensor Event.
2	MAJ	Host boot timeout. Hardware Platform Interface (HPI) OEM Event
3	MAJ	Host Alarm. Hardware Platform Interface (HPI) User Event
4	MIN	Loss of External Power to SAMP. Hardware Platform Interface (HPI) Sensor Event
5	MAJ	Host failure timeout. Hardware Platform Interface (HPI) Watchdog Event

S8710 Alarms

S8710 environmental alarms

The Environmental maintenance object (ENV-MO) monitors environmental variables within the server, including temperature and fans. However, you can check these variables from the Maintenance Web Pages also.

Server Alarms

To check the S8710 server temperature and voltage readings:

1. At the Maintenance Web Pages, select **Diagnostics > Temperature/Voltage**.
2. The **Temperature/Voltage** page displays.

Temperature/Voltage

This page displays status information pertaining to monitored temperatures, voltages, and fan speeds.

*** Hardware Health ***

PowerSupplies:

ID	TYPE	LOCATION	STATUS	REDUNDANT
1	Standard	Pwr. Supply Bay	Normal	No

Fans:

ID	TYPE	LOCATION	STATUS	REDUNDANT	FAN SPEED
2	Var. Speed	Processor Zone	Normal	No	Low (14)
4	Var. Speed	I/O Zone	Normal	No	Low (14)
5	Var. Speed	Processor Zone	Normal	No	Low (14)
6	Var. Speed	Processor Zone	Normal	No	Low (14)
7	Var. Speed	Pwr. Supply Bay	Normal	No	Low (14)

Temperature:

ID	TYPE	LOCATION	STATUS	CURRENT	THRESHOLD

S8710 server BIOS error messages

The S8710 server BIOS error messages are listed and interpreted in [Table 36](#).

Table 36: S8710 BIOS error messages

Error Code	Description	Audible Beeps	Possible Problem	Possible Action
207	Memory configuration warning; DIMM in DIMM Socket X is not 4 bytes wide (32 bits) and only supports standard ECC.	None	Installed DIMMs are 8 bytes wide (64 bits).	Escalate; replace the media server
209	Online spare memory configuration; spare bank is invalid. Mixing of DIMMs with 4 and 8 byte widths is not allowed in this mode.	One long and one short	Installed DIMMs for online spare bank are of a different primary width than the DIMMs in other banks.	Escalate; replace the media server
NA	A mixture of 533-MHz and 400-MHz front side bus speed processors detected. All processors must have the same front side bus speed. System halted.	One long and one short	Wrong processors; Processors have different front side bus speeds.	Escalate; replace the media server
NA	Media server only supports 400-MHz front side bus speed processors. One or more 533-MHz front side bus speed processors have been initialized at 400 MHz.	One long and one short	Wrong processors; Media server does not support a front side bus speed of 533 MHz.	Escalate; replace the media server

Chapter 2: Denial Events

The tables in this chapter define and explain the information listed on the Events Report (`display events` screen). The Event Type tables are grouped by denial event category, denial event number, and Communication Manager release number. The Event Tables list:

- The number that identifies the Event Type. See [Table 37: Denial Event types and ranges](#) on page 120. If the Event Type number defines different denial events in different Communication Manager releases, that information is also listed.
- Event Description text, as it appears on the Events Report (`display events type denial`).
- An explanation of why the event was generated.
- Type of data in **Event Data 1** and **Event Data 2** fields, for each applicable Event Type, where this information is available. See [Event Data](#) on page 121.

To view denial events, use:

- `display events type denial` (to see historical denial event logs)
- `list trace station`
- `list trace TAC`

Use `list trace` to see any available Calling Party Number and Calling Party Name associated with call setup.

Event Type number ranges

Event Type number ranges help define the type and source of the denial event, as listed in [Table 37: Denial Event types and ranges](#). Some numbers are placeholders and have no assigned denial event.

Table 37: Denial Event types and ranges 1 of 2

Number range	Type/source of denial event	Reference

Event Data

Use Event Data information to isolate mis-translation and/or mis-matched provisioning.

Event Data might contain the information for:

- Internal User ID (UID) of a component involved in the call (station, IP User, gatekeeper)
- Product ID
- Object ID
- IP Address
- Extension
- IP Address involved in the call
- TTI State
- Numeric reason code explained in the tables in this chapter
- Numeric code showing the Cause Value, Cause Value Diagnostic, and Location Code for the event. See [Cause Values and their meanings/interpretations](#) on page 122.

Cause Values and their meanings/interpretations

See [Table 48: ISDN, IP, and SIP-generated denial events \(1173 - 1224\)](#) on page 183 for the Denial Events that show Cause Value information (Cause Value, Location Code, and Diagnostic Code) in Event Data 2 fields.

Event Data 2 sometimes contains data that represents the Cause Value (CV) (required), Cause Value Diagnostic (DIAG) (optional), Location Code (LC) (optional) from the denial event. This information (DIAG/LOC/CV) is coded as a 32 bit hexadecimal number, divided into 8-bit fields.

- The least significant (right most) two digits are the Cause Value in hexadecimal.
- The next two digits to the left are the Location Code (optional) in hexadecimal. See [Table 41: Location Code definitions](#) on page 124.
- The next two digits to the left are the Diagnostic Code (optional) in hexadecimal.
- The most significant (left most) two digits are not used.

See [Table 38: Event Data 2 layout](#) on page 122.

Table 38: Event Data 2 layout

8 bits	8 bits	8 bits	8 bits
NOT USED	Diagnostic Code (DIAG) (optional)	Zero + Location Code in lower 4 bits (LOC) (optional)	Cause Value (CV) (required)

Interpreting Event Data 2 Cause Value information

In our example, we will use Denial Event 1178 with Event Data 1 and Event Data 2.

```

1178 Normal Call Clearing      0x64      0x429      01/09/09:53      01/09/09:53      1
    
```

1. Note the information under the Event Data 2 column: 0x429.

- 0x29 is the Cause Value.
- 0x4 is the Location Code.
- 0x00 is the Diagnostic Code (not provided for this denial event).

- Convert the hexadecimal number provided in Event Data 2 to three binary numbers: put a one in the appropriate binary number positions that add up to the value of the number.

Each binary number consists of eight bits. See [Table 39: Event Data 2 conversion example](#) on page 123 for an example of the hexadecimal number 0x429, and [Table 40: Hexadecimal, decimal, and binary equivalents](#) on page 124 for the binary equivalents for individual digits.

- Add up the decimal weights that have a one for each of the eight bit segments.
 - Convert Cause Value 0x29 to decimal and find the sum.
Cause Value (Bits 1 - 8): $1 + 8 + 32 = 41$. This is Cause Value 41.
 - Convert Location Code 0x4 to decimal and find the sum.
Location Code (Bits 9 - 16): $4 = 4$. This is Location Code 4.
 - Convert Diagnostic Value 0x00 (Bits 17 - 24): $0 = 0$.
Diagnostic Code is 0, not provided for this example denial event.
- Use the information in this chapter to find an explanation of the Data Event 2 information.
 - Cause Value 41 = Temporary Failure. See [Cause Values](#) on page 128.
 - Location Code 4 = Remote Network/Public Network Serving Remote User (the Local Exchange Carrier at the far end of the call). See [Table 41: Location Code definitions](#) on page 124.

Table 39: Event Data 2 conversion example

Diagnostic Code								Location Code								Cause Value																							
Event Data 2																																							
0								0								4								2								9							
Binary number																																							
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	1	0	1	0	0	1													
Decimal weight of each digit position																																							
8	4	2	1	8	4	2	1	8	4	2	1	8	4	2	1	8	4	2	1	8	4	2	1	8	4	2	1												
Decimal weight of the binary positions for each eight-bit field																																							
128	64	32	16	8	4	2	1	128	64	32	16	8	4	2	1	128	64	32	16	8	4	2	1	128	64	32	16	8	4	2	1								
Bit position

7	7	0111	F	15	1111

Location Codes

See [Table 48: ISDN, IP, and SIP-generated denial events \(1173 - 1224\)](#) on page 183 for the Denial Events that show Cause Value information (Cause Value, Location Code, and Diagnostic Code) in Event Data 2 fields.

Use the location information of Event Data 2 to identify where in the network the called number failed to be recognized, and from where the Cause Value originated. See [Table 41: Location Code definitions](#) on page 124.

Table 41: Location Code definitions 1 of 2

Location Code	Definition
0	User
1	Private Network Serving Local User. The Local PBX or phone system on the Called Party premise
2	Public Network serving the Local User (the CO to which the PBX is directly connected).
3	Transit network. For example, the long distance network to which the call was passed by the LEC.
4	Public Network Serving Remote User [the Local Exchange Carrier (LEC) at the far end of the call].
1 of 2	

Table 41: Location Code definitions 2 of 2

Location Code	Definition
5	Private Network Serving Remote User (the remote PBX or phone system on the Called Party premises).
7	International.
A	Network beyond inter-networking point.
2 of 2	

Transmission Protocols

See [Table 48: ISDN, IP, and SIP-generated denial events \(1173 - 1224\)](#) on page 183 for the Denial Events that show Cause Value information (Cause Value, Location Code, and Diagnostic Code) in Event Data 2 fields.

The meaning of the Denial Event Data information differs depending on the type of protocol used for the call. The transmission protocol for your system is defined on the DS1 screen (**add/change/display ds1 location** command) by:

- The numeric country code value in the **Protocol** field - sets the country protocol.
- The letter value for the protocol version in the **Protocol Version** field.

See [Table 42, Country Codes and Transmission Protocols](#), on page 125.

Table 42: Country Codes and Transmission Protocols 1 of 3

Country Code – Protocol Version	Country	Protocol Supported	B-channel Maint. Message	Inter-working Message
1-a	US-Canada	AT&T TR 41449 / 41459	SERVICE	PROGRESS
1-b	US	Bellcore TR1268; NIUF.302; ANSI T1.607	RESTART	PROGRESS
1-c	US-Canada	Nortel A211 AT&T TR 4449/41459 (with Layer 3 timers adjusted)	SERVICE	PROGRESS
1-d	US	Bellcore TR3268	SERVICE	PROGRESS

				3 of 3

Cause Values

The Data Event 2 field on the **display events** screen sometimes contains Cause Value information (DIAG/LOC/CV). Use this information to identify the Cause Value for each denial event. The following information lists classes of Cause Values, their meaning and interpretations, and associated translations.

See [Table 48: ISDN, IP, and SIP-generated denial events \(1173 - 1224\)](#) on page 183 for the Denial Events that show Cause Value information (Cause Value, Location Code, and Diagnostic Code) in Event Data 2 fields.

Cause Value Classes

Table 43: Cause Value Classes and Ranges 1 of 2

Number range	Cause Value Class
empty to 33	Normal Class Cause Values on page 128
<ul style="list-style-type: none"> ● 12, 14, 15, 24 	unassigned
34 to 47	Resource Unavailable Class Cause Values on page 141
<ul style="list-style-type: none"> ● 36, 48 	unassigned
49 to 63	Service or Option not Available Class Cause Values on page 145
1 of 2	

Table 43: Cause Value Classes and Ranges 2 of 2

Number range	Cause Value Class
● 55, 60, 64	unassigned
65 to 79	Service or Option not Implemented Class Cause Values on page 152
● 67, 68, 71-78, 80	unassigned
81 to 95	Invalid Message Class Cause Values on page 155
● 92-94	unassigned
96 to 127	Protocol Error Class Cause Values on page 159
● 104-109, 116-126	unassigned
2 of 2	

Cause Values

Normal Class Cause Values

Cause Value (empty)

**[] -
Normal call clearing (1TR6: AT&T ISDN Protocol)**

The call was disconnected normally by either end hanging up.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Cause Value 00

**[0x0/0x80] -
Normal disconnect**

The call was disconnected normally by either end hanging up. Most equipment uses [Cause Value 16](#) to report normal disconnect.

Cause Value 01

**[0x1/0x81] -
Unassigned (Unallocated number)/
Invalid Call Reference Value (CRV) (1TR6: AT&T ISDN Protocol)**

The call could not be completed because the number requested in the SETUP message is not assigned/allocated by the ISDN network.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

See also [Cause Value 22](#) on page 137 and [Cause Value 56](#) on page 148.

Troubleshooting

- Check the numbers sent to see if any prefixes or service values that were needed to access the network were not sent.
- Check the Cause Value Information Element (LOC). See [Location Codes](#) on page 124.
- Check Communication Manager administration.
 - Dial-plan/Location: The home NPA is administered incorrectly, causing incorrect code conversion.
 - IXC: The IXC matching pattern is administered incorrectly or not at all on the dial-plan, causing incorrect IXC manipulation.
 - AAR/ARS digit conversion: The wrong digit string substitution is being made. The call is being routed into the wrong network and over the wrong route pattern. Further conversion is needed, but the dial string is restricted from further conversion.
 - AAR/ARS digit analysis: Call type is incorrect for the call being made specifying the wrong type of number and/or number plan information, or it is preventing code conversion from taking place. Call is being routed to the incorrect route pattern where the incorrect digit manipulation and/or code conversion is taking place.
 - ARS toll analysis: Toll/no toll classification is incorrect, causing incorrect code conversion at the route pattern.
 - Route pattern: Incorrect code conversion due to wrong entries in NPA, prefix mark, and toll list/prefix mark fields. Deleting the wrong number of digits or inserting the wrong digits. Failing to strip IXC or international code digits, stripping a user-dialed IXC code, or IXC forcing the call to the wrong interexchange carrier.
 - Trunk Group: The incorrect service or feature is specified for the call being made on a CBC trunk group preference. The number format is being changed to a format incorrect for the call type.

Cause Value 02

[0x2/0x82] -

No route to specified transit network/

Calling party off hold (5ESS: 5 Electronic Switching System)

The ISDN service provider's equipment cannot route the call through the specified network. The network either does not exist or is not compatible with the ISDN service provider's equipment.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network.
- Send a more generic Cause Value through the network.

Denial Events

Because this Cause Value has only local significance, on tandem calls Communication Manager might map it to [Cause Value 31](#) instead of passing it back through the network.

Troubleshooting

- Check the diagnostic information (DIAG) for the transit network identity of the unreachable network. See [Cause Values and their meanings/interpretations](#) on page 122.
- Check the numbers sent for any missing prefixes or service values that were needed to access the network.
- Check that the call type (data, voice, fax) can be routed between the ISDN networks serving both ends of the call.
- Check that the bearer capabilities of the call are acceptable to the ISDN network serving both ends of the call.
- Check the Cause Value Information Element (LOC). See [Location Codes](#) on page 124.
- Check Communication Manager administration.
 - AAR/ARS digit analysis: Call type is incorrect for the call being made specifying the wrong type of number and/or number plan information, or it is preventing code conversion from taking place. Call is being routed to the incorrect route pattern where the incorrect digit manipulation and/or code conversion is taking place.
 - Route pattern: Incorrect digits or IXC were inserted. Incorrect number of digits were deleted. An incorrect **ITC** and/or **BCIE** were specified, affecting the SETUP message bearer capability encoding. An incorrect service or feature was specified for the preference. The number format specified is wrong for the call type.
 - The ITC administered on the originating endpoint might be incorrect for this call.
 - Incorrect data speed option is set in the BRI device, causing a call from a BRI endpoint tandeming through Communication Manager to create a SETUP message with the wrong bearer capability.

Cause Value 03

[0x3/0x83] -

No route to destination/

Calling party dropped while on hold (5ESS: 5 Electronic Switching System)/

Bearer service not implemented (1TR6: AT&T ISDN Protocol)

The ISDN service provider cannot route the call to the indicated destination. Communication Manager does not originate Cause Value 03.

Troubleshooting

- Check the numbers sent for any missing prefixes or service values that were needed to access the network.
- Check the Cause Value Information Element (LOC). See [Location Codes](#) on page 124.

- Check Communication Manager administration.
 - Dial-plan/Location: The home NPA is administered incorrectly, causing incorrect code conversion.
 - IXC: The IXC matching pattern is administered incorrectly or not at all on the dial-plan, causing incorrect IXC manipulation.
 - AAR/ARS digit conversion: The wrong digit string substitution is being made. The call is being routed into the wrong network and over the wrong route pattern. Further conversion is needed but the dial string is restricted from further conversion.
 - AAR/ARS digit analysis: Call type is incorrect for the call being made specifying the wrong type of number and/or number plan information, or it is preventing code conversion from taking place. Call is being routed to the incorrect route pattern where the incorrect digit manipulation and/or code conversion is taking place.
 - ARS toll analysis: Toll/no toll classification is incorrect, causing incorrect code conversion at the route pattern.
 - Route pattern: Incorrect code conversion due to wrong entries in NPA, prefix mark, and toll list/prefix mark fields. Deleting the wrong number of digits or inserting the wrong digits. Failing to strip IXC or international code digits, stripping a user-dialed IXC code, or IXC forcing the call to the wrong interexchange carrier. Number format changed to a format incorrect for the call type. The incorrect service or feature is specified for the call being made on a CBC trunk group preference.

Cause Value 04

**[0x4/0x84] -
Send special information tone/
Vacant Code (NI-2: National ISDN 2)**

Cause Value 04 indicates the remote number that was dialed could not be reached.

Cause Value 04 (NI-2) indicates that the destination requested by the calling party cannot be reached because the Numbering Plan Area (NPA) or Central Office (CO) code is vacant (unassigned).

Troubleshooting

- Check the numbers sent for any missing prefixes or service values that were needed to access the network.
- Check the Cause Value Information Element (LOC). See [Location Codes](#) on page 124.
- Check Communication Manager administration.
 - Dial-plan/Location: The home NPA is administered incorrectly, causing incorrect code conversion.
 - IXC: The IXC matching pattern is administered incorrectly or not at all on the dial-plan, causing incorrect IXC manipulation.

Denial Events

- AAR/ARS digit conversion: The wrong digit string substitution is being made. The call is being routed into the wrong network and over the wrong route pattern. Further conversion is needed but the dial string is restricted from further conversion.
- AAR/ARS digit analysis: Call type is incorrect for the call being made specifying the wrong type of number and/or number plan information, or it is preventing code conversion from taking place. Call is being routed to the incorrect route pattern where the incorrect digit manipulation and/or code conversion is taking place. An incorrect service or feature is specified for the call being made on a CBC trunk group preference. Changing the Number format to a format incorrect for the call type.
- ARS toll analysis: Toll/no toll classification is incorrect, causing incorrect code conversion at the route pattern.
- Route pattern: Incorrect code conversion due to wrong entries in NPA, prefix mark, and toll list/prefix mark fields. Deleting the wrong number of digits or inserting the wrong digits. Failing to strip IXC or international code digits, stripping a user-dialed IXC code, or IXC forcing the call to the wrong interexchange carrier.

Cause Value 05

[0x5/0x85] - Misdialed trunk prefix

The remote number that was dialed could not be reached.

Troubleshooting

- Check the numbers sent for any missing prefixes or service values that were needed to access the network.
- Check the Cause Value Information Element (LOC). See [Location Codes](#) on page 124.
- Check Communication Manager administration.
 - Dial-plan/Location: The home NPA is administered incorrectly, causing incorrect code conversion.
 - IXC: The IXC matching pattern is administered incorrectly or not at all on the dial-plan, causing incorrect IXC manipulation.
 - AAR/ARS digit conversion: The wrong digit string substitution is being made. The call is being routed into the wrong network and over the wrong route pattern. Further conversion is needed but the dial string is restricted from further conversion.
 - AAR/ARS digit analysis: Call type is incorrect for the call being made specifying the wrong type of number and/or number plan information, or it is preventing code conversion from taking place. Call is being routed to the incorrect route pattern where the incorrect digit manipulation and/or code conversion is taking place.
 - ARS toll analysis: Toll/no toll classification is incorrect, causing incorrect code conversion at the route pattern.

- Route pattern: Incorrect code conversion due to wrong entries in NPA, prefix mark, and toll list/prefix mark fields. Deleting the wrong number of digits or inserting the wrong digits. Failing to strip IXC or international code digits, stripping a user-dialed IXC code, or IXC forcing the call to the wrong interexchange carrier.
- AAR/ARS digit analysis: Call type is incorrect for the call being made specifying the wrong type of number and/or number plan information, or it is preventing code conversion from taking place. An incorrect service or feature is specified for the call being made on a CBC trunk group preference. Changing the Number format to a format incorrect for the call type.

Cause Value 06

[0x6/0x86] - Channel Unacceptable

The call attempt failed because the requested channel is not acceptable to the ISDN service provider.

Troubleshooting

- Check Communication Manager administration.
 - B-channels might be assigned off a T1/E1 into a trunk group that are not available for service from the remote end. Contact the ISDN service provider to find out which B-channels can be used.

Cause Value 07

[0x7/0x87] - Call awarded and being delivered in an established channel/ Call identity does not exist (1TR6: AT&T ISDN Protocol)

Cause Value 07 indicates that a new incoming call is being established and is being connected on a channel that has previously been connected to the same user for similar type calls (for example, packet mode X.25 virtual channels being established on the d-channel).

Cause Value 07 (1TR6) indicates that a call resume has been attempted for a call with an identity different from any currently suspended calls.

Not an option for ISDN D-channels.

Cause Value 08

[0x8/0x88] - Preemption/ Prefix 0 dialed in error (NI-2: National ISDN 2)/ Call identity in use (1TR6: AT&T ISDN Protocol)/ Call is proceeding (NI-1: National ISDN 1)

Cause Value 08 For Autovon switching networks, the call attempt was blocked by a call with a higher priority.

Denial Events

Cause Value 08 (NI-2) indicates that the network does not want to receive the prefix digit 0 as part of the digit string in the CALLED PARTY NUMBER.

Cause Value 08 (1TR6) indicates that the call identity that sent in the call resume request is already in use by the network.

Troubleshooting

Wait and try the call again later.

Cause Value 09

**[0x9/0x89] -
Preemption, circuit reserved for reuse/
Prefix 1 dialed in error (NI-2: National ISDN 2)**

Cause Value 09 For Autovon switching networks, the call attempt was blocked by a call with a higher priority reserving the requested channel for reuse.

Cause Value 09 (NI-2) indicates that the network does not want to receive the prefix digit 1 as part of the digit string in the CALLED PARTY NUMBER.

Troubleshooting

Wait and try the call again later.

Cause Value 10

**[0xA/0x8A] -
Prefix 1 not dialed (NI-2: National ISDN 2)/
No channel available (1TR6: AT&T ISDN Protocol)**

Cause Value 10 (NI-2) indicates that the user must send the prefix digit 1 as part of the CALLED PARTY NUMBER.

Cause Value 10 (1TR6) indicates that the call cannot be completed because there is no appropriate circuit/channel presently available to handle the call request, or that congestion exists within the ISDN network.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Cause Value 11

**[0xB/0x8B] -
Excessive digits received call proceeding (NI-2: National ISDN 2)**

The equipment received more address digits in the CALLED PARTY NUMBER IE than expected during call origination procedures, and the received address information has been truncated.

Cause Value 13

**[0xD/0x8D] -
Service Denied (NI-1: National ISDN 1)**

Cause Value 16

**[0x10/0x90] -
Normal call clearing/
Requested facility not implemented (1TR6: AT&T ISDN Protocol)**

Cause Value 16 indicates that the call was disconnected normally by either end hanging up.

Cause Value 16 (1TR6) indicates that the call could not be completed because the equipment sending this Cause Value does not support the requested service, feature, or supplementary service in the SETUP message.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

- Check the diagnostic information (DIAG) for the facility identifier of the not implemented service. See [Cause Values and their meanings/interpretations](#) on page 122.
- If the remote device terminated the connection unexpectedly, contact the person responsible for the remote end to determine if there is a problem with the remote endpoint.
- For data bearer capability calls, if the connection has failed to establish, but the CONNECT and CONNECT_ACK messages were exchanged before the DISCONNECT was received, the handshake between the devices involved in the call might have failed due to:
 - Option settings with the endpoint devices
 - Bandwidth constriction issues on the b-channel used by the two devices to make the call

Cause Value 17

**[0x11/0x91] -
User busy/
Requested facility not subscribed (1TR6: AT&T ISDN Protocol)**

Cause Value 17 indicates that the endpoint called is unable to accept another call.

Cause Value 17 (1TR6) indicates that the call could not be completed because the user has not subscribed to the service, feature, or supplementary service requested in the SETUP message.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

See also [Cause Value 16](#) on page 135 and [Cause Value 31](#) on page 140.

Denial Events

Troubleshooting

- Wait and try the call again later.
- If the user is supposed to have access to the service, feature, or supplementary service, complete the ordering process with the ISDN service provider.
- Check the Cause Value Information Element (LOC).
 - If the location information of the Cause Value is 4, “public network serving the remote user”, the trunk group to the remote endpoint location might be experiencing an “all trunks busy” condition or not enough channels allocated into a virtual group for the particular NSF of the call.
 - If the location information of the Cause Value is 0, “user”, the endpoint might be busy.
- If Communication Manager is generating this Cause Value, and the endpoint is not busy, check the following Communication Manager administration.
 - Trunk group screen: Usage Allocation is **y** on the **CBC Service Type** field. Not enough incoming channels have been allocated for the NSF associated with this call.
 - VDNs and Call vectoring: Analyze the vector processing and the call flow to determine where the failure is occurring. VDN vector administration might incorrectly send the call to a “busy” vector step. The call might go to a skill/Automatic Call Distribution (ACD) group queue that is full and cannot accept any more calls. Look Ahead Interflow/Best Service Routing (LAI/BSR) might receive an inappropriate ISDN response while checking other sites for available agents and return busy feedback to the caller. The LAI/BSR attempt might interact with the public network features Egress on busy – overflow to POTS, Alternate Destination Routing (ADR), or Alternate Destination Call Redirection (ADCR).
 - Trunk and/or station Class of Restriction (COR) might prevent the call from terminating at the endpoint.
 - The endpoint might be call forwarded, and this is the second call within the 30-second time limit on a station call-forwarding a call.

Cause Value 18

[0x12/0x92] -

No user responding/

No response from the remote device

The remote device/endpoint/PBX did not respond with an ALERTING/PROGRESS/CONNECT indication within the time administered in the T303 or T310 timers Q.931 specification.

Cause Value 18 indicates high traffic conditions in the serving ISDN network or noisy conditions on the T1/E1 span carrying the d-channel messaging. The noise is causing the loss of messages being sent to the remote device. The remote device might also be unable to respond to the incoming SETUP request.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Cause Value 19

[0x13/0x93] - User alerting no answer

The remote device returned an alerting [ringing] indication but did not provide a connect indication within the period of time prescribed by timer T301.

Communication Manager never originates this Cause Value.

Troubleshooting

Wait and retry the call later.

Cause Value 20

[0x14/0x94] - Subscriber absent [wireless networks]

The mobile remote device/endpoint is not available.

Troubleshooting

Wait and try the call again later.

Cause Value 21

[0x15/0x95] - Call rejected

The remote endpoint did not accept this call, even though the equipment is neither busy nor incompatible and it could have accepted the call.

Check the diagnostic information (DIAG) for the user-supplied condition for why the call was rejected. See [Cause Values and their meanings/interpretations](#) on page 122.

Cause Value 22

[0x16/0x96] - Number changed

The called party number was changed to a new number.

[Cause Value 01](#) appears if the ISDN network does not support Cause Value 22.

A BRI or Adjunct Switch Application Interface (ASAI) application might generate Cause Value 22. Communication Manager does not originate Cause Value 22 for PRI.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Check the diagnostic information (DIAG) for the new number. See [Cause Values and their meanings/interpretations](#) on page 122.

Denial Events

Cause Value 23

**[0x17/0x97] -
Redirection to new destination**

The call has been redirected to a different endpoint.

Communication Manager does not originate Cause Value 23.

Cause Value 25

**[0x19/0x99] -
Exchange routing error**

The call cannot be routed to the remote party.

Cause Value 26

**[0x1A/0x9A] -
Non-selected user clearing**

The call was cleared before the called endpoint was awarded the incoming call.

Cause Value 27

**[0x1B/0x9B] -
Destination out of order**

The call cannot be delivered to the remote endpoint because the interface to the endpoint is not functioning correctly. A signaling message could not be delivered to the remote device (for example, there is a physical or data link layer failure at the remote device, or the remote device is turned off).

Communication Manager does not originate Cause Value 27.

Cause Value 28

**[0x1C/0x9C] -
Invalid number format (address incomplete)
Special intercept announcement (NI-1: National ISDN 1)**

The called endpoint could not be reached because the CALLED PARTY NUMBER information is not in a valid format or is not complete.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

- Check the Cause Value Information Element (LOC). See [Location Codes](#) on page 124.
- Check Communication Manager administration (network generated the Cause Value).
 - Dial-plan/Location: The home NPA is administered incorrectly, causing incorrect code conversion.
 - IXC: The IXC matching pattern is administered incorrectly or not at all on the dial-plan, causing incorrect IXC manipulation.
 - AAR/ARS digit conversion: The wrong digit string substitution is being made. The call is being routed into the wrong network and over the wrong route pattern. Further conversion is needed but the dial string is restricted from further conversion.
 - AAR/ARS digit analysis: Call type is incorrect for the call being made specifying the wrong type of number and/or number plan information, or it is preventing code conversion from taking place. Call is being routed to the incorrect route pattern where the incorrect digit manipulation and/or code conversion is taking place.
 - ARS toll analysis: Toll/no toll classification is incorrect, causing incorrect code conversion at the route pattern.
 - Route pattern: Incorrect NPA is causing incorrect code conversion. If the **Prefix mark** field has the wrong value, incorrect code conversion takes place. Toll list in combination with prefix mark is causing incorrect code conversion to take place. The wrong number of digits are deleted, or failed to strip IXC digits or international code digits. Inserted the wrong digits IXC forcing the call to the wrong inter-exchange carrier, or stripped out a user dialed IXC code. The incorrect service or feature is specified for the call being made on a CBC trunk group preference. The Number format was changed to a format incorrect for the call type.
- Check administration (Communication Manager generated the Cause Value).
 - Trunk group: Incoming call handling table might cause Communication Manager to delete or insert the wrong digits or number of digits to match the dial-plan.

Cause Value 29

[0x1D/0x9D] -

Facility rejected/

Special intercept announcement undefined code (NI-1: National ISDN 1)

The call could not be completed because the ISDN network does not support or is not subscribed to the network service or feature requested for use by this call.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Denial Events

Troubleshooting

- Check the diagnostic information (DIAG) for the facility identifier of the service that was rejected. See [Cause Values and their meanings/interpretations](#) on page 122.
- Check Communication Manager administration (network generated the Cause Value).
 - Route pattern: The **service** or **feature** field contains an incorrect value for this route preference. The **ITC/BCIE** fields might not indicate the correct information for a data call.
- Check administration (Communication Manager generated the Cause Value).
 - Trunk group form: the **Service type** field might indicate a static service type when the network is sending NSF information. Change the field to indicate **CBC** service.

Cause Value 30

[0x1E/0x9E] -

Response to STATUS_ENQUIRY

Special intercept announcement number unassigned (NI-1: National ISDN 1)

Cause Value 30 is included in a STATUS message when the STATUS message is generated because a STATUS_ENQUIRY message was received. This is a normal event and does not indicate a call-affecting problem. Communication Manager generates a call-state audit every maintenance cycle that elicits this response from the remote end.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Cause Value 31

[0x1F/0x9F] -

Normal unspecified/

Special intercept announcement call blocked due to group restriction (NI-1: National ISDN 1)

Cause Value 31 reports a normal event when no other cause in the normal class applies.

The ISDN network might substitute this Cause Value for other causes generated within the network that do not have end-to-end significance.

For most Cause Values with only local significance on tandem calls, Communication Manager maps Cause Values to Cause Value 31. See also [Cause Value 02](#) on page 129.

Cause Value 31 can also be used as a return code on BSR polling attempts instead of [Cause Value 16](#) or [Cause Value 17](#) depending on which Cause Value has less impact/interaction on the intervening ISDN network.

Cause Value 32

[0x20/0xA0] - Outgoing calls barred (1TR6: AT&T ISDN Protocol)

The call could not be completed because the calling user does not have permission to make an outgoing call.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Cause Value 33

[0x21/0xA1] - User access busy (1TR6: AT&T ISDN Protocol)

Resource Unavailable Class Cause Values

Cause Value 34

[0x22/0xA2] - No circuit/channel available/ Negative closed user group comparison (1TR6: AT&T ISDN Protocol)

Cause Value 34 indicates that the call cannot be completed because there is no appropriate circuit/channel available to handle the call request, or congestion exists within the ISDN network.

Communication Manager generates this Cause Value when a call is tandeming through Communication Manager and the trunk group to be used for the outgoing leg is:

- In “all trunks busy” condition
- Otherwise unavailable for service
- Unreachable from the incoming trunk group due to Class of Restriction (COR), FRL, trunk-to-trunk transfer restrictions, or disconnect supervision restrictions

Cause Value 34 (1TR6) indicates that the packet mode call was rejected because the user is not a member of the remote end’s Closed User Group (CUG), which is a feature associated with packet mode calls similar to X.25 connection made over the ISDN D-channel.

Communication Manager does not support packet mode sessions on D-channels, therefore this is not applicable to Communication Manager.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Denial Events

Troubleshooting

- Check Communication Manager administration (network generated the Cause Value).
 - B-channels might be assigned off a T1/E1 into a trunk group that are not available for service from the remote end. Contact the ISDN service provider to find out which B-channels can be used.
- Check administration that might cause Communication Manager to generate this Cause Value.
 - If all of the B-channels in a span are busied out or otherwise tied up by switch maintenance but the D-channel is still up, an incoming call is rejected with this Cause Value because the call cannot be negotiated to another span.

Cause Value 35

[0x23/0xA3] -

Non-existent closed user group (1TR6: AT&T ISDN Protocol)

The packet mode call was rejected because the equipment sending the Cause Value does not recognize the requested Closed User Group (CUG), which is a feature associated with packet mode calls similar to X.25 connection made over the ISDN D-channel.

Communication Manager does not support packet mode sessions on D-channels, therefore this is not applicable to Communication Manager.

Cause Value 37

[0x25/0xA5] -

Semi-permanent connection not permitted (1TR6: AT&T ISDN Protocol)

Cause Value 38

[0x26/0xA6] -

Network out of order

The call was not completed because the ISDN network is not functioning correctly, and the condition is likely to last a relatively long period of time. Immediately reattempting the call will probably be unsuccessful.

Cause Value 39

[0x27/0xA7] -

Permanent frame mode connection out of service

This appears to be a Q.933 frame relay Cause Value. Equipment failure might have caused termination of a frame relay PVC.

Not applicable to a Communication Manager system.

Cause Value 40

[0x28/0xA8] - Permanent frame mode connection is operational

This appears to be a Q.933 frame relay Cause Value. A frame relay PVC that was terminated has been restored to service.

Not applicable to a Communication Manager system.

Cause Value 41

[0x29/0xA9] - Temporary Failure

The call was not completed because the ISDN network is not functioning correctly. The condition is not likely to last a long period of time. If the user attempts the call again it will probably complete.

Cause Value 41 might also indicate:

- The failure of channel negotiation at the terminating interface.
- A data link layer malfunction has occurred locally or at the remote network interface.
- The call is being cleared as a result of one or more protocol errors at the remote network interface.

See also [Cause Value 63](#) on page 151 and [Cause Value 79](#) on page 154.

Cause Value 42

[0x2A/0xAA] - Switching equipment congestion

The call could not be completed because the switching equipment generating this Cause Value is experiencing a period of high traffic.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

Wait and try the call again later.

Cause Value 43

[0x2B/0xAB] - Access information discarded

The network could not deliver access or user information (such as low-layer compatibility or calling-name information) to the remote endpoint for any one of various reasons. For example, the call interworked from ISDN to non-ISDN facilities, or the remote end does not support delivery of such information.

Denial Events

This Cause Value is usually delivered in a STATUS message. Communication Manager generates this Cause Value when:

- A tandem call inter-works from ISDN to non-ISDN trunking.
- Calling number and/or calling name information is sent in the SETUP message when it is not needed.
- Connected number information is sent when the network does not support it.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Check the diagnostic information (DIAG) for the Information Element identifier of the discarded information. See [Cause Values and their meanings/interpretations](#) on page 122.

Cause Value 44

[0x2C/0xAC] - Requested circuit/channel not available

The call was not completed because the circuit/channel requested for use in the SETUP message was not available, and the call could not be negotiated to another channel either because no other channel was available, or negotiation is not supported or was not wanted for this call.

This Cause Value is generated when a glare condition is occurring and B-channel negotiation is not supported.

Communication Manager generates this Cause Value when:

- It is the NETWORK side of the interface and a glare condition is occurring on the requested B-channel.
- The B-channel requested in the incoming SETUP message is not in the correct maintenance state to handle a call (for example, it is busied out or undergoing testing).

Troubleshooting

- CO switch default settings turn off channel negotiation support. Make a specific request to turn on channel negotiation support when ordering CO service.
- Check Communication Manager administration (network generated the Cause Value).
 - Trunk group form: When the **Channel Negotiation** field is set to **exclusive**, Communication Manager requests B-channels for calls without support for negotiation so if at the remote end the requested B-channel is unavailable for whatever reason the call cannot be negotiated to a more acceptable B-channel and the call will be rejected with Cause Value 44. Set the **Channel Negotiation** field to **preferred** to support channel negotiation.

Cause Value 45

**[0x2D/0xAD] -
Pre-empted**

The call could not be completed because the equipment sending this Cause Value does not have the requested B-channel in a maintenance state that allows for call requests to be processed.

Communication Manager does not support this Cause Value.

Cause Value 46

**[0x2E/0xAE] -
Precedence call Blocked**

For Autovon switching networks, the call could not complete because the remote endpoint is busy with a call that has a higher priority.

Cause Value 47

**[0x2F/0xAF] -
Resource unavailable, unspecified/
New destination (4ESS/5ESS: 4/5 Electronic Switching System)**

Cause Value 47 indicates a resource unavailable event only when no other cause in the resource unavailable class applies.

Cause Value 47 (4ESS/5ESS) If this Cause Value is returned in a RELEASE_COMPLETE or DISCONNECT message and the customer is an Alternate Destination Call Redirection (ADCR) subscriber, it invokes call redirection.

Communication Manager does not originate Cause Value 47.

Service or Option not Available Class Cause Values

Cause Value 49

**[0x31/0xB1] -
Quality of service unavailable**

The call could not be completed because the quality of service requested in the SETUP as defined in ITU recommendation X.213 cannot be provided (for example, requested throughput or transit delay cannot be supported).

Denial Events

Cause Value 50

[0x32/0xB2] - Requested facility not subscribed

The call could not be completed because the user has not subscribed to the service, feature, or supplementary service requested in the SETUP message. If the user is supposed to have access to this service, feature, or supplementary service, then complete the required ordering process with the ISDN service provider.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Communication Manager does not originate this Cause Value for PRI. A BRI or Adjunct Switch Application Interface (ASAI) application might generate this Cause Value.

Communication Manager translations that can affect receiving this Cause Value from the network are:

- **Route Pattern: service or feature:** An incorrect service or feature is specified for the call being made on this CBC trunk group preference. An incorrect **ITC** and/or **BCIE** is specified. These fields affect how the bearer capability is encoded in the SETUP message.
- **The ITC administered on the originating endpoint might be incorrect for this call.**
 - Incorrect data speed option is set in the BRI device, causing a call from a BRI endpoint tandeming through Communication Manager to create a SETUP message with the wrong bearer capability.
- **On tandem calls through Communication Manager from ISDN trunks to ISDN trunks, an inappropriate NSF can be tandemed from one D-channel to the other D-channel.**
- **The problem is that the outgoing trunk group is CBC but no service or feature was specified on the outgoing route pattern to overwrite the incoming NSF. Add the correct service or feature to the route pattern or make the outgoing trunk group a static trunk group (for example, public-network or tie) as appropriate.**
- **System Parameters Features: The US NI send Calling Name ID field is y. Communication Manager sends the Bellcore calling name ID but the customer has not subscribed to that service. Set the US NI send Calling Name ID field to n.**

Cause Value 51

[0x33/0xB3] - Bearer capability incompatible with service request (NI-1: National ISDN 1)

The requested action could not be completed. The requested action is incompatible with the bearer capability of the call (for example, trying to place a data call on hold).

Cause Value 52

[0x34/0xB4] - Outgoing calls barred

The call could not be completed because the network screened the call, and the calling user is not permitted to make an outgoing call.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Cause Value 53

[0x35/0xB5] - Service operation violated (NI-1: National ISDN 1)/ Destination not obtainable (1TR6: AT&T ISDN Protocol)

Cause Value 53 (NI-1) indicates that the user has violated the service operation.

Cause Value 53 (1TR6) indicates that the call cannot be delivered to the remote endpoint because the interface to the endpoint is not functioning correctly. A signaling message could not be delivered to the remote device (for example, there is a physical or data link layer failure at the remote device, or the remote device is turned off).

Cause Value 54

[0x36/0xB6] - Incoming calls barred

The call could not complete because the called user is not allowed to accept the call delivered in the SETUP message.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

- Check Communication Manager administration (network generated the Cause Value).
 - Trunk group: Direction: The Communication Manager field might be set to **two-way** on a trunk group that the ISDN network has configured as outgoing only, relative to the CO switch, and a user on Communication Manager is attempting to make an outgoing call over this trunk group, which is an incoming call to the CO.
 - On tandem calls through Communication Manager from ISDN trunks to ISDN trunks, an NSF for a one-way service (for example, Megacom 800) is being tandemed from one D-channel to the other D-channel. The problem is that the outgoing trunk group is CBC but no service or feature was specified on the outgoing route pattern to overwrite the incoming NSF. Add the correct service or feature to the route pattern or make the outgoing trunk group a static trunk group (for example, public-network or tie) as appropriate.

Denial Events

Cause Value 56

**[0x38/0xB8] -
Number changed (1TR6: AT&T ISDN Protocol)**

The called party number indicated has been changed to a new number that might be sent in the diagnostic information (DIAG) for this Cause Value. See [Cause Values and their meanings/interpretations](#) on page 122. If this Cause Value is not supported by the ISDN network, [Cause Value 01](#) is used instead.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Communication Manager does not originate this Cause Value for PRI. A BRI or Adjunct Switch Application Interface (ASAI) application might generate this Cause Value.

Cause Value 57

**[0x39/0xB9] -
Bearer capability not authorized/
Out of order (1TR6: AT&T ISDN Protocol)**

Cause Value 57 indicates that the call could not be completed because the user has requested a bearer capability in the SETUP message which is implemented by the equipment generating this Cause Value, but user has not subscribed to it or in other ways is not authorized to use.

Cause Value 57 (1TR6) indicates that the call cannot be delivered to the remote endpoint because the interface to the endpoint is not functioning correctly. A signaling message could not be delivered to the remote device (for example, due to a physical or data link layer failure at the remote device, or the remote device is turned off).

Troubleshooting

- Check the diagnostic information (DIAG) for the unauthorized bearer capability attributes. See [Cause Values and their meanings/interpretations](#) on page 122.
- Check Communication Manager administration (network generated the Cause Value).
 - Route pattern: An incorrect **ITC** and/or **BCIE** specified, these fields affect how the bearer capability is encoded in the SETUP message.
 - The ITC administered on the originating endpoint might be incorrect for this call, and/or the speed options in the device itself might be incorrect for calls over these ISDN facilities.
 - Incorrect data speed option is set in the BRI device, causing a call from a BRI endpoint tandeming through Communication Manager to create a SETUP message with the wrong bearer capability.
 - A call tandeming through Communication Manager ISDN trunk group to ISDN trunk group might have a bearer capability that is not supported by the outgoing ISDN facilities or network.

- A call tandeming through Communication Manager on a non-ISDN trunk group inter-working to an ISDN trunk group might have an incorrect bearer capability assigned on the incoming trunk group. The **BC** and **ITC** fields on the incoming trunk group might be set wrong.

Cause Value 58

[0x3A/0xBA] -

**Bearer capability not presently available/
No user responding (1TR6: AT&T ISDN Protocol)**

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Cause Value 58 indicates that the call could not be completed because the user has requested a bearer capability in the SETUP message which is implemented by the equipment generating this Cause Value, but for which there are presently no resources available to be used to complete the call.

Troubleshooting

Wait and try the call again later.

Cause Value 58 (1TR6) indicates that the remote device/endpoint/PBX did not respond with an ALERTING/PROGRESS/CONNECT indication within the prescribed period of time allocated by the expiry of the T303 or T310 timers in the Q.931 specification.

Troubleshooting

- Check the diagnostic information (DIAG) for the bearer capability attributes that are not available. See [Cause Values and their meanings/interpretations](#) on page 122.
- Check Communication Manager administration (network generated the Cause Value).
 - Route pattern: An incorrect **ITC** and/or **BCIE** specified, these fields affect how the bearer capability is encoded in the SETUP message.
 - The ITC administered on the originating endpoint might be incorrect for this call, and/or the speed options in the device itself might be incorrect for calls over these ISDN facilities.
 - Incorrect data speed option is set in the BRI device, causing a call from a BRI endpoint tandeming through Communication Manager to create a SETUP message with the wrong bearer capability.
 - A call tandeming through Communication Manager ISDN trunk group to ISDN trunk group might have a bearer capability that is not supported by the outgoing ISDN facilities or network.
 - A call tandeming through Communication Manager on a non-ISDN trunk group inter-working to an ISDN trunk group might have an incorrect bearer capability assigned on the incoming trunk group. The **BC** and **ITC** fields on the incoming trunk group might be set wrong.

Denial Events

Cause Value 59

[0x3B/0xBB] - User busy (1TR6: AT&T ISDN Protocol)

The endpoint called has indicated an inability to accept another call.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

- Wait and try the call again later.
- Check the Cause Value Information Element (LOC)
 - If the Location Information of the Cause Value is 0 (User), the endpoint is probably busy.
 - If the Location information of the Cause Value is 4 (Public Network Serving Remote User), it is most likely that the trunk group to the remote endpoint location is experiencing an “all trunks busy” condition or not enough channels allocated into a virtual group for the particular NSF of the call.
- If Communication Manager is generating this Cause Value and the endpoint is not busy, the following translations and features could be affecting the call:
 - Trunk and/or station Class of Restriction (COR) might be preventing the call from terminating at the called endpoint.
 - The endpoint might be call-forwarded and this is the second call within the 30-second time limit on a station call forwarding a call.
 - Trunk group form: CBC service type: **Usage Allocation** is **y**. The usage allocation plan might not have allocated enough incoming channels for the NSF associated with this call.
 - VDNs and Call Vectoring: The vector associated with the VDN might be incorrectly programmed and the call is inappropriately sent to a busy vector step. The skill/ Automatic Call Distribution (ACD) group that the call is trying to queue to might have a full queue and cannot accept any more calls. Look Ahead Interflow/Best Service Routing (LAI/BSR) might have received an inappropriate ISDN response while checking other sites for available agents and has inadvertently returned busy feedback to the caller. The LAI/BSR attempt might be interacting with the public network features Egress on busy – overflow to POTS, Alternate Destination Routing (ADR), or Alternate Destination Call Redirection (ADCR). Analyze the vector processing of the call and the call flow to determine where the failure is occurring.

Cause Value 61

[0x3D/0xBD] - Incoming calls barred (1TR6: AT&T ISDN Protocol)

The call could not complete because the called user is not allowed to accept the call delivered in the SETUP message.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

- Check Communication Manager administration (network generated the Cause Value).
 - Trunk group: Direction: Communication Manager might be set to “two-way” on a trunk group the ISDN network has configured as outgoing only, relative to the CO switch, and a user on Communication Manager is attempting to make an outgoing call over this trunk group, which is an incoming call to the CO.
 - On tandem calls through Communication Manager from ISDN trunks to ISDN trunks, an NSF for a one-way service (for example, Megacom 800) is being tandemed from one D-channel to the other D-channel. The problem is that the outgoing trunk group is CBC but no service or feature was specified on the outgoing route pattern to overwrite the incoming NSF. Add the correct service or feature to the route pattern or make the outgoing trunk group a static trunk group (for example, public-network or tie) as appropriate.

Cause Value 62

**[0x3E/0xBE] -
Service not authorized (VN4: French National PRI)/
Call rejected (1TR6: AT&T ISDN Protocol)**

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Cause Value 62 (VN4) indicates that the call could not be completed because the user has not subscribed to the service, feature, or supplementary service requested in the SETUP message. If the user is supposed to have access to this service, feature, or supplementary service, then complete the required ordering process with the ISDN service provider.

Cause Value 62 (1TR6) indicates that the remote endpoint does not wish to accept this call, although it could have accepted the call because the equipment is neither busy nor incompatible.

The diagnostic information (DIAG) might be populated with the user-supplied condition for why the call was rejected. See [Cause Values and their meanings/interpretations](#) on page 122.

Cause Value 63

**[0x3F/0xBF] -
Service or option not available, unspecified**

This Cause Value indicates that the requested service or option is unavailable when no other cause in the Service or option not available class applies.

As an implementation option, this Cause Value shall either be passed to the user or mapped to [Cause Value 41](#) (Temporary Failure) when it is received at a CO as part of SS7 call handling.

Communication Manager does not originate Cause Value 63.

Service or Option not Implemented Class Cause Values

Cause Value 65

[0x41/0xC1] Bearer capability not implemented

The call could not be completed because the equipment sending this Cause Value does not support the bearer capability requested in the SETUP message.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

The diagnostic information (DIAG) of the Cause Value should contain if implemented the bearer capability attributes that are not implemented. See [Cause Values and their meanings/interpretations](#) on page 122.

Cause Value 66

[0x42/0xC2] Channel type not implemented

The call could not be completed because the equipment sending this Cause Value does not support the channel type requested in the SETUP message.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

- Check the diagnostic information (DIAG) for the unsupported channel type. See [Cause Values and their meanings/interpretations](#) on page 122.
- Check Communication Manager administration (network generated Cause Value):
 - Communication Manager is attempting to make a wideband call over an interface to an ISDN network that does not support wideband calls. Check the trunk group and routing translations to be sure the attempted call has not inadvertently been routed to this interface or was mis-classified as a wideband call.
- Communication Manager administration that can affect sending of this Cause Value:
 - The network is supporting wideband calling and Communication Manager does not have wideband support enabled on the **Wideband Switching** field on the **system-parameters customer-options** screen
 - Communication Manager does not have wideband support enabled on the **Wideband Support** field on the appropriate trunk group
 - The trunk group does not have the correct type(s) of wideband channels enabled
 - Communication Manager does not have the right size wideband endpoint programmed.

Cause Value 69

[0x45/0xC5] - Requested facility not implemented

The call could not be completed because the equipment sending this Cause Value does not support the requested service, feature, or supplementary service in the SETUP message.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Communication Manager does not originate this Cause Value for PRI. A BRI or Adjunct Switch Application Interface (ASAI) application might generate this Cause Value.

Troubleshooting

- Check the diagnostic information (DIAG) for the facility identifier of the not-implemented service. See [Cause Values and their meanings/interpretations](#) on page 122.
- Check Communication Manager administration (network generated the Cause Value).
 - Route Pattern: service or feature: An incorrect service or feature is specified for the call being made on this CBC trunk group preference. An incorrect **ITC** and/or **BCIE** specified, these fields affect how the bearer capability is encoded in the SETUP message.
 - The ITC administered on the originating endpoint might be incorrect for this call.
 - Incorrect data speed option is set in the BRI device, causing a call from a BRI endpoint tandeming through Communication Manager to create a SETUP message with the wrong bearer capability.
 - On tandem calls through Communication Manager from ISDN trunks to ISDN trunks, an inappropriate NSF can be tandemed from one D-channel to the other D-channel. The problem is that the outgoing trunk group is CBC but no service or feature was specified on the outgoing route pattern to overwrite the incoming NSF. Add the correct service or feature to the route pattern or make the outgoing trunk group a static trunk group (for example, public-network or tie) as appropriate.
 - System Parameters Features: **US NI send Calling Name ID** field is **y**. Communication Manager sends the Bellcore calling name ID but the customer has not subscribed to that service. Set the **US NI send Calling Name ID** field to **n**.
- Communication Manager is attempting to send User-to-User information in a message through the public network when not subscribed to a UUS service, for example Look Ahead Interflow/Best Service Routing (LAI/BSR) information, Adjunct Switch Application Interface (ASAI) information, etc.

Denial Events

Cause Value 70

[0x46/0xC6] -

Only restricted digital information bearer capability is available

The call could not be completed because the equipment sending this Cause Value only supports the restricted version of the requested bearer capability, and in the SETUP message bearer capability was unrestricted.

Communication Manager does not originate Cause Value 70.

Troubleshooting

- Check Communication Manager administration (network generated the Cause Value).
 - Route pattern: An incorrect **ITC** and/or **BCIE** specified, these fields affect how the bearer capability is encoded in the SETUP message.
 - The ITC administered on the originating endpoint might be incorrect for this call, and/or the speed options in the device itself might be incorrect for calls over these ISDN facilities.
 - Incorrect data speed option is set in the BRI device, causing a call from a BRI endpoint tandeming through Communication Manager to create a SETUP message with the wrong bearer capability.
 - A call tandeming through Communication Manager ISDN trunk group to ISDN trunk group might have a bearer capability that is not supported by the outgoing ISDN facilities or network.
 - A call tandeming through Communication Manager on a non-ISDN trunk group inter-working to an ISDN trunk group might have an incorrect bearer capability assigned on the incoming trunk group. The **BC** and **ITC** fields on the incoming trunk group might be set wrong.

Cause Value 79

[0x4F/0xCF] -

Service or option not implemented, unspecified

The call could not be completed because the equipment sending this Cause Value has not implemented a service, feature, or supplementary service requested by the user, and none of the other Cause Values in the Service or option not implemented class apply.

As an implementation option, this Cause Value might be mapped to [Cause Value 41](#) (Temporary Failure) when it is received at a CO as part of SS7 call handling.

Communication Manager does not originate Cause Value 79.

Invalid Message Class Cause Values

Cause Value 81

[0x51/0xD1] - Invalid call reference value

The equipment sending this Cause Value received a message with a call reference value that is not currently in use on this user-network (D-channel) interface. This could indicate a call state mismatch for the attempted connection between the two sides of the interface.

This Cause Value is most often generated when a message in a call clearing sequence of messages is lost in transmission due to problems experienced on the D-channel. One side of the interface thinks that the call has been torn down but the other side sends messages to complete clearing the call. The response to this new call clearing sequence becomes a RELEASE_COMPLETE message with Cause Value 81.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Cause Value 82

[0x52/0xD2] - Identified channel does not exist

The equipment sending this Cause Value received a SETUP request to use a channel that is not activated on this interface for a call. For example, when a user has subscribed to those channels on a primary rate interface numbered 1 to 12, and the user equipment or network attempts to use one of the channels number 13 to 23, this Cause Value is generated.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Troubleshooting

- Check the diagnostic information (DIAG) for the channel number of the non-existent channel. See [Cause Values and their meanings/interpretations](#) on page 122.
- Check Communication Manager administration (network generated the Cause Value).
 - Communication Manager might have B-channels assigned off a T1/E1 into a trunk group that are not available for service from the remote end. Contact the ISDN service provider to find out which B-channels can be used.

Denial Events

- Communication Manager administration that can affect sending this Cause Value:
 - Communication Manager might have missed assigning some B-channels into a trunk group that the remote believes can be used for service and is attempting to request a call on one. Check which channel is being requested and if possible assign it into the appropriate trunk group. If the channel being requested is the 24th (T1) or 16th (E1) channel, it might be incorrectly programmed as **isdn-pri** on the **DS1** screen instead of **isdn-ext**.

Cause Value 83

[0x53/0xD3] -

A suspended call exists, but this call identity does not

This Cause Value indicates that a call resume has been attempted for a call with an identity that differs from any that are presently in a suspended state.

Cause Value 84

[0x54/0xD4] -

Call identity in use

This Cause Value indicates that the call identity sent in the call resume request is already in use by the network.

Cause Value 85

[0x55/0xD5] -

No call suspended

This Cause Value indicates that a call resume has been attempted for a call, but the network does not presently have any calls in a suspended state within the domain of interfaces over which calls can be suspended.

Cause Value 86

[0x56/0xD6] -

Call having the requested call identity has been cleared

The equipment sending this cause received a resume request for a call identity indicating a suspended call that had been cleared while still in the suspended state, either by a network timeout or by the remote user.

Cause Value 87

[0x57/0xD7] - User not a member of the Closed User Group [CUG]

The packet mode call was rejected because the user is not a member of the remote end's Closed User Group (CUG), which is a feature associated with packet mode calls similar to X.25 connection made over the ISDN D-channel.

Communication Manager does not support packet mode sessions on D-channels, therefore this is not applicable to Communication Manager.

Cause Value 88

[0x58/0xD8] - Incompatible destination

The call could not be completed because the call request in the SETUP message has low layer compatibility, high layer compatibility, or other compatibility attributes (for example, data rate, DN, or sub-address information) which the remote endpoint or network cannot accommodate.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

- Check Communication Manager administration (network generated the Cause Value).
 - Route pattern: An incorrect **ITC** and/or **BCIE** specified, these fields affect how the bearer capability is encoded in the SETUP message.
 - The ITC administered on the originating endpoint might be incorrect for this call, and/or the speed options in the device itself might be incorrect for calls over these ISDN facilities.
 - Incorrect data speed option is set in the BRI device, causing a call from a BRI endpoint tandeming through Communication Manager to create a SETUP message with the wrong bearer capability.
 - A call tandeming through Communication Manager ISDN trunk group to ISDN trunk group might have a bearer capability that is not supported by the outgoing ISDN facilities or network.
 - A call tandeming through Communication Manager on a non-ISDN trunk group inter-working to an ISDN trunk group might have an incorrect bearer capability assigned on the incoming trunk group. The **BC** and **ITC** fields on the incoming trunk group might be set wrong.
- Communication Manager administration that can affect sending this Cause Value:
 - The extension number assigned in Communication Manager that was received in the incoming SETUP message for this data call is assigned to an analog extension.
 - The extension number assigned in Communication Manager that was received in the incoming SETUP message for this voice call is assigned to a data extension.

Denial Events

- A data call attempt tandeming through Communication Manager ISDN trunk group to ISDN trunk group the outgoing route pattern has the Bearer Capability Class (BCC) required for making this call set to "NO" and/or the ITC and BCIE are not compatible with the incoming bearer capability.
- A TSC setup attempt that is tandeming through Communication Manager, the outgoing route pattern does not have the TSC bearer capability activated.

Cause Value 89

[0x59/0xD9] - Network Congestion (1TR6: AT&T ISDN Protocol)

The call could not be completed because the switching equipment generating this Cause Value is experiencing a period of high traffic.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Troubleshooting

Wait and try the call again later.

Cause Value 90

[0x5A/0xDA] - Non-existent closed user group (CUG)/ Remote user initiated clearing (1TR6: AT&T ISDN Protocol)

The packet mode call was rejected because the equipment that sent the Cause Value did not recognize the requested Closed User Group (CUG), which is a feature associated with packet mode calls similar to X.25 connection made over the ISDN D-channel.

Communication Manager does not support packet mode sessions on D-channels, therefore this is not applicable to Communication Manager.

Cause Value 91

[0x5B/0xDB] - Invalid transit network selection

The call could not be completed because the equipment that sent this Cause Value received a request to route a call to a transit network that it does not have a connection to, or the transit network identification that was received is of an incorrect format as defined in Annex C of the ITU Q.931 specification for either the TNS IE or the NSF IE.

Communication Manager does not originate Cause Value 91.

Troubleshooting

- Check Communication Manager administration (network generated the Cause Value).
 - Communication Manager sent the transit network identification in the NSF IE when the network expected it to be in the TNS IE. The protocol version on the **DS1** form does not match the near-end ISDN network that is terminating the D-channel. Contact the ISDN network service provider and try to line up the protocols being used. NI-2 only supports the TNS IE, while custom protocol supports use of the NSF IE for this purpose.

Cause Value 95

[0x5F/0xDF] - Invalid message, unspecified

This Cause Value indicates an invalid message event only when no other cause in the invalid message class applies.

Communication Manager does not originate this Cause Value for PRI. A BRI or Adjunct Switch Application Interface (ASAI) application might generate this Cause Value.

Troubleshooting

The diagnostic information (DIAG) of the Cause Value should contain, if implemented, the message type identifier of the invalid message. See [Cause Values and their meanings/interpretations](#) on page 122.

Protocol Error Class Cause Values

Cause Value 96

[0x60/0xE0] - Mandatory information element is missing

The equipment that sent this Cause Value Call Reference Value (CRV) received a message that did not contain a required Information Element for the message to be parsed and processed.

Depending on which message in the call establishment sequence is missing information, a message returned with this Cause Value might or might not indicate a problem establishing a call.

When the public network is screening for Calling Party Number (CPN), the fact that CPN is missing causes the network to return this Cause Value, but depending on optioning in the CO the call might still go through.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Troubleshooting

- Check that the protocols at each end of the interface match (for example, both sides are **AT&T Custom** or both sides are **NI-2**). If the ends of the interface are running different protocols, they might be running with different Information Element encoding.
- Check the diagnostic information (DIAG) for the IE identifier of the missing information. See [Cause Values and their meanings/interpretations](#) on page 122.

Communication Manager generates diagnostic information. See [Table 44, Cause Value 96 & 100 Diagnostic Information](#), on page 160.

Cause Value 97**[0x61/0xE1] -****Message type non-existent or not implemented**

The equipment that sent this Cause Value received a message containing a message type it does not recognize, either because the message type is not defined or it is defined but not implemented by the equipment.

Denial Events

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Troubleshooting

- Check that the protocols at each end of the interface match (for example, both sides are **AT&T Custom** or both sides are **NI-2**). If the ends of the interface are running different protocols, they might be running with different Information Element encoding.
- Check the diagnostic information generated by Communication Manager for the message type identifier of the unrecognized message.

Table 45: Cause Value 97, 98, 101 Diagnostic Information 1 of 2

Message Type Identifier	Message

2 of 2	

Cause Value 98**[0x62/0xE2] -****Message type, not compatible with call state, or non-existent, or not implemented**

The equipment that sent this Cause Value received a message, and the procedures in the protocol specification indicate that this is not a permissible message to receive while in this call state. A STATUS message was received indicating an incompatible call state.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Troubleshooting

- Check that the protocols at each end of the interface match (for example, both sides are **AT&T Custom** or both sides are **NI-2**). If the ends of the interface are running different protocols, they might be running with different call state machines, or different message type encoding.
- Check the diagnostic information generated by Communication Manager for the message type identifier of the message that violates protocol. See [Table 45: Cause Value 97, 98, 101 Diagnostic Information](#) on page 162.
- Call state problems are reported with STATUS messages. The equipment sending the Cause Value uses the CALL STATE IE of the STATUS message to indicate the call state. To determine the call state of the other end of the interface, run the message sequence of the call through the SDL flow charts of the appropriate side (user or network) and the appropriate protocol (TR41449/41459, TR1268, A211 etc.). If the call state at the other end of the interface does not agree with that reported in the STATUS message and both sides are already running the same protocol, then a problem with the implementation of the state machine exists on either side.

Denial Events

Problems have been revealed with the state machine implementations of some of the CO switches for different protocols, and the state machine problems in the CO switches are most likely not going to be corrected. Communication Manager has not shown any problems with its state machine implementations for the different protocols.

Change Communication Manager administration to change the message sequence of the call scenario causing the error, and help solve state machine implementation problems. For example:

- change the inter-working message on the **DS1** form from **PROGRESS** to **ALERTING**
- change the “wait” steps in vectors to be “i-silent” so that they do not generate extra PROGRESS messages in the calling message sequence.

Cause Value 99

[0x63/0xE3] -

Information element non-existent or not implemented

The equipment that sent this Cause Value received a message that includes Information Elements that are not recognized because the Information Element identifier is not defined, or it is defined but has not been implemented by the equipment sending the Cause Value. However, the Information Element is not mandatory in the message, and the equipment that sent the Cause Value does not need to parse the Information Element in order to process the message.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Troubleshooting

- Check that the protocols at each end of the interface match (for example, both sides are **AT&T Custom** or both sides are **NI-2**). If the ends of the interface are running different protocols, they might be running with different Information Element encoding.
- Check Communication Manager administration (network generated the Cause Value).
 - Sending connected number information with the domestic custom Information Element identity encoding (0C), but international encoding (4C) is expected.

Cause Value 100

[0x64/0xE4] -

Invalid information element contents

The equipment that sent this Cause Value received a message that includes an Information Element that it does recognize and implements, however one or more of the fields contained in the Information Element are coded in such a way that it has not been implemented by the equipment that sent this Cause Value.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Troubleshooting

- Check that the protocols at each end of the interface match (for example, both sides are **AT&T Custom** or both sides are **NI-2**). If the ends of the interface are running different protocols, they might be running with different Information Element encoding.
- Check Communication Manager diagnostics for the IE identifier of the Information Element that contains the information that violates protocol.

The PROGRESS INDICATOR IE information that Communication Manager generates should not affect call completion. There is no way to modify how Communication Manager generates this information.

See [Table 44, Cause Value 96 & 100 Diagnostic Information](#), on page 160.

Cause Value 101

[0x65/0xE5] -

Message not compatible with call state/

Protocol threshold exceeded (NI-2: National ISDN 2)

Cause Value 101 indicates that the equipment that sent this Cause Value received a message that it does not recognize, and procedures in the protocol specification indicate that it is not permissible to receive the message while in this call state.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Cause Value 101 (NI-2) can also mean that an established call or an establishing call is being cleared because the threshold for multiple signaling protocol errors occurring during an active call has been exceeded.

Troubleshooting

- Check that the protocols at each end of the interface match (for example, both sides are **AT&T Custom** or both sides are **NI-2**). If the ends of the interface are running different protocols, they might be running different call state machines.
- Check the Communication Manager diagnostic information for the message type identifier that is in violation of the protocol. [Table 45: Cause Value 97, 98, 101 Diagnostic Information](#) on page 162

Denial Events

- Call state problems are reported with STATUS messages. The equipment sending the Cause Value uses the CALL STATE IE of the STATUS message to indicate the call state. To determine the call state of the other end of the interface, run the message sequence of the call through the SDL flow charts of the appropriate side (user or network) and the appropriate protocol (TR41449/41459, TR1268, A211 etc.). If the call state at the other end of the interface does not agree with that reported in the STATUS message and both sides are already running the same protocol, then a problem with the implementation of the state machine exists on either side.

Problems have been revealed with the state machine implementations of some of the CO switches for different protocols, and the state machine problems in the CO switches are most likely not going to be corrected. Communication Manager has not shown any problems with its state machine implementations for the different protocols.

Change Communication Manager administration to change the message sequence of the call scenario causing the error, and help solve state machine implementation problems. For example:

- change the inter-working message on the **DS1** form from **PROGRESS** to **ALERTING**
- change the “wait” steps in vectors to be “i-silent” so that they do not generate extra PROGRESS messages in the calling message sequence.

Cause Value 102

[0x66/0xE6] -

Recovery on timer Expiry

The equipment sending this Cause Value sent or received a Layer 3 Q.931 message. Sending or receiving this message has initiated a Layer 3 timer that has expired. This Cause Value is being generated in conjunction with Q.931 protocol error handling procedures.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Communication Manager logs timer expiry errors that it generates to the hardware error log against the signaling group of the D-channel where the error occurred. The signaling group (ISDN-SER) error is Error Type 1 and the Aux Data contains the identifier of the Layer 3 timer that expired.

Communication Manager does not generate the diagnostic information for the Cause Value IE.

Table 46: Cause Value 102, Signaling Group Error Type 1, Aux Data information

Aux Data Value	Timer Name	Timer Value	Description
1	T302	4s	SETUP_ACK messages (overlap receiving mode)
2	T303_1	4s	SETUP message 1st timer expiration
3	T303_2	4s	SETUP message 2nd timer expiration
4	T305	4/30s	DISCONNECT message
5	T308_1	4s	RELEASE message 1st expiration
6	T308_2	4s	RELEASE message 2nd expiration
7	T310	10s	CALL_PROCEEDING message
8	T313	4s	CONNECT message
9	T313_2	4s	"no longer used"
10	T316	120s	RESTART message
11	TL3	30s	Layer 3 timer expired (d-channel dropped)
12	T309	90s	d-channel reestablishment expiration stable calls are dropped
13	T_WRN	h	FACILITY message (waiting for ACK or REJ)
14	T321	120s	SERVICE message (waiting for ACK)
15	TSM	h	retransmission of SERVICE on d-channel switchover
16	TM100	h	ISDN-BRI maintenance (MIM timer)

Troubleshooting

- Check the diagnostic information for the timer number that has expired. See [Cause Values and their meanings/interpretations](#) on page 122.
- Check that the protocols at each end of the interface match (for example, both sides are **AT&T Custom** or both sides are **NI-2**).
 - If the ends of the interface are running different protocols, they might be running with different values for their Layer 3 timers.
 - If the protocols at each end of the interface match, the Communication Manager timer might have expired because:

Denial Events

- the far end never saw the message because the message was corrupted in transmission by noise on the D-channel. Check for any type of T1/E1 facility errors.
 - the far end is experiencing a high traffic condition and did not have the processing time to parse the sent message before the timer expired.
 - even though the message was seen to be generated in an internal Communication Manager trace, the message was never transmitted out onto the D-channel. Perform an external protocol capture on the D-channel to confirm the transmission of the suspect message.
- To interpret the receipt of Cause Value 102 from the far end, look at a trace/protocol capture of the messaging taking place, and find the last message received from the far end before Cause Value 102 is received. The timer that expired is most likely the Layer 3 timer associated with that last message. If Communication Manager generated a message in between those 2 events that should have stopped the timer, the cause might be:
 - the far end never saw the message because the message was corrupted in transmission by noise on the D-channel. Check for any type of T1/E1 facility errors.
 - the far end might be experiencing a high traffic condition and did not have the processing time to parse the sent message before the timer expired.
 - even though the message was seen to be generated in an internal Communication Manager trace, the message was never actually transmitted out onto the D-channel. Perform an external protocol capture on the D-channel to confirm the transmission of the suspect message.
 - If Communication Manager did not respond to the receipt of the last message from the far end, then Communication Manager internal hardware and software becomes suspect, and trouble shooting the problem must proceed from that point.

Communication Manager administration that can contribute to seeing timer expiry errors:

- Trunk group form: Incoming call handling table. If the **Per call CPN/BN** field is incorrectly populated in comparison to how the CO is programmed to send CPN or BN, it causes Communication Manager to send a FACILITY message to the CO requesting CPN/BN information and the CO will never respond. Communication Manager will log many timer expiry errors against the signaling group (Error Type 1, Aux Data 13).
- DS1 form: Protocol version: If Communication Manager is running custom protocol (protocol version "A") and is connected to a Nortel DMS central office running custom protocol, Communication Manager will log timer expiry errors against signaling group for DISCONNECT problems (Error Type 1, Aux Data 4) during high traffic conditions.
- The DMS CO custom protocol implementation uses the ANSI recommended timer values for their Layer 3 timers while Communication Manager uses the ITU recommended timer values. Thus the T305 timer in the Communication Manager is 4 seconds while the same timer in the DMS is 30 seconds, this difference causes timer expiry problems in high traffic conditions. Change Communication Manager's protocol version to **c** to line up the timers.

Cause Value 103

[0x67/0xE7] - Parameter not implemented

The equipment sending this Cause Value received a message that includes an Information Element that it does recognize and implements, however one or more of the fields contained in the Information Element are coded in such a way that it has not been implemented by the equipment sending this Cause Value.

The diagnostic information of the Cause Value should contain, if implemented, the identifier of the Information Element that contains the information that violates protocol. See [Cause Values and their meanings/interpretations](#) on page 122.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Cause Value 110

[0x6E/0xEE] - Message with unrecognized parameter

The equipment sending this Cause Value received a message that includes Information Elements that are not recognized because the Information Element identifier is not defined, or it is defined but has not been implemented by the equipment sending the Cause Value. However, the Information Element is not mandatory in the message, and the equipment sending the Cause Value does not need to parse the Information Element in order to process the message.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Cause Value 111

[0x6F/0xEF] - Protocol error unspecified

Cause Value 111 indicates that the equipment sending this Cause Value experienced a protocol error event for which no other Cause Value in the Protocol Error class applies.

This Cause Value has local significance only. The ISDN network between the user and the equipment generating the Cause Value might:

- Send no cause indication through the network
- Send a more generic Cause Value through the network

Denial Events

Cause Value 111 (NI-2) is used in packet mode to be able to map the X.25 [Cause Value 17](#) "remote procedure error".

Communication Manager does not originate this Cause Value for PRI. A BRI or Adjunct Switch Application Interface (ASAI) application might generate this Cause Value.

Cause Value 112

**[0x70/0xF0] -
Local procedure error (1TR6: AT&T ISDN Protocol)**

This is a packet mode Cause Value.

Cause Value 113

**[0x71/0xF1] -
Remote procedure error (1TR6: AT&T ISDN Protocol)**

This is a packet mode Cause Value.

Cause Value 114

**[0x72/0xF2] -
Remote user suspended (1TR6: AT&T ISDN Protocol)**

This Cause Value indicates to the remote user that the call has been put on hold.

Cause Value 115

**[0x73/0xF3] -
Remote user resumed (1TR6: AT&T ISDN Protocol)**

This Cause Value indicates to the remote user that the call has been taken off hold.

Inter-working Class Cause Values

Cause Value 127

**[0x7F/0xFF] -
Inter-working, unspecified/
User info discarded locally (1TR6: AT&T ISDN Protocol)**

This Cause Value indicates that in the equipment sending this Cause Value is the point in the network where the call has inter-worked with a network that does not provide Cause Value information for actions it takes. Thus when an event takes place this Cause Value is sent because the precise cause for the event cannot be ascertained.

This Cause Value has end-to-end significance and should always be passed back through the network to the user.

Communication Manager generates this Cause Value for events on tandem calls that have inter-worked from ISDN trunk groups to non-ISDN trunk groups.

Troubleshooting

- Check the Cause Value Information Element (LOC). See [Location Codes](#) on page 124.

Denial Event Tables

Call processing Denial Events

Event Types 1000 - 2299 show denial events generated during call processing, as listed in [Table 47, Call Process denial events \(1001 - 1172\)](#), on page 171, [Table 49, Call Process denial events \(1225 - 1899\)](#), on page 187, and [Table 52, Call Process denial events \(2021 - 2299\)](#), on page 231.

Use Event Types 1000 - 1899 to help isolate the cause of receiving reorder or intercept treatment:

- Event Types 1000 -1299 might explain events where reorder treatments are initiated, or to events that eventually lead to reorder treatments.
- Event Types 1300 - 1899 might explain events where intercept treatments are initiated, or to events that eventually lead to intercept treatments.

Table 47: Call Process denial events (1001 - 1172) 1 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1001	Resource not available	grp_m process returned GM_FAIL in response to GM_MTM_DIG_DONE message.		
1002	Call parked on user	A call might already be parked on user.		
1003	Can't connect Tone Det	Cannot connect or reconnect tone detector during outgoing wait supervision. Automatic Number Identification (ANI) request is expected.		
1004	Can't reserve Tone Det	Cannot reserve tone detector.		
1005	Trunk sequence error	Outgoing MFE call received answer before addressing was complete.		
1006	TTR_unavail	GCOL_ERR usually means no Touch Tone Receiver (TTR) available.		
				1 of 13

Denial Events

Table 47: Call Process denial events (1001 - 1172) 2 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1007	CAS_remhold	The Centralized Attendant Service (CAS) Remote Hold feature was accessed. No CAS attendant exists.		
1008	CAS_remhold	Centralized Attendant Service (CAS) Remote Hold was accessed by a non-CAS attendant.		
1009	CAS_remhold	Centralized Attendant Service (CAS) Remote Hold was accessed by non-CAS attendant. Analog Answer-Hold/Unhold invalid.		
1010	TEG denied origination	Terminating Extension Group was denied an origination.		
1011	Dest_unavail	Facilities were exhausted during rerouting. Bearer capability is VOICE, VOICE BAND DATA. Received unexpected TCM not yet used in routing. Reroute attempt using received TCM finds principal is NULL or attendant extended call to ARS. Queueing is not allowed.		
1012	Dest_unavail	Facilities were exhausted during rerouting. Bearer capability is VOICE, VOICE BAND DATA. No outgoing trunk queuing, or no trunks, or DEXT, or Adjunct origination, or Administered Connection, or QSIG Call Completion Ringout attempt. Queueing is not allowed.		
1013	Dest_unavail	Facilities were exhausted during rerouting. Bearer capability is VOICE, VOICE BAND DATA. No outgoing trunk queuing, or no trunks, or DEXT, or Adjunct origination, or Administered Connection, or QSIG Call Completion Ringout attempt. Queueing is not allowed.		
1014	Dest_unavail	Inter-PBX attendant service termination attempt failed. The trunk was busy.		
1015	Dest_unavail	Attendant seizing trunk for thru-dialing failed. The trunk was busy or not available.		
1016	Remote Cvg loop denial	Outgoing remote coverage call, with digit conversion to the principal's extension. Prevent looping.		
1017	ADX_unavail	Termination to AUDIX coverage point failed, unable to terminate at an AUDIX hunt group.		
1018	MM_denial	Multimedia call. Convert termination to a meetme User ID instead of station User ID failed. Invalid bearer cap received.		
1019	MM_denial	Multimedia call. Convert termination to a meetme User ID instead of station User ID failed. user_m failed to get & return meetme User ID.		
1020	MM_denial	Multimedia call. Convert termination to a meetme User ID instead of station User ID failed. user_m returned a meetme uid = 0.		
1021	Call Term overflow	Call termination overflow to DDD of an Electronic Tandem Network Listed Directory Number. Call should be blocked.		
				2 of 13

Table 47: Call Process denial events (1001 - 1172) 3 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1022	CDR_resource	Call Detail Recording (CDR) resource exhaustion. Caller from tie trunk can receive reorder tone.		
1023	CDR_resource	Call Detail Recording (CDR) resource exhaustion. Give Trunk/Personal Central Office Line (TK/PCOL) caller termination to announcement. User ID not found for announcement.		
1024	CDR_resource	Call Detail Recording (CDR) resource exhaustion. Caller from non-Trunk/Personal Central Office Line (TK/PCOL) (from line) can receive reorder tone.		
1025	Incomptable Bandwidth	Terminated to an endpoint or trunk group that cannot support the requested bandwidth.		
1026	ADX_unavail	Call from non-trunk. Unable to terminate at an AUDIX hunt group.		
1027	Attd control trk denial	Switch Classified Calls might not go to a trunk controlled by an attendant.		
1028	Trk_unavail	No trunks are available and there is no chance of being queued.		
1029	Mod_unavail	Modem unavailable from pool.		
1030	Mod_unavail	Modem unavailable from pool.		
1031	LWC failure	Leave Word Calling. Async message response from msg_sv: give user LW_REORDER.		
1032	MM_fail	Multimedia call. Creating a multimedia user. User ID (UID) - failure. user_m returned a mtm_uid of 0.		
1033	MM_fail	Multimedia call. Cannot create a multimedia user.		
1034	MM_fail	Multimedia call. GM_MTM_DIGIT digit sending message failed on second address of multi-number call.		
1035	MM_fail	Multimedia call. Trying to send more than the maximum of two addresses in a multi-number call.		
1036	Station sec code len qry	The query for the administered minimum station-security-code length failed.		
1037	Routing UID=0	The Routing User ID (UID) = 0 for a remote Distributed Communication System (DCS) user that has activated automatic callback toward a station local to this switch.		
1038	Acd_login	Traditional Automatic Call Distribution (ACD) agent login failed. The maximum number of logins already exist.		
1039	Acd_login	GM/UM set up of the Automatic Call Distribution (ACD) Logical Agent login info failed, before password matching, if any.		
				3 of 13

Denial Events

Table 47: Call Process denial events (1001 - 1172) 4 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1040	Acid_login	GM/UM set up of the Automatic Call Distribution (ACD) Logical Agent login info failed after password matching succeeded.		
1041	DS0 loop around failed	Incoming ds0 test call failed to set up non-inverting digital loop-around capability.		
1042	TTR_unavail	Facility Access Test. Touch Tone Receiver (TTR) is missing, did not get attached, might be in use by some other call.		
1043	Specified TTR unavailable	Facility Access Test. The specified Touch Tone Receiver (TTR) needed to collect digits was in use.		
1044	reserve for FAT fat_compl	Facility Access Test. Reserved for silent reorder on the chance that recoding is required.		
1045	FAT tone test failed	Facility Access Test. The test to hear tone failed. The Expansion Network Link might be down.		
1046	Specified Tslot busy	Facility Access Test. Specified timeslot was busy.		
1047	Music port connect fail	Facility Access Test. Completing call to music port failed. EPN Link might be down, or music port is not administered.		
1048	FAT trunk busy	Facility Access Test - completing call to trunk. Trunk is busy.		
1049	ISDN trunk busy	Facility Access Test - completing call to ISDN trunk. Trunk is busy.		
1050	Illegal Message Retrieval	Remote access users are not allowed access to messages via voice coverage message retrieval.		
1051	Speech Port unavailable	No voice synthesis speech port is available for coverage message retrieval.		
1052	Called announcement busy	Call to announcement, but announcement is busy.		
1053	Chime tone connection	Connection of a chime tone to a service failed. There might be an invalid service ID or software error.		
1054	TTR_unavail	Collection of password digits needs a Touch Tone Receiver (TTR). No in-service TTRs are available.		
1055	No call to cancel	Deactivate automatic callback (ACB) was denied or outgoing trunk queueing (OTQ) was denied. The Caller ID of the ACB/OTQ call to be cancelled could not be found. There might be nothing to deactivate.		
1056	Adjct Rte calls can't Que	Adjunct Switch Application Interface (ASAI) adjunct originated switch classified calls and adjunct-routed calls are not allowed to queue.		
1057	COS - Auto Callback	User's Class of Service does not permit activation of automatic callback.		
				4 of 13

Table 47: Call Process denial events (1001 - 1172) 5 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1058	Auto Callback User ID	User activating automatic callback has software partyblock member misrepresented.		
1059	Auto Callback double queued	User is activating automatic callback, but the call has already been queued or has no principal terminating User ID.		
1060	Auto Callback terminator	Activating automatic callback is not allowed when the terminating extension is a group attendant, terminating extension group, Vector Directory Number, or if vector processing is active.		
1061	Auto Callback terminator	Activating automatic callback. <ul style="list-style-type: none"> ● For a non-Distributed Communication System (DCS) terminator, if there is an accompanying Call Detail Recording (CDR) ineffective call attempt record, the queue is full or zero-length. ● For a DCS terminator, termination did not happen for one of several reasons identified in rc from gm_term re_termination attempt in onhk_que.c 		
1062	Auto Callback activation	Activating automatic callback. Checks on queue availability and/or Distributed Communication System (DCS) termination pass OK, but activation is denied.		
1063	Auto Callback ineligible	Activating Automatic Callback (ACB). Response to callback type query is queue ineligible, might be ACB is in use or call is on hold, or GQRY_ERR (might be no call ID behind call back button).		
1064	Double queueing denied	Manual activation of queueing. Call has already been queued (automatic).		
1065	Manual queing terminator	Manual activation of queueing. There is no principal terminator on which to queue.		
1066	Manual queing - full que	Manual activation of queueing. The queue is full or queue length is zero.		
1067	Manual queing denied	Manual activation of queueing. Checks on queue availability pass OK, but activation is denied.		
1068	queued call went away	Reactivation of automatic callback or outgoing trunk queueing. The call disappeared from the queue.		
1069	PMS link/printer down	Property Management System (PMS) cannot log housekeeping status. PMS link is not operational and the printer is down.		
1070 (also in Table 48)	TTR_unavail	ISDN trunk initiation of in-band end-to-end digit collection failed. Might be waiting for a Touch Tone Receiver (TTR).		
1071	Wireless - trunk failure	General Central Office (GCO) Wireless Subscriber System (WSS) call origination denied - iap_cid_qry failure. Route to GCO subscriber trunk failed.		
				5 of 13

Denial Events

Table 47: Call Process denial events (1001 - 1172) 6 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1072	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in Audio add-on password supervision.		
1073	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in authorization code supervision, waiting for digit analysis of the authorization code.		
1074	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in Code Call paging seizure supervision.		
1075	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in feature supervision waiting to see which feature is being invoked.		
1076	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in idle supervision.		
1077	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in normal answer supervision.		
1078	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in outgoing trunk outpulsing supervision.		
1079	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in outgoing trunk seizure supervision.		
1080	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in the supervisor for telecommuting access waiting for certain Feature Access Codes after the telecommuting extension has been accessed.		
1081	Change SSC denied	Change Station Security Code (SSC) - REORDER. Possible causes: <ul style="list-style-type: none"> ● Too many admin users or save-trans in progress ● Data already locked ● Translations being saved ● SAT user changing station data ● Station recently removed from translation ● System error ● Problem applying confirmation tone ● Terminal Translation Initiation (TTI) feature not enabled ● TTI state not Voice (Data TTI enabled) 		
1082	Rmv skill - agent busy	Doing "Remove Skill" on agent currently busy for that skill (has DAC or is in ACW or on call).		
				6 of 13

Table 47: Call Process denial events (1001 - 1172) 7 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1083	Add/Rmv skill denied	Add/Remove Agent Skills. Possible causes: <ul style="list-style-type: none"> ● could not get station ID ● too many admin users or save-translations in progress ● data already locked, maybe translations are being saved or SAT user is changing agent data 		
1084	DCS link down	Remote user activation of call forward - Distributed Communication System (DCS) link not up.		
1085	PMS response timeout	Property Management System failed to respond to maid status in the 4 seconds allowed.		
1086	MFC no answer timeout	MultiFrequency Compelled (MFC) call circuit congestion. No answer timeout from MFC call.		
1087	MFC no answer timeout	MultiFrequency Compelled call circuit congestion. No answer timeout. Might be bad trunk or no Touch Tone Receiver (TTR) available at remote end, for example.		
1088	No answer timeout	MultiFrequency Compelled call circuit congestion. No answer timeout. Might be bad trunk or no Touch Tone Receiver (TTR) available at remote end, for example.		
1089	MFC no answer timeout	MultiFrequency Compelled call circuit congestion. No answer timeout. Might be bad trunk or no Touch Tone Receiver (TTR) available at remote end, for example.		
1090	T302 intercept timeout	T302 interdigit timer timeout.		
1091	Max Paste users Pasting	The maximum allowable stations are currently using PC Application Software Exchange (PASTE). Wait and try again.		
1092	Announcement unavailable	Might be announcement is busy, or announcement is not present on board.		
1093	Announcement memory exh	Announcement is dropped, announcement memory is exhausted.		
1094	Permanent Seizure	Direct Inward Dialing trunk origination. Digit timeout with no digits dialed. Permanent incoming seizure treatment is to give reorder.		
1095	QSIG Call Offer timeout	QSIG Call Offer encountered timeout of 1 minute path retention timer.		
1096	Wakeup time unavailable	Collecting digits for "room wakeup by tones" feature. Cannot do a wakeup for the specified time.		
1097	MFC No Answer timeout	MFC call circuit congestion. No answer timeout. Might be bad trunk or no Touch Tone Receiver (TTR) available at remote end, for example.		
				7 of 13

Denial Events

Table 47: Call Process denial events (1001 - 1172) 8 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1098	TTI merge/unmerge failed	Station server could not perform Terminal Translation Initiation (TTI) merge/unmerge. Certain resources are unavailable. The user can try again and the resources might be available.		
1099	LWC access code rejected	Voice synthesis Leave Word Calling access code rejected by msg_sv.		
1100	TTI - station active	In preparation for lock resources step for Terminal Translation Initiation (TTI) merge/unmerge, Personal Station Access (PSA) association/disassociation finds that the station is active on a call not to be interrupted.		
1101	Modem unavailable	There is a problem with allocating or finding a modem for an incoming data call.		
1102	MM - voice call failure	Processing a Multimedia compatible vector, there is failure doing conversion to voice call.		
1103	Tone Detector conn fail	Cannot connect tone detector for trunk terminated call. Silent Reorder.		
1104	Tone Detector conn fail	Cannot connect tone detector for voice station or DEXT. Silent Reorder.		
1105	Ringback limit met	The limit is met of 4 ringbacks in a row before far end answers. Silent Reorder.		
1106	Ringback limit met	The limit is met of 36 ringbacks in a row before far end answers. Silent Reorder.		
1107	Reorder tone received	Reorder tone received before far end answers. Silent Reorder.		
1108	LWC access code rejected	The message server rejected the Leave Word Calling Access code that was dialed.		
1109	DCS link/msg buffer	Remote busy verification encountered a Distributed Communication System (DCS) link down or an exhausted DCS message buffer.		
1110	DCS link down	Distributed Communication System (DCS) remote trunk group selection. Remote Direct Trunk Group Selection (DTGS) button push by attendant, but DCS link is down.		
1111	CFWD activate/cancel	Send a callforward activation message to the remote switch. Message buffers exhausted, call not UDP & not Distributed Communication System (DCS), DCS link is down.		
1112	TTR_unavail	Russian Automatic Number Identification (ANI) 3rd party feature button. Touch Tone Receiver (TTR) not available.		
1113	ANI error limit	3rd party feature activation. Automatic Number Identification (ANI) error on 2 tries.		
1114	DCS trunk required	Remote busy verification. A Distributed Communication System (DCS) trunk is required.		
				8 of 13

Table 47: Call Process denial events (1001 - 1172) 9 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1115	LWC timeout	Leave Word Calling timeout occurred in the dap for a non-call associated attempt.		
1116	DCS confirm msg timeout	Remote busy verification. A Distributed Communication System (DCS) confirmation message was not back in 4 seconds.		
1117	Outgoing trk seizure fail	Outgoing trunk seizure failure, busy verify hit glare, digit timeout via ogt_sz_sup().		
1118	Analog station ringer	Analog principal station has trouble ringing.		
1119	Analog station ringer	Analog covering station has trouble ringing and principal was station not rung successfully.		
1120	Bsy Vfy termination fail	RP_M found busy verification terminator available, but termination to it failed.		
1121	Bsy Vfy termination fail	RP_M found busy verification trunk terminator available, but USER_M found it maintenance busy or otherwise unavailable.		
1122	Bsy Vfy termination fail	GRP_M found busy verification terminator available, but USER_M found it out-of-service.		
1123	Bsy Vfy termination fail	GRP_M found busy verify terminator available, but USER_M denied termination to: <ul style="list-style-type: none"> ● TRUNK <ul style="list-style-type: none"> - admin busy - incoming seizure ● STATION <ul style="list-style-type: none"> - query for virtual set's station hunting User ID fails - virtual set's physical station's current state is not idle or call busy - admin busy - maintenance busy - no available call appearance - currently dialing - available call appearance not idle or busy HUNTGRP - no available member in free list, at least one not made busy 		
1124	Bsy Vfy termination fail	GRP_M found busy verify hunt group member available, but USER_M found hunt group all busy		
1125	Bsy Vfy call went away	Bridging a busy verification party to a call that no longer exists.		
1126	Bsy Vfy merge failed	Bridging a busy verification party to a call cannot be merged. Merge checks include: <ul style="list-style-type: none"> ● not being busy verified by another user ● not a data call ● the call is in either talk or park state <ul style="list-style-type: none"> - One exception to this is Converse calls which are always in nrm_ans_sup() ● no tone connected or bv or conference tone connected ● not exceed conference limit ● no aux trunk involved in the call 		
				9 of 13

Denial Events

Table 47: Call Process denial events (1001 - 1172) 10 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1127	Bsy Vfy warn tone conn	Busy verification warning tone connection (callr) failed.		
1128	Bsy Vfy warn tone conn	Busy verify warning tone connection to verified call (callr2) failed.		
1129	Bsy Vfy call went away	Bridging a busy-verification call with a busy-verification call that no longer exists.		
1130	Bsy Vfy merge failed	Bridging a busy verification party to a call cannot be merged. Merge checks include: <ul style="list-style-type: none"> ● not being busy verified by another user ● not a data call ● the call is in either talk or park state <ul style="list-style-type: none"> - One exception to this is Converse calls which are always in nrm_ans_sup() ● no tone connected or bv or conference tone connected ● not exceed conference limit ● no aux trunk involved in the call 		
1131	Bsy Vfy merge failed	Bridging a busy verification party to a call, the merge operation failed.		
1132	Auto Callback failure	<ul style="list-style-type: none"> ● Query for calling party's callback type failed ● Adding an automatic callback call to the que of a trunk group failed or the queue is full ● Calling party activation of automatic callback failed ● No automatic callback button/feature administered ● Automatic callback button already busy. 		
1133	Whisp Pg termination fail	Whisper paging termination to station, idle call appearance failed.		
1134	Whisp Pg to OS station	Whisper paging to Out of Service (OOS) station.		
1135	Whisp Pg term denied	Whisper page to station denied. STATION - admin busy <ul style="list-style-type: none"> ● user has blocked whisper pages or has service observe pending ● (BRI) maintenance busy and the call is already queued ● whisper page not allowed towards analog line ● whisper page termination requires at least 2 idle call appearances ● the current call is in the CA_DIAL state 		
1136	Whisp Pg hunt grp busy	Whisper paging - hunt group all made busy. shouldn't see this - hnt_qry does not respond to qtype QWHISP_PG.		
1137	Whisp Pg user blocked	User has whisper page blocked.		
1138	Whisp Pg Svc Obsvd call	Whisper page - bridging to service-observed call.		

10 of 13

Table 47: Call Process denial events (1001 - 1172) 11 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1139	Whisp Pg Attd call	Whisper page - bridging to call with an attendant on it.		
1140	Whisp Pg Man Exclsn call	Whisper page - bridging to call with manual exclusion activated.		
1141	Whisp Pg merge denied	Bridging a busy whisper paging party to a call cannot be merged. Merge checks include: <ul style="list-style-type: none"> ● not being busy verified by another user ● not a data call ● the call is in either talk or park state <ul style="list-style-type: none"> - One exception to this is Converse calls which are always in nrm_ans_sup() ● no tone connected or bv or conference tone connected ● not exceed conference limit ● no aux trunk involved in the call 		
1142	Whisp Pg warn tone conn	Whisper page warning tone connection to callr failed.		
1143	Whisp Pg warn tone conn	Whisper page warning tone connection to callr2 failed.		
1144	Whisp Pg merge failed	Merge page call with paged call - query for originator's portid failed.		
1145	Whisp Pg merge failed	Merge page call with paged call - query for paged party's portid failed.		
1146	Whisp Pg call went away	Merge page call with paged call - paged party's call no longer exists		
1147	Whisp Pg blocked	Merge page call with paged call - paged party has whisper page blocked.		
1148	Whisp Pg Svc Obsvd call	Merge page call with paged call - paged party is being service observed.		
1149	Whisp Pg merge Attd call	Merge page call with paged call - paged party is on a call with an attendant.		
1150	Whisp Pg merge Man Exclsn	Merge page call with paged call - paged party has manual exclusion activated.		
1151	Whisp Pg merge denied	Bridging a busy whisper paging party to a call cannot be merged. Merge checks include: <ul style="list-style-type: none"> ● not being busy verified by another user ● not a data call ● the call is in either talk or park state <ul style="list-style-type: none"> - One exception to this is Converse calls which are always in nrm_ans_sup() ● no tone connected or bv or conference tone connected ● not exceed conference limit ● no aux trunk involved in the call 		
1152	Whisp Pg merge failed	Merge page call with paged call - merge operation failed.		

11 of 13

Denial Events

Table 47: Call Process denial events (1001 - 1172) 12 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1153	ARS man activation queing	Manual activation of queueing seen while in ARS supervision - ARS DAC has been dialed.		
1154	Outgoing trk seizure fail	Seize failed. Indicates either: <ul style="list-style-type: none"> ● a problem with the selected trunk ● an incoming call was received on a trunk selected for an outgoing call in busy verification on non-Distributed Communication System (DCS) call type and not bridge-on case. 		
1155	Bsy Vfy digit timeout	Digit timeout while in busy verification on non-DCS call type and not bridge-on case.		
1156	Connection resrce unavail	Connection resource not available. this is an administered connection.		
1157	TTR_unavail	Activate service observing feature. Initiated from a vector step and only the Feature Access Code of service observing is in the vector step. End-to-end signaling digit collection of extension to be observed could not get a Touch Tone Receiver (TTR).		
1158	Svc Obsv Ext table full	Validation of service observed extension. No room in software table to store service observing User IDs.		
1159	Cancel wakeup failed	Collect digits for time used by the wakeup features. Could not cancel wakeup.		
1160	Activate wakeup failed	Collect digits for time used by the wakeup features. Could not activate wakeup time. Possible causes: <ul style="list-style-type: none"> ● previous request exists and cancel flag not set ● wakeup request time is too close ● 15 min interval limit exceeded ● system limit on requests exceeded? 		
1161	Max# connected parties	Whisper page - bridging to a call that has maximum number of parties already connected.		
1162	Max# connected parties	Whisper page - bridging to call that has maximum number of parties already connected.		
1163	TTR_TDM_VC	Time Division Multiplexed (TDM) Voice Condition (VC) creation for Touch Tone Receiver (TTR) failed while in whisper supervision.		
1164 (also in Table 48)	ISDN no cause value	Outgoing ISDN trunk rejected/ dropped by far end		DIAG/LOC/CV
1165	Attd ctrl of ARS pref (s)	Attendant control of trunk group access ARS preference(s).		
1166 (also in Table 48)	Unassigned number	Unassigned number.		
				12 of 13

Table 47: Call Process denial events (1001 - 1172) 13 of 13

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1167	Can't term emergency call	No Attendants or redirection extension assigned for termination of emergency call.		
1168	Second call failed	Russia MultiFrequency (MF) Packet Signaling - Second call attempt failed.		
1169	Retry option not enabled	Russia MultiFrequency (MF) Packet Signaling. Either T1 or T2 timer expired, or a B6 signal was received, and the "Re-try?" option is no.		
1170	Erroneous signal received	Russia MultiFrequency (MF) Packet Signaling - Erroneous signal received.		
1171	ATM Blockage:TDMSVC fail	TDM_SVC failed due to lack of resources, call was dropped. The caller hears dead air.		
1172	Path Rep ASAI to non-ASAI	Path Replace merged from Adjunct Switch Application Interface (ASAI) callr to non-ASAI callr.		
				13 of 13

ISDN, IP, and SIP Denial Events

Some Event Type numbers in this section can be re-used for IP and SIP Denial Events. Please check your log information carefully to determine what type of network experienced the event that led to the denial, even if the explanation refers to ISDN.

Table 48: ISDN, IP, and SIP-generated denial events (1173 - 1224) 1 of 4

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1070 (also in Table 47)	TTR_unavail	ISDN trunk initiation of in-band end-to-end digit collection failed. Might be waiting for a Touch Tone Receiver (TTR).		
1164 (also in Table 47)	ISDN no cause value	Outgoing ISDN trunk rejected/ dropped by far end.		DIAG/LOC/CV
1166 (also in Table 47)	Unassigned number	Unassigned number.		
1173	No route to transit ntwk	No route to specific transit network. See Cause Value 02 .	UID	DIAG/LOC/CV
1174	No route to dest	No route to destination. See Cause Value 03 on page 130.	UID	DIAG/LOC/CV
				1 of 4

Denial Events

Table 48: ISDN, IP, and SIP-generated denial events (1173 - 1224) 2 of 4

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1175	ISDN channel unacceptable	Channel unacceptable. See Cause Value 06 on page 133.	UID	DIAG/LOC/CV
1176	ISDN MLPP circ not resrvd	MLPP preemption, circuit not reserved. See Cause Value 08 on page 133.	UID	DIAG/LOC/CV
1177	ISDN MLPP circ resv reuse	MLPP preemption, circuit reserved for reuse. See Cause Value 09 on page 134.	UID	DIAG/LOC/CV
1178	Normal call clearing	Normal call clearing. See Cause Value 16 on page 135.	UID	DIAG/LOC/CV
1179	User busy	User busy. See Cause Value 17 on page 135.	UID	DIAG/LOC/CV
1180	No user responding	No user responding. See Cause Value 18 on page 136.	UID	DIAG/LOC/CV
1181	User alerting, no answer	User alerting, no answer. See Cause Value 19 on page 137.	UID	DIAG/LOC/CV
1182	Subscriber absent	Subscriber absent. See Cause Value 20 on page 137.	UID	DIAG/LOC/CV
1183	Call rejected	Call rejected. See Cause Value 21 on page 137.	UID	DIAG/LOC/CV
1184	Number changed	Number changed. See Cause Value 22 on page 137.	UID	DIAG/LOC/CV
1185	Dest out of order	Destination out of order. See Cause Value 27 on page 138.	UID	DIAG/LOC/CV
1186	Invalid number format	Invalid number format. See Cause Value 28 on page 138.	UID	DIAG/LOC/CV
1187	Facility rejected	Facility rejected. See Cause Value 29 on page 139.	UID	DIAG/LOC/CV
1188	Response status enquiry	Response status enquiry. See Cause Value 30 on page 140.	UID	DIAG/LOC/CV
1189	Normal, unspecified	Normal, unspecified. See Cause Value 31 on page 140.	UID	DIAG/LOC/CV
1190	No circ/chan avail	No circuit or channel available. See Cause Value 34 on page 141.	UID	DIAG/LOC/CV
1191	Network failure	Network failure. See Cause Value 38 on page 142.	UID	DIAG/LOC/CV
1192	Temporary failure	Temporary failure. See Cause Value 41 on page 143.	UID	DIAG/LOC/CV
1193	Equipment congestion	Switching equipment congestion. See Cause Value 42 on page 143.	UID	DIAG/LOC/CV
1194	ISDN user info discarded	User info discarded. See Cause Value 43 on page 143.	UID	DIAG/LOC/CV
				2 of 4

Table 48: ISDN, IP, and SIP-generated denial events (1173 - 1224) 3 of 4

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1195	Circ/channel unavail	Requested circuit / channel not available. See Cause Value 44 on page 144.	UID	DIAG/LOC/CV
1196	ISDN blocked precedence	Locked precedence level. See Cause Value 46 on page 145.	UID	DIAG/LOC/CV
1197	Resources unavail/unspec	Resources unavailable, unspecified. See Cause Value 47 on page 145.	UID	DIAG/LOC/CV
1198	ISDN req fac no subscribe	Requested facility no subscribed. See Cause Value 50 on page 146.	UID	DIAG/LOC/CV
1199	ISDN outgoing call barred	Outgoing calls barred. See Cause Value 52 on page 147.	UID	DIAG/LOC/CV
1200	ISDN incoming call barred	Incoming calls barred. See Cause Value 54 on page 147.	UID	DIAG/LOC/CV
1201	Bearer cap not available	Bearer capability not presently available. See Cause Value 58 on page 149.	UID	DIAG/LOC/CV
1202	Service unauth FranceVN4	Service not authorized / France VN4. See Cause Value 62 on page 151.	UID	DIAG/LOC/CV
1203	Serv/option unavailable	Service/option not available, unspecified. See Cause Value 63 on page 151.	UID	DIAG/LOC/CV
1204	Bearer cap not implem	Bearer capability not implemented. See Cause Value 65 on page 152.	UID	DIAG/LOC/CV
1205	ISDN chan type not implem	Channel type not implemented. See Cause Value 66 on page 152.	UID	DIAG/LOC/CV
1206	Req facility not implem	Requested facility not implemented. See Cause Value 69 on page 153.	UID	DIAG/LOC/CV
1207	Only restr digital BC av	Only restricted digital BC available. See Cause Value 70 on page 154.	UID	DIAG/LOC/CV
1208	Srv/opt not imp/unsp	Service/option not implemented, unspecified. See Cause Value 79 on page 154.	UID	DIAG/LOC/CV
1209	Invalid call reference	Invalid call reference. See Cause Value 81 on page 155.	UID	DIAG/LOC/CV
1210	Channel doesn't exist	Identified channel does not exist. See Cause Value 82 on page 155.	UID	DIAG/LOC/CV
1211	Incompatible dest	Incompatible destination. See Cause Value 88 on page 157.	UID	DIAG/LOC/CV
1212	ISDN trans ntwk not exist	Transit network does not exist. See Cause Value 91 on page 158.	UID	DIAG/LOC/CV
1213	Invalid message	Invalid Message. See Cause Value 95 on page 159.	UID	DIAG/LOC/CV
1214	Mandatory IE missing	Mandatory IE is missing. See Cause Value 96 on page 159.	UID	DIAG/LOC/CV
				3 of 4

Denial Events

Table 48: ISDN, IP, and SIP-generated denial events (1173 - 1224) 4 of 4

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1215	ISDN msg typ nonexist/imp	Message type nonexistent or not implemented. See Cause Value 97 on page 161.	UID	DIAG/LOC/CV
1216	Msg not compat state	Message not compatible with call state. See Cause Value 98 on page 163.	UID	DIAG/LOC/CV
1217	ISDN nonexistant IE	Nonexistent IE. See Cause Value 99 on page 164.	UID	DIAG/LOC/CV
1218	Invalid IE contents	Invalid IE contents. See Cause Value 100 on page 164.	UID	DIAG/LOC/CV
1219	ISDN msg not compat state	Message not compatible with call state. See Cause Value 101 on page 165.	UID	DIAG/LOC/CV
1220	Recovery on timer expiry	Recovery on timer expiry. See Cause Value 102 on page 166.	UID	DIAG/LOC/CV
1221	Protocol err unspecified	Protocol Error Unspecified. See Cause Value 111 on page 169.	UID	DIAG/LOC/CV
1222	ISDN intr ana ntwk Fr VN4	Inter-worked to analog network France VN4	UID	DIAG/LOC/CV
1223	ISDN goto con mode Fr VN4	Go to conversation mode France VN4	UID	DIAG/LOC/CV
1224	Interwork/cause unknown	Inter-working or cause unknown. See Cause Value 127 on page 170.	UID	DIAG/LOC/CV
1570 (also in Table 52)	TTR insertion failed	Processing incoming digits for ISDN call. Insertion of Touch Tone Receiver (TTR) to collect in-band digits failed.		
1573 (also in Table 52)	Principal is not ISDN	Get called digits, calling number and name, etc., and send ISDN SETUP message to the far end. The principal is not ISDN.		
				4 of 4

Call processing Denial Events

Event Types 1000 - 1899 show denial events generated during call processing, as listed in [Call Process denial events \(1001 - 1172\)](#) on page 171 and [Call Process denial events \(1225 - 1899\)](#) on page 187.

Table 49: Call Process denial events (1225 - 1899) 1 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1225	All SBS extensions in use	Separation of Bearer and Signaling (SBS) Signaling call tried to allocate an SBS extension, but all SBS extensions are in use.		
1226	Cannot get SBS Sig CID	Separation of Bearer and Signaling (SBS) Bearer call tried to retrieve SBS Signaling call Caller ID.		
1227	Can't send SBS ID to orig	Separation of Bearer and Signaling (SBS) Signaling call tried to send an INFO message with unique ID, but the INFO could not be sent.		
1228	Non-bearer trk to SBS ext	A non-trunk call terminated to an allocated Separation of Bearer and Signaling (SBS) extension waiting for the Bearer SBS call to come.		
1229	Unable to get ARS fac	Error occurred when getting the ARS Feature Access Code in order to build the Separation of Bearer and Signaling (SBS) complete callback number.		
1230	Unable to get contry code	Error occurred when getting the local country code in order to build the Separation of Bearer and Signaling (SBS) complete callback number.		
1231	Unable to get intl accode	Error occurred when getting the international access code in order to build the Separation of Bearer and Signaling (SBS) complete callback number.		
1232	TTR err SBS ID dgt coll	Error occurred when trying to allocate Touch Tone Receiver (TTR) to collect the Unique ID in-band at the terminating node.		
1233	Invalid SBS ID dgts/tmo	Invalid or partial Separation of Bearer and Signaling (SBS) Unique ID collected, or interdigit tmo while collecting Unique ID at SBS terminating node.		
1234	TTR err IGAR ID dgt coll	Error occurred when trying to allocate Touch Tone Receiver (TTR) to collect the Unique ID in-band at the originating node.		
1235	Invalid IGAR ID dgts/tmo	Invalid or partial Inter-Gateway Alternate Routing (IGAR) Index collected, or interdigit timeout while collecting destination IGAR index at IGAR originating node.		
1236-1299	not assigned			
	begin intercept type source of denials			
				1 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 2 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1300	Digits prevent call route	MultiFrequency Compelled call not routed due to invalid digit, not enough digits, etc.		
1301	Need MFC or TT dial type	Outgoing dial type is not MultiFrequency Compelled or Touch Tone (TT).		
1302	Dgts needed or caller typ	Minimum digits not dialed before pressing feature button, or calling party is not a station or attendant.		
1303	TTR queue type invalid	Touch Tone Receiver (TTR) queueing problem. Invalid "ttrq_typ" found.		
1304	Dgt absorbtion/insertion	Digit block requires preconditioning for digit absorption or insertion. Error in treatment. A Touch Tone Receiver (TTR) is available.		
1305	Dgt collection software	Software error. Invalid return code ttrq_type == ORIG_TTRQ? y - valid rc: GCOL_AUTO, GCOL_OK ttrq_type == NO_TTRQ? y - valid rc: GCOL_AUTO, GCOL_OK GCOL_ERR, GCOL_ATTD, GCOL_ATTD_NS, GCOL_NS, GCOL_TTRQ, GCOL_TERM		
1306	Satlt dropped TGU B4 ansr	Italian outgoing tie (TGU) call dropped by satellite before answer.		
1307	LoginID UID query failure	Query for User ID of logged-in Logical Agent's LoginID failed.		
1308	PNT or TIE restriction	Enforce PNT-PNT Restrictions. PTT or TIE not allowed to connect to this PTT trunk.		
1309	Data/Voice BCC setup fail	Trouble setting up voice to data/data to voice (change Bearer Capability Class) and/or outgoing Bearer Capability Class (BCC) for ISDN voice call.		
1310	Incompatible term endpnt	Tried to terminate to incompatible endpoint.		
1311	Routing software failure	Invalid return code from dpm_rerte. Software error.		
1312	Route PTRN trunk unavail	No available trunks in the routing pattern.		
1313	Remote DTGS invalid digit	Remote Direct Trunk Group Selection (DTGS) that was processing digits (after tie Trunk Access Code) from the preprocessing digit buffer to the digit buffer found invalid digit (digit = 0 or > 0xa).		
1314	Dgt collection setup fail	Error during setup for end-to-end signaling digit collection.		
1315	Dgt collection setup fail	Error during setup for end-to-end signaling digit collection prevented setting an indication in ttrq_typ that the call was queued during termination waiting for a Touch Tone Receiver (TTR) (CODEC_TTR).		

2 of 33

Table 49: Call Process denial events (1225 - 1899) 3 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1316	No unstrictd term point	No principal to terminate to, or it is termination restricted, and there is no termination coverage point.		
1317	Coverage software failure	Software error call_p termination to coverage point received invalid gm_term return code.		
1318	Split UID query failure	Adjunct Switch Application Interface (ASAI) Direct Agent Call termination fails in querying isg for split User ID.		
1319	Call record sftw failure	Incoming QSIG call completion ringout call. Failure retrieving suspended Temporary Signaling Connection (TSC) call record from service dispatcher.		
1320	Call record sftw failure	Incoming QSIG call completion ringout call. Call completion ringout call record does not match Temporary Signaling Connection (TSC) call record retrieved from service dispatcher suspension.		
1321	Illegal term to rmt Audix	Adjunct Switch Application Interface (ASAI) switch classified call. Illegal attempt to terminate off-switch to a remote AUDIX.		
1322	Data to station w/o H.320	ATA call to station type endpoint, but the station does not have the H.320 conversion flag set.		
1323	Dgt collection setup fail	Authorization code received, terminate to local extension, origination from ISDN trunk or endpoint, error during end-to-end signaling digit collection setup.		
1324	Data Ext code calling	Code calling by a data extension.		
1325	ASAI SCC to UDP nite svc	ASAI Switch Classified Call (SCC) to hunt group with UDP night service. This type of call is not allowed to go off-switch.		
1326	MM to Attd ctrld trunk	Multimedia user is not allowed to call a trunk under attendant control, Attendant Control of Trunk Group Active (ACTGA).		
1327	Obtaining Attd UID fails	Call to trunk under attendant control (Attendant Control of Trunk Group Active (ACTGA)). Failure getting attendant User ID from dpm.		
1328	Term to ACTGA Attd fails	Call to trunk under attendant control (Attendant Control of Trunk Group Active (ACTGA)). Failure terminating caller to controlling attendant.		
1329	Term to inappropriate pt	Block termination to incoming-only type trunk or user with voice bearer termination to a DEXT group.		
1330	Iterative term attd-retry	Call termination failure rerouting to attendant. Retry of termination to attendant was blocked to prevent an endless retry.		
1331	Italian misoperation	Italian misoperation treatment.		
				3 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 4 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1332	Data mod options qry fail	Reserving a pooled modem. Query data module for its options failed.		
1333	Term to modem failure	Seizing (terminating on) a pooled modem failed.		
1334	Term to modem failure	Analog endpoint termination to pooled modem (after administrable time delay expires) failed.		
1335	LWC blocked by msg_sv	Leave Word Calling. Async message response from msg_sv says give user LW_INTRCPT.		
1336	Tone detection timeout	Tone detector timeout without receiving a valid tone.		
1337	Intrcpt tone from far end	Intercept tone received before far end answers.		
1338	Wait for answer timeout	Wait answer supervision was timedout on a call from a station or tie trunk.		
1339	Auth code required	Digit analysis and routing problem. Authorization code required.		
1340	Rmt cfwd invald local ext	The attendant activated call forwarding for a remote extension to an invalid local extension.		
1341	Non-voice call intercept	Non-voice call was routed to attendant or announcement for intercept treatment. Switch to intercept tone treatment.		
1342	Dest BCC incompatible	The destination bearer capability code is incompatible.		
1343	Need higher FRL to route	A higher Facility Restriction Level is needed to route the call.		
1344	Hop count restricted	The outgoing call is hop count restricted.		
1345	Multiparty caller paging	Accessing paging equipment with more than 1 party on the call is not allowed.		
1346	Svc Obsrv from wireless	Service observing is not possible from wireless stations because they don't support "off-hook idle" state.		
1347	Svc Obsrv dpm query fail	Query of dpm to see if Feature Access Code service observing is optioned failed.		
1348	No Fac Svc Observing	Feature Access Code service observing is not optioned.		
1349	Term dial-up tst brdg app	Feature Access Code entered to do terminal dial-up test, not allowed on bridged appearances.		
1350	Term dial-up tst term typ	Terminal dial-up test is not allowed on attendant, BRI, wt or analog type terminal, or the terminal does not have a call appearance active on the voice channel.		
1351	More digits expected	Appending number to end of digit buffer. All digits have been processed for an Adjunct Switch Application Interface (ASAI) originated call, but more digits are expected to be collected.		

4 of 33

Table 49: Call Process denial events (1225 - 1899) 5 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1352	Port ntwk numbr too large	Facility access test specified a port network number greater than the maximum allowed (MAX_PPNS).		
1353	Cabinet number too large	Malicious call trace specified a cabinet number greater than the maximum allowed (MAX_PPNS).		
1354	SSC dialed ext's uid fail	Station Security Code (SSC) digit processing. The dialed extension's User ID has lost its association with the extension number.		
1355	Auth code required. (ASAI)	Call requires an authorization code. Call is an Adjunct Switch Application Interface (ASAI) phantom call. Not allowed.		
1356	ASAI SCC VDN destination	The first leg of an Adjunct Switch Application Interface (ASAI) Switch Classified Call (SCC) has Vector Directory Number as destination.		
1357	LAGT COR/COR restriction	There is a COR-to-COR (Class of Restriction) between the originating logical agent and terminating facility.		
1358	ASAI SCC term loginID	Adjunct Switch Application Interface (ASAI) Switch Classified Call (SCC) first leg attempting to terminate to logical agent loginID. Not allowed.		
1359	LoginID extensn qry fail	gm_query failure determining if the loginID extension used for the Direct Agent call is associated with a logged-in agent.		
1360	ASAI SCC term loginID	Adjunct Switch Application Interface (ASAI) Switch Classified Call (SCC) first leg attempting to terminate to logical agent loginID. Not allowed.		
1361	Page data call preindictd	Paging is denied if data call preindication was activated.		
1362	FAC follows priority FAC	Priority feature activation code shouldn't be followed by other feature activation codes. (auth)		
1363	FAC follows priority FAC	Priority feature activation code shouldn't be followed by other feature activation codes. (route)		
1364	FAC follows priority FAC	Priority feature activation code shouldn't be followed by other feature activation codes. (other)		
1365	More digits needed to rte	Adjunct Switch Application Interface (ASAI) call. DPM says it needs more digits to route on. There are no digits left to use in the preprocessing buffer, and no more digits are expected.		
1366	BCC incompatibility	Being called from auth_code(). DPM says digit analysis is done and we have Bearer Capability Class (BCC) incompatibility.		
1367	BCC incompatibility	Not being called from auth_code(). DPM says digit analysis is done and we have Bearer Capability Class (BCC) incompatibility.		

5 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 6 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1368	MFC out dialing timeout	outgoing MultiFrequency Compelled call under outpulse supervision. Interdigit or end-of-dialing timeout without any expectation of user completing dialing.		
1369	Dgt tmout PCOL merge fail	Unexpected digit timeout. Drop of principal finds that it is a Personal Central Office Line (PCOL) group User ID. Merge of PCOL member(s) into the call (pcol_merge()) for disposition via stndseq() fails.		
1370	Digit timeout - drop fail	Unexpected digit timeout. Drop of non-Personal Central Office Line (PCOL)-type principal failure.		
1371	Abbrv Dial DAC limit	Abbreviated Dialing was already dial accessed. There is a limit of 3 times that the DAC can be dialed to get digits to route on. This would seem to have a purpose of preventing looping via entries in the abbreviated dial lists.		
1372	Abbrv Dial list/entry inv	Abbreviated Dialing. Invalid list and/or list entry.		
1373	Abbrv Dial software fail	Abbreviated Dialing. Software error while getting the digits stored in user's abbreviated dial list.		
1374	Agent skills enabled qry	Error while querying system parameters to see if Expert Agent Selection (EAS) agent skills is enabled.		
1375	Dbi agent login to statn	Agent is logging into a physical station that already has an agent logged in.		
1376	Agent login illegl source	Trunk user or Remote Access user trying to do Expert Agent Selection (EAS) agent login operation. Not allowed.		
1377	Last ACD call skill qry	Query of UM for last Automatic Call Distribution (ACD) call's skill fails. Query of attendant, hunt, DEXT, paging or Personal Central Office Line (PCOL) group or Non Call Associated-Temporary Signaling Connection (NCA-TSC) user		
1378	No hunt grp for split idx	Split group index from dialed digits is a non-existent hunt group number.		
1379	Agent logout fail (auto?)	Agent logout failure. Might be spl_chk.c. logging out while auto-available.		
1380	Agent login failure	Agent login failure getting number of digits in logical agents password. Might be login-id User ID was not found in dpm extension table Ext_e, or an invalid logical agent login-id extension.		
1381	Agent login failure	Agent logging into MCH split already logged in logging into adjunct controlled split?		
1382	agent login invalid/error	Login invalid or error condition.		

6 of 33

Table 49: Call Process denial events (1225 - 1899) 7 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1383	Agent login failure/error	Logical Agent (LAGT) failure getting agent login-id. Possible causes: <ul style="list-style-type: none"> ● error initializing agent-stat table ● login for a skill failed ● TRAD logging into split already logged into ● already logged into maximum number of splits. 		
1384	Agent logins maximum'd	Maximum number of simultaneous logins exceeded or ACPT_LOGIN failed.		
1385	Agent passwd digits fail	Failure getting logical agent password digits from DPM.		
1386	Agent passwd mismatch	Agent entered password does not match administered password.		
1387	Agent login invalid/error	Login invalid or error condition.		
1388	Login acceptance fails	Logical Agent login processing of ACPT_LOGIN message to the la_spl_chk routine fails.		
1389	Agent login max/error	Maximum number of simultaneous logins exceeded, or this agent failed the login digits check (for example, this agent is using someone else's login-id).		
1390	Work mode change failed	Change of Agent Work Mode to after-call-work failed.		
1391	Work mode change failed	Change of Logical Agent Work Mode to aux-work failed.		
1392	Work mode change failed	Change of Agent Work Mode to man_in failed.		
1393	Work mode change failed	Change of Agent Work Mode to auto-in failed.		
1394	Agent feat act FAC error	Unrecognized Feature Access Code being processed for Automatic Call Distribution (ACD) agent feature activation.		
1395	Agent sup assist rqst er	Agent requesting supervisor assist. Possible causes: <ul style="list-style-type: none"> ● split group invalid ● agent not logged in ● split group has no supervisor ● administered 		
1396	Split invalid/agent login	Adjunct Switch Application Interface (ASAI) requesting supervisor assist. Possible causes: <ul style="list-style-type: none"> ● split group invalid ● agent not logged in 		
1397	Direct agent call setup	Supervisor assisted call to Expert Agent Selection (EAS) login ID. Error encountered in setting up Direct Agent Call.		
1398	Direct agent calling COR	Supervisor assisted call to Expert Agent Selection (EAS) login ID. Direct agent calling Class of Restriction (COR) check failure.		

7 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 8 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1399	EAS not enabled	Activating Add/Remove Skill feature but Expert Agent Selection (EAS) is not enabled.		
1400	EAS not enabled	Activating Add/Remove Skill feature but Expert Agent Selection (EAS) is not enabled.		
1401	COR_AR_SKL query failure	Activating Add/Remove Skill feature COR_AR_SKL dpm_query failed. User ID structure not found.		
1402	Skills COR restricted	Activating Add/Remove Skill feature. User has no Class of Restriction (COR) permission to Add/Remove Agent Skills.		
1403	Console prmsn, EAS agent	Activating Add/Remove Skill feature. User has no console permission and is not an Expert Agent Selection (EAS) Agent. Activator is wrong type.		
1404	LoginID prompt setup err	Activating Add/Remove Skill feature. Error in setting up the prompt for agent's loginID.		
1405	Skills prompt setup err	Setting up prompting for skill number in the Add/Remove Skills feature. Error in setting up prompt for agent's skills.		
1406	LoginID tenant nbr fail	Add agent. Skills translations failed to get the Tenant Number for the agent's loginID.		
1407	Skills tenant nbr fail	Add agent Skills translations. Failed to get the Tenant Number for the agent's skill.		
1408	Tenant number mismatch	Add agent Skills translations. Tenant Number of the Expert Agent Selection (EAS) agent's loginID does not match the Tenant Number of the skill being added.		
1409	Skill level out of range	Add agent Skills translations. Skill level out of range.		
1410	DAC skill nbr qry failed	Remove agent Skills translations. dpm_query for Logical Agent's (LAGT) DAC skill number failed.		
1411	DAC skill not removable	Remove agent Skills translations. Logical agent's DAC skill is not removable.		
1412	Skills ftr msg failure	Add/Remove agent Skills translations. Add/Remove Skills feature message sending to station server failed. (SS_AR_SKL)		
1413	DAC agent dest/split	Adjunct Switch Application Interface (ASA) third party direct agent call. Process CP_DIR_AGENT message from ISG. No DAC agent destination or split specified in message.		
1414	DAC agent dgts to uid	Adjunct Switch Application Interface (ASA) third party direct agent call. Process CP_DIR_AGENT message from ISG. DAC agent digits conversion to User ID. failure.		

8 of 33

Table 49: Call Process denial events (1225 - 1899) 9 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1415	DAC msg err/agent login	Adjunct Switch Application Interface (ASAI) third party direct agent call. process CP_DIR_AGENT message from ISG. Possible causes: <ul style="list-style-type: none"> ● adjunct agent not logged in ● adjunct gave the switch a wrong agent extension ● adjunct gave the switch a wrong split extension 		
1416	Auth code dgt coll fail	Collecting authorization code digits as end-to-end signaling failed.		
1417	TTR queueing invalid	Collecting authorization code digits. "TTR queueing occurred in remote access" is indicated in Touch Tone Receiver (TTR) of callr - not valid in this routine.		
1418	Bsy vfy trk member	Error on query for busy status. Possible causes: trunk member specified greater than maximum trunks in group, or corrupted trunk index after a tape read.		
1419	COS restrctn Rus Intrsn	User's Class of Service does not allow access to Russian Power Trunk Intrusion feature.		
1420	Bsy vfy call merge fail	Merging the busy-verifying call with the busy-verified call. Failure to find an available callr2 party slot.		
1421	Bsy vfy termination fail	Terminating the busy-verifying call to a trunk. Failure to find an available caller party slot.		
1422	Bsy vfy termination fail	Terminating the busy-verifying call to a trunk. Error getting the trunk's index into the tmem_tbl		
1423	Software invalid stim	Remote user activation/deactivation of a type of attendant call forwarding - stimulus other than CP_ACFON, CP_ACFBDAON or CP_ACFOFF received.		
1424	Cfwd dest dgts storage	Activation of call forwarding. Call forward destination address digits did not all get stored.		
1425	Cfwd actvt error/denial	Activation of call forwarding. Error or denial of activation.		
1426	Off prem extension size	Request remote switch to activate CF on one of its local extensions. Answer Distributed Communication System (DCS) off-premise station extension size is defined by destination digits dialed.		
1427	FWDed party extension nbr	Activating call forwarding. Feature button IDs forwarded party extension number for which we cannot find a user ID.		
1428	Phys ext not cfwd avail	Logged-in Expert Agent Selection (EAS) agent's physical extension is unavailable for any "simple" (on switch?) call- forwarding.		

9 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 10 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1429	Rmte cfwd not allowed	Disallow remote call-forwarding of an Expert Agent Selection (EAS) loginID extension in all cases (for example, whether the loginID is logged into a terminal or not).		
1430	COS deny cfwd activate	User's Class of Service does not allow this call forwarding activation.		
1431	Cfwd deact not allowed	Expert Agent Selection (EAS) agents are not permitted to deactivate call forwarding.		
1432	Cfwd deact err/denial	Deactivation of call forwarding. Error or denial of deactivation.		
1433	Held xfr call missing	Converse Data Return requires that there be a call held due to transfer while processing the Converse Data return code (CONV_DAT_RET).		
1434	Held call retrieval fail	Converse Data Return processing failed to retrieve the suspended call record from the SD for the held call. The held call must be active on a Converse vector step.		
1435	Invalid vec step typ/pty	Converse Data Return processing encountered an invalid vector step type (not V_CONVERSE) or the party is invalid.		
1436	No COS for ctl rstrctn	User Class of Service does not allow activation/deactivation of controlled restrictions.		
1437	Sys parm - dir call pkup	Directed-call-pickup system parameter is not enabled.		
1438	Invalid usr dir call pkup	Directed call pickup attempt from invalid user (for example, not a station or attendant).		
1439	Dir call pkup COR rstrct	Directed call pickup attempt from user without Class of Restriction (COR) permission.		
1440	Dir call pkup non-station	Directed call pickup attempt on a call to an endpoint other than a station.		
1441	Dir call pkup COR rstrct	Directed call pickup attempt to a station that has no Class of Restriction (COR) permission to accept directed call pickup.		
1442	Ring check query failure	Directed call pickup attempt. Failure of UM query to see if called station is still ringing before completing the pickup to it.		
1443	COS deny dat pvcy fr act	User's Class of Service does not allow activation of the data privacy feature.		
1444	DS0 test call invalid	DS0 test call is valid only for incoming data trunk calls.		
1445	Rmt emrg accs to attd dny	Emergency access call to attendant is not permitted from a remote user.		
1446	Port ID/UID mapping fail	Facilities Access Test call. Trunk or Touch Tone Receiver (TTR) port_id->User ID mapping failed.		

10 of 33

Table 49: Call Process denial events (1225 - 1899) 11 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1447	TTR port type query fail	Facilities Access Test call - Touch Tone Receiver (TTR) test. CM query for TTR port type fails.		
1448	Tested not trunk or TTR	Facilities Access Test call - user type being tested is neither a trunk or Touch Tone Receiver (TTR), but logic that got us here thought it was.		
1449	Vis Imprd Svc incompatibl	Facilities Access Test call - this feature is not compatible with Visually Impaired Service.		
1450	FAT call error	Facilities Access Test call. Possible causes: <ul style="list-style-type: none"> ● CM error connecting to tone or maintenance timeslot ● necessary number of digits not dialed for tone or timeslot call ● on trunk or Touch Tone Receiver (TTR), call conversion of external ID to internal ID failed, or portid to User ID mapping failed. 		
1451	Connection to music error	Facilities Access Test call to a music port. CM error connecting to music.		
1452	FAT non-ISDN COR rstrct	Facilities Access Test (FAT) call to a trunk. User is Class of Restriction (COR) restricted from making a FAT test of the non-ISDN trunk.		
1453	FAT test RLT/DID illegal	Facilities Access Test (FAT) call to a trunk. FAT is allowed for this trunk type, Release Link Trunk (RLT) or Direct Inward Dialing (DID).		
1454	Trk svc state change fail	Facilities Access Test call to a trunk. Failure moving trunk from out-of-service state to in-service. Might be a bad User ID.		
1455	FarEnd TstLn nbr qry fail	Facilities Access Test call to a PRI trunk. GM query for far end ISDN test line number failed (QTC_NUM).		
1456	FarEnd TstLn nbr invalid	Facilities Access Test call to a PRI trunk. Invalid digit in far end test line number.		
1457	FarEnd TstLn nbr invalid	Facilities Access Test call to a PRI trunk. Invalid digit in far end test line number.		
1458	Wrg Bch svc/usg/mnt state	Facilities Access Test (FAT) call to a PRI trunk. Wrong B-channel service, usage or maintenance state to allow FAT test.		
1459	Bad user Id	Facilities Access Test call to a trunk. Might be a bad User ID.		
1460	Trk grp qry/get TAC	Facilities Access Test call to a trunk. um_query failure getting trunk's group User ID (QTRKGRPUI)? dpm_dgtget() failure getting trunk group's "real" dial access code.		
1461	User Coverage path missing	User activating Send All Calls does not have coverage path allowing Send All Calls. If user is an Expert Agent Selection (EAS) agent neither the agent or station has a coverage path.		

11 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 12 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1462	Split group digits wrong	User activating/deactivating Position Busy. Wrong number of digits used to specify split group.		
1463	Agent denied in split group	Agent deactivating Position Busy, not allowed in split group.		
1464	Agent not in aux work	Agent not in AUX_WORK activating Position Busy.		
1465	SAC unavail to attd	Send All Calls (SAC) or Position Busy feature activation/deactivation denied (for example, attendant is not allowed to activate/deactivate SAC).		
1466	No call to xfr to AUDIX	Route transferred or call conferenced to AUDIX. There is no held call that would be transferred/ conferenced in with AUDIX.		
1467	No call to xfr to AUDIX	Route transferred or call conferenced to AUDIX, but the calling party was disconnected.		
1468	Inelgbl invoker xfr AUDIX	Route transferred or conferenced call to AUDIX. Only the principal or covering user (or bridges of them) are allowed to invoke this feature.		
1469	Invlid remote ADX mach-nbr	Route remote transfer to AUDIX. Failure getting the remote principal's AUDIX Machine number.		
1470	No ADX mach-nbr/ node-name	Route remote transfer to AUDIX. The remote principals AUDIX Machine number does not translate into an adjunct index. (QAX_ADJ_IDX)		
1471	Invalid AUDIX mach-nbr	Route remote transfer to AUDIX. The remote principal's AUDIX Machine number received is "0". dpm query for user's serving AUDIX index fails.		
1472	Invalid AUDIX mach-nbr	Route remote transfer to AUDIX. The remote principal's AUDIX Machine number received is "0". dpm query for user's serving AUDIX index received "0". Query of grp_m for the first AUDIX whose DCS link is up fails.		
1473	No local AUDIX mach-nbr	route local transfer to AUDIX. the local principals AUDIX Machine number received is "0". dpm query for user's serving AUDIX index fails.		
1474	No primary AUDIX hnt grp	Route transfer to AUDIX. Query for an AUDIX. Adjunct's Primary Transfer into AX Hunt Group failed.		
1475	No ADX hnt grp-cvg path	Route local non-vector transfer to AUDIX. AUDIX hunt group is not in the principal's coverage path.		
1476	Dat pvcy/rstrct ICOM call	User with data privacy or data restriction is trying to originate an ICOM call. This is not allowed.		
1477	Invalid ICOM grp/dial cod	ICOM call handling. Invalid ICOM group or ICOM dial code of terminating station. (icm_route())		

12 of 33

Table 49: Call Process denial events (1225 - 1899) 13 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1478	Block iterative Lst Nbr DI	Last Number Dialed was accessed through an Abbreviated Dialing list. Do not allow it again.		
1479	LND digits - DPM fail	User's Last Number Dialed (LND) digits were not returned successfully by dial plan manager. (DPM_LND)		
1480	LND digits - DPM fail	User's Last Number Dialed (LND) digits were not returned successfully by dial plan manager. (software error)		
1481	MASI setup not incmg ISDN	Multimedia Application Server Interface (MASI) path setup call - valid only for incoming ISDN calls.		
1482	MCT on DCS trk disallowed	User activating Malicious Call Trace for a DCS trunk not allowed.		
1483	MCT target type invalid	Malicious Call Trace target cannot be a group User ID. Target PORT entered, must be a regular TRUNK port or PRI.		
1484	MCT target not in a call	Malicious Call Trace target must actually be involved in a call.		
1485	MCT call serv_d rtrv fail	Malicious Call Trace cannot retrieve callr from serv-d for the call being traced.		
1486	MCT trace resorce unavail	Malicious Call Trace activation by button could not get trace resources from GRP_M.		
1487	MCT start invld ctrl alrt	Malicious Call Trace start invalid controller alerting return code from GRP_M (mct_start()).		
1488	MCT deact dny by GRP_M/er	Malicious Call Trace deactivation (not via busyout) denied by GRP_M or error. (mct_end())		
1489	MCT activator grp uid/uid	Malicious Call Trace activation failure getting individual User ID from activator group User ID.		
1490	MCT activator COR rstrctd	Malicious Call Trace (MCT) activation. Activator's Class of Restriction (COR) does not allow MCT feature access.		
1491	Trk ext/int ID cnvsn fail	Malicious Call Trace request targeted to a trunk port ID. Failure converting the external ID (cabinet, carrier, slot, circuit) into an internal ID (angel, circuit). (dig23dportid() - ATM, dig2portid()).		
1492	MCT act on trk pt ID fail	Malicious Call Trace request targeted to a trunk port ID. failure activating MCT for given trunk pt ID.		
1493	AD prg from non station	Abbreviated dialing programming is messaging the station server to enter a different mode and prepare for digit collection. Only simple users allowed. Wrong user type.		
1494	Extension/passwd required	Coverage message retrieval. Remote access not allowed unless the user supplies the extension and password.		
				13 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 14 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1495	Local only/annc dest/uid	Announcement record/playback session. Only local calls to the announcement are allowed. Call destination must be an announcement group. Must have a User ID slot for the announcement board.		
1496	Annc ID needed/conn fail	Begin integrated announcement session. Integrated announcement not identified (ann_sess()). cm_pt_conn failure or invalid Caller ID root (au_sbegin()).		
1497	Restricted by COS	User's Class of Service does not permit one of: <ul style="list-style-type: none"> ● Leave Word Calling-cancel ● AP Demand Print ● voice synthesis principal message retrieval ● voice synthesis coverage message retrieval ● integrated announcement session 		
1498	MM call software failure	MultiMedia Call Handling multimedia call activation from voice station. Notification of USER_M failed.		
1499	MM failure getting BCC	MultiMedia Call Handling multimedia call activation from voice station button. Failure getting bearer capability from USER_M.		
1500	Ext nbr or page typ invld	Failure getting Code Call paging ID corresponding to dialed extension. Invalid extension number or page type.		
1501	Page call park failure	Drop paging equipment, start park timer, and park call permanently. There is no record in callr of a call having been parked during a page.		
1502	Drop software failure	Paging zone seizure denied. gm_drop() problem returned other than GDRP_OK, GDRP_ANS, or GDRP_OUT.		
1503	Answer back merge failure	Answer parked call, give confirmation tone to parked party, merge 2 calls. Have no call record of party originating answer back.		
1504	Answer back merge failure	Answer parked call, give confirmation tone to parked party, merge 2 calls. No call parked on this extension.		
1505	Answer back merge failure	Answer parked call, give confirmation tone to parked party, merge 2 calls. Unknown return from GRP_M retrieval of Caller ID of the parked call.		
1506	Answer back merge failure	Answer parked call, give confirmation tone to parked party, merge 2 calls. Unknown return from GRP_M unpark of call if the last party drops.		
1507	Answer back merge failure	Answer parked call, give confirmation tone to parked party, merge 2 calls. Accessing the callr of the parked call failed retrieval from serv-d.		

14 of 33

Table 49: Call Process denial events (1225 - 1899) 15 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1508	Unparking vec ctrld call	Answer parked call, give confirmation tone to parked party, merge 2 calls. Deny the unpark (answer back) attempt if the parked call is under vector control.		
1509	Answr back station dialed	Answer parked call, give confirmation tone to parked party, merge 2 calls. User ID of station dialed for answer back differs from park_uid in call_r.		
1510	COR/COR user restricted	Answer parked call, give confirmation tone to parked party, merge 2 calls. COR-to-COR (Class of Restriction) between user where call is parked and users in answer back callr.		fail code (for example, DPXFR_DENY_9)
1511	Parked call already droptd	Answer parked call, give confirmation tone to parked party, merge 2 calls. The parked call was already dropped by the originator but the chimes haven't finished yet.		
1512	Too many parties to merge	Answer parked call, give confirmation tone to parked party, merge 2 calls. The merge is not possible because cannot find an empty slot in callr2.		
1513	Park call on station only	Trying to park a call on a non-station type user. must park on a user with a SMPL group type.		
1514	No call to park	There is no conference pending. The caller to be parked must have dropped or been dropped.		
1515	Park ftr serv_d failure	Failure encountered releasing the callr to serv_d.		
1516	Park ftr serv_d failure	Failure encountered retrieving the callr from serv_d.		
1517	Park ftr serv_d failure	Failure encountered retrieving the callr from serv_d.		
1518	Too many park conferees	Too many conferees in the call to allow parking.		
1519	Vector active cant park	Vectoring is active on the held call. Cannot allow the held call to be parked.		
1520	Park ftr serv_d failure	Failure encountered releasing the callr to serv_d.		
1521	Park ftr serv_d failure	Failure encountered retrieving the callr from serv_d.		
1522	TAAS from guest room	Pickup for Call Pickup or Trunk Answer Any Station (TAAS). Attendant backup alerting is active, maid status is dialed from guest room on station doing pickup. Might be maid is invoking TAAS from guest room.		
1523	Not a pickup grp mbr	Pickup for Call Pickup or Trunk Answer Any Station (TAAS). Pickup initiator is not a member of a pickup group.		
1524	Picked up call ID error	Pickup for Call Pickup or Trunk Answer Any Station (TAAS). Error encountered getting call ID of call to be picked up.		

15 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 16 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1525	Call pickup from adjct	Pickup for Call Pickup or Trunk Answer Any Station (TAAS). Pickup of call originated by an adjunct is not allowed.		
1526	Pickup of call wait call	Pickup for Call Pickup. Pickup of a call waiting call is not allowed.		
1527	Pickup of converse call	Pickup for Call Pickup or Trunk Answer Any Station (TAAS). Trying to pickup a converse call, this is not allowed. Passing data efficiently to a party that has already cut through on the call cannot be handled.		
1528	Pickup of self's call	Stations A and B are in same pickup group. Station A calls Station B, holds, and dials Feature Access Code for pickup. Disallow pickup of self-initiated call.		
1529	Pickup COR/COR usr rstrct	Pickup for Call Pickup or Trunk Answer Any Station (TAAS). COR-to-COR (Class of Restriction) restriction between the initiator of pickup and user(s) of the call being picked up.		fail code (for example, DPXFR_DENY_9)
1530	Priority call COS denied	Caller's Class of Service does not allow initiation of priority calling treatment of call.		
1531	Priority call COS denied	Caller pushes the priority calling button after the call has been dialed, but before it is answered. Caller's Class of Service does not allow initiation of priority calling treatment of call.		
1532	Passwd storage exhausted	Dual Tone MultiFrequency (DTMF) password collection for audio add-on party in VSP-MCU passworded conference. No room in opsl_dig to store conference password - should never happen.		
1533	Invalid TTR queueing type	Dual Tone MultiFrequency (DTMF) password collection for audio add-on party in VSP-MCU passworded conference. Touch Tone Receiver (TTR) queuing type in callr has invalid indication whether or where TTR queuing occurred.		
1534	Software invalid stim	Performing the callback of a party after the call has been queued. Invalid Call Processing (CP) message being processed and passed from a call supervisor.		
1535	ACB held call dropped	Analog station flashhooks and dials Automatic Callback (ACB) activation Feature Access Code. The call from which the user flashed is to be removed from hold and used to activate ACB. The call didn't get held or it disappeared.		
1536	GRP_M que service error	GQSRV_ERR error returned from gm_qsvc().		
1537	Callback type sftw error	Invalid callback type returned by gm_query().		
1538	Auto callback COS denied	User's Class of Service does not allow activation of Automatic Callback feature.		
1539	Callback type qry failed	gm_query() for callback type failed.		

16 of 33

Table 49: Call Process denial events (1225 - 1899) 17 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1540	Callback type qry failed	Invalid callback type returned by gm_query().		
1541	Invalid call ID/conn fail	Switch has answered remote access call. Set up end-to-end signaling digit collection. Invalid Caller ID or Touch Tone Receiver (TTR) connection failure. (tu_ecoll_dg(), bch_ecoll_dg() -).		
1542	TTR queueing error	Switch answered a remote access call. Set up end-to-end signaling digit collection. Touch Tone Receiver (TTR) queueing erroneously occurred in auth_feat().		
1543	Telcmt accss ext qry fail	Switch answered a remote access call and set up end-to-end signaling digit collection. Failure querying DPM for User ID of telecommuting access extension.		
1544	Barrier/auth cod qry fail	Switch answered a remote access call and set up end-to-end signaling digit collection. Invalid response from DPM on query for whether barrier code and authorization code are needed. (dpm_remqry())		
1545	Acct code length qry fail	Query of DPM for SMDR account code length failed.		
1546	Held call serv_d failure	Handle T120 requests for a video conference. Accessing the callr of the held call failed retrieval from serv-d.		
1547	Video conf deact flag er	T120 request for deactivation of video conference, but the call has no indication that a video conference exists. (mm_dataconf_on)		
1548	Dat drop not frm dat orig	T120 request for deactivation of video conference. It is only valid to drop data from the originator of data. The user who pressed the button is not the originator.		
1549	T120 drop CM failure	CM failure on T120 drop request from valid user with T120 on.		
1550	T120 activate CM failure	CM failure on Feature Access Code dialed request for T120 activation.		
1551	Invalid test tone specfd	Terminating trunk transmission test call. Invalid test tone specified for connection to the call.		
1552	Whisp pg elgblity qry err	Query of GRP_M for whisper page eligibility encountered an error or the response was invalid.		
1553	Whisp pg too many parties	Activate whisper page answer ftr. callr party block has no slot available for the page originator.		
1554	Whisp pg ansr merge fail	Activate whisper page answer ftr. switch of the Caller ID of the paging party from the original call failed (um_wpswap())		
1555	Whisp pg too many parties	Merging the paging call with the paged call. callr2 party block has no slot available for the merged call.		

17 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 18 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1556	Annc/music connect fail	Wakeup announcement verification. Failure of the CM to connect a wakeup announcement or music to the call.		
1557	Wakeup annc vfy COS deny	Call originator does not have Class of Service permission to verify wakeup announcements.		
1558	Maid status PMS msg fail	Sending the PMA_MDSTATUS message to the PMS failed.		
1559	Maid status ext COS deny	Maid status Feature Access Code dialed from a room station that does not have Class of Service permission.		
1560	Maid info digits qry fail	Query of DPM for number of maid info digits failed.		
1561	Maid status PMS msg fail	Send of a PMA_MDSTATUS message to the PMS failed.		
1562	Maid status ext COS deny	Maid status Feature Access Code dialed from a designated station that does not have Class of Service permission.		
1563	Maid status ftr ID invld	Processes the dialed maid status code, but callr feat_id is invalid for either maid status dialed from a guest room or from a designated station.		
1564	PMS rejects hskp status	Property Management System rejects housekeeping status v.		
1565	PMS hskp response invalid	Property Management System response to housekeeping status is invalid. (CP_MDRES)		
1566	Guest rm station COS deny	Routing call to Property Management System to log or obtain guest room status. The User ID of the station entered by the user is not Class of Service identified as a guest room station.		
1567	Maid info digits qry fail	Routing call to Property Management System to log or obtain guest room status. Query of DPM for number of maid information digits failed.		
1568	Maid status PMS msg fail	Routing call to Property Management System (PMS) to log or obtain guest room status. Send of a PMA_MDSTATUS message to the PMS failed.		
1569	Voice msg type call_r flg	Digit timeout waiting for entry of Do Not Disturb turn-off time or entry of Automatic Wakeup time. callr does not have this flagged as a Voice message type call (vtype).		
1570 (also in Table 48)	TTR insertion failed	Processing incoming digits for ISDN call. Insertion of Touch Tone Receiver (TTR) to collect in-band digits failed.		
1571	WSS no calling pty nbr IE	Processing incoming digits for ISDN call. A General Central Office (GCO) Wireless Subscriber System (WSS) call origination denied - no calling party number IE was sent.		

18 of 33

Table 49: Call Process denial events (1225 - 1899) 19 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1572	Call hndlng/usg alloc err	Processing incoming digits for ISDN call. Error during Incoming Call Handling Treatment or Usage allocation Check (GM_ISDNDIG).		
1573 (also in Table 48)	Principal is not ISDN	Get called digits, calling number and name, etc., and send ISDN SETUP message to the far end. The principal is not ISDN.		
1574	SETUP msg IEs not created	Get called digits, calling number and name, etc., and send ISDN SETUP message to the far end. IEs necessary for SETUP not created and stored in the IAP.		
1575	SETUP msg send failed	Get called digits, calling number and name, etc., and send ISDN SETUP message to the far end. The "send" failed. (trk_setup(), um_setup())		
1576	ISDN routing failure	Get called digits, calling number and name, etc., and send ISDN SETUP message to the far end. Routing failure. (gm_routepat())		
1577	ISDN SETUP msg failure	ISDN trunk group Trunk Access Code dialed or simulated Q931_REC IEs set up and stored in iap, and request send of SETUP msg. cp_setup() returned a failure error.code. suser_m got a failure indication from the gip in trying to send the ISDN SETUP message?		
1578	Inc tst call 2many partys	Incoming test call for talk/listen on same timeslot. Failure to find an available callr party slot.		
1579	Inc tst call wrg usr type	Incoming test call for talk/listen on same timeslot. This type of test call is not permitted to access the user type.		
1580	Must be ISDN trunk group	Check for usage allocation restrictions on incoming overlap receiving calls. Possible causes: <ul style="list-style-type: none"> ● not ISDN trunk group ● insane index into the call by call data table ● get_tmemb() failure from GRP_M usage_chk() ● Unexpected error from inc_cuap_sf() 		
1581	Passwd digits err/timeout	MCU audio add-on password supervision. Possible causes: <ul style="list-style-type: none"> ● digit timeout before collecting all the digits ● an invalid digit ● a set of digits that does not match the conference password 		
1582	Spvsr state/feat_id wron	Generating intercept via CP_REORDER with sup = ACT_TTI_SUP (for Terminal Translation Initiation digit collection) and feat_id != CHG_SEC (Change station security code). Possible causes: <ul style="list-style-type: none"> ● wrong supervisory state ● wrong feat_id in callr 		

19 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 20 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1583	Spvsr state/feat_id wrong	Generating intercept via CP_CONFTONE with sup = ACT_TTI_SUP (for Terminal Translation Initiation digit collection) and feat_id != CHG_SEC (Change station security code). Possible causes: <ul style="list-style-type: none"> ● wrong supervisory state ● wrong feat_id in callr 		
1584	Software invalid stim	Software error. Invalid Call Processing (CP) stimulus received while in supervision state that handles Terminal Translation Initiation (TTI) digit collection during dialing of the TTI security code and extension.		
1585	Abbrv Dial invalid digit	Invalid digit detected while processing abbreviated dialing.		
1586	Abbrv dial prg rejected	Rejection of abbreviated dialing programming from station server.		
1587	Agent extension invalid	Add/Remove Agent Skills. Feature Access Code was dialed by a user with console permissions, but the agent-loginID extension entered is not a valid Expert Agent Selection (EAS) AGENT extension.		
1588	Skill grp nbr illegal	Add/Remove Agent Skills feature has been invoked and the Skill number has been collected. It does not represent a legal skill group number.		
1589	Skill number invalid	Add/Remove Agent Skills feature has been invoked and the Skill number is not valid.		
1590	System or software error	Add/Remove Agent Skills feature has been invoked. STN_SV encountered system or software error.		
1591	Digit collection error	Add/Remove Agent Skills feature has been invoked. Error in digit collection.		
1592	Routing not to a station	QSIG Call Completion ringout call from remote originating party. Routing erroneously to a local facility that is not an SMPL station.		
1593	Digit tmo/invld rsn code	Interdigit timeout or invalid reason code entered during Expert Agent Selection (EAS) aux work and logout reason code digit collection is in progress.		
1594	Software invalid stim	Code Call paging seizure supervision received a Call Processing (CP) stimulus from one of a big list of incompatible feature CP stimulus.		
1595	Cfwd tenant partn rstrct	Attendant-activation of call forwarding, and extended administration of call forwarding. Error or access denial resulted from TENANT_CHECK where originator's partition is restricted from accessing partition of extension being administered for call forwarding.		

20 of 33

Table 49: Call Process denial events (1225 - 1899) 21 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1596	Attd must enter station	Attendant-activation of call forwarding, and extended administration of call forwarding. The extension being administered is not a simple station user.		
1597	Attd cant fwd attd calls	Attendant-activation of call forwarding, and extended administration of call forwarding. Attendant is not allowed to forward its own calls.		
1598	Feature ID invalid	Attendant-activation of call forwarding, and extended administration of call forwarding. The feature ID in callr feat_id is wrong for the Call Processing (CP) stimulus being processed by this supervisor.		
1599	Change cvg COR restricted	Attendant-activation of call forwarding, and extended administration of call forwarding. Change coverage Feature Access Code was dialed. Class of Restriction (COR) of dialed extension does not permit change coverage.		
1600	Software error	Attendant-activation of call forwarding, and extended administration of call forwarding. CP_REJECT - partial perch write in station server to administer the new active coverage option failed.		
1601	Software invalid stim	Attendant-activation of call forwarding, and extended administration of call forwarding. Invalid Call Processing (CP) stimulus type sent to this supervisor.		
1602	Cfwd act to paging grp NA	Call forwarding supervision. Activating call forwarding to a paging group is not allowed.		
1603	Cfwd offnet COS restrcted	Call forwarding supervision. Activating call forwarding off-net is not allowed for this user. check the Class of Service permissions.		
1604	Cfwd offnet COS restrcted	Call forwarding supervision. Activating call forwarding off-net via AAR/ARS is not allowed for this user. Check the Class of Service permissions.		
1605	Cfwd to self denied	Call forwarding supervision. Call forwarding to self is prevented.		
1606	Software error	Call forwarding supervision. Invalid feedback message type received with CP_FEEDBK type stimulus to this supervisor from dap function.		
1607	Software invalid stim	Call forwarding supervision. invalid Call Processing (CP) stimulus type sent to this supervisor.		
1608	Routing not to data user	The "routed to" party is not a Data User.		
1609	Local rtg must be to sta	QSIG Call Completion ringout call from the remote originating party. Routing locally, but not to a station. This is not allowed.		
1610	Party count not = 1	Prepare to collect deluxe paging & park extension. The callrpty_cnt is not = 1.		

21 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 22 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1611	Not MM station/chnl busy	Sending down the MultiMedia Call Handling Basic mode activation message to the User Manager fails. Possible causes: <ul style="list-style-type: none"> ● station not part of Multi-media ● data user busy on at least one channel. 		
1612	Svc link creation failure	Sending down the MultiMedia Call Handling Enhanced mode deactivation message to the User Manager fails. Might be the creation of a service link failed.		
1613	BCC query failed	MultiMedia Call Handling multinumber type call. Query of USER_M for bearer capability failed.		
1614	Ctrl rstrct/DND fail	Controlled restriction activation/ deactivation, with possible interaction with do-not-disturb. Failure return from (dpm_crstrict()) or awu_cancel()).		
1615	Rstrct typ/featid/usr id	Initial processing supervision for controlled restriction. Possible causes: <ul style="list-style-type: none"> ● originator's User ID not found in DP_MGR User ID data tables ● restriction digit does not identify with outward, total, termination or station-to-station type restriction ● featid is not one of: <ul style="list-style-type: none"> - activate user control restriction - deactivate user control restriction - activate group control restriction - deactivate group control restriction 		
1616	Ctrl rstrct featid bad	Initial processing supervision for controlled restriction. Might be featid is not one of: <ul style="list-style-type: none"> ● activate user control restriction ● deactivate user control restriction ● activate group control restriction ● deactivate group control restriction 		
1617	Dialing tmo/invalid digit	Supervisor for Logical Agents is logging in by dialing LoginID digits, dialing timeout occurs or an invalid digit is dialed.		
1618	Paging timeout	Loudspeaker paging seizure supervision. Might be a paging timeout.		
1619	LWC access cod dgt invld	Supervision for Leave Word Calling access code. Processing invalid digit dialed.		
1620	LWC access code rejected	Supervision for Leave Word Calling access code. Processing msg_sv rejects code.		
1621	Software invalid stim	Invalid Call Processing (CP) message stimulus'd to Malicious Call Trace supervisor.		
1622	BCC selection digit invld	Supervision for multimedia parameter selection. Invalid digit dialed for selecting bearer capability for call.		
1623	MM parm select failure	Supervision for multimedia parameter selection. error returned from gm_ftr_act().		

22 of 33

Table 49: Call Process denial events (1225 - 1899) 23 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1624	Backward tone absent tmo	Trunk outpulsing supervision. Outgoing backward tone absent timeout on MultiFrequency Compelled digit sending.		
1625	7 min tmo - no tone rcvld	Trunk outpulsing supervision. No tone has been detected within 7 minutes after dialing Trunk Access Code of a Cut Through Central Office (CO) or Foreign Exchange (FX) trunk.		
1626	MFC trk seize failure	Trunk seizure supervision on outgoing trunks. MultiFrequency Compelled trunk seizure failure.		
1627	Out trk seize dgt invld	Trunk seizure supervision on outgoing trunks.		
1628	7 min tmo - no tone rcvld	Trunk seizure supervision on outgoing trunks. No tone has been detected within 7 minutes after dialing Trunk Access Code of a Cut Through Central Office (CO) or Foreign Exchange (FX) trunk.		
1629	7 min tmo - no tone rcvld	Supervision when there is a tone detector on the call, a wait timer has been set for a VOICE user, or a data call over a trunk is waiting for a Stall Answer feedback to DEXT. No tone has been detected within 7 minutes after dialing the Trunk Access Code of a Cut Through Central Office (CO) or Foreign Exchange (FX) trunk.		
1630	Onhk que spvsn invld dg	Queued call or anticipated manually queued call sees CP_INVLDGT from somewhere.		
1631	Rmt ACB ftr act timeout	Queued call or anticipated manually queued call sees timeout waiting for remote drop by activator of Automatic Call Back feature.		
1632	PASTE enbl/rstrct/usrtyp	Possible causes: <ul style="list-style-type: none"> ● PC Application Software Exchange (PASTE) not enabled ● attendant use of PASTE is not allowed. station ● Class of Restriction (COR) does not allow PASTE ● totally restricted station cannot use PASTE ● station has no display ● bridge appearance cannot use PASTE ● agent not in AUX cannot use PASTE ● (su_ok4paste()) COR restricted for PASTE 		
1633	Digit tmo/list nbr invld	Inter-digit timeout or invalid list number entered during PC Application Software Exchange (PASTE) display list number collection.		
1634	Software invalid stim	Supervision after position busy (de)activation dial access code has been recognized. Collecting more digits. Invalid Call Processing (CP) stimulus type sent to this supervisor.		
1635	Extension type qry fail	Refresh Terminal Parameters supervision. The query to get the extension type failed.		

23 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 24 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1636	Not a downloadable set	Refresh Terminal Parameters supervision. Port type is not a valid downloadable station port type. Only 8400/6400/4600/603 type stations and the 302 type attendant consoles are allowed.		
1637	Wrt prot/maxd/annc bd	Supervision for announcement record/playback session processing. Integrated announcement session instruction message sent to GRP_M. Possible causes: <ul style="list-style-type: none"> ● announcement is write/delete protected ● invalid feat_type or not the same Caller ID that is in the session ● CM port connection failure ● invalid Caller ID root (au_sbegin()) ● CM port disconnect failure ● CM port listen failure ● no announcement board ● maximum number of announcements already recorded 		
1638	Record playback reject	Supervision for announcement record/playback session processing. CP_REJECT stimulus received from somewhere.		
1639	Permanent seizure	Standard action stimulus processing. Non-Direct Inward Dialing trunk origination. Digit timeout with no digits dialed. The permanent incoming seizure treatment is to give intercept.		
1640	Permanent seizure	Standard action stimulus processing. Italian external tie (TGU) call. Digit timeout with no digits dialed. The permanent incoming seizure treatment is to give intercept.		
1641	Permanent seizure	Standard action stimulus processing. Trunk group type other than: DID, IN_TIE, EX_TIE, TAN_TIE, ACCESS, IN_APLT, EX_APLT, ISDN_PRI, or DIOD. Digit timeout with no digits dialed. The permanent incoming seizure treatment is to give intercept.		
1642	Ofhk alrt tmo intvl admin	Standard action stimulus processing. Station, attendant or analog adjunct data extension originator. Off-hook alert feature activation. No off-hook alert timeout interval administered. (OHK_ALERT)		
1643	Off-hook dialing time out	Standard action stimulus processing. originator group type not trunk, DEXT, SMPL(station), or attendant? DEXT, SMPL, attendant does not Class of Service allow off-hook alert, processing a CP_DG_TMO for Line Intercept Tone timer.		
1644	Orig block/invalid digits	Standard action stimulus processing. originator group type not trunk, DEXT, SMPL(station), or attendant? DEXT, SMPL, ATTD does not Class of Service allow off-hook alert and NOT processing a CP_DG_TMO for Line Intercept Tone timer.		
1645	Talk state MFC trk fail	MultiFrequency Compelled trunk failure after the call is the talking state. (CP_MFCINTRCPT)		

24 of 33

Table 49: Call Process denial events (1225 - 1899) 25 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1646	No act call_ap/sftw err	One-button transfer to data feature activation failed. Possible causes: <ul style="list-style-type: none"> ● No active call appearance ● Call id passed from call_p to su_obt() is not on the active call appearance 		
1647	Telcomtr diald illegl FAC	Supervisor for telecommuting access. Telecommuting extension was accessed, then a Feature Access Code was dialed that is not allowed to telecommute.		
1648	Ctrl rstrct VDN extension	Supervision for controlled restriction of user. Control Restriction Activation/Deactivation for a Vector Directory Number extension is not allowed.		
1649	Ctrl rstrct locl ext only	Supervision for controlled restriction of user. Control Restriction Activation/ Deactivation must be on an extension that is local to the switch.		
1650	Rstrct typ/featid/COR/sta	Supervision for controlled restriction of user. Possible causes: <ul style="list-style-type: none"> ● Originator's User ID not found in DP_MGR User ID data tables ● Restriction digit does not identify with outward, total, termination or station-to-station type restriction ● Featid is not one of: <ul style="list-style-type: none"> - activate user control restriction - deactivate user control restriction - activate group control restriction - deactivate group control restriction ● Class of Restriction (COR) restricted ● Controlled restriction not allowed on trunk or attendant group type. 		
1651	TTI merge/unmerge fail	Station server could not perform Terminal Translation Initiation (TTI) merge/unmerge.		
1652	LWC access cod dgt invld	Voice synthesis Leave Word Calling access code digit processing saw an invalid digit or msg_sv, rejected the request.		
1653	TTI - attd not allowed	Terminal Translation Initiation (TTI) unmerge operation is not allowed from attendants.		
1654	TTI - attd not allowed	Personal Station Access (PSA) associate operation cannot be originated by attendant.		
1655	TTI - BRI not allowed	Personal Station Access (PSA) associate operation cannot be originated by BRI station.		
1656	Other calls active/COS	Personal Station Access (PSA) associate operation. If not on a Terminal Translation Initiation (TTI) port, check the Class of Service. Deny if possible. Also check for other calls active on the station.		
1657	TTI - attd not allowed	Personal Station Access (PSA) disassociate operation cannot be originated by attendant.		

25 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 26 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1658	TTI - BRI not allowed	Cannot Personal Station Access (PSA) disassociate a BRI station.		
1659	TTI - COS restricted	Class of Service does not allow Personal Station Access (PSA) disassociate operation.		
1660	TTI - BRI not allowed	Cannot Personal Station Access (PSA) associate a BRI station.		1
1661	TTI - COS restricted	Class of Service of the extension to be associated does not have Personal Station Access (PSA) capability.		
1662	Crossing tenant partition	Personal Station Access (PSA) associate operation cannot cross tenant partitions.		
1663	Invalid user ID/sftw err	Personal Station Access (PSA) associate operation. There is no extension associated with user ID. Invalid User ID or software error.		
1664	Getting user ID failed	Failure getting the User ID for the extension dialed in an association/ dissociation step.		
1665	Data mod usr id qry fail	Data Terminal Translation Initiation (TTI) call. The query for the real User ID of data module in dext group failed.		
1666	Originator ext not dialed	Unmerge sequence initiated, and the extension dialed must be the same as the originator's.		
1667	Non trunk intercept	Proper intercept treatment for non DID/TIE/ISDN trunk groups, or non-trunk originators.		
1668	Trk needs disc supervisn	Activate service observing feature. Service observing cannot be activated by a trunk without disconnect supervision.		
1669	Svc obsrv from attd NA	Activate service observing feature. Service observing cannot be activated by an attendant.		
1670	Svc obsrv from brdg NA	Activate service observing feature. Service observing cannot be activated from a bridged appearance.		
1671	Svc obsrvg svc obsrvd NA	Activate service observing feature. Service observing cannot be activated by a user that is already a service observer or is being service observed.		
1672	Svc obsrvr/obsrvd COR dny	Activate service observing feature. Activating user's Class of Restriction (COR) does not allow it to be a service observer of intended observed.		
1673	Svc obsrvr COR rstrct	Activate service observing feature. Activator's Class of Restriction (COR) check failed.		
1674	Svc obsrvr/obsrvd COR dny	Activate service observing feature. Activating user's Class of Restriction (COR) does not allow it to be a service observer of intended observed.		

26 of 33

Table 49: Call Process denial events (1225 - 1899) 27 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1675	Svc obsrvr vecstep/extdgt	Activate service observing feature. Initiated from a vector step and only the Feature Access Code of service observing is in the vector step. End-to-end signaling digit collection of extension to be observed failed.		
1676	Svc obsrv not on ext/VDN	Validation of service observed extension. Service observing is allowed only on a simple User ID or a Vector Directory Number.		
1677	Svc obsrv cust opt qry	Validation of service observed extension. Query for service observing customer-options failed.		
1678	Need VDN obsrvg option	Validation of service observed extension. Vector Directory Number observing is not enabled.		
1679	Svc obsrvee data rstrctd	Validation of service observed extension. Observee is data restricted.		
1680	Svc obsrvg svc obsrvd	Validation of service observed extension. Non-Vector Directory Number observee is already being observed, or is an observer.		
1681	Svc obsrvee COR rstricted	Validation of service observed extension. Class of Restriction (COR) of observee does not allow being observed.		
1682	Svc obsrvd COR chk fail	Validation of service observed extension. Class of Restriction (COR) check failure.		
1683	Svc obsrvr/obsrvd COR dny	Validation of service observed extension. Observer/observee Class of Restrictions do not allow observer to observe observee.		
1684	Svc obsrvg/obsrvg race	Validation of service observed extension. The observee is already in the process of activating service observing for another party.		
1685	Svc obsrv ftr act failure	Validation of service observed extension. Feature activation of selected "listen only" or "listen/talk" service observing failed.		
1686	Svc obsrv VDN SO wait flg	Supervision after confirmation tone to a service observer. DPM failure to set Vector Directory Number (VDN) Service Observing wait flag in the VDN's VDN information block.		
1687	Obsrvr conf_state unclear	Supervision after confirmation tone to a service observer. Confirmation tone is complete for an observer. Make observer eligible to be taken off the wait list for the Vector Directory Number. Failure to clear the "conf_state" for the observer.		
1688	Svc obsrvg/obsrvg race	Supervision after confirmation tone to a service observer. Bridging observer onto the agent encountered race condition, observee is already in the process of activating service observing for another party.		
1689	Svc obsrv ftr act fail	Supervision after confirmation tone to a service observer. Failure activating service observing for observee.		

27 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 28 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1690	Software invalid stim	Supervision after confirmation tone to a service observer. Invalid Call Processing (CP) stimulus received by this supervisor.		
1691	Term restriction chk fail	Processing incoming Call Forwarding. All Distributed Communication System (DCS) message. Other switch had problem processing CF_ACT message. Termination restriction check failed or could not convert designated extension to a user ID.		
1692	LWCmsn/UDPext/dpst admin	Leave Word Calling (LWC) operations generates INT_DRP. Possible causes: <ul style="list-style-type: none"> ● attendant cannot leave DCS messages because of eDIM, S85 ● lw_nocall() activator of lwc store does not have lwc permission ● activator is not a udp ext ● lwc_store() lw_rmstore()- DCS LWC - no remote users involved ● lwc store operation remote to local-Voice Mail Applications Support is disabled ● called party not administered to receive LWC messages ● no called party message header ● no LWC depository administered ● error in sending AUDIX STORE message info (from remote user) to AAP 		
1693	Out trk DID orig/sftw err	Italian Direct Inward Dial (DID) trunk group drop treatment. Possible causes: <ul style="list-style-type: none"> ● DID origination on outgoing trunk ● Invalid return code from gm_orig()? ● Software error? 		
1694	Sta intrcpt tone fwd disc	Station Intercept Tone Forward Disconnect.		
1695	Bsy vfy sta/trk/hnt grp	Cannot busy verify attendants.		
1696	Bsy vfy trk grp no mbr	Busy verify of trunk failure. Possible causes: <ul style="list-style-type: none"> ● No trunk in the group ● Trunk group member not found 		
1697	Bsy vfy access endpt trk	Busy verification not supported for access endpoint trunk type.		
1698	Bsy vfy hnt grp no mbr	Busy verify of hunt group failure. Might be there is no member in the hunt group.		
1699	LWC msg stor fail (conf)	Leave Word Calling message cannot be stored when there is a conference call.		
1700	LWC msg - no destination	No destination determined for Leave Word Calling message store.		
1701	Whisp pg not to station	Whisper page allowed only to simple station group type of user.		
1702	Whisp pg query fail	Whisper paging - shouldn't see this - sim_quer/su_query don't develop GQRY_INVALID response to qtype QWHISP_PG		

28 of 33

Table 49: Call Process denial events (1225 - 1899) 29 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1703	Whisp pg query fail	Whisper paging - shouldn't see this - sim_quer/su_query don't develop GQRY_AE response to qtype QWHISP_PG		
1704	Whisp pg usr not allowed	Whisper paging. User is not allowed to make whisper pages.		
1705	Whisp pg query fail	Whisper paging. QWHISP_PG type gm_query failed.		
1706	Wake up typ/voice actvat	VIP and DAILY type wakeup cannot be modified or deleted via voice-activated process.		
1707	No attd to rcv wakeup	Voice synthesizer is not available. Routing automatic wakeup call to attendant, but no attendant. (TN725).		
1708	No attd to rcv wakeup	Voice synthesizer not available. Routing automatic wakeup call to attendant, but no attendant. (TN725).		
1709	Bsy vfy term is PCOL	Busy verify is denied, the principal terminator is Personal Central Office Line (PCOL).		
1710	Bsy vfy is term rstrctd	Busy verify is termination restricted.		
1711	Bsy vfy dgt invalid/tmo	While collecting digits for busy verification, supervisor got an indication of invalid digit or digit timeout.		
1712	Ofhk alrt tmo intvl admin	Standard action stimulus processing. Station, attendant, or analog adjunct data extension originated off-hook alert feature activation, but no off-hook alert timeout interval is administered.		
1713	Bsy vfy dgt invalid/tmo	While collecting trunk member number digits for busy verification, supervisor got an indication of invalid digit or digit timeout.		
1714	Whisp pg term is PCOL	Whisper page feature activated, principal terminator is Personal Central Office Line (PCOL).		
1715	Whisp pg is term rstrctd	Whisper page feature activated, whisper page is termination restricted.		
1716	Software invalid stim	Whisper page feature activated, whisper page supervisor saw an invalid Call Processing (CP) stimulus while collecting station digits.		
1717	Self Sta Display denial	Self Station Disp feature activated, either activated from a bridged appearance or GRP_M denial.		
1718	Grp call pkup not enabled	Group Call pickup is not enabled.		
1719	Invalid dgts collected	Invalid digits are collected in dgt_egpkup().		
1720	QSIG VM-no simple uid	Could not obtain simple user User ID for an SS-B ISDN trunk.		
				29 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 30 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1721	QSIG VM-no remote user id	Received a Voicemail Number MSI but did not receive an original diverting number.		
1722	QSIG VM-prin not smpl uid	The local principal User ID is not a simple user User ID.		
1723	QSIG VM-no voicemail nbr	Do not know the number of the voicemail adjunct, the call cannot transfer to the adjunct.		
1724	Annc Record Session Fail	Announcement record session was denied by the board.	UID	board's reason for denial.
1725	QSIG VM-hunt not in cvg p	Principal does not have a QSIG MWI (Message Waiting Indicator) hunt group in its coverage path.		
1726	Cant get Smpl Attd-uid	Cannot get simple attendant User ID.		
1727	cannot use PASTE	Station restriction is total, cannot use PC Application Software Exchange (PASTE).		
1728	Deny PE originated calls	PE already active on call.		
1729	Direct Agent call failed	Direct Agent Call failed.		
1730	Trk-grp uid retrieve fail	All failed to retrieve Release Link Trunk (RLT) trunk group User ID for Centralized Attendant Service (CAS).		
1731	I/C call on O/G Trunk	Incoming call on outgoing trunk.		
1732	Caller COR Restricted	Caller Class of Restriction (COR) restricted access.		
1733	Conference 2 Attendants	Cannot conference 2 attendants.		
1734	Max Pub Net Trks on conf	Maximum number of Public Network Trunks on conference.		
1735	Max conf parties w/PNTrks	Maximum number of conference parties with Public Network Trunks.		
1736	Max conf parties wo/PNTrk	Maximum number of conference parties without Public Network Trunks.		
1737	Max conf/xfer parties	Maximum number of conference or transfer parties.		
1738	Conf/xfer unstable calls	Cannot conference or transfer unstable calls.		
1739	Div Reroute/Path Replace	Cannot transfer Diversion Rerouting or Path Replacement call.		
1740	No Disconnect Supervision	Cannot transfer, no disconnect control party.		
1741	Transfer trunk to trunk	Cannot transfer trunk to trunk.		
1742	Conf/xfer Whisper Page	Cannot conference or transfer whisper page.		
1743	cnf/xfr Emergency/Wakeup	Cannot conference or transfer emergency or wakeup call.		
				30 of 33

Table 49: Call Process denial events (1225 - 1899) 31 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1744	Conf/xfer a tone	Cannot conference or transfer tone.		
1745	Conf/xfer Announcements	Cannot conference or transfer with multiple announcements.		
1746	Conf/xfer a Vector call	Cannot conference or transfer vector call.		
1747	Cnf/xfr Service Observers	Cannot conference or transfer two service observers.		
1748	Conf/xfer a Page call	Cannot conference or transfer group or loudspeaker page call.		
1749	No Disconnect Supervision	Cannot route call, no disconnect control party.		
1750	FRL too low to route call	Cannot route the call, Facility Restriction Level is too low.		
1751	No AAR/ARS route pat/pref	No route pattern or preference translated.		
1752	Conf with no ISDN connect	Conference when ISDN connect message has not been sent due to SA8434.		
1753	Caller cvgpt COR restrict	Remote/caller cannot terminate to coverage point due to Class of Restriction (COR) setting.		
1754	Caller cvgpt COR restrict	Remote/caller cannot terminate to coverage point due to Class of Restriction (COR) setting.		
1755	Caller cvgpt COR restrict	Remote caller cannot terminate to coverage point due to Class of Restriction (COR) setting.		
1756	Caller fwdto COR restrict	Remote/caller cannot terminate forwarded to party, Class of Restriction (COR) setting.		
1757	Attd release COR restrict	Attendant cannot release call, Class of Restriction (COR) setting.		
1758	Attd release link failure	Attendant cannot release call, link restriction.		
1759	Attd hold COR restrict	Attendant cannot release call, Class of Restriction (COR) setting.		
1760	Conference COR restrict	Controller cannot conference call, Class of Restriction (COR) setting.		fail code
1761	Transfer COR restrict	Controller cannot transfer call, Class of Restriction (COR) setting.		
1762	Transfer no pooled modem	Controller cannot transfer call, no pooled modem.		
1763	Cnf/xfr Intercept Annmnt	Attempt to transfer/conference an intercept announcement.		
1764	Btn Ring Control timeout	Button ring control activated via Feature Access Code & time out has occurred. SA8428		
1765	Invalid button pushed	Invalid button pushed in button ring control mode. SA8428		
1766	Remote Logout Agent fail	no info available		
				31 of 33

Denial Events

Table 49: Call Process denial events (1225 - 1899) 32 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1767	Rmt Logout COR restricted	no info available		
1768	Rmt Logout COS restricted	no info available		
1769	Rmt Logout invalid input	no info available		
1770	Rmt Logout tenant number	no info available		
1771	Rmt Logout cant do self	no info available		
1772	PSA on Virt EXT disallow	Personal Station Access (PSA) associate/disassociate not allowed for virtual extension.		
1773	Cnf/xfr Atd Intcpt Ann	Attempt to transfer an intercept announcement at the attendant.		
1774	Stn Lock act/deact failed	Station lock activation or deactivation failed.		
1775	No adm for SBS extensions	Separation of Bearer and Signaling (SBS) call tried to allocate an SBS extension, but none was administered.		
1776	Can't send SBS # to orig	Separation of Bearer and Signaling (SBS) call tried to send back an INFO message with the SBS complete public number, but the INFO could not be sent. Check proper administration of isdn-pub-unk form.		
1777	Calling Pty COR chk fail	Error occurred when retrieving Class of Restriction (COR) of calling party.		
1778	Orig COR/Auth COR dny	Calling party Class of Restriction (COR) not allowed to use mapped COR from authorization code entry.		
1779	FIPN RO when call on hold	Fujitsu Intelligent Priva Network (FIPN -a Fujitsu ISDN Protocol spec) route optimization denial. There is call on hold. SA8506		
1780	AAR/ARS fac not administered	ARS/ARR Feature Access Code is not administered.		
1781	Note: Error codes 1781 through 1791 apply to Feature Access Code invocations that are designed to operate on contact closure relays on a G350 Media Gateway. These error codes apply only to Linux-based servers.			
1781 ¹	CC: Improper COS	ARS/ARR Feature Access Code is not administered.		
1782 ¹	CC: Invalid digits	Invalid digits (or a symbol for a digit, etc.) entered for contact-closure related operation on a G350 Media Gateway.		
1783 ¹	CC: MG# out of range	Media gateway number is out-of-range.		
1784 ¹	CC: software error	Contact-closure related operation had internal software error, should never happen. First byte of the seconds data item gives info to ID where error occurred out of many places that it can happen.		
1785 ¹	CC: Invalid closure#	Contact-closure related operation had bad closure number.		

32 of 33

Table 49: Call Process denial events (1225 - 1899) 33 of 33

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1786 ¹	CC: MG not administered	Contact-closure related operation had unadministered media gateway number.		
1787 ¹	CC: MG not registered	An unregistered media gateway was selected for a contact-relay related operation on a G350 Media Gateway.		
1788 ¹	CC: MG in link recovery	The G350 Media Gateway selected for a contact-relay related operation was in link recovery mode.		
1789 ¹	CC: No CC on this MG type	The media gateway selected for a contact-relay related operation does not have a contact relay.		
1789 ¹ Communication Manager Release 2.2	CC: MG not a G350 gateway	The media gateway selected for a contact-relay related operation is not a G350.		
1790 ¹	CC: Invalid button push	An invalid feature button was pushed after invoking contact closure feature.		
1791 ¹	CC: Trunk usr not allowed	Trunk access is not allowed for contact closure feature.		
1792	MI Chg Fail: Agt Burnout	Deny change to manual-in mode because the agent is in burnout state.		
1793	AI Chg Fail: Agt Burnout	Deny change to auto-in mode because the agent is in burnout state.		
1794	No STNHNT for Remote cvg.	Deny station hunt after coverage if the last coverage party is remote.		
1795 Communication Manager Release 2.2	Caller FEAC restricted access.			
1796-1899	not assigned			
				33 of 33

1. Error codes 1781 through 1791 apply to Feature Access Code invocations that are designed to operate on contact closure relays on a G350 Media Gateway. These error codes apply only to Linux-based servers.

User Manager Events

Event Types 1900 - 1906 show User Manager-generated denial events, as listed in [User Manager denial events \(1900 - 1906\)](#) on page 220.

Table 50: User Manager denial events (1900 - 1906)

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1900	Invalid CFWD destination	CF_DEST digits do not map to station User ID.		
1901	Control Restrtn Check fail	Control Restriction.		
1902	Enhanced Abbr List Failur	Enhanced Abbreviated Dialing entry length failed.		
1903	LWC Button xIn Error	Ignore Leave Word Calling button push due to bad translation.		
1904	Override for the PGN disa	User not allowed to activate override for this partition		
1905	Auto selection of DID dis	Automatic selection of Direct Inward Dialing numbers is disabled.		
1906	SA8428 Btn Ring Ctl disab	SA8428 Station User Button Ring Control has been disabled, ignore button-ring button push.		

IP Denial Events

Event Types 1907 - 2079 show IP denial events, as listed in [IP Denial Events \(1907 - 2020\)](#) on page 220.

Table 51: IP Denial Events (1907 - 2020) 1 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1907	IP RRJ-Invalid RAS addr	IP Registration Rejected because the RAS address in the registration request (RRQ) is invalid.	0	IP address of the endpoint
1908	IP RRJ-Invld call SigAddr	IP Registration Rejection because the call signaling address in the registration request (RRQ) is invalid.	0	IP address of the endpoint

1 of 11

Table 51: IP Denial Events (1907 - 2020) 2 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1909	IP RRJ-RemoteOfc misadmin	Registration rejected because: <ul style="list-style-type: none"> ● Remote Office is enabled on the Signaling Group screen, but the registration request (RRQ) is not from a supported Remote Office product (the Remote MAX Product/Vendor ID is invalid). ● The RRQ is from a supported Remote Office product, but Remote Office is not enabled on the Signaling Group screen. ● Remote Office is enabled on the Signaling Group screen, but the Terminal Type in the RRQ is not valid (the Terminal Type is not a gateway). 	0	IP address of the endpoint
1910	IP RRJ-H323 UserObj undef	IP Registration rejected because there is no H323 User Object.	0	IP address of the endpoint
1911	IP RRJ-Exceed max endpts	IP Registration rejected because the capacity for either registered endpoints, registered Remote Office endpoints, or registered un-authenticating endpoints is exceeded. Check maximum allowed in the system on page 1 of the System Parameters Customer Options screen.	0	Upper part: number of registered RO endpoints. Lower part: number of registered IP endpoints.
1912	IP RRJ-Exceed ProdID/Ver	IP Registration rejected because the maximum number of registered endpoints of a specific product ID and version is exceeded. Check the limit on the System-Parameters Customer-Options screen.	Truncated Product ID from the System-Parameters Customer-Options screen	Upper part: registered limit. Lower part: actual count.
1913	IP RRJ-Invalid ProdID/Ver	IP Registration rejected because of an invalid Product ID / Version. Registering Application's product ID is not administered on the System-Parameters Customer-Options screen or no Product ID in registration request (RRQ) message.	Truncated Product ID of the registering application	Major version number of the endpoint sent in the RRQ
1914	IP RRJ-ProdID search fail	IP Registration rejected because the search for the registering application's Product ID failed.	Truncated Product ID of the registering application	Major version number of the endpoint sent in the RRQ
1915	IP RRJ-Invalid endpt/Ver	Registration rejected because the endpoint version is not compatible with the gatekeeper version.	IP address of endpoint	Endpoint's major version number in 2nd byte, minor version number in low byte
				2 of 11

Denial Events

Table 51: IP Denial Events (1907 - 2020) 3 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1916	IP RRJ-No H323 NonStdData	Registration rejected because Non-standard Data (NSD) is missing in the registration request (RRQ) from the endpoint.	0	IP address of the endpoint
1917	IP RRJ-Invlid H323 ObjID	Registration rejected because the H323 Object ID in the registration request (RRQ) is invalid.	Object ID in RRQ	IP address of the endpoint
1918	IP RRJ-Invlid H225 NSData	Registration rejected because cannot decode H225 Non-standard Data (NSD) message.	0	IP address of the endpoint
1919	IP RRJ-Bad H225 NSDchoice	Registration rejected because an unexpected Non-standard Data (NSD) message was received from the registering application.	NSD choice in RRQ	IP address of the endpoint
1920	IP GRJ-RRJ: new LM fail	Registration rejected because of failure in creating a new Login Manager. Possible causes are: <ul style="list-style-type: none"> ● No available heap memory to create LoginMgr ● Cannot start LoginMgr timer ● Clock not set 	UID	IP address of the endpoint
1921	IP RRJ-IP-TTI port fail	Registration rejected because of failure when inserting the IP Terminal Translation Initiation (TTI) port.	UID	IP address of the endpoint
1922	IP RRJ-TTI inactive	Registration rejected for an IP set with Terminal Translation Initiation (TTI) service. Possible causes: <ul style="list-style-type: none"> ● TTI is not enabled on the System Parameters Customer Options screen. ● Remote Office is not enabled on the System Parameters Feature Options screen. 	0	IP address
1922 Communi- cation Manager Release 2.2	IP RRJ-TTI or RO inactive	Registration rejected for an IP set with Terminal Translation Initiation (TTI) service. Possible causes: <ul style="list-style-type: none"> ● TTI is not enabled on the System-Parameters Customer-Options screen. ● Remote Office is not enabled on the Feature Related System-Parameters screen. 	0	IP address
1923	IP RRJ-No E164 number	Registration rejected because there is no valid E.164 number in the RRQ or the extension is not administered.	UID	IP address of the endpoint
1924	IP RRJ-No GRQ msg rcvd	Registration rejected because no Gatekeeper Request message was received	UID	IP address of the endpoint
				3 of 11

Table 51: IP Denial Events (1907 - 2020) 4 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1925	IGAR trunk routing failed	Registration rejected, denied while routing an outgoing Inter-Gateway Alternate Routing (IGAR) trunk call, because of failure creating a new Login Manager. Possible cause: <ul style="list-style-type: none"> ● No available heap memory to create LoginMgr ● Cannot start LoginMgr timer ● Clock not set 	UID	IP address
1926	IP RRJ-Authenticatn fail	Registration rejected because of password authentication/ encryption failure. The password that the user entered and the administered password on the station screen do not match.	UID	IP address of the endpoint
1927	IP RRJ-Invlid station type	Registration rejected because of: <ul style="list-style-type: none"> ● invalid station type ● no Remote Office or IP Softphone administration on the station screen ● IP Softphone tried to register shared-control to the wrong telephone endpoint type. ● 	UID	station type or IP address of the endpoint
1928	IP RRJ-StnTyp/Proctocl err	Registration rejected because station type and call-signaling protocol are inconsistent. An IP Softphone should be assigned as one of the following: <ul style="list-style-type: none"> ● DCP extension, with call control set to IP Softphone ● H.323 extension, with call control set to none 	UID	Endpoint type (3rd and 2nd nyble); call signaling protocol (low nyble)
1929	IP RRJ-No idx for MMCmplx	Registration rejected: user record for dual-connected DCP set is missing the index for the multimedia complex.	UID	IP address of the endpoint
1930	IP RRJ-No voice path spec	Registration rejected because the endpoint (the virtual phone) has neither an associated multimedia extension nor a specified voice path, so no audio path exists. Either: <ul style="list-style-type: none"> ● add a Media Complex extension on the station screen or ● add an extension on the softphone (register as a telecommuter) 	UID	IP address of the endpoint
				4 of 11

Denial Events

Table 51: IP Denial Events (1907 - 2020) 5 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1931	IP RRJ-H323 ext is MMCmpx	Registration rejected because this H.323 extension is administered as a Media Complex extension on a non-H.323 (for example, a DCP) set.	UID	IP address of the endpoint
1932	IP RRJ-Ext has data modl	Registration rejected because the extension has a data module.	UID	IP address of the endpoint
1933	IP RRJ-IP addr mismatch	Registration rejected because the H.323 application is not at the same IP address as the authenticating application.	UID	IP address of registering endpoint
1934	IP RRJ-Ext already reg	Registration rejected because the extension is already registered.	UID	IP address of the endpoint
1935	IP RRJ-Not Remote Ofc ext	Registration rejected because Remote Office is not administered on the station screen for this extension.	UID	IP address of the endpoint
1936	IP RRJ-RO stn mismatch	Registration rejected because of invalid analog station type.	UID	IP address of the endpoint
1937	IP RRJ-RemOfc not admin	Registration rejected because the Remote Office is not administered on the remote-office form	UID	IP address of the endpoint
1938	IP RRJ-Immediate re-reg	Immediate re-registration is rejected when a registration or unregistration is in progress for the extension.	UID	IP address of the endpoint
1939	IP RRJ-Failure moving ext	Registration rejected because of failure while trying to force the unregistration of an extension in the process of moving it to another port.	UID	IP address of the endpoint
1940	IP RRJ-Duplicate ext	Registration rejected as a duplicate extension.	UID	IP address of the endpoint
1941	IP KA-from invld endpt ID	Keep Alive registration request rejected because of invalid endpoint identifier in RRQ.	UID	IP address of the endpoint
1942	IP KA-from unreg user	Keep Alive registration request rejected because it was received from an unregistered extension.	UID	IP address of the endpoint
1943	IP-KA-from unreg SigGrp	Keep Alive registration request rejected because it was received from an unregistered signaling group.	UID	IP address of the far-end
1944	IP RRJ-PSA merge failure	Registration rejected because the Personal Station Access (PSA) merge failed (internal software error). Check for corruption	UID	IP address of the endpoint
1945	IP RRJ-New IP user fail	Registration rejected because of failure to construct new H323 User object (internal software error).	0	IP address of the endpoint
				5 of 11

Table 51: IP Denial Events (1907 - 2020) 6 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1946	IP RRJ-PSA merge failure	Registration rejected because the LoginManager Personal Station Access (PSA) merge operation failed (internal software error). Check for corruption.	0	IP address of the endpoint
1947	IP RRJ-PSA unmerge fail	Registration rejected because the LoginManager Personal Station Access (PSA) unmerge operation failed (internal software error). Check for corruption.	UID	IP address of the endpoint
1948	IP RRJ-Complete pend reg	Registration rejected because of failure to obtain a station user record (internal software error – corrupt translation).	UID	IP address of the endpoint
1949	IP RRJ-Build KARCF msg	Registration rejected because of failure to build a KeepAlive Registration Confirm (KARCF) message (internal software error).	0	IP address of the endpoint
1950	IP RRJ-Build RCF msg	Registration rejected because of failure to build a Registration Confirm (RCF) message (internal software error).	0	IP address of the endpoint
1951	IP GRJ-Invlid IP addr/port	Gatekeeper request rejected because of invalid destination IP address and port in the request (GRQ).	0	IP address
1952	IP GRJ-Invlid gatekeeperID	Gatekeeper request rejected because the message is not for this gatekeeper.	Gatekeeper ID	IP address
1953	IP GRJ-Invlid auth capblty	Gatekeeper request rejected because the gatekeeper supports a capability that the registering endpoint does not.	0	IP address of the endpoint
1954	IP GRJ-Invlid auth algrthm	Gatekeeper request rejected because no compatible authentication algorithm exists between the endpoint and the gatekeeper.	0	IP address of the endpoint
1955	IP GRJ-Bld GCF:Gateway/MCU	Gatekeeper request rejected because of failure to build a GateKeeper Confirm (GCF) message for a GateWay/MCU (internal software error).	0	IP address
1956	IP GRJ-Bld GCF:TTI	Gatekeeper request rejected because of failure to build a GateKeeper Confirm (GCF) message for an un-named endpoint registration (internal software error).	0	IP address
1957	IP GRJ-GK will not host	Gatekeeper request rejected because the gatekeeper is unwilling to host endpoint because: <ul style="list-style-type: none"> ● no alias address has been provided or ● Terminal Translation Initiation (TTI) is in incorrect state (for example, TTI is not enabled for voice) 	TTI state	IP address of the endpoint
				6 of 11

Denial Events

Table 51: IP Denial Events (1907 - 2020) 7 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1958	IP GRJ-Invalid extension	Gatekeeper request rejected because the extension is not administered.	Either extension number or 0	IP address of the endpoint
1959	IP GRJ-No stn user record	Gatekeeper request rejected because no station user record exists for registering this user (internal software error).	UID	IP address of the endpoint
1960	IP FURQ-Shared Ctrl Unreg	Forced Unregistration Request: The Gatekeeper is unregistering the IP Softphone because it is in shared control with IP Telephone, and the Telephone is unregistering.	UID	IP address of IP Softphone
1961	IP GRJ-Build GCF msg	Gatekeeper request rejected because of failure to build a GateKeeper Confirm (GCF) message (internal software error).	UID	IP address of the endpoint
1962	IP LRJ-No H323 sig group	Location Request rejected because no H.323 signaling group is administered to handle the call.	UID	IP address of the far-end
1963	IP LRJ-Build LCF msg	Location Request rejected because of failure to build a Location Request Confirm (LCF) message (internal software error).	UID	IP address
1964	IP DRJ-Null UserID	Disengage Request rejected because the endpoint ID could not be converted to a User ID (UID).	UID	IP address
1965	IP DRJ-Bld DCF:Gateway/MCU	Disengage Request rejected because of failure to build Disengage Request Confirm (DCF) message for a gateway or MCU (internal software error).	UID	IP address
1966	IP DRJ-Endpt not reg	Disengage Request rejected because the endpoint is not registered.	UID	IP address
1967	IP DRJ-Build DCF msg	Disengage Request rejected because of failure to build a Disengage Request Confirm (DCF) message for a non-gateway or MCU user (internal software error).	UID	IP address
1968	IP BRJ-Null UserID	Bandwidth Request rejected because an invalid endpoint ID was received.	0	IP address
1969	IP BRJ-Bld BCF:Gateway/MCU	Bandwidth Request rejected because of failure to build a Bandwidth Request Confirm (BCF) message for a Gateway or MCU (internal software error).	UID	IP address
1970	IP BRJ-Endpt not reg	Bandwidth Request rejected because the endpoint is not registered.	UID	IP address
1971	IP BRJ-Build BCF msg	Bandwidth Request rejected because of failure to build a Bandwidth Request Confirm (BCF) message for a non-Gateway or MCU user (internal software error).	UID	IP address
				7 of 11

Table 51: IP Denial Events (1907 - 2020) 8 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1972	IP BRJ-No H323 user	Bandwidth Request rejected because the H.323 user object does not exist (internal software error).	UID	IP address
1973	IP BRJ-Call non-existent	Bandwidth Request rejected because the request is made for a non-existing call.	UID	IP address
1974	IP BRJ-Bandwidth rqst fail	Bandwidth Request rejected because of unexpected return code from bandwidth request.	UID	IP address
1975	IP ARJ-Null UserID	Admission Request rejected: received invalid endpoint ID.	NIL UID	IP address
1976	IP ARJ-Endpt not reg	Admission Request rejected: the endpoint is not registered.	UID	IP address
1977	IP ARJ-No avail B-channel	Admission Request rejected: no B channel is available for the call.	UID	IP address
1978	IP ARJ-Bld ACF:Gateway/MCU	Admission Request rejected: because of failure to build an Admission Request Confirm (ACF) message for a Gateway or MCU (internal software error).	UID	IP address
1979	IP ARJ-Not an H323 user	Admission Request rejected: request was received from a non-H.323 user.	UID	IP address
1980	IP ARJ-Stn not in service	Admission Request rejected: station is not in service.	UID	IP address
1981	IP ARJ-Build ACF msg	Admission Request rejected: failure to build an Admission Request Confirm (ACF) message for a non-Gateway or MCU user (internal software error).	UID	IP address
1982	IP ARJ-No H323 user	Admission Request rejected: H.323 user object does not exist (internal software error).	UID	IP address
1983	IP ARJ-CRV already in use	Admission Request rejected: Call Reference Value (CRV) is already in use by another call.	UID	IP address
1984	IP ARJ-CRV does not exist	Admission Request rejected: this call reference value (CRV) does not exist.	UID	IP address
1985	IP ARJ-CRV already in use	Admission Request rejected: Call Reference Value (CRV) is already in use by another call. An ARQ has been received while an earlier one is still pending.	UID	IP address
1986	IP ARJ-Insuff bandwidth	Admission Request rejected: insufficient bandwidth available to support this call.	UID	IP address
1987	IP ARJ-Admissn rqst fail	Admission Request rejected: unexpected return code from Admission Request (internal software error).	UID	IP address
1988	IP URJ-Null UserID	Unregistration Request rejected: received invalid endpoint ID.	0	IP address of the endpoint
				8 of 11

Denial Events

Table 51: IP Denial Events (1907 - 2020) 9 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
1989	IP URJ-Endpt not reg	Unregistration Request rejected: endpoint is not registered.	UID	IP address of the endpoint
1990	IP URJ-No endpoint ID	Unregistration Request rejected: no endpoint ID provided in URQ.	0	IP address of the endpoint
1991	IP URJ-GW/MCU is not reg	Unregistration Request rejected: URQ received from a Gateway or MCU that is not registered.	UID	IP address of the far-end
1992	IP URJ-No H323 sig group	Unregistration Request rejected because there is no H.323 user for the signaling group (internal software error).	UID	IP address of the far-end
1993	IP URJ-No non-std data	Unregistration Request rejected because there is no non-standard data in the URQ.	UID	IP address of the endpoint
1994	IP URJ-NSD has invld OID	Unregistration Request rejected because the Non-standard Data (NSD) from the registered application has an invalid object ID in the URQ.	UID	IP address of the endpoint
1995	IP URJ-Can't decode NSD	Unregistration Request rejected because of failure to decode Non-standard Data (NSD) in the URQ.	UID	IP address of the endpoint
1996	IP URJ-Unexpected NSD msg	Unregistration Request rejected because of unexpected Non-standard Data (NSD) in the URQ from the registered endpoint.	UID	IP address of the endpoint
1997	IP URJ-User is on a call	Unregistration Request rejected because the user is on a call.	UID	IP address of the endpoint
1998	IP URJ-PSA unmerge failed	Unregistration Request rejected because the Personal Station Access (PSA) unmerge operation failed (internal software error). Check for corruption.	UID	IP address of the endpoint
1999	IP URJ-PSA merge failed	Unregistration Request rejected because the Personal Station Access (PSA) merge operation failed (internal software error). Check for corruption.	UID	IP address of the endpoint
2000	IP URJ-No stn user record	Unregistration Request rejected because no station user record exists for unregistering user (internal software error).	UID	IP address of the endpoint
2001	IP URJ-TTI op failed	Unregistration Request rejected because of an unexpected Terminal Translation Initiation (TTI) return code.	UID	IP address of the endpoint
2002	IP URJ-Build UCF msg	Unregistration Request rejected because of failure to build an unregistration request confirm (UCF) message (internal software error).	0	IP address of the endpoint
2003	IP URJ-PSA unmerge failed	Unregistration Request rejected because the Personal Station Access (PSA) unmerge operation failed (internal software error). Check for corruption.	UID	IP address of the endpoint
				9 of 11

Table 51: IP Denial Events (1907 - 2020) 10 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2004	IP URJ-No stn user record	Unregistration Request rejected because the no station user record exists for the unregistering user (internal software error).	UID	IP address of the endpoint
2005	IP URJ-PSA unmerge failed	Unregistration Request rejected because the Personal Station Access (PSA) unmerge operation failed (internal software error).	UID	IP address of the endpoint
2006	IP FURQ-no H.323 ext reg	Force Unregistration Request. Received a KeepAlive request (RRQ) from a dual-connect endpoint without a registered H.323 extension (cannot make calls). Re-register the endpoint.	UID	IP address
2007	IP FURQ-User, no sig conn	Force Unregistration Request. Unregister user because there is no signaling connection. RAS is alive, but the signaling connection has gone down (user cannot make calls). Re-register the endpoint.	UID	IP address of the endpoint
2008	IP FURQ-H323, no sig conn	Force Unregistration Request. Unregister associated H.323 user because there is no signaling connection. Re-register the endpoint.	UID	IP address of the endpoint
2009	IP FURQ-Move user	Force Unregistration Request. Extension is already registered, but received a forced login registration request (RRQ). Send a URQ to the existing extension.	UID	IP address of the endpoint
2010	IP FURQ-Sig Conn closed	Forced Unregistration Request. The Gatekeeper is unregistering the endpoint because its call signaling connection has closed.	UID	0
2011	IP FURQ-NoQ931 msg rcvd	Force Unregistration Request. After an endpoint registers it should initiate the TCP connection and send a SETUP message. The SETUP message has not been received from the endpoint, and no Q931 Call object exists. The endpoint cannot make calls, so unregister it.	H.323 UID	IP address of the endpoint
2012	IP FURQ-Aged Endpt-no KA	Force Unregistration Request. Unregister endpoint that has aged out. Endpoint's time to live (TTL) expired without receiving a keep-alive request (RRQ).	UID	IP address of the endpoint
2013	IP FURQ-SigGrp removed	Force Unregistration Request. An H.323 Gateway (administered as a signaling group) is registered. Unregister the Gateway before removing the administered signaling group.	Gateway UID	IP address of the far-end
2014	IP FURQ-Siggrp changed	Force Unregistration Request. Changes have been made to a registered H.323 Gateway (administered as a signaling group). Unregister the Gateway.	Signaling group	IP address of the near-end
				10 of 11

Denial Events

Table 51: IP Denial Events (1907 - 2020) 11 of 11

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2015	IP FURQ-Ext removed	Forced Unregistration Request. Unregister user because the extension has been removed.	UID	0
2016	IP FURQ-IPusr is sftphone	Forced Unregistration Request. <ul style="list-style-type: none"> ● A user has Personal Station Accessed (PSA) an extension that was registered as an IP endpoint. ● An IP telephone extension in shared-control was moved to another IP port via registration. Both shared-control IP Telephone and IP softphone will unregister if the rejected registration attempt is forced. 	IP User-UID	0
2017	IP FURQ-Records exhausted	Forced Unregistration Request. Unregister the LAN port if there are no station user-records remaining.	IP User-UID	0
2018	IP FURQ-Mtc: H323/Vphone	Forced Unregistration Request. The release command was run on the extension or port.	UID	0
2019	IP FURQ-Mtc: Remote Max	Forced Unregistration Request. The release command was run on the Remote Office extension or port.	UID	0
2020	IP FURQ-Mtc:RemOfc TTI	Forced Unregistration Request. Terminal Translation Initiation (TTI) background maintenance task has requested the removal of Remote Office LAN TTI ports.	UID	0
				11 of 11

Call Process Denial Events

Event Types 2021 - 2299 show Call Process denial events, as listed in [Call Process denial events \(2021 - 2299\)](#) on page 231.

Table 52: Call Process denial events (2021 - 2299) 1 of 8

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2021	Cust Sel of DIDs inactive	Custom Selection of VIP Direct Inward Dialing numbers feature is not active.		
2022	Annc pres but not admin	Announcement present but not administered.		
2023	Annc pres none on board	Announcement present but no announcements administered for the board.		
2024	Cannot create entry	Registration rejected because unable to create an entry in the MTM complex table.	UID	IP address of the endpoint
2025	Unadministered option	Registration rejected because the option chosen by the endpoint in the RRQ for the emergency call does not match the option administered on the station form.	UID	IP address of the endpoint
2026	Xmobile OOS: block orig	Xmobile offhook request rejected because Xmobile station has been taken out of service.		
2027	Annc not found on board	User attempted to play MO_VAL_BD announcement and file was not found on board.		
2028	Annc file has bad format	User attempted to play MO_VAL_BD announcement and file had bad format.		
2029	IP GRJ-NSD has invld OID	Gatekeeper Request rejected because the Non Standard Data (NSD) from the registered application has an invalid object ID.	UID	IP address of the endpoint
2030	IP GRJ-Can't decode NSD	Gatekeeper Request rejected because of failure to decode Non Standard Data (NSD) element.	UID	IP address of the endpoint
2031	IP GRJ-Unexpected NSD msg	Gatekeeper Request rejected because of unexpected Non Standard Data (NSD) message from the registered application endpoint.	UID	IP address of the endpoint
2032	Force Unregistration Req	Force Unregistration Request. Instruct the RAS manager to cleanup a User ID which had just been registered prior to a system restart. This event is not logged, but only passed in the URQ.		
				<i>1 of 8</i>

Denial Events

Table 52: Call Process denial events (2021 - 2299) 2 of 8

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2033	IP FURQ-Demand Unregister	Force Unregistration Request. The command to force unregister endpoints has been executed from the SAT.	User ID	IP address
2034	Illegal TSC interaction	A QSIG Non Call Associated-Temporary Signaling Connection (NCA-TSC) tried to route out an AT&T TSC, or vice versa, and this interaction is not supported. This might occur when a bsr_poll call over an IP trunk tries to use a QSIG TSC but is tandemed out an AT&T TSC.		
2035	NCA-TSC not available	Possible causes: <ul style="list-style-type: none"> ● The terminated administered TSC endpoint is disabled ● The incoming Non Call Associated-Temporary Signaling Connection (NCA-TSC) call arrived at the wrong signaling group ● The Maximum number of NCA-TSC is set to 0 		
2036	Incoming QSIG LWC failed	Leave Word Calling on the incoming side of a QSIG_LWC MSI CSOFAC message failed.		
2037	QSIG LWC fail find voice	Getting the voice callr on the outgoing side of a QSIG_LWC MSI SETUP message failed.		
2038	QSIG LWC fail get cling	Getting the calling party number from the incoming side of the call failed.		
2039	IP KA-No endpoint ID	Keep Alive Registration Request. Registration rejected because no endpoint identifier was provided.	0	IP address
2040	IP GRJ-No CLAN available	Gatekeeper Request rejected because no resources available for signaling connection.	UID	IP address
2041	IP RRJ-No DSP Resource	Registration Request rejected because no Digital Signal Processor (DSP) resources are available.	UID	IP address
2042-2046	not assigned			
2047	Reject-Unauthorized MG	Registration rejected because it was received from unauthorized media gateway.		
2048	Reject-MGC not ready	Registration rejected because it is not ready for a media gateway re-registration.		
2049	No VOIP Resource	VOIP Resources unavailable.		

2 of 8

Table 52: Call Process denial events (2021 - 2299) 3 of 8

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2050	No MG Resource	No gateway resource available.		
2051	IP GRJ-RemOfc No Sig Grp	Remote Office invalid request (GRQ) No Sig Group available.		
2052	IP RRJ-RemOfc No Sig Grp	Remote Office invalid registration request (RRQ) No Sig group available.		
2053	MG heartbeat missed	MGKeepAlive: Wakeup() media gateway heartbeat missed, indicates lack of traffic from specified gateway.		
2054	Signaling CONN Congestion	UMSocket: SockWrite() Congestion on the Signaling Link due to PCD buffer exhaustion.		
2055	Reset MG - Pkt Send Err	Reset the media gateway Signaling Link due to error in Sending packets.		
2056	No null caps SBS orig end	IncomingMsg. Null caps not received on originating end of Separation of Bearer and Signaling (SBS) trunk.		
2057	No null caps SBS term end	IncomingMsg. Null caps not received on terminating end of Separation of Bearer and Signaling (SBS) trunk.		
2058	Null caps on H323 trunk	IncomingMsg. Null caps received on terminating end of H323 trunk.		
2059	SecCode change disallowed	Change of security code through Feature Access Code not supported for IP.		
2060	SA8508:Off	Emergency access call to the attendant using the 2nd access code is not permitted because the SA8508 is not optioned.		
2061	Invalid Post msg dgt/tmo	Post message digit timeout.		
2062	Post msg too many msg dgt	Post message too many digits.		
2063	Post msg not stn user	Post message not station user.		
2064	IP RRJ-NSD encode failed	Registration rejected because of failure to encode Non-standard Data (NSD) message.	UID	IP address
2065	IP RRJ-Invalid vendor id	Registration rejected because LSP requesting registration has not sent a valid vendor ID.	NULL	IP address
2066	IP RRJ-LSP obj not init	Registration rejected because the LSP object has not been initialized.	NULL	IP address
3 of 8				

Denial Events

Table 52: Call Process denial events (2021 - 2299) 4 of 8

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2067	IP RRJ-NSD improper OID	Registration rejected because the Non-standard Data (NSD) sent by the LSP contains an invalid OID.	NULL	IP address
2068	IP RRJ-Cannot decode NSD	Registration rejected because of failure to decode Non-standard Data (NSD) message sent by the LSP.	NULL	IP address
2069	IP RRJ-Unxpctd NSD	Registration rejected because of receipt of an unexpected Non-standard Data (NSD) message from LSP.	NULL	IP address
2070	MG must send full reg msg	Media gateway attempted registration with "warm start" condition, but the controller needs "cold start" data.		
2071	Serial Number incorrect	Media gateway attempted to register with a different serial number.		
2072	Conf/Transfer 2 Meet-me	Conference or transfer 2 Meet-me conference call.		
2073	Permission denied (or) Download permission deny	User attempted to download firmware to a station. User does not have console permission.		
2074	Rec fail: annc is playing	Attempt to record a VAL announcement while that announcement is playing on a VAL board.		
2075	Var-in-Vec COS restricted	User does not have console permissions		
2076	IP RRJ-Call Mismatch	IP Registration Rejection (RRJ) because of no call present on the switch side. But there is a call present on the ept.	UID	IP address.
2077	IP FURQ-CallTimer Expired	Force Unregistration Request. Unregister endpoint whose call preservation timer (H323 link loss delay timer) expires.	UID	IP address.
2078	Extend Call Button Denial	OPTIM Extend Call via extend call button press was denied.	station where the button was pushed	Reason the call was denied: 0 - denied because the call already has 6 ports on it 1 - denied because the station is at the OPTIM call limit 2 - denied because the application has no termination mapping 3 - denied because call failed to extend (check application RTU)

4 of 8

Table 52: Call Process denial events (2021 - 2299) 5 of 8

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2079	IP RRJ-Invld sta state	Registration rejected because set in wrong state (for example on call, Out of Service (OOS), Administered Without Hardware (AWOH), Terminal Translation Initiation (TTI), shared-control endpoints attempt to register to different LSPs).		
2080	IP FURQ-User dialed TSA	IP Softphone in shared control configuration with DCP is forced unregistered because user dialed TSA.		
2081	IP FURQ-Invld sta state	IP Softphone in shared control configuration with DCP is forced unregistered because softphone switched to invalid state.		
2082	Exceeded TLS conn limit	A TLS socket was rejected because of the constraint on the maximum number of TLS peers.		
2083	TLS: No cert returned	A peer cert was rejected by common name checking.		
2084	TLS: Handshake Failure	Handshake failed, for example due to no common cipher suite.		
2085	TLS: Certificate expired	An expired certificate was returned and rejected.		
2086	SBS bearer Auth not supp	If authorization code is required on outgoing Separation of Bearer and Signaling (SBS) bearer call, this is not supported. The call is dropped with intercept treatment to the originator.		
2087	IP RRJ-Shrd Ctrl OutofSrv	Used to inform softphone trying to register in shared control with an out-of-service DCP endpoint to try registration with LSP.	UID	IP address
2088		Bad Record Max. For example, an attacker does not have the correct private key, which can go undetected until the MAC of the exchange is checked.		
2089		Bad Record Max. For example, an attacker does not have the correct private key, which can go undetected until the MAC of the exchange is checked.		
2090		TLS shutdown received. Listen socket could not be created.		
2091	Conf/xfer Audix rec	AUDIX one-step rec while conf.		
2092	Post msg invalid SSC	Post message invalid Station Security Code (SSC).		
5 of 8				

Denial Events

Table 52: Call Process denial events (2021 - 2299) 6 of 8

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2093	Can't start announcement	Cannot start announcement.		
2094	TCP/IP sig socket failure	Establish a socket on an IP trunk. The far end might be mis-administered.	IP address of the far end to which the call failed	Port number of the far end
2095	Rmt Div-fwding ext local	QSIG Remote Diversion activation for local extension not allowed.		
2096	Rmt Div-SSC too long	QSIG Remote Diversion Station Security Code (SSC) contains too many digits.		
2097	Rmt Div-non QSIG trunk	QSIG Remote Diversion is not allowed over a non-QSIG trunk.		
2098	Rmt Div-act ext not stn	QSIG Remote Diversion activation only allowed from station user.		
2099	Rmt Div-act/deact failed	QSIG Remote Diversion activation/deactivation failed.		
2100	Rmt Div-QSIG VALU disable	QSIG Remote Diversion is not allowed over a QSIG trunk with QSIG VALU disabled.		
2101	Feat. requires only dgts	A feature was activated via a request URI. The part of the request URI string that should contain all digits contained characters other than digits.		
2102	SIP Estab Timer expiry	SIP call establishment timer expired prior to 200 OK (incoming or outgoing call). Timer length is administered on SIP sig-group forms.		
2103	Cannot ring add-in party	Attempt to add a party to a call failed at the termination stage.	UID of the party that was attempting to terminate	Cause value/feedback indicating the reason.
2104	Cannot add party to call	Attempt to add a party to a call failed at or after answer.	UID of the party that was being added in	reason code: 1: internal failure (look for proc_err around same time) 2: internal failure (look for proc_err around same time) 3: conflict (ie adding announcement to call with tone or announcement) 4: already have six connected/held parties on the call 5: unable to combine voice streams 6: internal failure (look for proc_err around same time) 7: internal failure (look for proc_err around same time)

6 of 8

Table 52: Call Process denial events (2021 - 2299) 7 of 8

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2105	SCCAN handover denied	Seamless Converged Communications Across Networks (SCCAN) attempt to handover failed.	UID of the station involved in handover	reason for failure: 0: No call found to handover to 1: There is already a call in the wireless domain 2: There are multiple candidate calls to handover to 3: Handover from call not found 4: Handover to call not found 5: Handover aborted 6: Call is at conference limit
2106	SCCAN announcement denied	Seamless Converged Communications Across Networks (SCCAN) attempt to handover failed.	UID of the station involved in handover	reason for failure: 0: Announcement not administered on sys-param scan form 1+ - Feedback type OPTIM SCCAN termination was denied 1: WLAN call limit exceeded 2: No termination mapping 3: Cellular call limit exceeded 4: No termination mapping or call NOT allowed or disabled is the most likely cause (user controlled) 5: Call on bridged appearance, and termination disallowed
2107	SCCAN call out blocked	OPTIM Seamless Converged Communications Across Networks (SCCAN) termination was denied	UID of the station involved	reason for denial: 1: WLAN call limit exceeded 2: No termination mapping 3: Cellular call limit exceeded 4: No termination mapping or call NOT allowed or disabled. Disabled is the most likely cause (user controlled) 5: Call on bridged appearance and termination disallowed.
2108	SCCAN retransmit denied	There are problems with Seamless Converged Communications Across Networks (SCCAN) notify retransmission response.	UID of the station involved	reason for denial: 1: Could not get Event header from request 2: Could not get time to wait for retransmission 3: Unknown event type 4: Internal failure (look for proc_err around same time) 5: OPTIM application not SCCAN 6: Station not administered with OPTIM
2109	IP RRJ-Unknown unnamed	Registration rejected because an unnamed endpoint did not have the terminal present bit set, or because it did not supply Lucent vendor information.		

7 of 8

Denial Events

Table 52: Call Process denial events (2021 - 2299) 8 of 8

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2110	Release btn push ignored	Agent pushed IM_ACD_REL button simultaneously with call termination.	UID of agent pushing IM_ACD_REL button	NULL
2111	IP RRJ-TTI reg not in map	Deny Terminal Translation Initiation (TTI) registration, IP endpoint not in ip-network-map.	IP address	TTI state
2112	IP RRJ-TTI reg shared ctl	Deny Terminal Translation Initiation (TTI) registration, IP endpoint requesting shared control.	IP address	TTI state
2113	IP RRJ-TTI incapable	Deny Terminal Translation Initiation (TTI) registration, IP endpoint not TTI capable.	IP address	TTI state
2114	IP RRJ-TTI reg eConsole	Deny Terminal Translation Initiation (TTI) registration, request from IP eConsole.	NULL	IP address.
2115	IP RRJ-RO addr no admin	Deny Terminal Translation Initiation (TTI) registration, Remote Office address not administered.	IP address	TTI state
2116	460.1 Neg failed in GRQ	460.1 feature not supported.		
2117-2299	not assigned

Connection Manager Denial Events

Event Types 2300 - 2399 show Connection Manager denial events, as listed in [Connection Manager denial events \(2300 - 2399\)](#) on page 238.

Table 53: Connection Manager denial events (2300 - 2399) 1 of 3

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2300	Ept capabilities mismatch	Endpoint connects to Time Division Multiplexed (TDM) bus or it hairpinned capabilities mismatch.		
2301	Tran/rec codec mismatch	Transmitted or received codec mismatch.		
2302	Ip_ept is in loopback	Ip_ept is in loopback.		
2303	Silence suppress mismatch	Endpoint connects to Time Division Multiplexed (TDM) bus or is hairpinned silence suppression mismatch.		
2304	Tran/rec codec mismatch	Transmitted or received codec mismatch.		
				1 of 3

Table 53: Connection Manager denial events (2300 - 2399) 2 of 3

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2305	Silence suppress mismatch	Ept1 directly connected to Ept2 silence suppression mismatch.		
2306	Reject outbound OLC	Reject outbound OLC.		
2307	TDM resource blockage	Time Division Multiplexed (TDM) resource blockage.		
2308	Selected codec mismatch	Codec no longer supported.		
2309	Drop call codec mismatch	Drop call, codec mismatch.		
2310	Invalid regions	Invalid region.		
2311	Invalid codec region	Invalid codec region.		
2312	No DSP resource	No Digital Signal Processor (DSP) resource.		
2313	No free list channels	No channels on free list.		
2314	No channel resources	No channel resources.		
2315	Not enough capacity			
2316-2328	not assigned			
2329	No BW, prowler <--> IP ept	No bandwidth channel resources between processor and IP endpoint.		
2330	No BW, prowler <--> prowler	No bandwidth channel resources between processors.		
2331	No VOIP channel, PN <--> PN	No Voice Over IPchannel resources between port networks.		
2332	No BW, prowler <--> MG	No bandwidth channel resources between processor and media gateway.		
2333	No VOIP channel, PN <--> MG	No Voice Over IPchannel resources between port network and media gateway.		
2334	No channel resources	No channel resources.		
2335	RejReqMode-no common mode	Deny inbound RM, not compatible with modes received in request.		
2336	RejReqMode-no common mode	Deny inbound RM, cannot arrive at common profile.		
2337	RejReqMode-no modes rcvd	Deny inbound RM, no data modes were received in request.		
2338	RejReqMode-not 2 connectd	Deny inbound RM, there are not two pt_conn parties on call.		
2339	RejReqMode-no common mode	Deny inbound RM dirip ept, no common profile.		
2340	T38Fail-no voip resources	Insufficient voip resources.		
2341	T38Fail-far end timeout	Far-end timeout.		
2342	T38Fail-near end timeout	Near-end timeout.		
				2 of 3

Denial Events

Dial Plan Manager Denial Events

Event Types 2400 - 2406 show Dial Plan Manager denial events, as listed in [Dial Plan Manager denial events \(2400 - 2406\)](#) on page 241.

Table 54: Dial Plan Manager denial events (2400 - 2406)

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
2400	UDP: too many conversions	Digit conversion counter exceeded.		
2401	UDP: node-rte pat blank	Node number route pattern is blank.		
2402	UDP: ENP code blank	ENP numbering prefix is blank.		
2403	Loc Digits Size incorrect	Location Prefix digits size is not n, where the UDP form's matching row, Insert digits field is Ln.		
2404	Var-in-Vec No adm for VAC	Variable Access Code (VAC) in Variables in Vector Table not administered.		
2405	Var-in-Vec Invalid digit	Invalid digit entered, or Feature Access Code corrupted from call_p to dp_mgr.		
2406	Unadministered ann ext	Unadministered announcement extension for a location.		

Data Manager Denial Events

Event Types 3001 - 3003 show Data Manager denial events, as listed in [Table 55: Data Manager generated Denial Events \(3001 - 3003\)](#) on page 241.

Table 55: Data Manager generated Denial Events (3001 - 3003)

Event Type	Event Description, as it appears on the event log	Explanation
3001	Bridge in use	indicate PR_BRIDGE object is in use
3002	Button in use	PR_BUTTON/PR_BTNTTI object is in use
3003	Station/Trunk in use	one of the station/trunk PREC object is in use

Dial Access Plan Denial Events

Event Types 3101 - 3200 show Dial Access Plan denial events, as listed in [Dial Access Plan denial events \(3101 - 3200\)](#) on page 242.

Table 56: Dial Access Plan denial events (3101 - 3200)

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
3101	DCS invalid PBX/Mach/Node	Distributed Communication System (DCS) requires Trunk Group pbx-id, Signal Group Mach-id, or AAR Analysis node number.		
3102	DCS no msg buffer avail	No Distributed Communication System (DCS) message buffers are available.		
3103	DCS Station LWC mis-admin	Distributed Communication System (DCS) station Leave Word Calling is mis-administered.		
3104	DCS Trunk Group mis-admin	Distributed Communication System (DCS) trunk-group is mis-administered.		
3105	DCS invalid PBX/Mach/Node	Distributed Communication System (DCS) requires Trunk Group pbx-id, Signal Group Mach-id, or AAR Analysis node number		
3106-3200	not assigned			

Meet Me Conference Denial Events

Event Types 3201 - 3299 show denial events generated by the Meet Me conference process, as listed in [Meet Me Conference denial events \(3201 - 3299\)](#) on page 242.

Table 57: Meet Me Conference denial events (3201 - 3299) 1 of 2

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
3201	Meet-Me Access chg TMO	Meet-me security/access change time-out.		
3202	Invld Num Digits MM Acc.	Meet-me security/access change received too many digits.		
3203	MM Extention not valid	Meet-me security/access change not a valid extension.		
3204	MM Access Chg Not a VDN	Meet-me security/access change not a Vector Directory Number extension.		
3205	MM Invalid Access Entered	Meet-me security/access change invalid security/access code.		

1 of 2

Table 57: Meet Me Conference denial events (3201 - 3299) 2 of 2

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
3206	MM Access Obj/SAT Busy	SAT window with Meet-me security/access code or obj is busy and cannot make changes via AC.		
3207	Merge Meet-me Conf call	User tried to merge to a existing Meet-me conference call and mmcon_val failed to validate the merge.		
3208	Serv Observ Meet-me VDN	User tried to service-observe a Meet-me conference call and the service observing route failed.		
3209	Meet-me Conf call full	Meet-me conference total party number is over limit.		
3210	Wrong MM Acc. code dialed	Party failed to dial correct Meet-me conference access.		
3211	Chg Station no Cons/Perm	Meet-me security/access change the station extension does not have console permissions.		
3212	VDN not a meetme type	Vector Directory Number (VDN) is not a meetme type.		
3213	MM Invalid Conf Ctrlr Sta	Station extension does not match controller extension.		
3214	MM Inv Trk not Remote Acc	Trunk User ID not allowed as a controller extension.		
3215	MM Invalid Station Type	Invalid station type of calling extension.		
3216	Conf/Transfer 2 Meet-me	Conference/or transfer 2 Meet-me conference call.		
3217	MM Abbrev Dial Invalid	Cannot use abbreviated dialing.		
3218	Error in EMMC route dgt	Error retrieving Enhanced MeetMe Conferencing (EMMC) routing digits.		
3219	Empty EMMC route digits	Empty Enhanced MeetMe Conferencing (EMMC) routing digits.		
3220	Exceed EMMC active conf	Exceeded Enhanced MeetMe Conferencing (EMMC) active conference.		
3221	Exceed EMMC license ports	Exceeded Enhanced MeetMe Conferencing (EMMC) license ports.		
3222	Exceed EMMC party limit	Exceeded Enhanced MeetMe Conferencing (EMMC) party limit.		
3223-3299	not assigned			
				2 of 2

LSP Denial Events

Event Types 3300 - 3399 show LSP-generated denial events, as listed in [LSP denial events \(3300 - 3399\)](#) on page 244.

Table 58: LSP denial events (3300 - 3399)

Event Type	Event Description (keyword)	Explanation	Event Data 1	Event Data 2
3300	IP RRJ-LSP not active	Local Survivable Processor (LSP) is not yet active.	NULL	sending LSP's IP address
3301	IP RRJ-LSP not admin	Local Survivable Processor (LSP) has not been administered.	NULL	sending LSP's IP address
3302	IP RRJ-Version mismatch	Local Survivable Processor has not been administered.	NULL	sending LSP's IP address
3303	IP RRJ-GK reg with GK	Local Survivable Processor (LSP)/ESS is attempting to register with another LSP/ESS.		
3304	IP RRJ-LSP's MG not admin	Local Survivable Processor's serial number does not match any administered gateway.	NULL	sending LSP's IP address
3305-3399	not assigned			

Data Error Events

Event Types 3400 - 3499 show data error-generated denial events, as listed in [Data Error denial events \(3400 - 3499\)](#) on page 244.

Table 59: Data Error denial events (3400 - 3499) 1 of 2

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
3400	Error in vector data	Bad step type.		
3401	Invalid vector step type	Bad step type.		
3402	Companding mode mismatch	Companding mode mismatch.		
3403	Bad date in MCT record	Bad Malicious Call Trace date.		
3404	Bad date in MCT record	Bad Malicious Call Trace date.		
3405	Unicode cus file not read	Unicode translation read error. Entire customer file not read.		
3406	Error in Unicode cus file	Unicode translation read error. Error found in customer file.		

1 of 2

Table 59: Data Error denial events (3400 - 3499) 2 of 2

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
3407	Unicode ava file not read	Unicode translation read error. Entire Avaya file not read.		
3408	Error in Unicode ava file	Unicode translation read error. Error found in Avaya file.		
3409-3500	not assigned			
				<i>2 of 2</i>

Contact Closure Denial Events

Contact Closure Denial Event Types 3501 - 3503 show successful feature activations and are kept as historical data, as listed in [Contact Closure denial events \(3500 - 3503\)](#) on page 245.

Table 60: Contact Closure denial events (3500 - 3503)

Event Type	Event Description (keyword)	Explanation	Event Data 1	Event Data 2
3500	not assigned			
3501	Relay OPEN	Contact closure OPEN.		
3502	Relay CLOSE	Contact closure CLOSE.		
3503	Relay PULSE	Contact closure PULSE.		

ESS Denial Events

Event Types 3600 - 3604 are ESS-generated denial events, and listed in [ESS denial events \(3600 - 3604\)](#) on page 246.

Table 61: ESS denial events (3600 - 3604)

Event Type	Event Description, as it appears on the event log	Explanation	Event Data 1	Event Data 2
3600	IP RRJ-ESS not admin	ESS has not been administered.	NULL	sending ESS's IP address
3601	IP RRJ-ESS obj not init	EssMgr_ptr has not been initialized.	NULL	sending ESS's IP address
3602	IP RRJ-ESS bad SID sent	ESS sent a bad System ID.	SID	sending ESS's IP address
3603		ESS had a failure from ParseNsdLSPInfo method.	NULL	sending ESS's IP address
3604-	not assigned			

Chapter 3: LEDs

This chapter describes the meanings of the LEDs on system components and the alarm levels they indicate. The chapter includes the following topics:

- [Alarm levels](#) on page 247
- [Terminal alarm notification](#) on page 248
- [Attendant console LEDs](#) on page 249
- [Circuit pack LEDs](#) on page 249
- [Avaya Ethernet Switch LEDs](#) on page 260
- [UPS LEDs](#) on page 261
- [IPSI LEDs](#) on page 262
- [650A Power supply LEDs](#) on page 265
- [655A Power Supply LEDs](#) on page 265
- [S8710 Media Server LEDs](#) on page 268
- [S8700 Media Server LEDs](#) on page 271
- [S8500 Media Server LEDs](#) on page 274
- [S8300 Media Server LEDs](#) on page 275
- [G700 and Media Module LEDs](#) on page 279

Alarm levels

If a maintenance object in the system begins to fail some of the periodic tests, the system automatically generates an alarm that indicates the system needs to be restored to a normal condition. The system identifies three levels of alarms:

- **Major alarms** — Failures that cause critical degradation of service and require immediate attention.
- **Minor alarms** — Failures that cause some degradation of service, but do not render a crucial portion of the system inoperable. This condition requires action, but its consequences are not immediate. Problems might be impairing service to a few trunks or stations or interfering with one feature across the entire system.
- **Warning alarms** — Failures that cause no significant degradation of service or failures in equipment external to the system.

Alarms are communicated to the system users and technicians by entries in the alarm log and the lighting of LEDs located on the attendant console, on all circuit packs, on the server, on the Cajun Ethernet switch if there is one, and, optionally, on customer-designated voice terminals. Warning alarms are not reported to the attendant console.

Terminal alarm notification

Terminal alarm notification is an optional feature which displays several types of alarms on voice terminals with administered feature buttons or the attendant console. A maximum of 10 digital and/or hybrid voice terminals may be used.

When an alarm occurs, the green status LED associated with the assigned button will be in a steady state. The LED may be turned off by pressing the button associated with the lighted alarm LED. If the LED is turned off and the alarm has not been resolved by the time maintenance reschedules testing, the green status LED will resume its steady state.

The following alarms are displayed:

ac-alarm	Administered Connection alarm: A locally administered connection (ADM-CONN) has a major, minor, or warning alarm active.
pr-awu-alm	Auto Wakeup Journal Printer alarm: The automatic wakeup journal printer has a major, minor, or warning alarm active.
off-bd-alarm	DS1 or ATM Facility alarm: An off-board major, minor, or warning alarm is active on a DS1-BD, UDS1-BD, or ATM-TRK board.
trk-ac-alm	Facility Access alarm: The facility access trunk test feature is activated.
major-alm	Major alarm: The system has logged a major alarm.
mj/mn-alm	Major/Minor alarm: The system has logged a major or minor alarm.
pr-pms-alm	The Property Management System (PMS) printer has a major, minor, or warning alarm active.
rs-alert	Reset-Alert: reset system 2 or 3 has been performed.
cdr1-alm	Call Detail Recording alarm: The primary CDR link has a major, minor, or warning alarm active.
cdr2-alm	Call Detail Recording alarm: The secondary link has a major, minor, or warning alarm active.
pr-sys-alm	System Printer alarm: The System Printer (SYS-PRNT) has a major, minor, or warning alarm active.
pms-alarm	The Property Management System has a major, minor or warning alarm active.

Attendant console LEDs

The console has two red LEDs, labeled “ALM” and “ACK.” The ALM LED lights steadily when there is a major or minor alarm at the switch cabinet. The ACK LED lights steadily if the alarm has been successfully reported. If the system is unable to report the alarm, the LED flashes; this signals the attendant to call the Avaya alarm receiving system and report the alarm.

Circuit pack LEDs

Typically each circuit pack has three LEDs on the front panel visible at the front of the carrier. There are some exceptions to this (for example, DS1CONV or IPSI circuit pack) that are covered later in this section. On most circuit packs, the LEDs indicate the following when lit ([Table 62: LED indicators](#) on page 249). Exceptions to these indications are explained in subsequent sections.

Table 62: LED indicators

LED Color	State	Interpretation
Red	Alarm	The system detected a fault in this circuit pack. The alarm log should contain an on-board alarm for this circuit pack or one of the maintenance objects associated with it. The red LED is also lit briefly when a circuit pack is inserted or reset. If the circuit pack passes its initialization tests, the LED is extinguished. If a fault is detected, it remains lit.
Green	Testing	The system is currently running tests on this circuit pack as part of background maintenance or demand testing. This LED is also lit briefly during initialization tests when a circuit pack is inserted or reset.
Yellow	Busy	The circuit pack is currently in use by the system.

This section includes LED interpretation on the following circuit packs:

- [LED alarms without Alarm Log entry or with Error Type 1](#) on page 250
- [Expansion Interface circuit pack LEDs](#) on page 251
- [Maintenance circuit pack LEDs](#) on page 252
- [DS1C \(TN574/TN1654\) circuit pack LEDs](#) on page 253
- [Switch Node Interface LEDs](#) on page 257
- [Tone-Clock circuit pack LEDs](#) on page 258
- [IPSI LEDs](#) on page 262

LED alarms without Alarm Log entry or with Error Type 1

Whenever the system or a part of the system is reset, every affected circuit pack will briefly light their red and green LEDs as they are initialized. Upon power up of a newly installed system, several alarm indicators may remain lit until the circuit packs are administered. These alarms should be ignored until administration is completed.

Boards with a "P" suffix have downloadable firmware. If such a board has both its green and yellow LEDs lit simultaneously, a download may be in progress and the board will not appear to be recognized. Use either the SAT command `status firmware download` or `status firmware download last` to verify this condition.

G350: For G350 - WAN media modules, MM314, MM340, and MM342. If these media modules are inserted in a slot administered for a voice media module the red LED will be lit.

After a circuit pack has been initialized, a red LED should be accompanied by an alarm in the alarm log. A single fault can sometimes light alarm LEDs on several circuit packs, as in the following examples.

- A TDM bus problem may cause several port circuit packs to display red LEDs.
- A Maintenance circuit pack can prevent an Expansion Interface (EI) circuit pack from initializing.
- Extensive interactions in the Center Stage Switch (CSS) can cause multiple alarms from single faults in DS1C, SNI and SNC circuit packs and fiber links.
- Tone-Clock problems may cause other circuit packs to report alarms.
- Mis-connected optical fiber cables may cause several circuit packs to alarm.
- Packet-bus faults can cause several port circuit packs to display red LEDs.

If a circuit pack has had at least five minutes to be initialized, and the red LED is lit without an associated alarm in the alarm log, the circuit pack may not be in communication with the system. This may also be the case when a circuit pack is properly administered and present in its slot, but there is an error type 1 logged against it. To determine whether this is so, proceed as follows:

1. Enter the `list configuration board location` command. If the system does not detect the circuit pack, this command will return:

```
identifier not assigned or no board.
```

If the documentation for the associated maintenance object gives no special instructions for this situation, go to the next step.

2. Check the hardware error log for TONE-BD or TDM-BUS errors. If the board has a "P" suffix execute the `reset board location` command, otherwise execute the `test tdm` and `test tone-clock` commands and use the appropriate maintenance procedures to resolve any identified faults. If this does not resolve the problem, go to the next step.

3. Reseat the suspect circuit pack.

⚠ CAUTION:

This procedure can cause a partial or total service outage. Consult thoroughly the documentation for the associated maintenance object before proceeding. Observe the precautions and procedures described above.

4. Inspect the backplane connectors for bent pins.
5. If the system seems to be functioning correctly, but the circuit pack in question will not communicate with the system, replace the circuit pack.

Expansion Interface circuit pack LEDs

The Expansion Interface (EI) TN570 circuit pack has the standard red, green and yellow LEDs. The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress.

The yellow LED displays various flashing patterns to provide status information useful in isolating faults in the fiber link and other components connected to the fiber link.

[Table 63: Expansion Interface yellow LED flashing codes](#) on page 251 illustrates the EI yellow LED states.

Table 63: Expansion Interface yellow LED flashing codes

LED on	LED off	Condition
0.1 sec	0.1 sec	Fiber Out-of-Frame. This state indicates a failure of test #989. This may be caused by absence of the opposite end EI or Switch Node Interface (SNI), a broken or missing fiber, or a missing lightwave transceiver on either endpoint.
0.5 sec	0.5 sec	In Frame — No Neighbor. This state corresponds to a failure of test # 237, usually due to a failure of this EI or of the EI or SNI at the other end of the fiber.
2 sec	0.2 sec	EI Active. This is the normal state of an active EI that is an archangel of an EPN.
solid on		EI Active. This is the normal state for an active EI that is not an EPN archangel. These include EPN EIs connected to other EPN EIs in direct connect configurations, and EIs located in the processor port network.
	solid off	EI Standby. This is the normal state for a standby EI in systems with a duplication option.

Maintenance circuit pack LEDs

TN775D PN maintenance circuit packs have seven LEDs on their front panels. The top three LEDs are the standard group of red, green and yellow, and indicate the status of the circuit pack. The green LED on TN775Ds blinks faintly once per second, indicating continual self-testing.

The second group of three LEDs, labeled “ALARMS”, reflects maintenance conditions throughout the system and indicates alarms reported against other components, as shown in [Table 64: Maintenance circuit pack LED interpretation](#) on page 252.

Table 64: Maintenance circuit pack LED interpretation

LED color	State	Level/ Function	Interpretation
Red	flashing	MAJOR	Major alarm against a component in the same cabinet.
	solid	MAJOR	Major alarm against a component in another cabinet.
	solid	MINOR	Minor alarm against a component in another cabinet.
	flashing	MINOR	Minor alarm against a component in the same cabinet.
Yellow	flashing	WARNING	Warning alarm against a component in the same cabinet.
	solid	WARNING	Warning alarm against a component in another cabinet.
Green	on	ACK	Acknowledged; alarm has been reported.
Red	on	EMERGENCY TRANSFER	Emergency transfer has been invoked. This occurs upon power-up as well as during disabling failures.

These LEDs are illustrated [Figure 1: TN775 circuit pack LEDs on faceplate](#) on page 253.

Figure 1: TN775 circuit pack LEDs on faceplate
**Figure notes:**

| 2 Test LED (Green) | 5 Locking lever |
| 3 Busy LED (Yellow) | |

DS1C (TN574/TN1654) circuit pack LEDs

The TN574 and the TN1654 LEDs provide an indication of the state of the DS1 converter and facilities.

Note:

DS1 converters are used exclusively with a CSS.

TN574 circuit pack LEDs

Seven LEDs provide an indication of the state of the DS1 converter (DS1C-BD) TN574 circuit pack and the DS1 facilities. The top group has the standard red, green and yellow LEDs. The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress. The four green LEDs on the bottom indicate the status of the DS1 facilities (see following section).

LEDs

The yellow LED is used to indicate the state of the fiber interface, the fiber channel, and the DS1 channel as listed in [Table 65: DS1C yellow LED flashing states](#) on page 254 in order of priority.

Table 65: DS1C yellow LED flashing states

LED on	LED off	Condition
0.1 sec	0.1 sec	Fiber Out-of-Frame or Fiber Loss of Signal
0.5 sec	0.5 sec	In Frame, fiber channel down. The fiber channel communicating between the DS1C and the other fiber endpoint (EI or SNI) is down.
1 sec	1 sec	In Frame, DS1 channel down. The channel between the two DS1Cs in the DS1C complex is down.
solid on		DS1C active. This is the normal state for an active DS1C.
	solid off	DS1C standby. This is the normal state for a standby DS1C in critical-reliability systems (duplicated PNC).

DS1 Facility LEDs

Below the three standard LEDs on the DS1C circuit pack are four green LEDs that indicate whether a receive signal is present for each of the four DS1 facilities. [Figure 2: TN574 DS1 Converter circuit pack LEDs](#) on page 255 shows which facility (A, B, C, or D) corresponds to each LED. If a green LED is off, there is a Loss of Signal condition on the DS1 facility associated with that LED. The presence of a signal does not guarantee that the signal is using the correct framing format or line coding; an Alarm Indication Signal indicating that the opposite end of the DS1C complex is out of service may be present.

Figure 2: TN574 DS1 Converter circuit pack LEDs
**Figure notes:**

|---------------------|---------------|
| 1 Alarm LED (Red) | 4 STATUS LEDs |
| 2 Test LED (Green) | 5 SPAN LEDs |
| 3 Busy LED (Yellow) | |
-

TN1654 circuit pack LEDs

The TN1654 DS1C-BD board has 11 LEDs on its faceplate. The top three system standard LEDs indicate the state of the DS1C-BD board. These LEDs are under firmware control until the board has established a link to the S8700 Media Server via the EI or SNI. Once the link is established, software controls the three LEDs. If the link breaks, the LEDs are again under firmware control.

The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress. The red and green LEDs are also turned on during circuit pack initialization by firmware. When the control link to the circuit pack is lost, firmware controls the red LED to indicate an alarm condition.

LEDs

The yellow LED under firmware control is used to indicate the state of the physical fiber interface, the Fiber Channel (link to EI or SNI), the DS1 Control Channel (link to opposite DS1CONV board), and the S8700 Media Server communications link in the following manner and order of priority. (The yellow LED remains on for longer periods of time as the DS1CONV complex becomes closer to being fully operational.)

1. If the fiber is Out of Frame or if a Fiber Loss of Signal condition exists, the yellow LED will flicker at a 5 Hz rate (on for 100 mS, off for 100 mS).
2. If the fiber channel is down (DS1 Converter circuit pack/fiber endpoint communications), the yellow LED will flash at a 1 Hz rate (on for 500 ms, off for 500 ms).
3. If the DS1 control channel is down between the two DS1CONVs in the DS1CONV complex, the yellow LED will pulse at a 0.5 Hz rate (on for 1 second, off for 1 second).
4. If the S8700 Media Server communications link is down, the yellow LED will wink off every 2 seconds for 200ms (2 sec on, 200 msec off).
5. If all is well with the fiber interface and every communications channel, the yellow LED will remain on continuously in a standard- or high-reliability system configuration. In critical-reliability systems (duplicated PNC), an active DS1CONV circuit pack will have its yellow LED on continuously, and a standby DS1CONV circuit pack will have its yellow LED off. The LED will then be under software control.

The bottom four green LEDs on the TN574 DS1CONV board are under hardware control. The four green LEDs indicate, for each DS1CONV facility, whether a receive signal is present for the DS1 facility

The next four LEDs on the TN1654 DS1CONV board are labeled STATUS LEDs and are for future use. These LEDs will not be lit.

The bottom four LEDs on the TN1654 board are labeled SPAN LEDs. These LEDs are under firmware control. If the facility is not administered, then the LED is not lit. The LED is lit amber if the facility is running alarm free. If the facility is detecting either a red alarm (loss-of-signal or loss-of-frame), a yellow alarm (remote frame alarm) or a blue alarm (AIS signal) then the LED is lit red. The SPAN SELECT switch on the TN1654 faceplate is for future use. Pushing the switch will have no effect on the board. See [Figure 3: TN1654 DS1CONV circuit pack](#) on page 257 for a view of the faceplate on the TN1654 DS1CONV circuit pack.

Figure 3: TN1654 DS1CONV circuit pack

Switch Node Interface LEDs

The Switch Node Interface (SNI) TN573 circuit pack has the standard red, green, and yellow LEDs. The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress.

The yellow LED displays various flashing patterns to provide status information useful in isolating faults in the fiber link and other components connected to the fiber link.

[Table 66: Switch Node Interface \(SNI\) yellow LED flashing states](#) on page 258 illustrates the SNI yellow LED states.

Table 66: Switch Node Interface (SNI) yellow LED flashing states

LED on	LED off	Condition
0.1 sec	0.1 sec	Fiber Out-of-Frame. This state indicates a failure of test #238, which may be caused by absence of the opposite end EI or Switch Node Interface, a broken or missing fiber, or a missing lightwave transceiver on either endpoint.
0.5 sec	0.5 sec	In Frame — No Neighbor. This state corresponds to a failure of test # 237, usually due to a failure of this SNI, or the EI or SNI at the opposite of the fiber. This condition may also be due to a faulty Switch Node Clock (SNC).
solid on		SNI Active. This is the normal state for an active SNI.
	solid off	SNI Standby. This is the normal state for a standby SNI in systems with a duplication option.

Tone-Clock circuit pack LEDs

The Tone-Clock circuit packs found in non-IPSI-connected port networks have the standard red, green and yellow LEDs. The red LED has the traditional meaning. The yellow and green LEDs flash in specific patterns to indicate the status of the circuit pack. The standby status applies only to systems with a duplication option.

Maintenance/Test circuit pack LEDs

The TN771D maintenance/test circuit pack has the standard red, green, and yellow LEDs. The red and green LEDs have the traditional meaning, where red indicates an alarm condition, and green indicates testing in progress.

The yellow LED can be off or on continuously or flashing, depending on the mode of operation of the TN771D and whether or not it has detected errors. The yellow LED is on steady when the TN771D's analog test port or digital test ports are being used to test trunks or line circuits. The yellow LED is also used to indicate packet-bus status. [Table 67: TN771D Maintenance/Test Yellow LED States](#) on page 259 illustrates the maintenance/test yellow LED states as they apply to packet-bus activity.

Table 67: TN771D Maintenance/Test Yellow LED States

LED State ¹	TN771D Mode	Condition
Solid off	Normal	The Maintenance/Test circuit pack detects no packet-bus faults.
Solid on ²	Normal	The Maintenance/Test packet-bus port has successfully reconfigured the packet bus around a fault.
Flashing (1 Hz)	Normal	The Maintenance/Test packet-bus port is unable to reconfigure the packet bus around a fault.
Solid off	Standalone ³	The Maintenance/Test detects no packet-bus faults.
Solid on	Standalone	This condition cannot normally occur. The LED is always either off or blinking in standalone mode.
Flashing (1 Hz)	Standalone	The Maintenance/Test packet-bus port detects a packet-bus fault.

1. It takes 5 to 10 seconds for the yellow LED to respond to a change in the state of the packet bus.

2. Because the yellow LED on the Maintenance/Test circuit pack can also be on steady when the digital and analog test ports on the circuit pack are in use, exact interpretation of the yellow LED may require that the technician busy out the analog and digital test ports or examine the error and alarm logs for PKT-BUS errors and alarms.

3. "Standalone" refers to the TN771D's capability to operate autonomously as a troubleshooting aid.

Avaya Ethernet Switch LEDs

The Avaya Ethernet switch's LEDs are shown in [Figure 4: Avaya Ethernet switch LEDs](#) on page 260.

Figure 4: Avaya Ethernet switch LEDs

Figure notes:

- | | |
|--------------------------|---|
| 1 Ports in use | 3 Power |
| 2 CPU boot status | 4 Lights if this module is the Cajun P33x stack master |

The following three LEDs are the primary indicators:

- SYS shows whether this module is the Cajun P330 stack master.
- OPR shows CPU boot status.
- PWR shows when power is on.

For all other LEDs, refer to the quick start guide and user guide that came with the Avaya Ethernet switch.

UPS LEDs

All Ethernet hubs and UPSs have LEDs to indicate that they are powered on or off. LEDs “on” imply the device is powered on. LED “off” implies the device is powered down.

The Powerware front panel has the LEDs shown in [Figure 5: UPS LEDs](#) on page 261.

Figure 5: UPS LEDs

Figure notes:

- | | | | |
|---|-------------------------|---|----------------------|
| 1 | Normal mode indicator | 5 | Off button |
| 2 | Battery mode indicator | 6 | On button |
| 3 | Bypass mode indicator | 7 | Bar graph indicators |
| 4 | Test/Alarm reset button | 8 | Alarm indicators |

When the Normal mode LED is steady green, it has power. If the LED is flashing, the UPS is in standby mode.

For information on the other LEDs, refer to the UPS user’s guide that came with the Powerware UPS unit.

IPSI LEDs

There are four LEDs on the TN2312AP IPSI faceplate, and five LEDs on the TN2312BP IPSI faceplate. The top three LEDs are the standard ones found on most TN circuit packs. The fourth LED imitates the TN2182B Tone-Clock's amber LED. The archangel flashes the yellow LED when active, 2 seconds on and 200 msec off. In addition, the TN2312BP has a fifth LED that shows the emergency transfer control status.

Figure 6: IPSI display showing connectivity status

Table 68: IPSI connection status (figure notes)

Connectivity status	1	2	3	4	5
IPSI is connected to Avaya Ethernet switch	no	yes	yes	yes	yes
IPSI has an IP address	no	no	yes	yes	no
Laptop computer is connected to IPSI services port	no	no	no	yes	yes

Figure 7: S8700 IP-Connect IPSI display

Figure notes:

- 3 IPSI has connectivity and an IP address

650A Power supply LEDs

[Table 69: LED and alarm conditions](#) on page 265 shows the LED and alarm conditions for the 650A Power Supply. Ring voltage and neon bus output do not activate alarm status.

Table 69: LED and alarm conditions

Condition	LED status	Alarm state	Fan alarm
Normal	Red off; Yellow on	Open	Normal
No input power	Red off; Yellow off	Closed	No input power
DC output not present (except Neon)	Red on; Yellow off	Closed	DC output not present (except Neon)
Fan alarm	Red on; Yellow on	Closed	Fan alarm

655A Power Supply LEDs

The G650 media gateway normally has two 655A power supplies. Each has a set of five LEDs, the function of which is indicated in [Table 70: 655A Power Supply LEDs](#) on page 265.

Table 70: 655A Power Supply LEDs

LED	Color	Function
1	Red	Failure of power supply or fan
2	Yellow	Status of power supply OK
3	Green	AC input voltage applied
4	Green	DC input voltage applied
5	Green	Power supply providing ring voltage

Normally the ring voltage LED (#5) on the left power supply is ON and the ring voltage LED on the right power supply is OFF. This changes momentarily when the ringer interchange test is run. The ring voltage LED will only remain lit on the right power supply when there is a power supply failure of the left hand supply or the left hand supply is removed.

LED indicators of serial bus commands to the power supply

Operation of the 655A power supply LED indicators for visual indication of serial bus commands to the power supply for power supply shutdown and ringing shutdown are described below.

Power supply shutdown

The 655A power supply can be commanded off for a period selectable from 1 to 255 seconds. The intent is to allow a hard reset to the G650 chassis remotely. The yellow LED indicating correct operation of the 655A power supply is on for normal power supply operation. When the power supply is commanded off, the yellow LED blinks at a rate of 1 second on and 100ms off, indicating that the power supply is operational but commanded off by the serial bus.

Ringing shutdown

The left hand power supply in the G650 cabinet is the master ringer. If the master ringer fails, ringing is transferred to the redundant power supply, if present, and the red LED on the left hand power supply turns on and the yellow LED turns off, indicating failure of the power supply.

The serial bus can command the ringer off for a period of 1 to 255 seconds. The purpose of this command is to verify redundant ringer operation through the serial bus, remotely from the G650 chassis. The red LED blinks at a rate of 1 second on and 100ms off, indicating that the power supply is operational but commanded off by the serial bus.

A second command relating to ringer operation is the to command the master ringer off, which shuts down the master ringer and transfers control to the redundant power supply. This command is used to permanently transfer ring voltage to the redundant power supply through the serial bus, in order to resolve a problem with the master ringer. The red LED blinks at a rate of 1 second on and 100ms off, indicating that the power supply is operational but commanded off by the serial bus.

Duplication memory card LEDs

The Duplication memory card has LEDs that indicate active/standby, fiber link integrity/activity states. The LED functions are:

- Link Active -- Green when light signal is sensed on the fiber.
- Link Sync -- Green when characters are received.
- Trans Mode -- Green when transmission is enabled.
- Receive Mode -- Green when reception is enabled.

On the active server the Trans Mode LED will be green and the Receive Mode LED will be dark. On the standby server the Receive Mode will be green and the Trans Mode LED will be dark.

Also see [System shutdown LEDs](#) on page 272.

Testing the Duplication Memory card LEDs

When you test the LEDs, the DAJ-1 or DAL-1 duplication memory card LED should blink according to the following pattern:

1 second red, 1 second red off, 1 second green, 1 second green off

and so on for a total of one minute.

If the LED shows any of the following flashing patterns, an abnormal condition is indicated.

[Table 71: Duplication memory card abnormal LED conditions](#) on page 267 describes the condition and suggests actions to take to resolve it.

WARNING:

The DAJ-1 and DAL-1 are not interchangeable. The DAJ-1 will not function in the S8710 and the DAL-1 will not function in the S8700 media server.

Table 71: Duplication memory card abnormal LED conditions

LED Color	Behavior	Indication	Resolution
Red	Flashes on 1 second, off 3 seconds in a repeating pattern	The green element is burned out	Replace the server.
Green	Flashes on 1 second, off 3 seconds, in a repeating pattern	The red element is burned out	Replace the server.
	LED remains off continuously	The DAJ-1 or DAL-1 card is not getting power, or the server is hung	If the server is hung, it should automatically reboot itself. If it does not, power it down and reboot it.
Green or Red	Flashed continuously	The server is hung	If the server is hung, it should automatically reboot itself. If it does not, power it down and reboot it.

S8710 Media Server LEDs

The S8710 Media Server has LEDs on both the front and back panels. Use the links in [Table 72](#) for LED information and interpretation.

Table 72: S8710 LED information

S8710 location	Diagram	LED interpretation
Front panel	Figure 9	Table 73: S8710 front panel LED interpretation on page 269

8	Power supply (GREEN)	ON: power is on and power supply is functioning properly OFF: indicates one or more of the following conditions: <ul style="list-style-type: none">● AC power is unavailable● Power supply failed● Power supply in standby mode● Power supply exceeded current limit

2 of 2

S8700 Media Server LEDs

The S8700 Media Server has an LED called Active/Standby that indicates whether the server is the active server or the standby server. The Active/Standby LED in the “on” state implies active and in the “flashing” state implies standby. It flashes at the rate of 400 ms “on” and 600 ms “off” when in standby mode.

Figure 11: S8700 Media Server LEDs—Front and Back

Figure notes:

- | | |
|---|--|
| 1 Power | 7 U2 (not used) |
| 2 Configuration fault | 8 4 NIC ports (the numbers indicate their assigned Ethernet ports) |
| 3 Disk activity | 9 LEDs for the NIC ports |
| 4 Network activity (not used) | 10 LEDs for fiber optic duplication connectivity |
| 5 Service—configuration health (not used) | 11 Status LED (not used) |
| 6 Active or standby mode indicator | |

System shutdown LEDs

All server and Avaya duplication memory card LEDs are in the “off” state but still powered “on” when the server is shut down.

Testing server LEDs

Using the media server Web interface, click **Diagnostics > Test Server LEDs** to make sure that the Active/Standby LED on the server and the transmit LED on the DAJ-1 or DAL-1 duplication memory card are controllable and not burned out, and that the server is not hung.

During the test, the Active/Standby LED on the media server and the transmit LED on the duplication memory card should blink slowly (1 second on, 1 second off) for 1 minute.

To test the server LEDs:

1. On the main menu, under **Diagnostics**, click **Test Server LEDs**.
2. On the **Test Server LEDs** screen, click **Test LEDs**.
3. Observe the Active/Standby LED on your server and the transmit LED on your duplication card to ensure they are blinking.

Interpreting the test results

An abnormal condition is indicated if an LED shows any of the following flashing patterns.

LED color / behavior	Indication
Flashes red	The green element is either burned out or not controlled.
Flashes green	The red element is either burned out or not controlled.
Flashes between red and amber	The green element is stuck on.
Flashes between green and amber	The red element is stuck on.
Stays amber continuously	Either the server is hung or the LED controller is stuck.
Stays off continuously	The server is hung or powered off, the controller is stuck, or the server is using a new or different LED controller.

Also see [Testing the Duplication Memory card LEDs](#) on page 267.

Resolving problems

If the server is hung, you do not need to do anything. It should automatically reboot and fix itself. If the server does not reboot itself, power it down and then reboot it.

If an LED is clearly stuck or has a burned out element, ignore the indicators until you can conveniently replace the server.

S8500 Media Server LEDs

The S8500 Media Server has:

- Five (5) LEDs on the front panel ([Figure 12: S8500 front panel](#) on page 274)
- Four (4) LEDs on the back ([Figure 13: S8500 rear panel](#) on page 275)

Figure 12: S8500 front panel

Figure notes:

- | | | | |
|---|-----------------------------------|---|--------------------------------------|
| 1 | CD-ROM drive activity LED (green) | 6 | System-error LED (amber) |
| 2 | CD eject button | 7 | Hard disk drive activity LED (green) |
| 3 | Power-control button | 8 | Reset button |
| 4 | USB connector 1 | 9 | Power-on LED (green) |
| 5 | USB connector 2 | | |

The four LEDs on the S8500 back panel are shown in [Figure 13: S8500 rear panel](#) on page 275.

Figure 13: S8500 rear panel

Figure notes:

- 1 Activity 2 Connection speed
- LED is off: there is a 10 BASE-T active link.
 - LED is green: there is a 100 BASE-T active link.
 - LED is orange: there is a 1000 BASE-T active link.

S8300 Media Server LEDs

Figure 14: S8300 Media Server

The S8300 Media Server has a total of 6 LEDs on the faceplate ([Figure 14: S8300 Media Server](#) on page 275), the three standard LEDs and three additional LEDs:

- A fourth LED labeled “OK-to-Remove”, which indicates when the S8300’s disk is properly shut down.
- Fifth and sixth LEDs, located on the lower left and right sides, respectively, of the Services Port, which indicate whether or not data is being sent over the RJ45 jack, and the data rate.

GREEN “OK-to-Remove” LED

The S8300 has a hard drive that must be shut down prior to removal of the S8300. Initiate a shutdown process by first depressing the shutdown button located next to the fourth GREEN “Ok-to-Remove” LED for 2-4 seconds (specific to the S8300). The GREEN LED will first blink; then go steady. Once steady, the GREEN LED indicates that the disk drive has been shut down properly and the S8300 is ready to be removed. Follow standard Media Module removal procedures after the GREEN LED indicates that the disk drive has been properly parked.

There are three different ways that you can properly shut down the S8300 before it is removed:

- Press the shutdown button on the faceplate for 2-4 seconds.
- Initiate shutdown via the Web interface with a computer connected either:
 - Remotely, on the customer’s LAN
 - Locally, on the S8300 using the Services Port on the faceplate of the S8300

GREEN or YELLOW Services Port LEDs

One LED is located on the lower left side of the Services port. It indicates the data rate of the connection:

- When GREEN, this LED indicates a 10MB connection.
- When YELLOW, this LED indicates a 100MB connection.

A second LED, located on the lower right side of the Services port, indicates whether or not data is being sent over the RJ45 jack. This LED serves as a visual status of the Services' Ethernet interface (TX/RX).

S8300 LED differences from Media Modules

Certain behaviors of the traditional S8300 LEDs differ from the Media Modules because the S8300 is a Media Server running Communication Manager.

- Situations like “insanity” and IP concepts of “registered” through H.248 do not necessarily apply to other Media Modules.
- The RED LED provides a major alarm indication. Software turns off the RED LED during system startup. After startup, software turns on the RED LED whenever a major alarm is present, and turns off the RED LED whenever a major alarm clears. Since the S8300 sees a major alarm whenever a G700 Media Gateway becomes unregistered, this means the RED LED turns on. If the Media Gateway subsequently becomes registered, the major alarm clears, and the RED LED turns off.

Note:

For an S8300 configured as an LSP, the converse is true. If a G700 Media Gateway registers with an LSP, a major alarm is generated, and the RED LED turns on. When the Media Gateway unregisters, the RED LED turns off.

The RED LED can be turned on by software to report an application or other error. The RED LED can also be turned on by a hardware watchdog that has not been cleared for at least 10ms, when the processing complex has ceased to function.

- The GREEN LED provides self-testing and maintenance indication.
- The YELLOW LED provides active “in use” indication. For an S8300, the software turns on the YELLOW LED during system startup, and turns off the LED during shutdown. During normal call processing operation, the YELLOW LED turns on whenever a G700 Media Gateway, an IP station, or an IP console is registered with the S8300. Likewise, it turns off when none of the IP endpoints are registered.

[Table 75: Major alarm \(red LED\)](#) on page 277 through [Table 79: ENET Link/Activity \(green LED\)](#) on page 279 illustrate the states of S8300 LEDs.

Table 75: Major alarm (red LED)

Major alarm	Indicator
Power on Reset	On
BIOS Boot	On
OS and SW Boot	On
System Up	Off - SW
H.248 Registered	Off - SW
Shutdown in Progress	On
Shutdown Complete	On

OS and SW Boot	N/A
System Up	Link Status
H.248 Registered	Link Status
Shutdown in Progress	Unknown
Shutdown Complete	Off

S8300 LED lighting sequence

In general, S8300 LEDs light in order from top to bottom, then from left to right on the S8300 faceplate.

The following order applies during restart or boot of the S8300:

1. ALM - RED: lights up first then turns off.
2. TST - GREEN: lights up second then turns off.
3. ACT - YELLOW: lights up third then turns off.
4. OK To REMOVE - GREEN: lights up fourth then turns off.
5. LEFT LED in SERVICES jack - GREEN (10 MB link speed): lights up fifth then turns off.
6. LEFT LED in SERVICES jack - YELLOW (100 MB link speed): lights up sixth then turns off.
7. RIGHT LED in SERVICES jack - GREEN: lights up seventh then turns off.

G700 and Media Module LEDs

LEDs are important status indicators for technicians during on-site installation, maintenance, troubleshooting, and repair. They encompass three major areas: Alarms, Testing, and Usage Activity. Some LEDs are specialized to support specific procedures (such as removing the S8300 Media Server). When alarms or problems occur, LEDs are present to indicate that attention by a technician is needed.

LEDs

LEDs appear on the G700 LED panel, and each Media Module. The G700 LEDs are the same as those on the Avaya Cajun P330, with the following exceptions:

- Slight modifications to two of the LEDs (OPR and SYS)
- Addition of the Alarm LED to the LED Panel to display prominently any error condition

See “[Table 2-1: Avaya P333T LED Description, in the "Avaya P333T User's Guide"](#) for a complete listing of LEDs.

Some Media Modules have additional LEDs, although each Media Module has the three standard LED. [Table 80: LED Interpretation](#) on page 280 indicates the meanings associated with standard DEFINITY server LEDs. Although in some cases these LEDs have been augmented or modified for the S8300 Media Server and G700 Media Gateway, it is important to be aware of their standard meanings when viewing the system.

Table 80: LED Interpretation

Red	Upon power-up or module insanity, this LED is turned on. Upon passing diagnostics, this LED is turned off.
Green	During power-up self testing and maintenance testing, this LED is turned on.
Yellow	This LED indicates that the module is in service.

Note:

The four multi-color specialized status LEDs that have appeared on various DEFINITY server TN boards like the T1/E1/DS1 board (TN464) do not appear on the Media Modules.

Note:

LEDs can also be viewed using the embedded Device Manager on the L2 Switching Processor; however, it displays LED position only, and does not indicate status.

LED panel location on the G700

As shown in [Figure 15: G700 LED Panel Location](#) on page 281, the LED panel is located on the top left corner of the G700. Directly below the LED panel is Media Module slot V1, which can be occupied by any type of Media Module. However, the S8300 Media Server can reside only in this particular slot because of height restrictions (for a specific discussion of the S8300 LEDs, see [S8300 Media Server LEDs](#) on page 275.

Figure 15: G700 LED Panel Location

Figure notes:

- | | | | |
|---|---|---|---|
| 1 | Media Module Slot #1 (V1) | 5 | 10/100 Base-T Ethernet Ports (Ext1, Ext2) |
| 2 | S8300 Services Port (Used with cross-over ethernet cable) | 6 | Media Module Slot #2 (V2) |
| 3 | S8300 USB-Series Modem connection | 7 | Media Module Slot #3 (V3) |
| 4 | Avaya Expansion Module Slot | 8 | Media Module Slot #4 (V4) |
| | | 9 | Console Interface (use with serial cable) |

[Figure 16: G700 LED Panel](#) on page 281 shows an expanded view of the G700 LED panel.

Figure 16: G700 LED Panel

Front panel LEDs

The front panel includes the following LEDs ([Figure 17: G700 Front Panel LEDs](#) on page 282):

- 4 LEDs in Voice/Data Module zone (ALM, PWR, CPU, MSTR)

Note:

The LEDs labeled OPR and SYS on the P330 are labeled CPU and MSTR, respectively, on the G700.

- 16 LEDs representing the Data Ports associated with the Personality Module or Data Expansion Ports
- 8 LEDs in Data Function zone (LNK, COL, Tx, Rx, FDX, FC, Hspd, LAG)
- 2 LEDs (EXT 1 and EXT 2) for two 10/100 Mb data ports on the chassis

Note:

The four LEDs (ALM, PWR, CPU, MSTR) are positioned as closely as possible to the top left corner of the LED Panel so that important motherboard-related information can be quickly located by the service technician.

Figure 17: G700 Front Panel LEDs

A total of 30 LEDs appear on the LED Panel for the G700. The following three LEDs have been added to the Avaya Cajun LEDs (see *“Avaya P330 Manager User Guide”*):

- RED ALM or Alarm LED
- EXT 1 LED
- EXT 2 LED

The G700 MSTR LED differs from the Avaya Cajun LED in that the bottom G700 in a stack of 10 G700s with the same version firmware is always elected master (therefore, its MSTR light is lit). But, if the firmware versions are not the same, the G700 with the latest firmware version is elected master and its MSTR light is lit. If there is only one G700 in a stack, its MSTR light is always lit.

Navigating using the front panel LEDs

Navigation using the front panel LEDs on the G700 is that same as with the Avaya Cajun P330 series. "Table 2-2: Avaya P330 <--> Select buttons, in the "Avaya P333T User's Guide". For example, a technician can use the arrows to move left and right between the LEDs, and check the following:

- LNK (link)
- Col (collision)
- Tx (send)
- Rx (receive)

In addition, a technician can query the status of the ports using 51-66 in the LED panel.

Use the push buttons (on the right and left of data mode LEDs) for selecting the function to be reported simultaneously by all 16 of the Port data expansion LEDs. The function you are selecting is indicated by a lightened LED in that Function zone. Each time you press on the right (or on the left) push-button, the function currently lighted moves by one to the right (or to the left) accordingly.

For example, if the COL LED is lit, all 16 Ports associated with the data expansion module LEDs are reporting the Collision status of their respective port. If you want to select the LAG function, press 6 times on the right push-button. Afterwards, if you want to select the Rx function, press 4 times on the left push-button.

For the G700, the LEDs display the information of ports 2 External 10/100Base-T Ethernet links and data expansion ports 51-66. At power up the LEDs indicate the Link status of ports 51-66 and ext 1 & ext 2. Push the right button once to move the indication to Collision status of ports 51-66 and ext 1 & ext 2. Push the left button to move the indication backwards.

Note:

Eight pushes in one direction complete a full cycle of display.

If you press the right and the left push buttons simultaneously for:

- 1.5sec, the module resets the Layer 2 Switching Processor but not the Media Gateway Processor
- 4 sec, the whole stack resets (performing slot renumbering)
- 18sec, the module enters the debug mode – module disabled for data traffic

Note:

Currently, there is no physical button or sequence of button presses defined to reset the Media Gateway Processor or G700. Complete software resets by using the Command Line Interface (CLI) for the Device Manager of the G700.

RED ALM or Alarm LED

The RED ALM or Alarm LED is on the top-left most corner of the LED Panel next to other important system LEDs (PWR, CPU, MSTR), as specified in [Figure 17: G700 Front Panel LEDs](#) on page 282. The presence of this RED ALM LED is primarily for on-site service technicians or dispatches. It alerts technicians of major failures that require a physical replacement or removal of equipment. Most major G700 components controlled or monitored by the motherboard can be a cause of illumination. This includes the Avaya VoIP Media Module, but not other Media Modules.

Note:

The RED ALM LED lights for motherboard problems only. Check for a RED ALM LED for problematic G700s and also check all of the Media Module LEDs for any Media Module specific RED ALM LEDs.

Note:

If the RED ALM LED is lit on a non-VoIP Media Module, check the G700 alarm screens and the Avaya Communication Manager alarm screens to determine where the fault lies.

The RED ALM LED indicates the health of the G700 by lighting under two distinct circumstances:

- G700 hardware failure
 - Impaired functions of the Layer 2 Switching Processor, Media Gateway Processor, or VoIP engine
 - Power supply voltage out of bounds
 - Unit overheating
- The G700 cannot communicate to any server

The following are a few examples:

- The RED ALM LED is lighted when two or more fans have failed.
Various warnings, alarms, and a graceful shutdown are performed based on the fan and thermal sensor conditions.
- The RED ALM LED is lit from the time power is applied until diagnostics end.
- The RED ALM LED turns “OFF” when:
 - Physical conditions such as temperature are rectified and return to normal or acceptable operating ranges.
 - The alarm is cleared manually.

EXT 1 LED

EXT 1 LED appears on the LED Panel ([Figure 17: G700 Front Panel LEDs](#) on page 282), which reports the status of the first 10/100 MB/sec port (these LEDs report the 8 different functional statuses dictated by the left and right arrow buttons).

EXT 2 LED

EXT 2 LED appears on the LED Panel ([Figure 17: G700 Front Panel LEDs](#) on page 282), which reports the status of the second 10/100 MB/sec port (these LEDs report the 8 different functional statuses dictated by the left and right arrow buttons).

G700 LED panel definitions

[Table 81: LED Definitions](#) on page 285 illustrates the LED definitions for the G700 LED Panel.

Table 81: LED Definitions 1 of 2

No.	LED Name	Description	LED States
1	ALM	Alarm Status Color is RED	OFF - No alarms exist ON (RED) - Alarm exists on the chassis itself
2	PWR	Alarm Status Color is GREEN	OFF - Power is down ON - Power is up Blinking - every 1.2 seconds (400ms on, 800ms off) when 5 volts power is not available to the riser board and the Media Modules
3	CPU	CPU Operation Color is GREEN	OFF - CPU is in boot operation or is running BIST ON - CPU boot operation and BIST completed
4	MSTR	Master/Slave Status Color is GREEN	OFF - Slave box of the stack ON - Master of the stack and redundant cable is not present or not active 1 Blink every 1.5 sec - Master of the stack and active redundant cable
5	a LNK port 51-66, Ext 1-2	Port Status Color is GREEN	OFF - Port disabled or not existent. At phase 1, or link fail of Giga ports. ON - Port is enabled and link is OK. 1 Blink every 1.5 sec - Link test fail (of 10/100M ports only at phase 1) 2 Blinks every 1.5 sec - Partition
	b COL Port 51-66, Ext 1-2	Collision (GREEN)	OFF - No collision or FDX port ON - Collision occurred on line

1 of 2

Table 81: LED Definitions 2 of 2

No.	LED Name	Description	LED States
c	Tx Port 51-66, Ext 1-2	Transmit to line (GREEN)	OFF - No transmit activity ON - Data transmitted on line
d	Rx Port 55-66, Ext 1-2	Receive from line (GREEN)	OFF - To receive activity ON - Data received from the line
e	FDX Port 51-66, Ext 1-2	Half/Full Duplex (GREEN)	OFF - Half Duplex mode of operation ON - Full Duplex mode of operation, or for 10/ 100Base-T ports when link test fail with auto-negotiation enabled
f	FC* Port 51-66, Ext 1-2	Symmetric Flow Control (GREEN)	OFF - Port is in an Asymmetric Flow control mode, or in Flow Control mode disabled, or it is in half duplex ON - Port is in full duplex and in a symmetric Flow Control mode
g	HSpd Port 51-66, Ext 1-2	High Speed (GREEN)	OFF - 10Base-T or for an expansion port that does not exist ON - 100Base-T, 100Base-F, 1000Base-X, and OC-12, or for 10/100Base-T ports when link test fail with auto-negotiation enabled
h	LAG Port 51-66, Ext 1-2	Link Aggregation "Trunking" (GREEN)	OFF - No LAG defined with this port ON - Port belongs to a LAG
6	Data	16 data expansion ports 51-66 (GREEN)	OFF - see notes on No. 5 a-h ON - see notes on No. 5 a-h
7	EXT 1	RJ 45 to Non-Avaya equipment (GREEN)	OFF - see notes on No. 5 a-h ON - see notes on No. 5 a-h
8	EXT 2	RJ 45 to Non-Avaya equipment (GREEN)	OFF - see notes on No. 5 a-h ON - see notes on No. 5 a-h

* For Giga ports, when auto-negotiation is enabled and the link is down, FC LED reflects the last mode

If the user resets the module/stack, then all of the module's/stack's LEDs light on (test lamp) for 150ms.
The COL, Tx, and Rx LED signals must be at least 150ms.

Media Module LEDs

Media Gateway physical LEDs provide the technician with information regarding the ability to troubleshoot the Media Module as a whole.

Note:

The physical LEDs provide board level status information, while the SAT provides port level status information.

LED Locations on the Media Modules

All Media Modules have three standard LEDs on the faceplate ([Figure 18: Faceplate of Media Modules with Standard LEDs](#) on page 287). On the Avaya VoIP (MM760), Avaya BRI (MM720), Avaya DCP (MM712), and Avaya Analog (MM711) Media Modules, these are the only LEDs present. In addition, the Avaya T1/E1 Media Module (MM710) has an additional LED, as shown in [Figure 19: T1/E1 Media Module with Fourth LED](#) on page 287.

Figure 18: Faceplate of Media Modules with Standard LEDs

mmdc712 KLC 022702

Figure 19: T1/E1 Media Module with Fourth LED

mmdc710 KLC 020402

MM710 T1/E1 Media Module LEDs

The T1/E1 Media Module has four LEDs on its faceplate (see [Figure 20: T1/E1 Media Module LEDs](#) on page 288). [Table 82: T1/E1 LEDs](#) on page 288 shows their color and functions. The first three are the standard LEDs, which are under software control.

Table 82: T1/E1 LEDs

Name	Color	Location	Description
ALM	RED	Top	Upon power-up, this LED is turned on. Upon passing diagnostics this LED is turned off. During normal circuit pack operation this LED is not turned on except for certain alarm states.
TST	GREEN	Second	During power-up self-testing and maintenance testing requested by the SPE, this LED is turned on.
ACT	YELLOW	Third	This LED indicates that the clock is synchronized with a source (usually the Central Office). The LED is blinking 2700 ms ON and 300 ms OFF. This is the most common condition. The opposite blinking of the YELLOW LED is 300 ms ON and 2700 ms OFF. This is an error condition, and indicates that the MM710 T1/E1 Media Module is not synchronized with a clock. An infrequent occurrence is a steady YELLOW LED. This indicates in-use activity, only when clock synchronization is set to local.
SIG	GREEN	Bottom	This LED indicates whether the link to the Central Office (CO) is up (equivalent to the TN464 circuit pack Status 3 GREEN LED). See Figure 20: T1/E1 Media Module LEDs on page 288.

Figure 20: T1/E1 Media Module LEDs

The supported portion of the LED control message allows software to change the status of the three standard LEDs on the T1/E1 Media Module faceplate. Power-up and alarm states are the only conditions where hardware sets the state of the LEDs independent of ANGEL firmware control. The exceptions to letting software turn off the LEDs are:

- The board is in reset (RED ALM LED remains on)
- A call is up (YELLOW ACT LED remains on while the E1 line is in-frame and at least one voice/data call is up)
- During board reset initialization testing (GREEN TST LED remains on until initialization testing is complete)

Note:

For ISDN operation, the Yellow LED will be turned on if ANY port has an active TDM connection (including the D-channel).

Synchronization

The YELLOW ACT LED on the front of the MM710 Media Module can tell you the status of that module regarding synchronization.

- If the YELLOW ACT LED is solidly on or off, it has NOT been defined as a synchronization source. If it is on, one or more channels is active. If it is an ISDN facility, the D-channel will count as an active channel and will cause the YELLOW ACT LED to be on.
- When the MM710 is driving a clock sync source line to the G700 main clock, the YELLOW ACT LED does not indicate port activity, but instead indicates that the MM710 is the sync source by flashing with a regular 3-second period:
 - It is on for 2.8 seconds and flashes off for 200 milliseconds if it has been specified as a sync source and is receiving a signal that meets minimum requirements for the interface.
 - If it has been specified as a sync source and is not receiving a signal, or is receiving a signal that does not meet minimum requirements for the interface, then the YELLOW ACT LED will be off for 2.8 seconds and flash on for 200 milliseconds.

T1/E1 Initialization

The T1/E1 Media Module LEDs behave in the following manner during initialization. The Angel provides a visual indication of the Media Module's status through the three faceplate LEDs:

- During initialization the YELLOW ACT LED is held off, while the RED and GREEN LEDs are on during the entire initialization sequence.
- Upon power up or reset, if only the RED ALM LED comes on, the Angel processor is dead or the board is being held permanently in reset.
- Upon completion of the diagnostics and initialization, the GREEN TST LED turns off.
- If the initialization tests fail, the RED ALM LED remains on.
- If the tests all pass, then all LEDs are extinguished until Communication Manager starts using the Media Module.

Operational control

After successful initialization, the T1/E1 Media Module's LEDs are controlled as follows:

- The Angel lights the YELLOW ACT LED when there is at least one non-idle trunk. If Communication Manager sends a message to drive the clock sync signals, the YELLOW ACT LED indicates this instead of the port busy/idle status.
- The Media Server may independently light and extinguish the three LEDs through downlink LED Control messages, subject to the constraint that it may not turn off a YELLOW ACT LED turned on by the Angel as a result of port activity.
- If the Media Module resets for any reason and is not released from reset, the RED ALM LED lights and the YELLOW ACT and GREEN TST LEDs are held off.

Chapter 4: G700 Media Gateway Traps

This chapter applies to the G700 Media Gateway only.

SNMP Alarming on the G700

Setting up SNMP alarm reporting involves two main tasks:

- [Configure the primary server to report alarms](#)
- [Configure the G700 to Send its Traps to the Primary Server](#)

Configure the primary server to report alarms

The primary server may be either an S8300 Media Server or an S8700 Media Server. The Media Server supports two methods for reporting alarms. Either method, both, or no alarm-reporting method may be used at a given site.

- **OSS Method.** The server's software applications and hardware devices under its control can generate Operations Support System (OSS) alarms. These alarms are recorded in the server logs, and may be reported to Avaya's Initialization and Administration System (INADS) or another services support agency over the server's modem interface.

To activate OSS alarm notification: The server requires a USB connection to a modem that is connected to an analog line. The modem must be configured using the Web Interface, in the Set Modem Interface screen, and enabled to send and receive calls using the Enable/Disable Modem screen. Configuration of the OSS alarming method can only be done using Linux shell commands.

- **SNMP Method.** SNMP traps may be sent in User Datagram Protocol (UDP) to a corporate network management system (NMS) using the Configure Trap Destinations screen. The OSS and SNMP alarm-notification methods operate independently of each other. Either or both may be used. Currently, the following NMSs are supported:
 - Avaya Communication Manager Fault and Performance Manager, as a standalone application, or integrated within
 - Avaya MultiService Network Manager
 - HP Openview

To activate SNMP alarm notification: On the server Web Interface, use the Configure Trap Destinations screen to set up SNMP destinations in the corporate NMS.

Add INADS Phone Numbers and Enable Alarms to INADS

The following procedure using the primary server's Linux shell commands administers the dial-out modem to send alarms in the OSS method. In this example, the primary server is an S8300, and the services support agency is Avaya's Initialization and Administration System (INADS).

Perform this task after all Communication Manager administration is complete.

To add INADS phone numbers and enable alarms to INADS

1. Connect your laptop to the Services port of the S8300 Media Server

Note:

Do these steps only if the S8300 is the primary controller and the customer has a maintenance contract with Avaya. Use the information acquired from the ART tool (see "Run the ART Tool for the INADS IP Address" in Chapter 3 of "Installation and Upgrades for the Avaya G700 Media Gateway Controlled by an Avaya S8300 or S8700 Media Server, 555-234-100"). Also, a USB modem must have already been installed. See "Universal Serial Bus (USB) Modems" in Chapter 7 of the same source.

2. Click **Start > Run** to open the Run dialog box
3. Type `telnet 192.11.13.6` and press **Enter**.
4. Log in as **craft**.
5. At the prompt, type `almcall -f INADS phone number -s second-number` and press **Enter**.
6. At the prompt, type `almenable -d b -s y` and press **Enter**.
7. Type `almenable` and press **Enter** to verify that the alarms are enabled.
8. Log off.

Configure the G700 to Send its Traps to the Primary Server

Configuring the G700 Media Gateway to send SNMP traps to the primary server can be accomplished by two commands:

- Layer 2 Switching Processor CLI command: `set snmp community trap [community string]`
- Media Gateway Processor (MGP) CLI command: `set snmp trap <IP address> enable`

Configure an SNMP community string for traps

SNMP requires community strings to be used for each SNMP "request". You can set only three community strings on the G700 — one each for read requests, write requests, and traps. The command for traps is `set snmp community trap [community string]`.

To configure an SNMP community string for traps

1. Open the Run dialog box.
2. Type `telnet <IP address of L2 Processor>` and press **Enter**.
3. Log in as **root**.
4. At the L2 Processor CLI prompt, type `set snmp community trap [community string]` and press **Enter**.
5. Type **exit**

Configure the destination for G700 SNMP traps

Events occurring on the G700 cause SNMP traps to be generated. The G700 MGP can be configured to send SNMP traps to any network management system (NMS) in the network, including the primary server (S8300/S8700). The MGP CLI `set snmp trap` command is the way to configure the NMS network element that will receive those traps. The traps are sent in User Datagram Protocol (UDP) on the customer's IP network.

The command syntax is:

```
set SNMP trap <IP address> {enable/disable}
[{all|power|temp|app|module|config|voice|operations}]
```

where `<IP address>` is the IP address of the NMS trap receiver that will be receiving the traps from the G700, and

`{all | power | temp | app | module | config | voice | operations}` indicates the groups whose traps will be sent to the specified receiver. If no keywords follow the IP address entry, then all traps will be enabled for the specified receiver.

If "enable" or "disable" is used without a trap designation keyword, then all traps is assumed. Up to ten trap receivers can be configured.

To configure the destination for G700 SNMP traps

1. From the L2 Processor CLI, type `session mgp`
2. At the `mg-xxx-n(super-user)` prompt, type `configure` and press **Enter**.
3. At the `mg-xxx-n(configure)` prompt, type `set snmp trap <IP address> enable` and press **Enter**.
4. Type **exit**

G700 Alarm Format

G700 Media Gateways (serving either as standalone port networks, or as port networks within an IP or a Multi-Connect system) report alarms to the primary server (either an S8300 or S8700 Media Server) using SNMP traps. Like the primary server's own alarms, alarms from a G700 Media Gateway:

- Reside in the primary server's alarm log
- Can be viewed using the SAT command `display alarms`
- Can be viewed using the Web Interface Display Alarms option

However, the format of these displayed alarms is slightly different. Using the G700 MO's Event ID #1 (the first entry in [Table 83: G700 Alarms \(SNMP Traps\) to the Primary Media Server](#) on page 295) as an example, a displayed G700 alarm has the following format:

```
n CMG 1 WRN 07/17/2002:13:45 121.1.1.2:cmgMultipleFanFault
```

Within the previous alarm-display string, the value:

- "n" is a sequential alarm ID.
- "CMG" identifies a G700 Media Gateway as the MO.
- "1" is the event's ID (1st column of [Table 83: G700 Alarms \(SNMP Traps\) to the Primary Media Server](#) on page 295).

This table also contains each alarm's corresponding SNMP trap # in the 2nd column of [Table 83: G700 Alarms \(SNMP Traps\) to the Primary Media Server](#) on page 295. However, many of the MIB-defined traps have been excluded, either because:

- A specific trap (such as, Trap #3) is the SNMP mechanism to clear an alarm logged by another specific trap (in this case, Trap #2).
- The specific event indicated by a trap is not severe enough to justify an entry in the primary server's alarm log.
- A trap is defined, but not implemented.
- A trap # is reserved for future use.
- "WRN" is the event's severity (3rd column of [Table 83: G700 Alarms \(SNMP Traps\) to the Primary Media Server](#) on page 295).
- "07/17/2002:13:45" is the event's date and time stamp.
- "121.1.1.2" is the IP address for Telnet access to the alarmed G700 Media Gateway Processor (MGP).
- "cmgMultipleFanFault" is an alarm description (4th column of [Table 83: G700 Alarms \(SNMP Traps\) to the Primary Media Server](#) on page 295).

G700 Traps and Resolutions

Although these alarms can be viewed from the primary server, they are normally resolved from within the G700 Media Gateway. The G700 generates the following traps. Follow the error resolution procedures in [Table 83: G700 Alarms \(SNMP Traps\) to the Primary Media Server](#) on page 295 to resolve errors indicated by these traps.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 1 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
1	2	WRN	<p>cmgMultipleFanFault — At least two G700 fans have been operating at less than 90% of their nominal speed for >= 5 minutes. (This may be an early warning of overheating.)</p> <ol style="list-style-type: none"> 1. Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command <code>show faults</code> to display any faults on the G700. 2. If there is a fan/temperature fault, check to see if the fans are working, and/or if there is sufficient space around the G700 for air circulation. 3. Maintenance software monitors voltages applied to the Media Modules and other components of the G700, and compares these to the general power supply unit (PSU) status bit. If none of these voltages are out of tolerance, but the PSU status indicates failure, this generates the fan fault, which will be indicated in the <code>show faults</code> command output. Replace the entire G700. Fans and the PSU are not field replaceable.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 2 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
2	4	MIN	<p>cmgPsuBriefFanFault — A G700's PSU fan has been operating at less than 90% of its nominal speed for between 5 and 15 minutes. (This may be an early warning of overheating.)</p> <ol style="list-style-type: none"> 1. Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command <code>show faults</code> to display any faults on the G700. 2. If there is a fan/temperature fault, check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. 3. Maintenance software monitors voltages applied to the Media Modules and other components of the G700, and compares these to the general power supply unit (PSU) status bit. If none of these voltages are out of tolerance, but the PSU status indicates failure, this generates the fan fault, which will be indicated in the <code>show faults</code> command output. Replace the entire G700. Fans and the PSU are not field replaceable.
3	6	MIN	<p>cmgPsuProlongedFanFault — A G700's fan has been operating at less than 90% of its nominal speed for \geq 15 minutes. (This may be an early warning of overheating.)</p> <ol style="list-style-type: none"> 1. Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command <code>show faults</code> to display any faults on the G700. 2. If there is a fan/temperature fault, check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. 3. Maintenance software monitors voltages applied to the Media Modules and other components of the G700, and compares these to the general power supply unit (PSU) status bit. If none of these voltages are out of tolerance, but the PSU status indicates failure, this generates the fan fault, which will be indicated in the <code>show faults</code> command output. Replace the entire G700. Fans and the PSU are not field replaceable.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 3 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
4	10	MIN	<p>cmgCpuTempWarningFault — A G700's CPU temperature sensor has exceeded its warning threshold.</p> <ol style="list-style-type: none"> 1. Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command <code>show faults</code> to display any faults on the G700. 2. If there is a temperature fault, turn off the G700 and allow it to cool. 3. Reboot the G700. Check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. Use the MGP CLI <code>show faults</code> command to check for fan problems. 4. Low voltage may be responsible for slower fans. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. If there are no fan faults, use the MGP CLI command <code>show voltages</code> to display voltages applied to components on the motherboard and to the Media Modules. 5. If the Media Module voltage is out of tolerance, systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage level. If one is found, replace the Media Module. 6. If no Media Module is found to be bad, the power supply is suspect. Replace the G700.

3 of 20

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 4 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
5	12	MIN	<p>cmgDspTempWarningFault — The temperature sensor in a G700's DSP complex has exceeded its warning threshold.</p> <ol style="list-style-type: none"> 1. Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command <code>show faults</code> to display any faults on the G700. 2. If there is a temperature fault, turn off the G700 and allow it to cool. 3. Reboot the G700. Check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. 4. Low voltage may be responsible for slower fans. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. If there are no fan faults, use the MGP CLI command <code>show voltages</code> to display voltages applied to components on the motherboard and to the Media Modules. 5. If the Media Module voltage is out of tolerance, systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage level. If one is found, replace the Media Module. 6. If no Media Module is found to be bad, the power supply is suspect. Replace the G700.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 5 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
6	14	MAJ	<p>cmgTempShutdownFault — The temperature sensor in a G700's CPU has exceeded its shutdown threshold. The system is about to begin controlled shutdown.</p> <ol style="list-style-type: none"> 1. Verify there are faults in the system. Use the Avaya G700 Media Gateway Processor (MGP) Command Line Interface (CLI) command <code>show faults</code> to display any faults on the G700. 2. If there is a temperature fault, turn off the G700 and allow it to cool. 3. Reboot the G700. Check to see if the fans are working and/or if there is sufficient space around the G700 for air circulation. 4. Enter the MGP CLI command <code>show voltages</code> to determine voltages for Media Modules and other components of the G700. While the +12V fan supply is not directly monitored, it is included in the general power supply unit (PSU) status bit. Use the <code>show faults</code> command to determine if there is a fan problem. If none of the monitored voltages are out of tolerance, but the PSU status indicates failure, this would generate a fan fault. If fans are faulty, then replace the entire G700. Fans are not field replaceable. 5. Voltage may also be reduced by a short in one of the Media Modules. Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels.

5 of 20

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 6 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
7	16	MAJ	<p>cmgMgpPowerFault — The voltage reading at the server's +5.1V power source is out of tolerance.</p> <ol style="list-style-type: none"> 1. Check voltages. Enter the MGP CLI command show voltages to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. 2. Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. 3. If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. 4. If a brown-out condition is suspected, use a power monitor to monitor the power line. 5. If the fault persists and the show voltages command continues to show the level is out of tolerance, then replace the G700.
8	18	MAJ	<p>cmgMediaModulePowerFault — The voltage reading at the Media Modules' -48V power source is out of tolerance.</p> <ol style="list-style-type: none"> 1. Check voltages. Enter the MGP CLI command show voltages to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. 2. Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. 3. If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. 4. If a brown-out condition is suspected, use a power monitor to monitor the power line. 5. If the fault persists and the show voltages command continues to show the level is out of tolerance, then replace the G700.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 7 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
9	20	MAJ	<p>cmgVoipPowerFault — The voltage reading at the VoIP complexes' +3.4V power source is out of tolerance.</p> <ol style="list-style-type: none"> 1. Check voltages. Enter the MGP CLI command show voltages to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. 2. Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. 3. If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. 4. If a brown-out condition is suspected, use a power monitor to monitor the power line. 5. If the fault persists and the show voltages command continues to show the level is out of tolerance, then replace the G700.
10	22	MAJ	<p>cmgDspPowerFault — The voltage reading at the DSP units' +1.58V power source is out of tolerance.</p> <ol style="list-style-type: none"> 1. Check voltages. Enter the MGP CLI command show voltages to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. 2. Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. 3. If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. 4. If a brown-out condition is suspected, use a power monitor to monitor the power line. 5. If the fault persists and the show voltages command continues to show the level is out of tolerance, then replace the G700.

7 of 20

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 8 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
11	24	MAJ	<p>cmg8620PowerFault — The voltage reading at the VoIP Processor's +2.5V power source is out of tolerance.</p> <ol style="list-style-type: none"> 1. Check voltages. Enter the MGP CLI command show voltages to determine voltages for Media Modules and other components of the G700. Voltage may be reduced by a short in one of the Media Modules or a bad power supply. 2. Systematically, remove each Media Module to determine if one of the Media Modules is responsible for reducing the voltage levels. Replace faulty Media Module. 3. If the MM760 Media Module is not present, the VoIP engine on the motherboard is possibly bad. Use the show faults command to check for VoIP faults. Replace the G700. 4. If the alarm clears in 10-20 seconds, it was a probable voltage spike. Do not replace the G700. Use a power monitor to monitor the power line. 5. If a brown-out condition is suspected, use a power monitor to monitor the power line. 6. If the fault persists and the show voltages command continues to show the level is out of tolerance, then replace the G700.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 9 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
14	30	MAJ	<p>cmgSyncSignalFault — Synchronization signal lost.</p> <ol style="list-style-type: none"> 1. Check that provisioned clock-sync source has a good signal by issuing a Media Gateway Processor (MGP) Command Line Interface (CLI) command show sync timing <p>Procedure for setting synchronization timing sources on T1/E1 MM or MM710:</p> <ol style="list-style-type: none"> 1. Be sure that the T1/E1 MM has been added properly on the Avaya S8300 Media Server or Avaya S8700 Media Server, otherwise go to System Access Terminal (SAT) and enter a add ds1 command before going to the MGP CLI and entering a set sync interface or set sync source command. Otherwise the MGP CLI will not allow these commands to be executed. 2. Go to the MGP's CLI, and first specify the primary and secondary clock sources for synchronizing the T1/E1 span, using the set synch interface command. Note: You don't specify the internal clock source from the CLI - only the primary and secondary. The local clock is "built-in" and not provisionable. 3. Enter a set sync source command to set to the specific MM710 T1/E1 Media Module to be used as the active clock reference. 4. Verify whether or not these commands were executed by issuing a show sync timing command to ensure that the source is provisioned and active, or visually inspect the Yellow LED on the MM710 Media Module. Note: When the Yellow LED is on 2.7 seconds and off 0.3 seconds, this means the tone-clock synchronizer is in "active" mode, and an external synchronization source is being used as a synchronization reference. Setting the sync timing was successful. When the Yellow LED is on 0.3 seconds and off 2.7 seconds, this means the tone-clock synchronizer is in "active" mode and the internal (on-board) clock is being used as a synchronization reference. Setting the sync timing was not successful.

9 of 20

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 10 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation	
14 (Cont'd)	30	MAJ	<p>5. Verify whether or not these commands were executed by issuing a show sync timing command to ensure that the source is provisioned and active, or visually inspect the Yellow LED on the MM710 Media Module.</p> <p>Note: When the Yellow LED is on 2.7 seconds and off 0.3 seconds, this means the tone-clock synchronizer is in “active” mode, and an external synchronization source is being used as a synchronization reference. Setting the sync timing was successful.</p> <p>When the Yellow LED is on 0.3 seconds and off 2.7 seconds, this means the tone-clock synchronizer is in “active” mode and the internal (on-board) clock is being used as a synchronization reference. Setting the sync timing was not successful.</p> <p>6. If there is more than one MM710 Media Module, and they have been set up as primary and secondary, this behavior could be on the second and not the timing of the bus.</p> <p>For more details, please consult the maintenance documentation under LEDs and T1/E1 Media Module, or see http://support.avaya.com/elmodocs2/S8300/cd/index.htm</p>	
	15	32	MAJ	<p>cmgVoipHardwareFault — A DSP complex serving the VoIP engines has failed.</p> <ol style="list-style-type: none"> 1. Check IP configuration. 2. Reset or replace Media Module.
		50		cmgModuleRemove — A Media Module has been removed.
	16	51		Reserved
		52		cmgModuleInsertFault — The insertion sequence for a Media Module has failed.
		53		cmgModuleInsertSuccess — A Media Module has been inserted.
		54		cmgMgBusyout — An administrator has busied-out a Media Module or a port.
		55		cmgMgRelease — An administrator has returned a busied-out media module or port back into service.
		56 – 69		Reserved
			10 of 20	

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 11 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
	74		cmgFirmwareDownloadBegun — A Media Gateway began downloading a software module.
	75		cmgModuleManualReset — A Media Module is beginning a user-requested reset operation.
	76		cmgVoipManualReset — A VoIP engine is beginning a user-requested reset operation.
	77		cmgDsuManualReset — An E1 or T1's DSU is beginning a user-requested reset operation.
	78		cmgConfigUploadBegun — A Media Gateway began uploading a configuration file.
	79		cmgConfigUploadSuccess — The Media Gateway successfully uploaded the configuration file.
			11 of 20

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 12 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
17	90	MAJ	<p>cmgMemoryFault — The Media Gateway Processor has detected a low processor memory condition. If an attempt by a software module to allocate memory fails, or if available memory falls below four million bytes, this trap is generated. If available memory later rises above five million bytes, this trap is cleared. If available memory falls below a half a million bytes, the Media Gateway Processor is automatically reset.</p> <ol style="list-style-type: none"> 1. Check the Media Gateway Processor and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. 2. If this trap occurs infrequently and is automatically cleared, the trap may be due to an unusual transient condition. Monitor future traps. 3. If this trap occurs frequently and is automatically cleared, it is likely that the Media Gateway Processor software has the wrong limits set for its memory monitoring. These limits are hard coded in the software. Escalate. 4. If this trap occurs and does not clear, the Media Gateway may be functionally impaired. Do not reset the Media Gateway. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis. 5. If this trap occurs and the Media Gateway Processor automatically resets, then a severe processor memory shortage occurred. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis.
18	92	MAJ	<p>cmgDhcpRequestFault — The Media Gateway cannot contact its DHCP server, or the DHCP server did not respond to a request.</p> <ol style="list-style-type: none"> 1. Either correct the DHCP problem, or correct the Media Module's configuration file.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 13 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
19	94	MAJ	<p>cmgFirmwareDownloadFault — An attempt to download a software module has failed.</p> <ol style="list-style-type: none"> 1. Check the event log to find the specific error. 2. Troubleshoot the specific error according to the information found. <p>For example, if the string “File not found” appears in the log, then verify that the image file:</p> <ol style="list-style-type: none"> a. Exists b. Has the correct name c. Resides in the correct directory
20	96	WRN	<p>cmgProcessRestart — a software module on the Media Gateway Processor failed. The Media Gateway Processor will attempt to restart the failing module. A successful restart of the module will clear this trap</p> <ol style="list-style-type: none"> 1. Check the Media Gateway Processor and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. 2. If this trap occurs infrequently and is automatically cleared, the trap may be due to an unusual transient condition. Monitor future traps. 3. If the trap occurs frequently and is automatically cleared, it may indicate an issue with a particular software module. Reset the Media Gateway at a time convenient with the customer. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis. 4. If the trap occurs and does not clear, the Media Gateway may be functionally impaired. Reset the Media Gateway at a time convenient with the customer and consistent with the impairment. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 14 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
21	98	MAJ	<p>cmgIccMissingFault — An internal communications controller, expected in Slot 1, is missing.</p> <ol style="list-style-type: none"> 1. Check for presence of S8300. 2. If present, check the G700 administration. 3. If the administration is correct, suspect the S8300.
22	100	MAJ	<p>cmgIccAutoReset — The Media Gateway automatically reset the internal communications controller.</p> <ol style="list-style-type: none"> 1. If the problem persists, escalate.
23	102	MAJ	<p>cmgPrimaryControllerFault — The Media Gateway cannot contact the first controller in its controller list.</p> <ol style="list-style-type: none"> 1. Verify that the controller list is correct. From the MGP CLI, enter the command <code>show mgc list</code>. The IP address should match the S8700 Media Server CLAN or the S8300 Media Server IP addresses. 2. If needed, correct this in 'configure' mode on the MGP's CLI by clearing the mgc list first with the <code>clear mgc list</code> command, and then issuing a <code>set mgc list</code> with the correct IP addresses. 3. If so, verify that the primary controller is up. 4. If so, shut down every LSP.
24	104	MAJ	<p>cmgNoControllerFault — The Media Gateway does not have any controllers in its controller list.</p> <ol style="list-style-type: none"> 1. Verify that the controller list is empty. From the MGP CLI, enter the command <code>show mgc list</code> to verify that there are no controllers listed. 2. If none are listed, correct this by adding the correct IP address of the S8700/S8300. In 'configure' mode on the MGP's CLI, enter the <code>set mgc list</code> command with the correct IP address.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 15 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
25	106	MAJ	<p>cmgRegistrationFault — The Media Gateway cannot register with any controllers in its controller list.</p> <ol style="list-style-type: none"> 1. Verify that the controller list is correct. From the MGP CLI, enter the command <code>show mgc list</code>. The IP address should match the S8700 Media Server CLAN or the S8300 Media Server IP addresses. 2. If needed, correct this in 'configure' mode on the MGP's CLI by clearing the mgc list with the <code>clear mgc list</code> command, and then issuing a <code>set mgc list</code> with the correct IP addresses. 3. If the IP address in the mgc list matches the S8700 Media Server CLAN or the S8300 Media Server IP addresses, there may be a network problem. 4. Verify that the primary controller is up.
26	108	MIN	<p>cmgH248LinkDown — An H.248 link between the Media Gateway and its controller is down.</p> <ol style="list-style-type: none"> 1. Check the S8300 or S8700. 2. If down, bring up. 3. If not, check the G700 administration. <p>Since the following command causes a brief service outage, it should only be executed at the customer's convenience.</p> <ol style="list-style-type: none"> 4. If the administration is correct, reboot the G700. 5. If the problem persists, check network connectivity. Use <code>ping</code> or <code>traceroute</code> to the S8300/S8700 to check connectivity. 6. If the problem persists, escalate.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 16 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
29	114	WRN	<p>cmgMgAutoReset — The Media Gateway Processor automatically reset (rebooted). The processor automatically resets when a critical error occurs from which it cannot recover. The error may be software or hardware related. It may also automatically reset in response to a maintenance test running on the call controller. (A reset performed at the request of a SAT or CLI command entered by craft or Tier technical support generates a different trap indicating a manual reset.) Finally, it may automatically reset when it reregisters with a call controller after being out of touch for too long. This trap is generated as the Media Gateway Processor comes back up after resetting. If the Media Gateway Processor resets and fails to come back up, this trap will not be generated.</p> <ol style="list-style-type: none"> 1. Check to see if a maintenance test that is supposed to reset the processor was run. 2. Check that the reset was not due to the link with the call controlling going down. If the reset is due to a link failure with the call controller, follow call controller link failure troubleshooting procedures. 3. Check the Media Gateway Processor and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. 4. If this trap occurs infrequently, the trap may be due to an unusual transient condition. Monitor future traps. 5. If this trap occurs and the Media Gateway Processor is frequently resetting, manually reset the media gateway. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis. 6. If this trap occurs frequently and the Media Gateway Processor is not resetting, the Media Gateway may be functionally impaired, and is not capable of resetting itself to restore service. If service is impaired, reset the Media Gateway manually. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 17 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
30	116	WRN	<p>cmgModuleAutoReset — A Media Module in the Media Gateway automatically reset (rebooted). A Media Module automatically resets when it fails a sanity test performed by the Media Gateway Processor. It may also automatically reset in response to a maintenance test running on the call controller. (A reset performed at the request of a SAT or CLI command entered by craft or Tier technical support generates a different trap indicating a manual reset.).</p> <ol style="list-style-type: none"> 1. Check to see if a maintenance test that is supposed to reset the Media Module was run. 2. Check the Media Module and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. 3. If this trap occurs infrequently, the trap may be due to an unusual transient condition. Monitor future traps. 4. If this trap occurs and the Media Module does not return to service, or if this trap occurs frequently, attempt to reset the failing module from the SAT or CLI and see if this returns it to stable service. 5. If manually resetting the Media Module does not return it to service, and if a spare Media Module of the same time is available, replace the failing Media Module with the spare and see if the spare Media Module goes into service. If so, follow procedures for dealing with the original, bad, Media Module. 6. If the spare Media Module fails to go into service, it is of course possible that the spare Media Module is bad as well. But that aside, try manually resetting the Media Gateway Processor at a time convenient to the customer and see if this restores service. If so, the both the original and the spare Media Modules can probably be considered okay, and the problem is probably with the Media Gateway Processor itself. Escalate and have Tier 3 personnel capture the trap information and the event logs for analysis.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 18 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
32	118	MIN	<p>cmgModulePostFault — A Media Module failed its power-on start-up test.</p> <ol style="list-style-type: none"> 1. Reset or replace the Media Module.
34	122	MAJ	<p>cmgConfigUploadFault — An attempt to upload a configuration file failed.</p> <ol style="list-style-type: none"> 1. Check the event log for an error message during the backup/restore process. 2. Troubleshoot the specific error according to the information found. 3. Retry the upload (backup) command; for example: <p style="text-align: center;">copy mgp-config tftp <filename> <ip address></p> <p>Since the following command causes a brief service outage, it should only be executed at the customer's convenience.</p> 4. If the problem persists, reboot the G700.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 19 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
37	128	WRN	<p>cmgVoipAutoReset — A VoIP (Voice Over IP) module in the Media Gateway automatically reset (rebooted). A VoIP module automatically resets when it fails a sanity test performed by the Media Gateway Processor. It may also automatically reset in response to a maintenance test running on the call controller. (A reset performed at the request of a SAT or CLI command entered by craft or Tier technical support generates a different trap indicating a manual reset.) It automatically resets when its IP address is administered. Finally, it automatically resets when it fails a ping test performed by the Media Gateway Processor against the VoIP module's IP address.</p> <ol style="list-style-type: none"> 1. Check to see if a maintenance test that is supposed to reset the VoIP module was run. 2. Check to see if the VoIP module had its IP address re-administered. 3. Check to see if the IP address administered on the VoIP module is correct. 4. Check to see if the IP address of the Media Gateway itself can be pinged. Physical or logical connectivity issues (cabling or routing problems) in the data network can cause ping failures. 5. Check the VoIP module and insure that it has the latest version of firmware installed. If it does not, install the latest version of firmware and continue to monitor. 6. If this trap occurs infrequently, the trap may be due to an unusual transient condition. Monitor future traps. 7. If this trap occurs and the VoIP module does not return to service, or if this trap occurs frequently, attempt to reset the failing module from the SAT or CLI and see if this returns it to stable service.

Table 83: G700 Alarms (SNMP Traps) to the Primary Media Server 20 of 20

Event ID	Trap #	Alarm Level	Description / Recommendation
37 (Cont'd)	128	WRN	<p>8. If manually resetting the VoIP module does not return it to service, and if a spare VoIP module of the same type is available, replace the failing VoIP module with the spare and see if the spare VoIP module goes into service. If so, follow procedures for dealing with the original, bad, VoIP module.</p> <p>9. If the spare VoIP module fails to go into service, it is of course possible that the spare VoIP module is bad, as well. There may be a power issue, also.</p> <p>10. Try manually resetting the Media Gateway Processor at a time convenient to the customer and see if this restores service. If so, both the original and the spare VoIP modules can probably be considered okay, and the problem is probably with the Media Gateway Processor itself. Capture the trap information. If possible, capture the event logs, using the <code>show event-log</code> CLI command, for analysis. Escalate.</p> <p>If none of this works, capture the trap information. If possible, capture the event logs, using the <code>show event-log</code> CLI</p>

Chapter 5: Communication Manager Maintenance-Object Repair Procedures

Note:

This chapter does not contain MOs for the DEFINITY Wireless Business System (DWBS), nor MOs for messaging systems. Refer to the maintenance documentation that accompanies these products for this information

The Communication Manager maintenance subsystem is partitioned into separate entities called Maintenance Objects (MOs). A maintenance object can be:

- An individual circuit pack or media module
- A hardware component that is part of a circuit pack or media module
- An entire subsystem
- A set of monitors
- A process (or set of processes)
- A combination of processes and hardware

“Maintenance names” are recorded in the Error and Alarm logs. Individual copies of an MO are assigned an address that defines the MO physical location in the system when applicable. These locations display as the **port** field in the Alarm and Error logs and as output of commands such as `test board` (see [Figure 21: Display of test board](#) on page 316).

Figure 21: Display of test board

```
test board lv4 long                                     Page 1
```

```
TEST RESULTS
```

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
001V4	MG-DS1		50	ABORT	1412
001V4	MG-DS1		52	PASS	
001V4	MG-DS1		138	PASS	
001V4	MG-DS1		139	PASS	
001V4	MG-DS1		140	PASS	
001V4	MG-DS1		141	PASS	
001V4	MG-DS1		142	PASS	
001V4	MG-DS1		143	PASS	
001V4	MG-DS1		144	PASS	
001V4	MG-DS1		145	PASS	
001V4	MG-DS1		146	PASS	
001V4	MG-DS1		1227	ABORT	1412
001V401	TIE-DS1	0001/001	7	ABORT	1412

Subsystems Maintained by Communication Manager

Communication Manager subsystems are listable using `list config` and, in most cases, have some maintenance activities involved.

Note:

`list config all` on the Communication Manager SAT gives you information that includes whether or not stations have been administered on a port. `show mg list_config` on the G700 MGP gives you information for the installed equipment in that G700.

[G700](#)

G700 Subsystems Maintained by Communication Manager

The G700 subsystems that are applicable to Communication Manager maintenance considerations are identifiable by the presence of 'angels'. Angels may be either physical or virtual, and both types use the CCMS message. [Table 84: G700 Subsystems Maintained by Communication Manager](#) on page 317 lists the applicable subsystems and how they are maintained.

Table 84: G700 Subsystems Maintained by Communication Manager

Subsystem	Angel Maintenance Type
Any Media Module	Physical Angel
Messaging Daughter Board (part of the S8300)	Virtual Angel
Announcement Circuitry (part of the MGP)	Virtual Angel

G700 Media Gateway MOs

The following list shows G700 specific maintenance objects. Other maintenance objects have been modified slightly for the G700.

- [MED-GTWY \(MEDIA GATEWAY\)](#)
- [MG-ANA \(ANALOG MM711\)](#)
- [MG-ANN \(Voice Announcements\)](#)
- [MG-BRI \(BRI Trunk Media Module MM720\)](#)
- [MG-DCP \(Digital Line Media Module\)](#)
- [MG-DS1 \(DS1 Interface Media Module\)](#)
- [MG-ICC \(Internal Call Controller\)](#)
- [MG-VOIP \(MM760 MED PRO DSP PORT\)](#)

MO Groupings by MM Type

[Table 85: Media Module Tests](#) on page 318 shows MO groupings by Avaya Media Module type.

Table 85: Media Module Tests 1 of 2

Media Module	Maintenance Object
T1/E1 Media Module (MM710)	Board (MG-DS1)
	DS1 CO Trunk (CO-DS1)
	DS1 DID Trunk (DID-DS1)
	DS1 Tie Trunk (TIE-DS1)
	DS1 ISDN Trunk (ISDN-TRK)
	ISDN-PRI Signaling Link Port (ISDN-LNK)
	ISDN-PRI Signaling Group (ISDN-SGRP)
	Wideband Access Endpoint Port (WAE-PORT)
Analog Media Module (MM711)	Board (MG-ANA)
	Analog Line (AN-LN-PT)
	Analog Co Trunk (CO-TRK)
	Analog DID Trunk (DID-TRK)
	DIOD Trunk (DIOD-TRK)
	Alarm Port (ALARM-PT)
BRI Trunk Media Module (MM720)	Board (BRI-MM)
	ISDN Trunk Side BRI Port (TBRI-PT)
	ISDN Trunk Side Signaling (TBRI-TRK)
DCP Media Module (MM712)	Board (MG-DCP)
	Digital Line (DIG-LINE)
BRI Trunk Media Module (MM720)	Board (MG-BRI)
	ISDN Trunk Side BRI Port (TBRI-PT)

Viewing Communication Manager Alarms

The technician views Communication Manager alarms and events through commands that are available via the Web Interface or the SAT command-line interface. See [Table 86: Commands for Viewing Communication Manager Alarms](#) on page 319.

Table 86: Commands for Viewing Communication Manager Alarms

Command	Interface	Purpose	Description
View Current Alarms	Web Interface, under Alarms and Notification	View a list of outstanding alarms against Communication Manager	Displays a summary of alarms, if present, followed by a detailed table of explanation.
<code>display alarms</code>	SAT CLI	View logged Communication Manager alarms	These are alarms that have not yet been cleared, either manually or via an Expert System.

Command Syntax

Maintenance commands use a different command syntax depending upon whether they refer to port network circuit packs or media gateway Media Modules.

Communication Manager Maintenance-Object Repair Procedures

The command syntax for circuit packs is `test port location`.

Variable	Definition	Platform	Range
UU	Universal cabinet number	ATM PNC	1-64
		CSS PNC	1-44
		G600	1-64
C	Carrier designation	ATM PNC	A, B, C, D, or E
		CSS PNC	A, B, C, D, or E
		G600	A, B, C, or D
SS	Circuit pack slot	ATM PNC	01-21
		CSS PNC	01-21
		G600	01-10
pp	2-digit port number	All	01, 02,...

The command syntax for media modules is `test port GGGVSpp`.

Variable	Definition	Platform	Range
GGG	Media gateway number	G700	1-250
		G350	1-250
V	Literal: designates media gateway	All	N/A
S	Media module number	G700	1-9
		G350	1-7, 9
pp	2-digit port number	All	01, 02,...

Full test commands can be either short or long, and can be repeated several times. For example, in

```
test port location sh r 1
```

- sh = short
- r = repeat
- 1 = the number of times the test should be repeated.

Abort Code 1412

Tests that do not run on the G700 abort with Abort Code 1412. Tests that abort are listed under each MO, but are not described.

Escalation Procedure

This document is not intended to solve all levels of trouble. When the limits of these procedures have been reached but a problem is not resolved, a technician should escalate the problem to a higher level of technical support.

This escalation should conform to the procedures in the *Technical and Administration Plan*.

Frequently, a repair procedure recommends repeating a test several times after waiting short time intervals, for example, at one minute intervals up to five times. If after these repetitions, no response to the test has occurred, or if the same Abort or Failure continues to occur, escalate the problem to a higher level of technical support.

ABRI-PORT (ASAI ISDN-BRI Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full MO Name
ABRI-PORT ¹	MAJ MIN WRN	<code>test port location 1</code>	ASAI ISDN-BRI port

1. Use **set options** to set the alarm level for ABRI ports. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ABRI port in the system.

For repair procedures, see [BRI-PORT \(ISDN-BRI Port\) ABRI-PORT \(ASAI ISDN-BRI Port\)](#) on page 661.

AC-POWER

S8700 | 8710 / S8500

AC Power for AC-Powered Systems

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AC-POWER	WRN	<code>test environment UU¹</code>	AC Power

1. **UU** is the universal cabinet number indicated in the `PORT` field of the alarm log.

S8700 MC

S8700 Multi-Connect systems support three different cabinet types as PNs: multicarrier cabinets, single-carrier cabinets and the G650 rack mounted cabinets. All types may be powered by either an AC or DC power source. Environmental maintenance differs according to a cabinet's type and its power supply.

CAUTION:

Before powering down a cabinet or carrier that contains EMBEDDED AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging its software. Instructions for powering down this unit are in *EMBEDDED AUDIX System Maintenance*, 585-300-110 for the circuit pack, and in *Avaya S8300 and Avaya S8700 Media Server Library*, 555-233-825.

Power System for Single-Carrier Cabinet

Each single-carrier cabinet has one power supply that distributes DC power and AC ringing voltage to the circuit pack slots in the cabinet.

AC Power Supply (WP-91153)

In an AC-powered cabinet, a single, plug-in, multi-output AC power supply is in the power supply slot. A power cord, with a 3-prong plug on one end and an appliance connector on the other end, connects the supply to a dedicated AC power source. The inputs to the power supply can be (depending on list version):

- 120 VAC, 60 Hz, 15 to 20 Amp; three wires in the power cord (one hot, one neutral, and one ground wire)
- 220 VAC or 240 VAC, 50 Hz, 10 Amp; three wires in the power cord (one hot, one neutral, and one ground wire)

Communication Manager Maintenance-Object Repair Procedures

The AC power supply produces the following DC outputs: +5 VDC, -5 VDC, -48 VDC, +12 VDC, and a battery-charging voltage. The DC outputs distribute power on the cabinet backplane to the circuit pack slots.

The AC power supply also produces AC ringing voltage. The AC ringing voltage output value and frequency depend on the country of use. The power supply has a circuit breaker and EMI filtering.

Nominal Power Holdover

Multicarrier Cabinets

Two types of battery holdover are available:

- The small battery assembly provides short-term battery holdover. If AC power fails, 48 VDC batteries power the system for:
 - 15 seconds in a PN cabinet
 - 10 minutes in the expansion control carrier in the “A” position of a PN cabinet
- Some AC-powered multicarrier cabinets (MCCs) contain three 48-Volt batteries and a battery charger (397C) to provide backup power in case power is interrupted. The holdover times are identical to those above.

Single-Carrier Cabinets

A holdover circuit in the power supply allows a system to operate normally during AC power interruptions. When AC input power fails, reserve batteries supply power to the memory and processor circuit packs and fans for two minutes. Every port circuit pack is inactive during this time. The power supply contains a battery charger to charge the holdover batteries.

Error Log Entries and Test to Clear Values

Table 87: AC Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test environment UU sh r 1
513	Any	AC Power Query test (#78)	WRN	OFF	test environment UU sh r 1

1. Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order shown. By clearing error codes associated with the Battery and Battery Charger Query test (#5), you may clear errors from other tests in the testing sequence.

Note:

The following tests apply to J58890CE, J58890CF, and J58890CH.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery & Battery Charger Query test (#5)	X	X	ND
AC Power Query test (#78)	X	X	ND
Power Unit Query test (carrier E) (#127)	X	X	ND
Power Unit Query test (carrier D) (#127)	X	X	ND
Power Unit Query test (carrier A) (#127)	X	X	ND
Power Unit Query test (carrier B) (#127)	X	X	ND
Power Unit Query test (carrier C) (#127)	X	X	ND
Emergency Transfer Query test (#124)	X	X	ND
Cabinet Temperature Query test (#122)	X	X	ND
External Alarm Lead Query test (#120)	X	X	ND
Analog Ring Generator Initialization test (#117)	X	X	ND
Analog Ring Generator Query test (#118)	X	X	ND

1. D = Destructive; ND = Nondestructive

AC Power Query Test (#78)

This test queries either the server's watchdog (via an Ethernet or USB interface) or an MCC PN's Maintenance circuit pack for status of the cabinet's AC power.

Table 88: Test #78 Power Query Test 1 of 2

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required to run test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
100 2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to ABORT with error code 2000, check for system powering problems with the PN's A carrier. Resolve every AC-POWER and CARR-POW (S8700 IP : RMC-ENV) alarm. Repeat the test. 3. S8700 MC : If the test still ABORTs with error code 2000, check for and resolve every MAINT (Maintenance circuit pack) error in a PN. Repeat the test. 4. If the test still ABORTs with error code 2000, escalate the problem.
2029 2319 2320 2500	ABRT	Internal system error
1	FAIL	The cabinet is currently without AC power. Note: For a J58890CE, skip to Procedures for a J58890CE . Procedures for a Global MCC (J58890CH) 1. For a nominal holdover system if there is no AC power at the wall outlet, have a qualified electrician restore power to the outlet. Power should range from 170 to 264 VAC. 2. If there is AC power at the wall outlet, then there could be a problem with the RM0850 rectifiers, BU3200A BIU (battery interface unit), or battery. Resolve every alarm logged against the POWER MO, and rerun the test. If the test still fails, the BIU may be defective. Check the BIU. If the BOD alarm LED is on, replace the BIU. For S8700 MC , if the BOD LED is off and the BOK LED is on, then a PN's Maintenance circuit pack may be incorrectly reporting the problem. Resolve every alarm against these MOs, and rerun the test.
1 of 2		

Table 88: Test #78 Power Query Test 2 of 2

Error Code	Test Result	Description / Recommendation
1 (cont'd)	FAIL	<p>Procedures for a J58890CE</p> <ol style="list-style-type: none"> 1. Check for AC power at the wall outlet (99–127 or 200–250 VAC). 2. If AC power is absent, then the problem is not with the system itself. Power must be restored to the wall outlet. If present, there could be a problem with the battery or battery chargers. Resolve every alarm logged against POWER (battery & battery charger), and rerun the test. 3. If the test still fails, then fuse F5 may have opened. Replace this fuse, and rerun the test.  WARNING: Turn off the 397C Battery Charger before inserting or removing Fuse F5. 4. If the test still fails, then the server's watchdog or a PN's Maintenance circuit pack may be incorrectly reporting the problem. Resolve every alarm against these MOs, and rerun the test. Some watchdog and Maintenance circuit-pack errors <i>may not</i> be detected by their respective maintenance routines, but can cause many environment tests to fail. 5. If more than two environment tests are failing, replace the suspected circuit pack (depending on the system configuration), and rerun the test.
100	FAIL	<p>The cabinet is currently without AC power, and AC power maintenance is in the middle of timing the NPH interval.</p> <ol style="list-style-type: none"> 1. Follow the repair steps for error code 1.
	PASS	<p>The server's watchdog or the PN's Maintenance circuit pack has reported that the cabinet has AC power.</p>
2 of 2		

AC-POWER for DC-Powered Systems

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AC-POWER	WRN	<code>test environment location</code>	AC Power

Note:

In a DC-powered multicarrier cabinet, the AC-POWER MO exists but serves no functional purpose. Because the system cannot determine the type of power used, the AC-POWER test should always pass or abort. See [CARR-POW \(Carrier Power Supply\)](#) on page 744 for the maintenance strategy for power components in DC cabinets.

S8700 MC supports three cabinet types for PNs: multicarrier cabinets (MCCs), single-carrier cabinets (SCCs), and 19-inch rack mounted cabinets. Every type may be powered by either an AC or DC power source. Environmental maintenance differs according to a cabinet's type and its power supply.

S8700 IP supports 19-inch rack mounted cabinets, powered by either an AC or DC power source.

Error Log Entries and Test to Clear Values

Table 89: AC Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	<code>test environment UU sh r 1</code>
513	Any	AC Power Query test (#78)	WRN	OFF	<code>test environment UU sh r 1</code>

1. Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented below. Clearing error codes associated with the one test may also clear errors generated from other tests in the sequence.

Table 90: System Technician-demanded tests: AC-Power

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery & Battery Charger Query test (#5)	X	X	ND
AC Power Query test (#78)	X	X	ND
Power Unit Query test (carrier E) (#127)	X	X	ND
Power Unit Query test (carrier D) (#127)	X	X	ND
Power Unit Query test (carrier A) (#127)	X	X	ND
Power Unit Query test (carrier B) (#127)	X	X	ND
Power Unit Query test (carrier C) (#127)	X	X	ND
Emergency Transfer Query test (#124)	X	X	ND
Cabinet Temperature Query test (#122)	X	X	ND
External Alarm Lead Query test (#120)	X	X	ND
Analog Ring Generator Initialization test (#117)	X	X	ND
Analog Ring Generator Query test (#118)	X	X	ND

1. D = Destructive; ND = Nondestructive

AC Power Query Test (#78)

AC Power Query Test (#78) is not valid for DC-powered cabinets and should always abort or pass. **S8700 IP** will always abort.

Table 91: Test #78 Power Query Test

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required to run test are not available.
100 2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2029 2319 2320 2500	ABRT	Internal system error. S8700 MC: 1. Retry the command at 1-minute intervals up to 5 times.
S8700 MC Any	FAIL	A PN's Maintenance circuit pack is incorrectly reporting an AC power problem. If this test fails, there is a problem with a Maintenance circuit pack. Replace the suspected circuit pack, and run the test again.
S8700 MC	PASS	Since this test is invalid for DC-powered cabinets, this result simply indicates that a PN's Maintenance circuit pack is handling this test properly.

ADM-CONN (Administered Connection)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ADM-CONN	MAJ MIN WRN	<code>status administered-connection n</code> ¹	Administered Connection

1. *n* is an administered connection number indicated in the PORT field of the Alarm or Error Log.

An administered connection provides an end-to-end connection between two access endpoints or data modules residing in either the same switch or different switches. When administered, the connection is automatically established and scheduled to be permanently active.

An error is logged whenever an administered connection fails or cannot be established. Failures to establish a connection generate an error whether they occur on an initial try, a retry, a fast retry, a re-dial or an auto-restoration. A failed connection generates an error whether or not the connection is subsequently reestablished by fast retry, re-dial, or auto restoration.

An alarm is logged when an administered connection cannot be established either initially or after a connection failure. Both the alarm level (none to major) and a failure threshold can be administered for each administered connection. An alarm is raised when either of the following occurs:

- The number of consecutive failed attempts to establish a connection reaches the administered threshold.
- Software determines that failure to establish a connection is due to a mistake in administration. See [Table 92: Administered Connection Error Log Entries](#) on page 331.

Error Log Entries and Test to Clear Values

Table 92: Administered Connection Error Log Entries 1 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0, 29	Any	None	Any	OFF	None

88 (a)	Any	None	Any	OFF	None
91, 95, 96, 97, 98, 99, 100, 111	Any	None	Any	OFF	None
					2 of 2

For ADM-CONN Errors

None of the Administered Connection Error Types have a specific associated test and, except for errors 17 and 127, are valid only for administered connections established over ISDN-PRI facilities. Error 127 is valid for administered connections established over non-ISDN facilities or between two endpoints on the same switch.

Notes:

- a. **Error Types 1, 16, 22, 50, 52, 65, 66, 69, 88** are typically associated with administration problems and are not expected to be temporary. The administered connection is not retried and the failure is alarmed immediately. The alarm threshold specified by the customer is ignored.

- b. **Error Types 1, 28:** the address of the destination endpoint is: an unassigned number (**1**), has an invalid number format (**28**), or is restricted from terminating calls due to Class of Restriction (“Access Denied”). Verify that the destination address is correct and that the destination endpoint is administered. The destination endpoint is not administered on the switch where this error is logged.
- c. **Error Type 2:** a request has been made to use a transit network or common carrier that cannot be accessed. Check the routing pattern used by this administered connection and verify that the inter-exchange carrier specified is correct.
- d. **Error Types 6, 21, 31, 127:** the exact failure cause is unknown or has been mapped to one of these values. If this is a permanent condition, try reversing the direction of the Administered Connection (originate the administered connection from the destination switch). This may yield another failure cause.
- e. **Error Type 17:** the destination endpoint is not available. Check the status of the destination endpoint at the far-end switch. The status for the destination endpoint will not be available on the switch where this error is logged. At the far end, use `status access-endpoint` or `status data-module` to see whether the endpoint is busy, out-of-service or otherwise unavailable.
- f. **Error Types 18, 102:** this switch sent an ISDN message to another switch that either did not respond (**18**) or did not respond within the allotted time (**102**). This could be due to link failure, or congestion, or an outage at the other switch.
- g. **Error Type 22:** the address of the destination endpoint has changed. Change the administered connection accordingly. The destination endpoint will not be administered on the switch where this error is logged.
- h. **Error Types 34, 42, 44, 58:** a resource (for example, a circuit or bearer capability) required by the administered connection is not currently available.
- i. **Error Types 38, 41:** a network failure (**38**) or temporary failure (**41**) has occurred. Error Log entries for other MOs (for example, DS1-BD) may indicate a local problem.

ADX8D-BD (AUDIX Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ADX8D-BD	MIN WRN	<code>test board location sh</code>	AUDIX circuit pack

The ADX8D-BD MO defines a TN566/TN2169 EMBEDDED AUDIX circuit pack (also called DEFINITY AUDIX) operating in DP (digital-port) mode.

For port-level problems, see [ADX8D-PT \(AUDIX Digital Port\)](#) on page 335.

For circuit-pack-level problems, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

EMBEDDED AUDIX consists of two circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance which tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *EMBEDDED AUDIX System Maintenance, 585-300-110*.

ADX8D-PT (AUDIX Digital Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ADX8D-PT	MIN	<code>test port location 1</code>	AUDIX digital port
ADX8D-PT	WRN	<code>test port location sh</code>	AUDIX digital port

The ADX8D-PT MO represents a port on a TN566/TN2169 EMBEDDED AUDIX circuit pack (also called DEFINITY AUDIX) operating in DP (digital-port) mode. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

The tests described in this section apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *EMBEDDED AUDIX System Maintenance, 585-300-110*.

AUDIX resides on a combined pair of circuit packs: the TN566 MFB (multifunction board) and the TN2169 ALB (alarm board). Because of its size, this combination occupies 5 slots, but only 1 slot is functional as far as the switch is concerned. The other 4 slots are seen by the switch as "AUDIX-reserved" slots (or ADXDP-RS/ADX8D-RS).

In DP mode the TN566 pack supports up to 8 voice ports, each with a primary and a secondary information channel. Ports are administered in increments of two. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, EMBEDDED AUDIX is not an adjunct.

 **CAUTION:**

Never do any of the following without first shutting down AUDIX. Follow instructions on the TN566/TN2169 faceplate:

- Remove EMBEDDED AUDIX circuit packs
- Cycle power to a carrier containing EMBEDDED AUDIX circuit packs
- Remove power to a carrier containing EMBEDDED AUDIX circuit packs

Error Log Entries and Test to Clear Values

Table 93: EMBEDDED AUDIX Digital Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location sh r 1</code>
1 (b)	40987	None	WRN	OFF	
1 (c)	1 to 20	None	WRN	OFF	
15 (d)	Any	None			
18 (e)	0	<code>busyout port location</code>	WRN	OFF	<code>release port location</code>
23 (f)	0	None	WRN	OFF	
130 (g)		None	WRN	ON	<code>test port location sh</code>
257 (h)	40971	None

3840 (l)	40965	None			
3840 (m)	41029	None			

1. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in **set options**.

Notes:

- a. **Error Type 0:** run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test’s description, and follow its recommended procedures.

- b. **Error Type 1, Aux Data 40987:** the user may experience a noisy port or link, due to an off-board problem that is detected by the port circuit. If so, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined time.
- c. **Error Type 1, Aux Data 1 to 20:** At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented. Also see Note (a).
- d. **Error Type 15:** internal type error that occurs when an audit request fails.
- e. **Error Type 18:** the port is busied-out by command. Use `release port location` to release the port.
- f. **Error Type 23:** the circuit pack is administered but not physically installed. The alarm will clear when a circuit pack is inserted.
- g. **Error Type 130:** the circuit pack was removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the AUDIX circuit pack (see Caution at the beginning of this section).
- h. **Error Type 257:** Something is interfering with transmission to the voice port. This is usually an on-board problem and can be ignored if there are no user complaints.
- i. **Error Type 513:** AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. See *EMBEDDED AUDIX System Maintenance, 585-300-110*, if necessary.
- j. **Error Type 1537:** An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if there are no user complaints. If the problem persists, replace the circuit pack (see Caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a certain period of time.
- k. **Error Type 2305:** the link between the circuit pack and the voice port successfully reset. No craft action is necessary.
- l. **Error Type 3840, Aux Data 40965:** no voice ports are connected to the EMBEDDED AUDIX circuit pack. No maintenance action is required.
- m. **Error Type 3840, Aux Data 41029:** the message buffer in the circuit pack is full.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented when you are inspecting errors in the system.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Voice and Control Channel Local Looparound test (#13)		X	ND
NPE Crosstalk test (#9)		X	ND

1. D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for EMBEDDED AUDIX emulates the one for DIG-LINE. NO-OP Tests apply only to DIG-LINE and not to EMBEDDED AUDIX. NO-OP tests always return PASS.

- Electronic Power Feed test (#11)
- Station Lamp Updates test (#16)
- Station (Digital) Audits test (#17)

NPE Crosstalk Test (#9)

NPE Crosstalk Test (#9) verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. An NPE that is not working correctly may cause 1-way and noisy connections. This test is part of a port's long test sequence, and it executes in about 20 to 30 seconds.

Crosstalk testing is performed on both the primary (for voice) and the secondary (for data) information channel associated with each EMBEDDED AUDIX port. If NPE Crosstalk Test (#9) fails on either channel, the voice port is taken out of service.

Table 94: Test #9 NPE Crosstalk Test 1 of 2

Error Code	Test Result	Description / Recommendation
1	ABRT	<p>During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test.</p> <ol style="list-style-type: none"> 1. Check the port status. 2. Use display port location to determine the voice port extension of the port. Use status station to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle. 3. Retry the command at 1-minute intervals up to 5 times.
2	ABRT	<p>System resources may not have been available, or the port may have been busy during the test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	<p>System resources required to run this test are not available. The port may be active.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the voice port extension of the port. Use status station to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle before retesting. 2. Retry the command at 1-minute intervals up to 5 times.
1001	ABRT	<p>System resources required to run this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out-of-service due to TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1 of 2		

Table 94: Test #9 NPE Crosstalk Test 2 of 2

Error Code	Test Result	Description / Recommendation
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service.</p> <ol style="list-style-type: none"> 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. Retry the command at 1-minute intervals up to 5 times.
1004	ABRT	<p>The port was put in use during the test. The test has been aborted.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the voice port extension of the port. Use status station to determine the service state of the port. If the port is active, wait until it is idle before testing.
1020	ABRT	<p>Test disabled by background testing.</p> <ol style="list-style-type: none"> 1. Use status station to determine when the voice port is available for testing.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1 2	FAIL	<p>The NPE of the tested port is transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	<p>The port is using its allocated time slots correctly.</p> <ol style="list-style-type: none"> 1. To be sure that this is not an intermittent problem, repeat this test up to 10 times to make sure it continues to pass. 2. If complaints still exist, examine the connections.
		2 of 2

Voice and Control Channel Local Loop Test (#13)

Voice and Control Channel Local Loop Test (#13) checks the information and control channels between a server and the EMBEDDED AUDIX port circuit. First, the primary information (voice) channel loop back test is run.

While the primary information channel is still looped around, the Control Channel Looparound test is performed. The Looparound test for the secondary information (data) channel is then performed. This is the same test as the primary information channel's loop-around test.

Next, a Conference test is implemented for the primary information channel. This is the same test as Conference test (#6).

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any tests fail or abort, the sequence stops.

Table 95: Test #13 Voice and Control Channel Local Loop Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error. 1. Retry the command at 1-minute intervals up to 5 times. Then try (b).
1000	ABRT	System resources required to run this test are not available. The port may be active. 1. Use display port location to determine the voice port extension of the port. Use status station to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle before retesting. 2. Retry the command at 1-minute intervals up to 5 times.
1001	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or may have time slots that are out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABRT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals up to 5 times.

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ADXCL-BD ADX16A-BD	MIN WRN	<code>test board location sh</code>	AUDIX circuit pack

The ADX16A-BD MO represents a TN566/TN2169 EMBEDDED AUDIX circuit pack combination operating in control-link (CL) mode. For circuit-pack-level problems, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494. Port-level maintenance is covered by ADX16A-PT.

EMBEDDED AUDIX consists of two circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *EMBEDDED AUDIX System Maintenance, 585-300-110*.

ADX16D-P (16-Port AUDIX Digital Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ADX16D-P	MIN WRN	<code>test port location 1</code>	AUDIX Digital port

 **CAUTION:**

Never do any of the following without first shutting down AUDIX. Follow the instructions on the TN566/TN2169 faceplate:

- Remove EMBEDDED AUDIX circuit packs
- Cycle power to a carrier containing EMBEDDED AUDIX circuit packs
- Remove power to a carrier or cabinet containing EMBEDDED AUDIX circuit pack

The ADX16D-P MO represents a port on a TN566/TN2169 EMBEDDED AUDIX circuit pack operating in digital-port (DP) mode. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

The tests described in this section apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction board (MFB) and the TN2169 Alarm board (ALB). Because of its size this combination occupies 5 slots, but the system sees only 1 slot as functional. The other 4 slots are seen by the switch as "AUDIX-reserved" slots (or ADX16-RES/ADX16D-RS).

In 16-port DP mode, the TN566 pack supports up to 16 voice ports, each with a primary and a secondary information channel. Ports are administered in increments of two. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, EMBEDDED AUDIX is not an adjunct.

Error Log Entries and Test to Clear Values

Table 96: EMBEDDED AUDIX Digital Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location sh r 1</code>
1 (b)	40987	None	WRN	OFF

3840 (l)	40965	None			
3840 (m)	41029	None			

1. Minor alarms may be downgraded to Warning alarms based on the values used in **set options**.

Notes:

- a. **Error Type 0:** run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow the recommended procedures

- b. **Error Type 1 with Aux Data 40987:** The user may experience a noisy port or link, due to an off-board problem that is detected by the port circuit. If so, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined time.
- c. **Error Type 1:** At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented. Also see Note a above.
- d. **Error Type 15:** An internal type error that occurs when an audit request fails.
- e. **Error Type 18:** The port is busied-out by command. Release the port with `release port location`.
- f. **Error Type 23:** The circuit pack is administered but not physically installed. The alarm will clear when a circuit pack is inserted.
- g. **Error Type 130:** The circuit pack has been removed or has been insane for more than 21-minutes. To clear the error, reseal or replace the AUDIX circuit pack (see caution at the beginning of this section).
- h. **Error Type 257:** Something is interfering with transmission to the voice port. This is usually an on-board problem and can be ignored if there are no user complaints.
- i. **Error Type 513:** AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. Refer to *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.
- j. **Error Type 1537:** An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if there are no user complaints. If the problem persists, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a certain period of time.
- k. **Error Type 2305:** The link between the circuit pack and the voice port is successfully reset. No craft action is necessary.
- l. **Error Type 3840 with Aux Data 40965:** No voice ports are connected to the EMBEDDED AUDIX circuit pack. No maintenance action is required.
- m. **Error Type 3840 with Aux Data 41029:** The message buffer in the circuit pack is full.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Voice and Control Channel Local Looparound test (#13)		X	ND
NPE Crosstalk test (#9)		X	ND

1. D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for EMBEDDED AUDIX emulates the one for DIG-LINE. The tests listed below apply only to DIG-LINE and not to EMBEDDED AUDIX. These tests always return PASS.

- Electronic Power Feed test (#11)
- Station Lamp Updates test (#16)
- Station (Digital) Audits test (#17)
- Digital Terminal Remote Looparound test (#1201)

NPE Crosstalk Test (#9)

NPE Crosstalk Test (#9) verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. NPE Crosstalk Test (#9) is part of a port's long test sequence, and it executes in about 20 to 30 seconds.

Crosstalk testing is performed on both the primary (for voice) and the secondary (for data) information channel associated with each EMBEDDED AUDIX port. If this test fails on either channel, the voice port is taken out-of-service.

Table 97: Test #9 NPE Crosstalk Test 1 of 2

Error Code	Test Result	Description / Recommendation
1	ABRT	<p>During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test.</p> <ol style="list-style-type: none"> 1. Check the port status. 2. Use display port location to determine the voice port extension of the port. Use status station to determine the service state of the port. If the port is active, it is unavailable for this test. Wait until the port is idle. 3. Retry the command at 1-minute intervals up to 5 times.
2	ABRT	<p>System resources may not have been available, or the port may have been busy during the test.</p> <ol style="list-style-type: none"> 1. Verify that the port's status is idle. 2. Retry the command at 1-minute intervals up to 5 times.

If the port is active, it is unavailable for certain tests. Refer to “Status” commands in Maintenance SAT Commands in Maintenance Commands Reference (03-300191) for explanations of every possible state. Wait until the port is idle before testing.
1020	ABRT	<p>Test disabled via background testing.</p> <ol style="list-style-type: none"> 1. Use <code>status station</code> to determine when the voice port is available for testing.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1, 2	FAIL	<p>The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack (see caution at the beginning of this section).
	PASS	<p>The port is using its allocated time slots correctly.</p> <ol style="list-style-type: none"> 1. To verify that this is not an intermittent problem, repeat this test up to 10 times, and make sure it continues passing. 2. If complaints still exist, examine the connections.
2 of 2		

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between the server the EMBEDDED AUDIX port circuit. The server sends a message to loop around both the information and control channels for the port. First, the primary information (voice) channel loop back test is run.

While the primary information channel is still looped around, the Control Channel Looparound test is performed. The loop-around test for the secondary information (data) channel is then performed. This test is the same as the primary information channel's loop-around test.

Next, a Conference test is implemented for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any test fails or aborts, the sequence is stopped.

Table 98: Test #13 Voice and Control Channel Local Loop Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be active. 1. Use <code>display port location</code> to determine the voice port extension of the port. Use <code>status station</code> to determine the service state of the port. Wait until the port is idle before testing. 2. Retry the command at 1-minute intervals up to 5 times.
1001	ABRT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots that are out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABRT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 98: Test #13 Voice and Control Channel Local Loop Test 2 of 2

Error Code	Test Result	Description / Recommendation
1004	ABRT	<p>The port was put in use during the test. The test has been aborted.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the voice port extension of the port. Use status station to determine the service state of the port. If the port is active, wait until it is idle before retesting.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources for this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
7	FAIL	<p>Conference test failed on the primary channel. In some cases, users may not notice a disruption in service. In extreme cases, the conferencing feature may not work at all.</p>
14	FAIL	<p>The primary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.</p>
15	FAIL	<p>The control channel between the processor and AUDIX is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port. This failure could also be disruptive to other users.</p>
16	FAIL	<p>The secondary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.</p>
None	FAIL	<p>The test failed for reasons external to the AUDIX.</p> <ol style="list-style-type: none"> 1. Run circuit tests to check the Tone Generator circuit and the Tone Detector circuit using test board locations. 2. Resolve any problems detected on the Tone Generator circuit or Tone Detector circuit. 3. If both circuit packs are functioning properly and the test still fails, replace the AUDIX (see caution at the beginning of this section).
	PASS	<p>Voice and Control Channel Local Loop test passed. Every channel are transmitting properly.</p> <ol style="list-style-type: none"> 1. To be sure that this is not an intermittent problem, repeat this test up to 10 times, and see whether it continues to pass. 2. If complaints still exist, examine the connections.
2 of 2		

ADX16A-PT (AUDIX Analog Line/Control Link)

S8700 | 8710 S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ADXCL-PT or ADX16A-PT	MIN	<code>test port location 1</code>	AUDIX Analog Line/ Control Link
ADXCL-PT or ADX16A-PT	WRN	<code>test port location sh</code>	AUDIX Analog Line/ Control Link

 **CAUTION:**

Never do any of the following without first shutting down AUDIX. Follow the instructions on the TN566/TN2169 faceplate:

- Remove EMBEDDED AUDIX circuit packs
- Cycle power to a carrier containing EMBEDDED AUDIX circuit packs
- Remove power to a carrier containing EMBEDDED AUDIX circuit packs

The ADX16A-PT MO represents a port on a TN566/TN2169 EMBEDDED AUDIX circuit pack that is operating in control-link (CL) mode. For circuit-pack-level problems (ADX16A-BD or ANL-16-BD), see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494. For port-level problems with AUDIX operating in digital-port mode, see:

- [ADX8D-PT \(AUDIX Digital Port\)](#) on page 335
- [ADX16D-P \(16-Port AUDIX Digital Port\)](#) on page 345

The tests described in this section apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction board (MFB) and the TN2169 Alarm board (ALB). Because of its size this combination occupies 5 slots, but only 1 slot is functional as far as the switch is concerned. The other 4 slots are seen by the switch as "AUDIX-reserved" slots.

In CL mode the TN566 pack supports up to 16 voice ports. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, EMBEDDED AUDIX is not an adjunct.

Error Log Entries and Test to Clear Values

Table 99: EMBEDDED AUDIX Analog Line/Control Link Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	<code>test port location sh r 1</code>
1 (a)	40977	None			
18	0	<code>busyout station ext</code>	WRN	ON	<code>release station extension</code>
23 (b)	0	None	WRN	OFF	
130 (c)		None	WRN	ON	<code>test port location sh</code>
257 (d)	40973	None			
513 (e)	Any	None			
1025 (f)		Looparound test (#161)	MIN WRN ²	ON	<code>test port location 1 r 2</code>
1281		Conference test (#7)	MIN WRN ²	ON	<code>test port location 1 r 2</code>
1537		NPE Crosstalk test (#6)	MIN WRN ²	ON	<code>test port location 1 r 2</code>

1. Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

2. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in **set options**.

Notes:

- a. **Error Type 1** is an in-line error that can only be resolved over time. No terminal equipment was present when ringing was attempted. Execute `test port location s`.
- b. **Error Type 23**: The circuit pack was logically administered but not physically installed. The alarm will clear when the circuit pack is installed.
- c. **Error Type 130**: The circuit pack was removed or has been insane for more than 11 minutes. To clear the error, reseal or replace the circuit pack.

- d. **Error Type 257** is an in-line error and can only be resolved over time. Ringing voltage is absent. If only one analog circuit pack in the system has this problem, replace the circuit pack. If only analog circuit packs on a particular carrier have this error, the ringing generator may not be connected to this carrier. If analog circuit packs on many carriers have this error, check the ringing generator.
- e. **Error Type 513**: AUDIX is not available to the switch. Check the **AUDIX** system, referring to *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.
- f. **Error Type 1025**: The **TDM** bus is out of service. See [TDM-BUS \(TDM Bus\)](#) on page 2193.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the *Looparound* test (#161), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Looparound test (#161)		X	ND
Conference test (#7)		X	ND
NPE Crosstalk test (#6)		X	ND

1. D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for EMBEDDED AUDIX emulates the one for ANL-16-L. The tests listed below apply only to ANL-16-L and not to EMBEDDED AUDIX. These tests always return PASS.

- Battery Feed test (#35)
- Audits and Updates test (#36)
- Station Present test (#48)

Tests 36 and 48 ABORT when AUDIX is not running.

NPE Crosstalk Test (#6)

This test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of the long test sequence and executes in about 25 seconds.

Table 100: Test #6 NPE Crosstalk Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use <code>display port location</code> to determine the station extension. Use <code>status station</code> to determine the service state of the port. If the port is active, it is unavailable for certain tests. Wait until the port is idle before testing. 2. Retry the command at 1-minute intervals up to 5 times.
1001	ABRT	Could not allocate the necessary system resources to run this test.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, then retry the command at 1-minute intervals up to 5 times.
1003	ABRT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 100: Test #6 NPE Crosstalk Test 2 of 2

Error Code	Test Result	Description / Recommendation

Use status station to determine the service state of the port. If the port is active, it is unavailable for certain tests. Wait until the port is idle before testing. 2. Retry the command at 1-minute intervals up to 5 times.
1005	ABRT	<p>This condition indicates that the test is not applicable when the analog port is used in a combined modem pool. This error can be ignored.</p>
1018	ABRT	<p>Test disabled via administration.</p> <ol style="list-style-type: none"> 1. To enable the test for the particular analog station being tested, enter change station extension. 2. Enter y in the Test field.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2012	ABRT	<p>System could not respond to this request.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	<p>The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	<p>The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.</p>
2 of 2		

Conference Circuit Test (#7)

This test verifies that the NPE channel for the port being tested can correctly perform the conferencing function.

Table 101: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run test are not available. The port may be busy with a valid call. 1. Use display port location to determine the station extension. Use status station to determine the service state of the port. If the port is active, wait until it is idle before retesting. 2. Retry the command at 1-minute intervals up to 5 times.
1004	ABRT	The port was seized by a valid call during the test. The test has been aborted. 1. Use display port location to determine the station extension. Use status station to determine the service state of the port. If the port is active, wait until it is idle before testing. 2. Retry the command at 1-minute intervals up to 5 times.
1018	ABRT	Test disabled by administration. This only applies to analog stations. 1. To enable the test for the analog station being tested, enter change station extension and enter y in the Test field.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources for this test. 1. Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This causes noisy and unreliable connections. 1. Replace the circuit pack.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.

Loop-Around Test (#161)

This test is designed to check the on-board transmission capabilities of the NPE on the analog port.

Table 102: Test #161 Loop-Around Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	<p>Could not allocate the necessary system resources for this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	<p>System resources required to run this test are not available. The port may be busy with a valid call.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the station extension. Use status station to determine the service state of the port. If the port is active, wait until it is idle before testing. 2. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1002	ABRT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABRT	<p>The port was seized by a valid call during the test. The test has been aborted.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the station extension. Use status station to determine the service state of the port. If the port is active, wait until it is idle before testing. 2. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 102: Test #161 Loop-Around Test 2 of 2

Error Code	Test Result	Description / Recommendation
1018	ABRT	Test disabled by administration. 1. To enable the test for the particular analog station, enter change station extension . 2. Enter y in the Test field.
2000	ABRT	Response to the test was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	The reflective loop-around test failed. This causes noisy or unreliable connections or other users calling this port may hear an echo. 1. Replace the circuit pack.
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
		2 of 2

ALARM-PT (Alarm Port)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ALARM-PT	MIN	<code>test port location 1</code>	Alarm-Port
ALARM-PT	WRN	<code>test port location sh</code>	Alarm-Port

The Alarm Port MO provides on-board maintenance for an analog line port that is administered as an external device alarm port. Tests are provided to verify the analog line ports ability to detect an external device alarm. The related MO, [EXT-DEV ADMIN? Y \(External Device Alarm\)](#) on page 1213, is used for the off-board external device alarm.

Error Log Entries and Test to Clear Values

Table 103: ALARM-PT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location sh r 1</code>
15 (b)	Any	Audits and Updates (#36)			
18	0	<code>busyout station extension</code>	WRN	OFF	<code>release station extension</code>
130 (c)		None	WRN	ON	<code>test port location sh</code>

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 15** is a software audit error that does not indicate any hardware malfunction. Run the short test sequence, and investigate errors.
- c. **Error Type 130** indicates that the circuit pack or Media Module was removed or has been insane for more than 11 minutes. To clear the error, reseal or replace the circuit pack or Media Module

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented in the table below. For example, by clearing error codes associated with the Battery Feed test (#35), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery Feed test (#35)	X	X	ND
Station Status and Translation Audits and Updates test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and trying to detect a current.

Table 104: Test #35 Battery Feed Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	ABRT	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be reporting an external device alarm. 1. Before retesting, enter test external-device-alarm port location to determine whether the port is reporting an EXT-DEV failure. 2. If the port has no EXT-DEV failures, retry the command at 1-minute intervals up to 5 times.
1 of 3		

Table 104: Test #35 Battery Feed Test 2 of 3

Error Code	Test Result	Description / Recommendation
1000	ABRT	<p>System resources required to run this test are not available. The port may be busy with a valid call. Use display port location to determine the station extension, attendant number, or trunk group/member number of the port. Use status station, status attendant, or status trunk to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out.</p> <ol style="list-style-type: none"> 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABRT	<p>The port received an EXT-DEV failure during the test. The test has been aborted.</p> <ol style="list-style-type: none"> 1. Before retesting, enter test external-device-alarm port location to determine whether the port is reporting an EXT-DEV failure. 2. If the port has no EXT-DEV failures, retry the command at 1-minute intervals up to 5 times.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	<p>The port's battery feed chip is unable to supply sufficient power to sense the external device alarm. This may occur when the test is performed at the same time that the external device contact closure occurs.</p> <ol style="list-style-type: none"> 1. Before retesting, enter test external-device-alarm port location to determine whether the port is reporting an EXT-DEV failure. Wait until the port has no EXT-DEV failures before retesting. 2. Retry the command at 1-minute intervals up to 5 times.
	PASS	<p>The port's battery feed chip is able to provide power to the external device alarm to detect contact closure.</p>
2 of 3

Error Code	Test Result	Description / Recommendation
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. enter <code>list config</code>, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, enter <code>busyout board location</code> 3. Enter <code>reset board location</code> 4. Enter <code>release board location</code> 5. Enter <code>test board location long</code> <p>This should re-establish the linkage between the internal ID and the port. If this is not the case, check to ensure that there is a valid board inserted.</p>
		3 of 3

Station Status and Translation Audits and Updates Test (#36)

Port Updates Test (#36)

For an analog line port that is administered as an external alarm, this test is limited to updating the software with the switchhook state.

This test sends port level translation data from switch processor to the circuit pack to assure that the translation is correct. The port audit operation verifies the consistency of the current state of the port in the switch software.

Table 105: Test #36 Station Status and Translation Audits and Updates 1 of 3

Error Code	Test Result	Description / Recommendation

If the board was found to be correctly inserted in step 1, enter <code>busyout board location</code> 3. Enter <code>reset board location</code> 4. Enter <code>release board location</code> 5. Enter <code>test board location long</code>. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.
3 of 3		

ANL-16-L (16-Port Analog Line)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ANL-16-L	MIN	<code>test port location 1</code>	16-Port Analog Line
ANL-16-L	WRN	<code>test port location sh</code>	16-Port Analog Line

The circuit packs listed below provide 16 analog line ports for single-line voice terminals. The table below indicates which circuit packs are equipped with lightning protection (for off-premises, out-of -building stations), and which ones support the neon message waiting lamp feature.

16-Port Analog Line Circuit Packs

Circuit Pack	Off- Premises	Neon
TN468B	y	
TN479		
TN746		y
TN746B	y	y
TN2135	y	
TN2144	y	
TN2149	y	
TN2180	y	

S8700 | 8710 / S8500

These circuit packs provide 16 ports for analog voice terminals. The TN746, TN468, and TN749 support only single-line, on-premises/in-building, analog voice terminals, and not off-premises stations, since these circuit packs are not equipped with lightning protection. The TN746B, TN2144, TN2149, and TN468B support both on-premises and off-premises (that is, out-of-building) analog voice terminals. The TN468, TN468B, TN479, TN2135, TN2144, and TN2149 do NOT support the neon message waiting feature.

No maintenance of the terminal connected to the 16-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power and the common ringing application circuitry are reported as part of common port circuit pack errors; see errors 1281 and 1793 in [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

Ringling Caused by Maintenance Testing

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled in the `Tests` field of the `change station extension` screen. Be aware that this action will also disable Tests #6, 7, 161, and 35.

Error Log Entries and Test to Clear Values

Table 106: 16-Port Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location sh r 1</code>
1(b)	40960 40975 40977	none

1537		NPE Crosstalk (#6)	MIN WRN ¹	ON	<code>test port location l r 2</code>

1. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in `set options`.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 1:** These are in-line errors and can only be resolved over time.
- c. **Aux Data 40960** indicates that too many simultaneous incoming ringing attempts were made on this board. Only 4 ports on a board may ring simultaneously. A 5th incoming call causes an inline error from the board.
- d. **Aux Data 40975** indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal rings. If the terminal does not ring, then replace it. Otherwise, enter **test port location**, and follow the procedure for Test #48.
- e. **Aux Data 40977** indicates that no terminal equipment was connected when ringing was attempted. Run the short test via **test port location**, and follow the procedure for the results of Test #48.
- f. **Error Type 15** is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors.
- g. **Error Type 130:** the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reseal or replace the circuit pack.
- h. **Error Type 257:** This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only 1 analog circuit pack in the system has this problem, then replace the circuit pack. If only analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If analog circuit packs on many carriers have this error, then it is probably a problem with the ringing generator.
- i. **Error Type 513:** Associated Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this disturbs the customer or the terminal equipment, disable it by setting the **Tests** field on the **change station extension** screen to **n**. On some software releases, this will also disable Tests #6, 7, 161, and 35.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the *Battery Feed* test (#35), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery Feed test (#35)	X	X	ND
Station Present test (#48)	X	X	ND
Looparound test (#161)		X	ND
Conference test (#7)		X	ND
NPE Crosstalk test (#6)		X	ND
Station Status and Translation Audits and Updates test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conference functions on a per-port basis.

This test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually part of the long test sequence and executes in about 20 to 30 seconds.

Table 107: Test #6 NPE Crosstalk Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.

		3 of 3

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery and detecting the resulting current.

Note:

For the TN746B, Test #35 does not actually run and instead always returns PASS. Test #35 operates in the normal manner for TN746.

Table 109: Test #35 Battery Feed Test 1 of 3

3 of 3		

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations with information in the software.

Table 110: Test #36 Station Status and Translation Audits and Updates 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1004	ABRT	The port was seized by a valid call during the test. The test has been aborted. 1. Use <code>display port location</code> to determine the station extension. Use <code>status station</code> to determine the service state of the port. If the port is active, wait until it is idle. 2. Retry the command at 1-minute intervals up to 5 times. 3. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABRT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1006	ABRT	This port has been busied out by command, or taken out-of-service by the failure of the NPE Crosstalk test. 1. Look in the error log for error type 18 (port busied out) for this port. If this error is present, release the port with <code>release station extension</code> , and run the test again. 2. Check the error log for error type 1025 (NPE crosstalk test failed) for this port. If this error is present, investigate the errors associated with the NPE Crosstalk test (#6). 3. Make sure that the terminal is connected and in service, and then retest.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 110: Test #36 Station Status and Translation Audits and Updates 2 of 2

Error Code	Test Result	Description / Recommendation
1	FAIL	This does not indicate a hardware problem. The switchhook audit failed. The other updates were not performed because of this failure. This may occur when the audit is performed at the same time the terminal equipment goes off-hook. <ul style="list-style-type: none"> 1. Use <code>status station</code> to determine when the port is available. 2. Retry the command at 1-minute intervals up to 5 times.
5	FAIL	This may be an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
7	FAIL	The translation update failed. There may be an internal software error. The ringer update was not performed because of this failure.
8	FAIL	This does not indicate a hardware problem. There may be an internal software error. The ringer update failed. <ul style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. <ul style="list-style-type: none"> 1. Verify that the board's translations are correct. Enter <code>list config</code> and resolve problems. 2. If the board was found to be correctly inserted in step 1, enter <code>busyout board</code> 3. Enter <code>reset board location</code> 4. Enter <code>release board location</code> 5. Enter <code>test board location long</code> This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.
		2 of 2

Station Present Test (or Ringing Application Test) (#48)

This test applies momentary ringing voltage to the terminal equipment and monitors resulting current flow to determine whether terminal equipment is connected to the port. This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing disturbs the customer or the terminal equipment, you can disable it via the Tests field on the **change station** screen. However, on some software releases, Tests #6, 7, 161, and 35 are disabled.

Table 111: Test #48 Station Present Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABRT	The port was seized by a valid call during the test. The test has been aborted. 1. Use display port location to determine the station extension. 2. Use status station to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle. 3. Retry the command at 1-minute intervals up to 5 times.
1005	ABRT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1008	ABRT	Could not allocate a ringing circuit. Either every ringing circuit is active or the ringing generator is either defective or incorrectly wired. Retry the command at 1-minute intervals up to 5 times. 1. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or is incorrectly wired. If it does not occur on other ports, then all four ring phases are active.
		1 of 3

Table 111: Test #48 Station Present Test 2 of 3

Error Code	Test Result	Description / Recommendation
1018	ABRT	<p>The test has been disabled by administration. The default for the Test field on the station screen is y. Determine why this field was set to n on this station. It may be due to the brief ringing disturbance that this test may cause.</p> <ol style="list-style-type: none"> To enable the test for the particular analog station being tested, enter change station extension and set the Test field on the station to y.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate necessary system resources to run this test.</p> <ol style="list-style-type: none"> Retry the command at 1-minute intervals up to 5 times.
	FAIL	<p>The terminal equipment is not connected to the circuit pack. Some terminal equipment, such as modems, may fail even when connected properly.</p> <ol style="list-style-type: none"> Remotely test the equipment. If the test fails again, look for RING-GEN errors in the Error Log. Check all of the wiring between the station equipment and the switch. Then, run the test again. If the test still fails, the set may be defective. Check the set, and replace it, if necessary. Some terminal equipment could fail even when it is connected properly. If this is the case, disable the test using change station extension (enter n into the Test field). Note that this action also disables Tests 6, 7, 161, and 35 on this port.
	PASS	<p>The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. Investigate user-reported troubles on this port by using other port tests or by examining the station and its wiring.</p>

Error Code	Test Result	Description / Recommendation
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Enter <code>list config</code>, and resolve any problems. 2. If the board was found to be correctly inserted in step 1, enter <code>busyout board location</code> 3. Enter <code>reset board location</code> 4. Enter <code>release board location</code> 5. Enter <code>test board location long</code> <p>This should re-establish the linkage between the internal ID and the port. If not, verify that a valid board is inserted.</p>
4 of 4		

ANL-BD (Analog Line Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name Of MO
ANL-BD	MIN WRN	<code>test board location sh</code>	8-Port Analog Line circuit pack
ANL-BD	MIN WRN	<code>test board location sh</code>	8-Port Neon Analog Line circuit pack
ANL-BD	MIN WRN	<code>test board location sh</code>	16-Port Neon Analog Line circuit pack

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for circuit pack-level errors. See also [ANL-16-L \(16-Port Analog Line\)](#) on page 367 for related line information.

See also [ANL-LINE, ANL-NE-L \(8-Port Analog Line\)](#) on page 387 for related line information.

ANL-LINE, ANL-NE-L (8-Port Analog Line)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command To Run	Full Name of MO
ANL-LINE	MIN	<code>test port location 1</code>	8-Port Analog Line
ANL-LINE	WRN	<code>test port location sh</code>	8-Port Analog Line
ANL-NE-L	MIN	<code>test port location 1</code>	8-Port Neon Analog Line
ANL-NE-L	WRN	<code>test port location sh</code>	8-Port Neon Analog Line

The 8-port Analog Line circuit packs,

TN712	TN411 [G3rV2]	TN742
	TN443 [G3r V2]	TN769
	TN443 [G3r V2]	TN467 [G3r V2]

each provide eight ports for single-line, on or off-premises analog endpoints such as analog voice terminals, queue warning level lamps, recorded announcements, dictation machines, PAGEPAC paging equipment, external alerting devices, modems, fax machines, and AUDIX voice ports. Only the TN769 supports a neon message waiting lamp.

Note:

PAGEPAC is a registered trademark of Harris Corporation, Dracon Division.

Test #48 may cause some terminal equipment to ring briefly during daily maintenance, which may disturb the customer or the terminal equipment. Test #47 may cause a false alarm when the port is connected to certain off-premises equipment, non-voice terminal equipment, or loop equipment. In either case, the tests can be disabled by entering `n` in the `Tests` field on the `change station extension` screen. Be aware that this will disable Tests 6, 35, 47, and 48.

No maintenance of the terminal connected to the 8-Port Analog Line circuit pack or 8-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the common ringing application circuitry and the neon message waiting lamp power (ANL-NE-L only) are reported as errors 1281 and 1793 against XXX-BD (Common Port Circuit Pack) in [Table 882: Common Port Circuit Pack Maintenance Error Log Entries](#) on page 2499.

Hardware Error Log Entries and Test to Clear Values

1281 (g)					
1793 (g)					

1. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in **set options**.

Notes:

- a. Error Type 0: Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

b. **Error Type 1:** These are in-line errors that can only be resolved over time.

Aux Data 40960: too many simultaneous incoming ringing attempts were made on this board. Only 4 ports on a board may ring simultaneously. A 5th incoming call will cause an inline error from the board.

Aux Data 40975: the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal rings. If the terminal doesn't ring, then replace it. Otherwise, enter **test port location**, and follow the procedure for Test #48.

Aux Data 40977: no terminal equipment was connected when ringing was attempted. Run **test port location sh**, and follow the procedure for the results of Test #48.

c. **Error Type 15:** software audit error, does not indicate any hardware malfunction. Run short test sequence, and investigate errors (if any).

d. **Error Type 130:** the circuit pack was removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

e. **Error Type 257:** Associated Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled via **change station extension**. However, on some releases of the software, this will disable Tests #6, 47, and 35 as well as Test #48.

f. **Error Type 769:** Associated Test #47 may cause a false alarm when the port is connected to off-premises equipment, some non-voice terminal equipment, and some loop equipment. If this causes a false alarm, use **change station**, and change the **Tests** field to **n** to disable the test.

g. **Error Types 1281 and 1793:** See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Battery Feed test (#35), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery Feed test (#35)	X	X	ND
Station Present test (#48)	X	X	ND
NPE Crosstalk test (#6)		X	ND

Communication Manager Maintenance-Object Repair Procedures

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Loop Around and Conference test (#47)		X	ND
Station Status and Translation Audits and Updates test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more NPEs (Network Processing Elements) reside on each circuit pack with a TDM-bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 114: Test #6 NPE Crosstalk Test 1 of 4

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-on-Hold port when it is off-hook, which it usually is. 1. Enter display port location to determine the station's extension. Enter status station extension to determine the service state of the port. If the port is active, it will be unavailable for certain tests. Wait until the port is idle before retesting. 2. When the port is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.

		4 of 4

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and trying to detect a current.

Table 115: Test #35 Battery Feed Test Results 1 of 3

		3 of 3

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations (such as station type, dial type, network connection) with information kept in the software. The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

Table 116: Test #36 Station Status and Translation Audits and Updates Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test.

		3 of 3

Looparound and Conference Test (#47)

Each Analog port consists of:

- An NPE (Network Processing Element) for port connectivity and gain, and conferencing functionality
- A codec that converts TDM Bus digital signals to analog
- A battery feed chip that provides power to the telephone set for signaling, dial pulsing, transmission, and balance.

This test is designed to check the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the Analog port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog port. The Analog port is then instructed to go into loop around mode (see [Figure 22: Analog Looparound and Conference Test](#) on page 400). The test passes if the signal measured by the Tone Detector is within acceptable limits.

Communication Manager Maintenance-Object Repair Procedures

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. Test #47 also tests the operation of the port conference circuits in the NPE for three and four parties. In addition, a test is run to measure noise. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

The noise test is performed by filtering out the tone, and then measuring inherent port noise.

Note:

This looparound test is sensitive to the length of the loop, the equipment in the loop, or the equipment terminating the loop, such as off-premises stations. If this test is causing a false alarm, use **change station** for this station and change the **Tests** field to **n**, to disable the test.

Error Code	Test Result	Description / Recommendation
1005	ABRT	<p>The test was aborted due to a configuration problem. This error code occurs under either of the following conditions:</p> <ul style="list-style-type: none"> ● This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, a modem pool member or music on hold). ● The circuit pack is one of the following: <ul style="list-style-type: none"> - TN742 vintage 13, 14, or 15 - TN769 vintage 3, 4, or 5
1018	ABRT	<p>Test disabled by administration. The default for the Test field is y. Determine why the field is n on this station. It may be due to the ringing application test 48, which can be customer or terminal disturbing.</p> <ol style="list-style-type: none"> 1. To enable the test for a particular station, enter change station extension and set the Test field on the Station screen to y.
1392	ABRT	<p>This port is currently a TTI port and the test will not execute on it.</p> <ol style="list-style-type: none"> 1. Verify that the port is a TTI port using either display port to show that the port is a TTI port, or list config, where the display shows a t for the port. 2. If either list config or display port indicate that the port is <i>not</i> a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct for the test, and no action is necessary.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a Tone-Clock problem). The Tone-Clock and Tone Detectors could be having a communication problem. For example, the companding modes could be out of synchronization.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
3 of 5		

Table 117: Test #47 Loop Around and Conference Test 4 of 5

Error Code	Test Result	Description / Recommendation
7	FAIL	The conference test or the noise test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board, as described below.
13		The reflective loop around with gain set to low and the 600-ohm balance failed. This will cause noisy or unreliable connections.
14		The reflective loop around test (with the gain set to high, using RC balance) failed. This could cause noisy or unreliable connections. The problem can also be off-board, as described below.
15		<p>The nonreflective loop-around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board as described below.</p> <ol style="list-style-type: none"> 1. Disconnect the terminal equipment from the circuit pack at the cross-connect and run the test again. 2. If the test fails again, replace the circuit pack and reconnect the terminal equipment. If the test passes the second time, then the test results were affected by the terminal equipment connected to the port. In this case, ignore the results of this test if every other test passes or aborts and the station is operating properly. Failure of test 47 does not cause an alarm. If there are failures of other tests, then investigate those errors. User reported troubles with this port should be investigated by using other port tests, by examining station wiring, and by examining the station to ensure that it is correctly translated as off-premises or on-premises. <p>If the Looparound and Conference circuit test fails for every port on a circuit pack, a -5 Volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with the power unit, see the RMC-ENV MO (S8700 IP), or the CARR-POW MO (S8700 MC). If a red LED is lit on TN736 or TN752 power unit circuit pack, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test.</p>
		4 of 5

Table 117: Test #47 Loop Around and Conference Test 5 of 5

Error Code	Test Result	Description / Recommendation
	PASS	<p>The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises.</p> <p>Note: This test always passes for circuit packs TN712 prior to vintage 14 and TN742 prior to vintage 6.</p>
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Enter <code>list config</code>, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, enter <code>busyout board location</code> 3. Enter <code>reset board location</code> 4. Enter <code>release board location</code> 5. Enter <code>test board location long</code> <p>This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.</p>

5 of 5

Station Present Test (or Ringing Application Test) (#48)

This test provides a burst of ringing current to the terminal equipment and detects that current flows. This test is to ascertain whether or not terminal equipment is connected to the port.

This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen. However, on some releases of the software, this action disables Tests #6, 47, and 35, as well as Test #48.

Table 118: Test #48 Station Present Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test were not available. The port may be busy with a valid call. 1. Use <code>display port location</code> to determine the station's extension. Use <code>status station extension</code> to determine the service state of the port. If the port is active, it will be unavailable for certain tests. Wait until the port is idle before retesting. 2. If the port is idle, retry the command at 1-minute intervals up to 5 times. 3. Check for phone left off-hook or for wiring problems.
1004	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use <code>display port location</code> to determine the station extension. Use <code>status station</code> to determine the service state of the port. If the service state indicates that the port is active, then the port is unavailable for certain tests. Wait until the port is idle before retesting. 2. Retry the command at 1-minute intervals up to 5 times. 3. If the test continues to abort and the port is idle, escalate the problem.
1005	ABRT	The test was aborted due to a configuration problem. This error code occurs under either of the following conditions: 1. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold). 2. The circuit pack is: <ul style="list-style-type: none"> ● TN742 vintages 13, 14, and 15 ● TN769 vintages 3, 4, and 5
<i>1 of 3</i>		

Table 118: Test #48 Station Present Test 2 of 3

Error Code	Test Result	Description / Recommendation
1008	ABRT	<p>Could not allocate a ringing circuit for one of the following reasons:</p> <ul style="list-style-type: none"> ● Every ringing circuit is active. ● The ringing generator is defective. ● It is incorrectly wired. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for Test #48 on other circuit packs as well, then the ringing generator may be defective or incorrectly wired. If it does not occur on other ports, then that circuit pack is currently using all four ringing phases.
1018	ABRT	<p>The test was disabled by administration. The default for the Test field is y; thus, you may want to determine why this field has been set to “n” on this station (this may be due to the ringing application Test #48, which can be customer or terminal disturbing).</p> <ol style="list-style-type: none"> 1. To enable the test for a particular station, enter change station extension and set the Test field to y.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a Tone-Clock problem). The Tone-Clock and Tone Detectors could be having a communication problem. For example, the companding modes could be out of synchronization.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
2 of 3		

Table 118: Test #48 Station Present Test 3 of 3

Error Code	Test Result	Description / Recommendation
	FAIL	<p>The terminal equipment is not connected to the circuit pack or the ringing generator may have failed.</p> <ol style="list-style-type: none"> 1. Remotely test the equipment. 2. If the test fails again, look for RING-GEN errors in the error log. If present, see RING-GEN (Analog Ring Generator) on page 1900 (analog ring generator) maintenance. 3. Check all of the wiring between the station equipment and the switch. Then, run the test again. 4. If the test still fails, the set may be defective. Check the set, and replace it, if necessary. 5. Some terminal equipment (such as a modem) could fail even when it is connected properly. If this is the case, disable the test using change station extension (enter n into the Test field). Note that this action also disables Tests 6, 7, 161, and 35 on this port.
	PASS	<p>The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. Investigate user-reported troubles on this port by using other port tests or by examining the station and its wiring.</p>
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Enter list config and resolve any problems. 2. If the board was found to be correctly inserted in step 1, enter busyout board location 3. Enter reset board location 4. Enter release board location 5. Enter test board location long <p>This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.</p>
3 of 3		

AN-LN-PT (Analog Line Port)

S8700 | 8710 / S8500 / S8300 / G700

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AN-LN-PT	MIN	<code>test port location 1</code>	Analog Line port
AN-LN-PT	WRN	<code>test port location sh</code>	Analog Line port

The TN793B/TN2793B Analog Line (w/ Caller ID) and the TN797 Analog Trunk and Line circuit packs both support AN-LN-PT.

The TN793B/TN2793B Analog Line circuit pack (w/ Caller ID) provides 24 ports for voice terminals and supports both on-premises and off-premises analog voice terminals.

Note:

For DEFINITY G3i, si, and csi systems the TN793B/TN2793B analog line circuit pack supports analog data modules. When assigned, analog data modules provide access to the NetPkt (TN794 circuit pack) data ports. To activate an analog data module you must assign the port location on the data screen and connect a modem to the port. The analog data module can be used for connection to a CDR output, or other adjuncts as needed. These ports are tested like any other analog port on the circuit pack.

For S8500, S8700 products, CDR data is moved via LAN to a CDR adjunct.

The TN797 Analog Trunk and Line circuit pack provides 8 ports, each of which may be administered in any of several ways, as described in MO TR-LN-BD.

S8300 / G700: The MM711 Analog Trunk and Line Media Module provides 8 ports, each of which may be administered in any of several ways, as described in MO MG-ANA.

Note:

Although the AN-LN-PT MO is provided for the G700 Media Gateways, AN-LN-PT only partially supports the MM711 Analog Media Module.

Ringling caused by maintenance testing

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing disturbs the customer or the terminal equipment, disable it in the `Tests` field of the `change station extension` form. Be aware that this action also disables Tests #6, 7, 161, and 35 on some software releases.

G700: Tests #6, 7, and 161 abort on the G700 with Error Code 1412.

Error log entries and test to clear values

Table 119: Analog line port error log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location sh r 1</code>
1 (b)	40960 40975 40977	none			
15 (c)	Any	Audits and Updates test (#36)			
18	0	<i>busy station extension</i>	WRN	ON	<code>release station extension</code>
130 (d)		None	WRN	ON	<code>test port location sh</code>
257 (e)	40973	None			
513 (f)		Station Present test (#48)	WRN	OFF	<code>test port location sh r 2</code>
769		Battery Feed test (#35)	MIN WRN ¹	ON	<code>test port location sh r 2</code>
1025		Looparound test (#161)	MIN WRN ²	ON	<code>test port location 1 r 2</code>
1281		Conference test (#7)	MIN WRN ²	ON	<code>test port location 1 r 2</code>
1537		NPE Crosstalk test (#6)	MIN WRN ²	ON	<code>test port location 1 r 2</code>

1. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in **set options**.

Notes:

- a. **Error type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 1:** these are inline errors and can only be resolved over time.
 - Aux Data 40960 indicates that too many simultaneous incoming ringing attempts were made on this board. Only 4 ports on a board may ring simultaneously. A 5th incoming call causes an inline error from the board.
 - Aux Data 40975 indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance.
 1. Call the terminal equipment and verify that the terminal rings.

Communication Manager Maintenance-Object Repair Procedures

2. If the terminal does not ring, replace it.
3. Otherwise, run `test port location`, and follow the procedure for Test #48.
 - 40977 indicates that no terminal equipment was connected when ringing was attempted. Run `test port location sh`, and follow the procedure for the results of Test #48.
- c. **Error Type 15:** this is a software audit error that does not indicate any hardware malfunction. Run the short test sequence, and investigate any associated errors.
- d. **Error Type 130:** this error type indicates that the circuit pack or media module has been removed or has been insane for more than 11 minutes. To clear the error, reseal or replace the circuit pack or media module.
- e. **Error Type 257:** this is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent.

S8700 | 8710 / S8500

- If only 1 analog circuit pack in the system has this problem, replace the circuit pack.
- If only analog circuit packs on a particular carrier have this error, the ringing generator may not be connected to this carrier.
- If analog circuit packs on many carriers have this error, it is probably a problem with the ringing generator.

S8300 / G700

- If not resolved over time, replace the media module.

-
- f. **Error Type 513:** Test #48 can cause some terminal equipment to ring briefly during daily maintenance.
 1. If this disturbs the customer or the terminal equipment, disable it by setting the `Tests` field on the `change station extension` form to `n`. On some software releases, this also disables Tests #6, 7, 161, and 35.

S8300 / G700: In the G700, Tests #6, 7, and 161 abort with Error Code 1412.

System technician-demanded tests: descriptions and error codes

Investigate tests in the order presented. By clearing error codes associated with the Battery Feed test (#35), you may clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery Feed test (#35)	X	X	ND
Station Present test (#48)	X	X	ND
Analog Looparound test (#161) S8300 / G700 : This test aborts with Error Code 1412.		X	ND
Conference test (#7) S8300 / G700 : This test aborts with Error Code 1412.		X	ND
NPE Crosstalk test (#6) S8300 / G700 : This test aborts with Error Code 1412.		X	ND
Station Status and Translation Audit and Update test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

S8300 / G700: This test aborts with Error Code 1412.

This test verifies that the port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually part of the long test sequence and executes in about 20 to 30 seconds.

Table 120: Test #6 NPE Crosstalk Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	Necessary system resources could not be allocated to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.

Battery Feed Test (or Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery power, and detecting the resulting current.

Table 122: Test #35 Battery Feed Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Necessary system resources could not be allocated to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
1000	ABRT	System resources are unavailable. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. <ol style="list-style-type: none"> 1. Enter <code>display port location</code> to determine the station's extension. 2. Enter <code>status station extension</code> to determine the service state of the port. 3. If the port is active, wait until it is idle. Retry the command at 1-minute intervals up to 5 times. 4. If the test continues to abort, escalate the problem.
1004	ABRT	A valid call seized the port during the test and aborted the test. <ol style="list-style-type: none"> 1. Use <code>display port location</code> to determine the station extension. 2. Use <code>status station extension</code> to determine the service state of the port. 3. If the port is active, wait until it is idle before testing. Retry the command at 1-minute intervals up to 5 times. 4. If the test continues to abort, escalate the problem.
1005	ABRT	This test was aborted due to a configuration problem. The test is not applicable for this type of analog port. This error can be ignored.

3 of 3		

Station Present Test (or Ringing Application Test) (#48)

This test applies momentary ringing voltage to the terminal equipment and monitors resulting current flow to determine whether terminal equipment is connected to the port. This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing disturbs the customer or the terminal equipment, you can disable it via the **Tests** field on the **change station extension** screen. However, on some software releases, Tests #6, 7, 161, and 35 also are disabled.

S8300 / G700: In the G700, Tests #6, 7, and 161 abort with Error Code 1412.

Table 124: Test #48 Station Present Test 1 of 3

ANN-BD (Announcement circuit pack)

MO Name in Alarm Log	Alarm level	Initial command to run	Full name of MO
ANN-BD	MIN	<code>test board location 1</code>	Announcement Circuit Pack
ANN-BD	WRN	<code>test board location 1</code>	Announcement Circuit Pack

Note:

The information contained in ANN-BD refers only to the TN750-series of circuit packs. Expressions such as "announcement circuit pack" and "announcement board" are to be interpreted to mean the TN750-series only.

The TN750 Announcement circuit pack is a service circuit which provides an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (for example, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. In addition to the 16 Announcement Ports, the Announcement circuit pack also has one Data Line Circuit Port (port 17). The Data Line Circuit Port is used for uploading/downloading the announcement memory to/from the memory card. If there are any errors associated with port 17, refer to [DAT-LINE \(Data Line Port\)](#) on page 845. If there are any errors associated with any other port, refer to [ANN-PT \(announcement port\)](#) on page 447.

Note:

TN750C is required if your system has multiple TN750x announcement boards (up to ten are allowed). Only one TN750A/B may be present in the system with up to nine additional TN750C boards. All ten boards may be TN750C. The announcements from a TN750A/B can be saved and restored to a TN750C, but once the announcements are recorded onto a TN750C they are not backward compatible with the TN750A/B.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack and communicates with the switch via the control channel on the TDM Bus. The second processor, or Speech Processor (SP), controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

General notes

Here are a few important general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, especially if the circuit pack needs to be replaced.

1. The TN750 Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power*. For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always best to try to reset the circuit pack via **reset board PCSS** first. If that does not work, replace the circuit pack. Announcements are preserved through a software reset, but they are lost when the circuit pack is reseated.
2. If a customer has announcements on the Announcement circuit pack, then announcements must be saved on the memory card to ensure that they are not lost. This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the circuit pack is in proper working order (see Note).

Note:

Unlike translations, announcements are NEVER automatically saved to the memory card.

3. **Save announcements** replaces the TN750x announcement file on the memory card. Care must be taken not to mistakenly enter this command and, as a result, destroy a valid file on the memory card.
4. **Restore announcements** replaces the TN750x Announcement circuit pack speech memory with the announcement file on the memory card. Care must be taken not to mistakenly enter this command, destroying valid speech memory, especially if the memory card does not have a valid announcement file on it.
5. Whenever the TN750x Announcement circuit pack is replaced, announcements must always be rerecorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the pack.
6. If announcement speech memory is corrupted, announcements should not be saved [that is, if the Announcement Checksum Test (#209) fails, or if the speech sounds corrupted on playback]. This can ruin a good announcement file on the memory card and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file on the memory card, announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).
7. Due to a hardware fault in the TN750 announcement board, the following sequence of events may cause the announcement file to become corrupted and unusable:
 - a. Fill the board with recorded announcements.
 - b. Delete the last few announcements recorded.
 - c. Re-record the announcements deleted.

If the announcement file becomes corrupted, the only solution is to re-record all announcements. To do this, follow these steps:

- d. Remove the announcement board.
- e. Remove the tape cartridge from the tape drive. Do this so that announcements are not automatically restored from tape.
- f. Re-insert the announcement board.
- g. Re-record all announcements.
- h. Insert the tape cartridge in the tape drive.
- i. Enter **save announcements** to save all the announcements on the tape.

This hardware fault is fixed in the TN750B announcement board. However, the TN750B board will not automatically correct an announcement file which has previously been corrupted by a TN750 board. The only way to correct an announcement file corrupted by the TN750 board is to follow the steps above.

Announcement administration

A brief description of the integrated announcement administration is given here to aid in troubleshooting the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to *Administrator's Guide for Avaya Communication Manager, 555-233-506*.

Announcement session

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate Feature Access Code (FAC), administered as Announcement access code on the FACs form. Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted, or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit **1**, record after the tone, and hang up when done. To play back an announcement, press **2**. To delete an announcement, press **3** (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

Uploading/Downloading announcements

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the memory card with **save announcements**. Likewise, integrated announcements can be downloaded to the Announcement circuit pack with **restore announcements**. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a memory card. These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads and/or downloads take between 30 and 45 minutes.

The system automatically tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

- An announcement is recorded within 10 minutes of circuit pack insertion.
- An announcement download is invoked sooner with the **restore announcements**.
- No announcement and/or NETCON data module is administered.
- Either the announcement data module is busy or all the administered NETCON data modules are busy.
- No memory card is in the system.
- The memory card in the system does not have a valid announcement file saved on it.

Hardware error log entries and test to clear values

Table 126: Announcement circuit pack error log entries 1 of 2

Error type	Aux data	Associated test	Alarm level (See WRN message)	On/Off board	Test to clear value
0 (a)	0	Any	Any	Any	test board PCSS sh r 1

					2 of 2

**WARNING:**

All alarms are upgraded to MAJOR when the BASE Tone Generator is set to 12 (France).

Communication Manager Maintenance-Object Repair Procedures

Notes:

- a. **Error Type 0:** Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- b. **Error Type 1:** the circuit pack totally stopped functioning or it was physically removed from the system.

Note:

The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, follow the instructions for "Red (alarm)" in [RIGHT LED in SERVICES jack - GREEN: lights up seventh then turns off.](#) on page 279.

Note:

The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

WARNING:

Reseating and/or replacing the circuit pack results in loss of integrated announcements (TN750/B only). See [General notes](#) on page 447 near the beginning of this Maintenance procedure.

- c. **Error Type 2:** Check the Class of Restriction (COR) administered for the Data Line extension assigned to the TN750 for uploading and downloading announcements. The extension can be found by using `list data-module`.
- d. **Error Type 14:** logged when the Announcement Checksum Test (#209) fails. The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by `display announcement`. This error only appears in the Error Log in conjunction with Error Type 2817. Follow the procedures for Error Type 2817 to troubleshoot Error Type 14.
- e. **Error Type 23:** the circuit pack has been logically administered but not physically installed. The alarm is cleared when the circuit pack is installed.
- f. **Error Type 125:** the wrong circuit pack is inserted in the slot where this circuit pack is logically administered. To resolve this problem, either remove the wrong circuit pack and insert the logically administered circuit pack OR use `change circuit-pack` to readminister this slot to match the circuit pack inserted.
- g. **Error Type 217 and 267:** there is more than one TN750 Announcement circuit pack inserted in the system. Remove the alarmed circuit pack.
- h. **Error Type 257:** transient communication problems with this circuit pack. This error is not service-affecting and no action is required.

- i. **Error Type 513:** when reported with Aux Data in the range of 4352 to 4358, the circuit pack has reported a hardware failure on the circuit pack. The circuit pack should be replaced.

Replacing the circuit pack results in loss of integrated announcements (TN750/B only). See [General notes](#) on page 447 near the beginning of this Maintenance procedure.

- j. **Error Types 1025 and 3840:** not service-affecting, no action is required.
- k. **Error Type 1281:** the speech processor (SP) found a fault in the speech main memory (SMM) (that is, it found one or more faulty memory locations). Whenever this error is logged, error 2817 is also logged [see Note (m)], which causes the maintenance system to run the Announcement Checksum Test (#209) to determine if the bad memory location was being used by an announcement.
- l. **Error Type 1538:** the hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:
 1. The tests run on the ports of this circuit pack are returning with a NO-BOARD.
 2. A busyout/release of the circuit pack has no effect on test results.
 3. A **list configuration** command shows that the circuit pack and ports are properly installed.

The system tries to restore the circuit pack within 15 minutes. If the error recurs after 15 minutes, replace the circuit pack. (Refer to [Reseating and replacing circuit packs](#) in *Maintenance Procedures (03-300192)*.)

- m. **Error Types 2049 and 2817:** logged in conjunction with Error Type 1281, Aux Data 17699. Because Error Type 1281 means that a defective speech memory location was found, [see Note (k)] the announcement checksum error is also logged. This causes the Announcement Checksum Test (#209) to run, which determines if the defective memory location has corrupted any recorded announcements. If the Checksum Test passes, the faulty memory location is currently not being used, and the SP marks the location as faulty to ensure that future announcements do not attempt to use it.

Note:

As memory locations are marked faulty, the amount of available memory decreases, which decreases the total amount of announcement time available on the circuit pack.

- n. **Error Type 2049:** transient error that does not cause an alarm can occasionally occur during a SPE, TDM BUS, or Tone Clock interchange. It is possible for a marginal Tone-Clock circuit pack to cause this error against the ANN-BD without alarming the TONE-BD. If this error occurs again, replacing the Tone-Clock circuit pack may clear up this error. See the FAIL case in the Clock Match Inquiry Test (#212).
- o. **Error type 3999:** the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System technician-demanded tests: descriptions and error codes

Investigate tests in the order presented in [Table 127: System Technician-demanded tests: ANN-BD](#) on page 436. By clearing error codes associated with the first test, you may clear other errors in the sequence.

For a complete description of these tests, refer to the [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

Table 127: System Technician-demanded tests: ANN-BD

Order of investigation	Short test sequence	Long test sequence	Reset board sequence	D/ND ¹
Control channel loop-around test (#52)		X		ND
Angel-speech processor (sp) handshake (#208)		X		ND
Clock match inquiry test (#212)	X	X		ND
Super frame match inquiry test (#211)	X	X		ND
140AY loop around test (#210)	X	X		ND
Announcement checksum test (#209)	X	X		ND
Connection Audit Test (#50) (a)		X		ND
SAKI Sanity Test (#53) (a)			X	D

1. D = Destructive, ND = Nondestructive

Angel-speech processor (sp) handshake test (#208)

This test checks the integrity of the communication link between the two processors on the Announcement circuit pack.

WARNING:

Failure of this test indicates that the Speech Processor is insane and results in the loss of all integrated announcements on the circuit pack.

Table 128: TEST #208 angel-speech processor (SP) handshake test

Error code	Test result	Description/ Recommendation
2000	ABRT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	ABRT	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Test failed. Circuit pack cannot be used. Announcement speech memory is cleared when this test fails. Therefore, when the problem has been resolved, announcements must be rerecorded or downloaded to the circuit pack. 1. Reset the circuit pack via reset board PCSS and then run this test again. If the test continues to fail, replace the circuit pack and then run this test again. 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works. ⚠ WARNING: Replacing the circuit pack results in loss of integrated announcements. See General notes on page 447.
	PASS	The communications link between the two processors on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to ANN-PT (announcement port) on page 447 for a description of the port tests.

Announcement checksum test (#209)

Associated with every recorded announcement is a checksum. In this test, the SP checks a stored global checksum covering all recorded announcements against a calculated one and returns the results to the maintenance system. If the global checksum failed, maintenance requests the SP to check each individual announcement's checksum.

Communication Manager Maintenance-Object Repair Procedures

If the test fails, then it returns the total number of defective announcements found. In addition, associated with each failure is an error in the Error Log (Error Type 14). The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by `display announcement`.

Table 129: TEST #209 announcement checksum test 1 of 3

Error code	Test result	Description/ Recommendation
0	ABRT	An error code of 0 indicates that the announcement file has been corrupted due to a hardware fault in the TN750 board. Follow step #7 under General notes on page 447 at the beginning of this section.
1023	ABRT	There are no announcements currently recorded on the circuit pack.
1024	ABRT	<p>This abort code is given for the following reasons:</p> <ol style="list-style-type: none"> 1. An announcement upload or download is in progress. 2. An announcement upload or download is requested when this test is running. 3. A record is in progress. 4. A record request comes in when this test is running. <p>If an announcement upload or download is in progress, <code>status data-module <announcement data extension></code> should show that the announcement data port is connected to a NETCON data channel, and the "card-in-use" LED for the memory card is on (to determine the extension of the announcement data module, use <code>list data-module</code>).</p> <p>See Note (a) at end of table for more information.</p> <ol style="list-style-type: none"> 1. Wait until the blocking event is finished, and then run this test again. An upload or download could take up to 45 minutes to complete, and a recording session is finished as soon as the station that was making the recording is placed on-hook. 2. If the test continues to abort, and a record or upload/download is not in progress, escalate the problem.
2000	ABRT	<p>Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1 of 3		

Table 129: TEST #209 announcement checksum test 2 of 3

Error code	Test result	Description/ Recommendation
	ABRT	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
0-256	FAIL	<p>Test failed. The error code indicates the total number of defective announcements that were found.</p> <p>When TEST #209 fails with error code 0, the Global Checksum failed on the board, but no individual Checksum failed.</p> <p>Note:</p> <p>Since the announcements are recorded digitally, it is possible for the Announcement Checksum Test to <i>fail</i> but still have all the announcements sound uncorrupted. When an individual announcement fails the Checksum Test, always listen to the announcement first before taking any action (an announcement can be played back by dialing the announcement extension associated with the announcement number). If the announcement sounds corrupted, then rerecord it or delete it.</p> <ol style="list-style-type: none"> 1. Look in the Error Log to determine the number of the first defective announcement. Play back the announcement. If the announcement sounds defective, rerecord it or delete it. If the error code was greater than one (indicating that there is more than one defective announcement), run this test again and repeat this step. 2. If after deleting and rerecording all defective announcements, the checksum test still fails, reset the circuit pack using reset board PCSS and run this test again. 3. If the test still continues to fail, reseal the circuit pack and restore all announcements with an appropriate time estimate (for example, 40 minutes.) Then rerecord the lost announcements (that is, those recorded since the last save operation) and run this test again. 4. If the test still continues to fail, replace the circuit pack, and run this test again. <p> WARNING:</p> <p>Replacing the circuit pack results in loss of integrated announcements. See General notes on page 447 near the beginning of this Maintenance procedure.</p>

2 of 3

Table 129: TEST #209 announcement checksum test 3 of 3

Error code	Test result	Description/ Recommendation
	PASS	All recorded announcements checksum correctly, indicating that the speech main memory is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to ANN-PT (announcement port) on page 447 Maintenance documentation for a description of the port tests.
3 of 3		

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement do not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yield the following abort codes:
 - Ports 1 AND 9 abort Test #206 with code 1024
 - Ports 1 AND 9 abort Test #205 with code 2000
 - Board level Tests #209 and #210 abort with code 1024
3. **Save/restore announcements** times out with:

`Error encountered, can't complete request`

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- Reset circuit pack using **reset board PCSS**
- Release circuit pack using **release board PCSS**

140AY loop around test (#210)

This test checks the integrity of the record channel on the Announcement circuit pack (Announcement Port 1). The main function of the 140AY device is to accept Pulse Code Modulation (PCM)/Adaptive Differential Pulse Code Modulation (ADPCM) samples and compress/expand the samples using ADPCM. This test connects a Tone Generator to one port (Announcement Port 1, the recording port), and a Tone Detector to another port (Announcement Port 9). A tone is generated by the Tone Generator on the first port and looped through the 140AY device to the second port. The Tone Detector then responds with a tone present/absent message. The 140AY Loop Around Test is repeated at three different speech compression rates.

Since this test involves sending a tone through two different ports, the Playback Speech Memory Array (PSMA) Test (#206) is run on the two ports first to make sure that they are working properly. See [ANN-PT \(announcement port\)](#) on page 447 for a description of this test.

Table 130: TEST #210 140AY loop around test 1 of 3

Error code	Test result	Description/ Recommendation
1-3	ABRT	Response to the test request was not received within the allowable time period. The error code indicates at which speech compression rate the test aborted (one being the first rate tested, three being the last). 1. Retry the command at 1-minute intervals a maximum of 5 times.
10	ABRT	The PSMA Test (#206) failed on Announcement Port 1. 1. Refer to ANN-PT (announcement port) on page 447 Maintenance documentation, Test #206.
90	ABRT	The PSMA Test (#206) failed on Announcement Port 9. 1. Refer to ANN-PT (announcement port) on page 447 Maintenance documentation, Test #206.
1000	ABRT	System resources required to run this test are not available. This test needs Announcement Ports 1 and 9 to run. One of the ports may be in use on a valid call. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and Ports 1 and 9 are not in use, escalate the problem.
		1 of 3

Table 130: TEST #210 140AY loop around test 2 of 3

Error code	Test result	Description/ Recommendation
1002	ABRT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM Bus) on page 2193 Maintenance documentation to diagnose any active TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service.</p> <ol style="list-style-type: none"> 1. Look for TTR-LEV errors in the Error Log. If present, refer to the TTR-LEV (TTR Level) on page 2325. 2. Look for TONE-PT errors in the Error Log. If present, refer to the TONE-PT (Tone Generator) on page 2308. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.
1007	ABRT	<p>The Announcement circuit pack thinks that Port 1 or Port 9 is busy.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, follow the Announcement Port maintenance procedures for Ports 1 and 9.
1024	ABRT	<p>Announcement circuit pack blocked the test because an announcement download is in progress. If an announcement download is in progress, status data-module <announcement data extension> should show that the announcement data port is connected to a NETCON data channel, and the "card-in-use" LED for the memory card should be on (to determine the extension of the announcement data module, use list data-module). See Note (a) at end of table for more information.</p> <ol style="list-style-type: none"> 1. Wait until download is finished (can take up to 45 minutes), and then run the test again. 2. If the test continues to abort and there is no download in progress, escalate the problem.
2000	ABRT	<p>Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this error type.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
		2 of 3

Table 130: TEST #210 140AY loop around test 3 of 3

Error code	Test result	Description/ Recommendation
2007	ABRT	The Announcement circuit pack thinks that Port 1 or Port 9 is busy. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, follow the Announcement Port maintenance procedures for Ports 1 and 9.
2100	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
	ABRT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
1-3	FAIL	Test failed. The error code indicates at which speech compression rate the test actually failed (one being the first rate tested, three being the last). <ol style="list-style-type: none"> 1. Reset the circuit pack via <code>reset board PCSS</code> and then run this test again. If the test still fails, replace the circuit pack (see Warning) and run this test again. 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). <p> WARNING: Replacing the circuit pack results in loss of integrated announcements. See General notes on page 447.</p>
	PASS	The record channel on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to ANN-PT (announcement port) on page 447 for a description of the port tests.
3 of 3		

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, `save/restore announcements` will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

Communication Manager Maintenance-Object Repair Procedures

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a `test board long` when the circuit pack is in this state yields the following abort codes:
 - Ports 1 AND 9 abort Test #206 with code 1024
 - Ports 1 AND 9 abort Test #205 with code 2000
 - Board level Tests #209 and #210 abort with code 1024
3. `save/restore announcements` times out with **Error encountered, can't complete request**

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- `busyout board PCSS` (this command drops all calls in progress on the Announcement circuit pack)
- Reset circuit pack using `reset board PCSS`
- Release circuit pack using `release board PCSS`

Super frame match inquiry test (#211)

The super frame is a means by which the SP synchronizes with the 140AY device on the Announcement circuit pack. If the super frame is not synchronized, the SP is not able to properly process record/playback requests. Both the SP and the hardware generate a super frame pulse. When these two pulses are out of synch, the SP sets a flag to indicate the mismatch. When this test is run, the state of this flag is returned.

Table 131: TEST #211 super frame match inquiry 1 of 2

Error code	Test result	Description/ Recommendation
2000	ABRT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type. 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 131: TEST #211 super frame match inquiry 2 of 2

Error code	Test result	Description/ Recommendation
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	ABRT	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Test failed. Announcement playbacks should sound corrupted. 1. Reset the circuit pack via reset board PCSS and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning).  WARNING: Replacing the circuit pack results in loss of integrated announcements. See General notes on page 447 near the beginning of this Maintenance procedure.
	PASS	The SP can properly process record/playback requests. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to ANN-PT (announcement port) on page 447 for a description of the port tests.
2 of 2		

Clock match inquiry test (#212)

This test is supported to determine the state of the clock generation circuitry on the Announcement circuit pack. This circuitry is used for controlling various pieces of the hardware, like the 140AY device. It is also used to synchronize the Announcement circuit pack with the clock that is on the backplane.

Table 132: TEST #212 clock match inquiry test 1 of 2

Error code	Test result	Description/ Recommendation
2000	ABRT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
1 of 2		

Table 132: TEST #212 clock match inquiry test 2 of 2

Error code	Test result	Description/ Recommendation
2100	ABRT	Could not allocate the necessary system resources to run this test.
	ABRT	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Test failed. Announcements recorded or played back while the clock circuitry is not functioning properly sound distorted. The ANN-BD may be defective or the Active Tone-Clock circuit pack (TONE-BD) may be marginal and is causing this test to fail. 1. Reset the circuit pack via <code>reset board PCSS</code> and then run this test again. If the test continues to fail, proceed to Step 2 or 3 as applicable.  WARNING: Replacing the circuit pack results in loss of integrated announcements. See General notes on page 447 near the beginning of this Maintenance procedure.
	FAIL	2. Replace the ANN-BD. Rerun the test. If the test continues to fail, replace the Tone-Clock circuit pack.  WARNING: Replacing the TONE-BD causes a COLD 2 reset. See Replacing the IPSI or Tone-Clock Circuit Pack on page 2292. Replacing the ANN-BD results in loss of integrated announcements. See General notes on page 447 near the beginning of this Maintenance procedure. 3. If there are recurring alarms on this circuit pack caused by this test failing, replace the ANN-BD even if the previous steps were successful.
	PASS	Announcement record/playbacks should have clear sound quality. User-reported troubles on this circuit pack should be investigated using other circuit packs and port tests. Refer to ANN-PT (announcement port) on page 447 for a description of the port tests.
		2 of 2

ANN-PT (announcement port)

MO Name in Alarm Log	Alarm level	Initial command to run	Full name of MO
ANN-PT	MIN	<code>test port location 1</code>	Announcement Port
ANN-PT	WRN	<code>test port location 1</code>	Announcement Port

The TN750 Announcement circuit pack is a service circuit pack that provides an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (that is, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. If there are any errors associated with the circuit pack, refer to [ANN-BD \(Announcement circuit pack\)](#) on page 429.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack, and communicates with the switch via the control channel on the TDM Bus. The second processor, or SP, controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

General notes

Here are a few very important general notes that apply to any problem on the TN750 Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, especially if the circuit pack needs to be replaced.

1. The TN750/B Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power*. For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always better to try to reset the circuit pack via `reset board PCSS` first and, if that does not work, then try to reseat it. Announcements are preserved through a software reset, but they are lost when the circuit pack is reseated.
2. If a customer has announcements on the Announcement circuit pack, then announcements must be saved on the system tape to ensure that they are not lost. This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the pack is in proper working order (see Note).

Note:

Unlike translations, announcements are NEVER automatically saved to the memory card.

Communication Manager Maintenance-Object Repair Procedures

3. **Save announcements** replaces the announcement file on the card with the Announcement circuit pack speech memory. Care must be taken not to mistakenly enter this command, thereby destroying a valid file on tape.
4. **Restore announcements** replaces the Announcement circuit pack speech memory with the announcement file on the card. Care must be taken not to mistakenly enter this command, thereby destroying valid speech memory (especially if the card does not have a valid announcement file on it).
5. Whenever the Announcement circuit pack is replaced, announcements must always be re-recorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the circuit pack.
6. If announcement speech memory is corrupted, announcements should not be saved, that is, if the Announcement Checksum Test (#209) fails or if the speech sounds corrupted on playback. This can ruin a good announcement file and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file, then announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).
7. Although Announcement Port 5 and Data Line Circuit Port 17 on the Announcement circuit pack are logically two separate ports, they are physically the same port. Therefore, if one of the ports is in use, the other one will be busy. Also, if Announcement Port 5 is out-of-service, the Data Line Circuit Port is taken out-of-service. However, if the Data Line Circuit Port is out-of-service, the Announcement Port remains in-service.

Announcement administration

A brief description of the integrated announcement administration is given here to aid in the troubleshooting of the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to *Administrator's Guide for Avaya Communication Manager, 555-233-506*.

Announcement session

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate FAC (administered as Announcement access code on the FACs form). Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press station keypad digit 2. To delete an announcement, press station keypad digit 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

Uploading/Downloading announcements

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the memory card with **save announcements**. Similarly, integrated announcements can be downloaded to the Announcement circuit pack with **restore announcements**. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a memory card. These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads/downloads take between 30 and 45 minutes.

The system automatically tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

- An announcement is recorded within 10 minutes of circuit pack insertion.
- An announcement download is invoked sooner with the administration terminal **restore announcements** command.
- There is no announcement and/or NETCON data module administered.
- Either the announcement data module is busy or all the administered NETCON data modules are busy.
- There is no memory card in the system.
- The memory card in the system does not have a valid announcement file saved on it.

Note:

Unlike translations, there is no provision in the system for automatically saving announcements to the memory card.

Announcement Board Locked Condition

The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the announcement ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and will attempt to use the ports.

If the circuit pack is locked into this state, the following symptoms will be observed:

1. When attempting to record an announcement, users will hear the proper record tone, but the announcement will not record (they will not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state will yield the following abort codes:
 - Ports 1 AND 9 abort Test 206 with code 1024.
 - Ports 1 AND 9 abort Test 205 with code 2000.
 - Board-level Tests 209 and 210 abort with code 1024.
3. The **save/restore announcements** times out with:

`Error encountered, can't complete request`

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board location** (this command drops every call in progress on the Announcement circuit pack).
- Reset circuit pack using **reset board location**.
- Release board using **release board location**.

Hardware error log entries and test to clear values

Table 133: Announcement port error log entries

Error Type	Aux data	Associated test	Alarm level	On/Off board	Test to clear value
0 (a)	0	Any	Any	Any	test port <i>PCSSpp</i> sh r 1
1		Playback Speech Memory Array (PSMA) Test (#206)	MIN	ON	test port <i>PCSSpp</i> sh r 3
18	0	The port was busied out	WRN	OFF	release port <i>PCSSpp</i>
130 (b)		None	WRN	ON	test port <i>PCSSpp</i> sh
257		Channel Administration Memory Array (CAMA) Test (#205)	MINOR	ON	test port <i>PCSSpp</i> l r 3
	17667	In-line error			
513		140AY Channel Sanity Inquiry Test (#222)	MINOR	ON	test port <i>PCSSpp</i> sh r 3
	17684	In-line error			
769 (c)		None			

Notes:

- a. **Error Type 0:** Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- b. **Error Type 130:** the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- c. **Error Type 769** is logged and the port is alarmed when an alarm is raised on the Announcement circuit pack because of a faulty condition with a common circuit pack resource. Any one of the following alarmed errors on the Announcement circuit pack causes this error to be logged against the Announcement Port: 1793, 2049, 2305, 2561. Follow the [ANN-BD \(Announcement circuit pack\)](#) maintenance documentation to resolve these alarms. When the corresponding circuit pack alarm is cleared, this alarm clears.

System technician-demanded tests: descriptions and error codes

Investigate tests in the order presented. By clearing error codes associated with the Channel Administration Memory Array (CAMA) Test, you may also clear other errors.

Table 134: Announcement port system technician-demanded tests

Order of investigation	Short test sequence	Long test sequence	D/ND ¹
Channel administration memory array (cama) test (#205)		X	ND
Playback speech memory array (PSMA) test (#206)	X	X	ND
140AY channel sanity inquiry test (#222)	X	X	ND

1. D = Destructive; ND = Nondestructive

Channel administration memory array (CAMA) test (#205)

This test is a memory device that stores information used to control the 140AY device. The Angel asynchronously feeds the CAMA with the control information. During the CAMA test, the Angel writes patterns into the CAMA, reads them back, and verifies that they match. If the patterns do not match, the test fails. This test is run periodically by the switch maintenance and by the Announcement circuit pack in the background.

Table 135: TEST #205 channel administration memory array (CAMA) test 1 of 2

Error code	Test result	Description/ Recommendation
1000	ABRT	System resources required to run this test are not available. The port may be in use on a valid call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABRT	Response to the test request was not received within the allowable time period. See Note (a) at end of table for more information.
2100	ABRT	Could not allocate the necessary system resources to run this test.
	ABRT	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.

1 of 2

Table 135: TEST #205 channel administration memory array (CAMA) test 2 of 2

Error code	Test result	Description/ Recommendation
	FAIL	<p>Test failed. Announcements played back on this port may sound corrupted.</p> <ol style="list-style-type: none"> 1. Reset the circuit pack via <code>reset board PCSS</code> and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). <p>⚠ WARNING: Replacing the circuit pack results in loss of integrated announcements. Refer to General notes on page 447.</p>
	PASS	<p>This test verifies that the Angel processor can properly set up this port for playbacks. User-reported troubles on this circuit pack should be investigated using other port and circuit pack tests. (Refer to ANN-BD (Announcement circuit pack) on page 429 for a description of the circuit pack tests.)</p>
		2 of 2

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) is unusable by software. Also, `save/restore announcements` do not work because the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

- When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
- Performing a `test board location long` when the circuit pack is in this state yields the following abort codes:
 - Ports 1 AND 9 abort Test #206 with code 1024
 - Ports 1 AND 9 abort Test #205 with code 2000
 - Board level Tests #209 and #210 abort with code 1024
- `Save/restore announcements` times out with **Error encountered, can't complete request**

Clear the Announcement circuit pack lock-up remotely by performing a soft reset to the circuit pack:

1. `busyout board location` (this command drops all calls in progress on the Announcement circuit pack)
2. Reset circuit pack using `reset board location`
3. Release circuit pack using `release board location`

Playback speech memory array (PSMA) test (#206)

The PSMA test checks the integrity of a playback channel's interface to the speech memory and the TDM Bus. The SP has an internal buffer that contains a specific 256-byte sequence. During this test, the byte sequence is "played" through the 140AY device onto the TDM Bus. A General Purpose Tone Detector is used to confirm that the proper sequence was played. This test is very important. It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

Table 136: TEST #206 playback speech memory array (PSMA) test 1 of 3

Error code	Test result	Description/ Recommendation
1000	ABRT	System resources required to run this test are not available. The port may be in use on a valid call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM Bus) on page 2193 to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat the test at 1-minute intervals a maximum of 5 times.

Refer to General notes on page 447.</p>
255	FAIL	<p>Test failed. The Announcement Port and the Tone Detector never synchronized. Check for active GPTD-PT errors, and refer to GPTD-PT (General-Purpose Tone Detector Port) on page 1303 to diagnose them first.</p> <ol style="list-style-type: none"> 1. If there are no active GPTD-PT errors, reset the circuit pack via reset board PCSS and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). <p>⚠ WARNING: Replacing the circuit pack results in loss of integrated announcements. Refer to General notes on page 447.</p>
	PASS	<p>This port can cleanly play announcements. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to ANN-BD (Announcement circuit pack) on page 429 for a description of the circuit pack tests.</p>
3 of 3		

Notes:

The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

- When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
- Performing a `test board location long` when the circuit pack is in this state yields the following abort codes:
 - Ports 1 and 9 abort Test #206 with code 1024
 - Ports 1 and 9 abort Test #205 with code 2000
 - Board level Tests #209 and #210 abort with code 1024
- The `restore announcements` command times out with **Error encountered, can't complete request**

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

1. `busyout board location` (this command drops all calls in progress on the Announcement circuit pack)
2. Reset circuit pack using `reset board location`
3. Release circuit pack using `release board location`

140AY channel sanity inquiry test (#222)

The Angel keeps a sanity status bit for each of the 16 channels on the 140AY device. This test queries the Angel to determine the status for a particular channel. If a channel is insane, that implies that announcements cannot be played back on that channel.

Table 137: TEST #222 140AY channel sanity inquiry test 1 of 2

Error code	Test result	Description/ Recommendation
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	ABRT	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.

ASAI-ADJ (ASAI Adjunct)

S8700 | 8710 / S8500

Refer to [BRI-SET, BRI-DAT, Various Adjuncts](#) on page 684.

ASAI-BD (Multi-Application Platform Board)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ASAI-BD	MIN	<i>test board location</i>	ASAI-BD
ASAI-BD	WRN	<i>test board location</i>	ASAI-BD

Maintenance testing of the common circuit pack is handled by on-board firmware and server-controlled tests. Maintenance software queries the firmware for error and alarm information, status, and test results. Firmware automatically reports error conditions that result in server-controlled testing.

For MAPD board insertion, the switch makes an additional board query if any of the following circuit packs are inserted:

Circuit Pack	Vintage
TN754	49
TN556	49, 80 or greater
TN800	any

For any of the previous initial board uplinks, the switch queries the board for administration data as well as reporting the switch software release and the system type.

For the native mode, the response to the board query downlink messages consists of several CCMS uplink messages that identify the true board code, vintage, suffix, emulation type, and number of reserved slots needed.

Note:

Refer to LAN-BD Maintenance documentation for circuit pack level errors. See also [ASAI-PT](#) on page 476 and [ASAI-EPT](#) on page 466 for related line information. See the following exceptions listed below:

- **Hyperactivity:** Currently, the common circuit pack is considered “hyperactive” if the Service Dispatcher receives 200 uplink messages from the circuit pack in a 10-second period. Since MAPD has 32 ports, the hyperactivity limit increases to 500 uplink messages per 10 seconds. The switch issues an alarm when the limit reaches 400; when it reaches 500 up-link messages in 10 seconds, the board is taken out of service.

- LED use: The LED Control message 038x requests the Angel to drive the red, amber, and green LEDs on the face plate of a typical port board on or off. Only the MAPD's red LED is controlled by this message. Yellow and green change requests the MAPD receives from the switch drive LCD behavior rather than LED behavior. The system continues to send the same LED control messages to the MAPD that the system currently sends to every other port board. The MAPD handles proper interpretation of these messages. You should note that the PC on the MAPD and the switch itself control the LEDs and the LCD on the MAPD.
- Port Administration: In Administration Without Hardware (AWOH), the switch allows administration of up to 8 ports in any of the first 12 ports. If the port type later reported by the board does not match the existing type, the switch assumes it to be a MAPD board with a different configuration and rejects the board.

ASAI-EPT

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ASAI-EPT	MAJ ¹	<code>test station extension</code>	ASAI-Adjunct

1. The alarm level for ASAI adjuncts is administered using **set options**. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI adjunct in the system.

The maintenance strategy for this endpoint MO is built on maintenance facilities offered in the Avaya ISDN-BRI protocol and in the ASAI adjuncts. Currently there are no facilities in the protocol that provide for maintenance of set data features.

The TN800 is a PC-based platform that allows interaction of multiple applications with Communication Manager at any time. Communication Manager (native mode) supports emulation of three types of port MOs on this board. The type of ports to be emulated is defined by the applications running on the TN800.

Note:

If the TN800 is emulating BRI, the software/firmware supports up to 12 ports, but only 8 of the 12 ports can be administered at any one time.

Error Log Entries and Test to Clear Values

					2 of 2

1. Major alarms on this MO may be downgraded to Warning alarms based on the value used in **set options**.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

Communication Manager Maintenance-Object Repair Procedures

- b. **Error Type 2:** ISDN-BRI signaling protocol violation. Timers associated with layer-3 messages expired before a required response was received. In the following table, the aux data column indicates which timer has just expired.

Aux Data	Timer Type
2	First T303 (SETUP timer)
3	Second T303 (SETUP timer)
4	T305 (DISConnect timer)
5	First T308 (RELease timer)
6	Second T308 (RELease timer)
10	T316 (REStart timer)
12	T309 (Layer-2 Failure timer)
16	TM100 (Management Information message Timer 1)
17	TM200 (Management Information message Timer 2)
102	TASAI (ASAI Routing Timer)

The switch sent a message to an endpoint that did not respond in the allotted time. This may be due to failure of the point-to-point signaling link or because of a problem in the ASAI adjunct. To repair:

- Execute **test station extension** and perform the associated repair procedures for those tests.
- c. **Error Type 257:** An endpoint is not responding to the service state query message sent to the adjunct or to the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or to the adjunct.

When this error occurs for an ASAI adjunct, the Aux Data field indicates the state of the ASAI link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

Aux Data	ASAI Link State	Error
102	13-restarting	No response to RESTART message
104	13-restarting	Invalid response to RESTART message
152	13-restarted	No response to layer-3 query
154	13-restarted	Invalid response to layer-3 query
202	13-established	No response to layer-3 query
204	13-established	Invalid response to layer-3 query

See [Maintenance SAT Commands](#) in Maintenance Commands Reference (03-300191) for an explanation of the ASAI link states.

For ASAI or Avaya adjuncts, the switch queries the adjunct every two minutes. The Layer 3 Query test is not executed for ASAI or Avaya adjuncts through a command entered from the management terminal. While alarmed for this error, the switch takes the associated port out-of-service for five seconds every 15 minutes. This action attempts to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or Avaya adjunct, the service technician should:

1. Execute `test station extension` and perform the associated repair procedures.
 2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.
- d. **Error Type 351:** logged against an ASAI endpoint when the adjunct asks the switch to suspend maintenance on the ASAI endpoint. Clear with busyout and release of the ASAI station.
- e. **Error Type 513:** the endpoint sent more messages than the switch could handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.
- f. **Error Type 769:** an ASAI endpoint's associated signaling link has too much traffic related to link establishment. This occurs when the signaling link is alternating between assigned and established states. If this problem persists, replace the endpoint.
- g. **Error Type 2561:** the ASAI-EPT message was not transmitted because the PKT-CTRL (Packet Control circuit pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI adjunct. Follow the repair procedures for the PKT-CTRL. If these attempts fail, re-engineering the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

Communication Manager Maintenance-Object Repair Procedures

- h. **Error Type 2562 - 2566:** the ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow-controlled. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI adjunct. Follow the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- i. **Error Type 2567:** This version of ASAI is not supported. Check the software version that is running on the ASAI adjunct.
- j. **Error Type 2568:** The adjunct identification is invalid. Check the vendor ID or software running on the ASAI adjunct.
- k. **Error Type 3329:** the point-to-point signaling link to the endpoint went down, except when the link goes down because either a system technician has busied out the PKT-CTRL or the PKT-BUS, or they have failed. This error raises an alarm against the endpoint or adjunct. Execute `test station extension short` and note the results of the Signaling Link Status Test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is re-established to the endpoint or adjunct.
- l. **Error Type 3584 - 3839:** The switch software logs certain ASAI cause values. The cause value is determined from the following formulas:
 - If the error type is greater than 3712, then the ASAI cause value is equal to the error type minus 3712. The switch sent this value to the adjunct.
 - If the error type is less than 3712, then the ASAI cause value is equal to the error type minus 3584. The adjunct sent this value to the switch.

[Table 141: ASAI cause values](#) on page 471 contains a description of the various ASAI cause values and recommended system technician actions associated with the cause value.
- m. **Error Type 3841 - 4095:** The switch software logs certain ASAI cause values. The cause value is determined from the following formula:
 - If the error type is greater than 3968, then the ASAI cause value is equal to the error type minus 3968. The switch sent this value to the endpoint.
 - If the error type is less than 3968, then the ASAI cause code is equal to the error type minus 3840. The endpoint sent this value to the switch.

Table 141: ASAI cause values 1 of 3

Code	Explanation	Recommendation
0	Unrecognized ASAI Protocol Operation.	<p>Requested ASAI protocol is not implemented by switch or adjunct. <i>Aux Data</i> field of error log entry contains protocol identifier for unrecognized operation.</p> <ol style="list-style-type: none"> 1. Consult switch and adjunct documentation to determine which set of operations is supported by switch and the adjunct. Turning off adjunct operations not implemented by the switch may resolve the problem.
34	No circuit or channel available	<p>A resource on the switch is unavailable for a call. For BRI endpoints, this cause value is not logged. For ASAI, this condition means that there are no available trunks for an outgoing call request.</p> <ol style="list-style-type: none"> 1. Verify that the adjunct is administered to support the trunk capabilities of the switch. 2. Investigate trunk-group status by issuing status trunk from the SAT or by requesting trunk-group queries from the adjunct. 3. Perform trunk diagnostic procedures outlined in this manual.
40	Resources not available.	<p>No available internal resources to service switch or adjunct request. Exceeds system transaction capacity for adjunct or switch.</p> <ol style="list-style-type: none"> 1. May require re-engineering of adjunct services.
1 of 3		

Table 141: ASAI cause values 2 of 3

Code	Explanation	Recommendation
50	Requested facility not subscribed	<p>Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct.</p> <p>For BRI endpoints:</p> <ol style="list-style-type: none"> 1. Verify the switch administration of endpoint using display station or display data-module. 2. If step 1 does not resolve the problem, refer to the endpoint's service manual and verify administration on the endpoint. <p>For ASAI adjuncts:</p> <ol style="list-style-type: none"> 1. Display the Customer Optional Features screen (administration screen) on the switch to determine which ASAI capabilities are turned on in the switch. 2. Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administered capabilities, then re-administer the switch and/or the adjunct to establish a consistent set of desired capabilities on both the switch and the adjunct.
58	Bearer capability not currently available	<p>Requested bearer capability is implemented, but not administered. No B channel is administered. See code 50 above.</p>
63	Service or option not available	<p>Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resource. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct.</p> <ol style="list-style-type: none"> 1. Verify that no overlapping administration of switch resources (for example, requesting notifications on a single domain by multiple adjuncts attempting to control a single call) exists across any adjunct connected to the switch. If an overlap exists, then re-administer the adjuncts to ensure that each adjunct is associated with a unique set of switch resources.
65	Bearer service not implemented	<p>Requested service not implemented in switch or endpoint.</p>
2 of 3		

Table 141: ASAI cause values 3 of 3

Code	Explanation	Recommendation
69	Requested facility not implemented	Requested service not supported in switch or endpoint. 1. Consult switch and endpoint documentation to determine service support.
79	Service or option not implemented	Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct. 1. Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Re-administration of the switch-administered capabilities (see Customer Optional Feature screen) or those of the adjunct may be necessary to correct the problem.
81	Invalid CRV	An invalid CRV was sent by the adjunct. 1. This may indicate a CRV inconsistency between the switch and the adjunct. See the CallVisor protocol reference manual.
87	Internal switch audit	There is an inconsistency in switch data records. 1. There is no action needed, since the switch has corrected the data inconsistency.
3 of 3		

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors associated with the circuit pack and port first. Clearing these error codes may also clear errors against the endpoint. When every circuit pack and port error has been cleared, but errors still exist against the endpoint, investigate errors in the table below.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND
Signaling Link Status test (#626)	X	X	Nondestructive

BRI Layer 3 Query Test (#629)

This test is not used by the ASAI-ADJ MO. For information about this test, see [BRI-SET](#), [BRI-DAT](#), [Various Adjuncts](#) on page 684.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is “bound” to an endpoint and fails if the link is “not bound.”

The definition of the term “bound” for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of “bound” for ASAI type of endpoint is:

- ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):

For endpoints of this type, the signaling link is “bound” when the link is connected at Layer 2 (L2 established).

Table 142: Test #626 Signaling Link Status Test 1 of 2

Error Code	Test Result	Description / Recommendation
1139	ABRT	The PN's packet bus is out-of-service. 1. Follow the repair procedures for the packet bus. 2. After completing step 1, execute <code>test port location long</code> and review the results of the BRI Port Local LAN Looparound test (#618) to verify the repair.
1141	ABRT	The PKT-CTRL is out-of-service. 1. Refer to PKT-CTRL maintenance documentation.
S8700 8710 S8500: 1187	ABRT	The circuit pack, port, or station may have been busied out. 1. Look in the Error Log for Error Type 18 (busied out) for ASAI-BD, ASAI-PT, or ASAI-EPT. 2. If this Error Type is present for ASAI-EPT only, use <code>release station</code> and run the test again. 3. If this Error Type is present for ASAI-PT and ASAI-EPT, use <code>release port</code> and run the test again. 4. If this Error Type is present for ASAI-BD, ASAI-PT, and ASAI-EPT, use <code>release board</code> and run the test again.
2012	ABRT	Internal system error
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 142: Test #626 Signaling Link Status Test 2 of 2

Error Code	Test Result	Description / Recommendation
1113	FAIL	<p>The signaling link is not “bound” to the adjunct. For ASAI adjuncts this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified by administration, the link is only “unbound” from the endpoint when it is disconnected.</p> <p>1. Execute <code>status bri-port location</code> and see BRI-PORT (ISDN-BRI Port) ABRI-PORT (ASAI ISDN-BRI Port) on page 661.</p>
	PASS	The signaling link is connected at Layer 2 and “bound” to the ASAI adjunct.
2 of 2		

ASAI-PT

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ASAI-PT	MAJ ^{1,2}	<code>test port location 1</code>	ASAI ISDN BRI port
ASAI-PT	WRN	<code>test port location 1</code>	ASAI ISDN BRI port

1. The alarm level for ASAI adjunct ports may be administered using **set options**. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI adjunct port in the system.
2. All alarming for an ASAI adjunct and off-board alarming for an ASAI port is disabled if the ASAI adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI adjunct. Check the Hardware Error and Alarm Logs to see if the adjunct has disabled alarming.

Unless otherwise stated, every maintenance action contained in this section applies to ASAI-PT and ISDN-BRI ports connected to ASAI adjuncts. This port type is administered as an ASAI-BD on the TN800 circuit pack.

The TN800 circuit pack is a PC-based platform that allows interaction of multiple applications with Avaya™ Communication Manager. Communication Manager software (native mode) supports emulation of three types of port MOs on this board. The type of ports to be emulated are defined by the applications running on the TN800. The TN800 can support up to 32 ports (time slots) at a time.

The TN800 connects to the switch through a single slot in the backplane, however its width is not limited to one slot. The number of slots occupied by the TN800 is supplied by the board during its insertion. The TN800 (Release 5 and higher) is three slots wide. The blank (reserve) slots are to the left of the functional slot.

In non-native mode the TN800 is recognized as TN556, TN2181, TN754, or TN746 based on the switch software and the application running on the TN800. In non-native mode only one type of port MO runs at any time, and the port type depends on the application running on the TN800. If the TN800 fails diagnostics in non-native mode, the system's alarm and error logs would show a failure for the board type the TN800 is emulating.

Error Log Entries and Test to Clear Values

Table 143: ASAI-PT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level ASAI-PORT	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location sh r 1</code>
1 (b)	(a)	Level 1 Status inquiry (#621)	MAJ ¹	OFF	<code>test port location sh r 2</code>
513 (c)	0	none	(b)	ON	
1537 (d)	46210	CRC Error counter (#623)	MAJ ₁	OFF	
3841 (e)	46208	None			
3844 (f)	46223	None			
3845 (g)	46211	None			
3846 (h)	TEI	None			

1. Major and Minor alarms may be downgraded to warning alarms based on the value used in **set options**.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 1:** Level 1 Status inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. The `Aux Data` field contains one of the following values:

Blank	This indicates that the Level 1 Status inquiry failed.
32773	This is a message from the ASAI-Line circuit pack indicating Level 1 has been deactivated.

Refer to the repair procedures for Test #621.

Communication Manager Maintenance-Object Repair Procedures

- c. **Error Type 513:** The circuit pack is having problems transmitting data to the packet bus, thus affecting the conveyance of signaling information over the D channel. This error occurs when the packet bus transmit FIFO buffer overflows. This condition probably indicates a hardware problem as well. The ASAI-PORT alarm level is MAJOR with aux data 0. Use troubleshooting procedures for both on-board hardware problems and potential off-board packet-bus problems.
- d. **Error Type 1537:** The port received an invalid frame over the D channel. When the cyclical redundancy check (CRC) errors exceed 5 within 15 minutes, the port is taken out of service for 5 seconds. If 5 more CRC errors are received within 15 minutes of the first set of 5 errors, the port is taken out of service for one minute. If 5 more CRC errors are received within 15 minutes of the last 5, the port is taken out of service for 15 minutes.

This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source, or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

- Check the wiring to the endpoints or the adjunct.
 - If the problem persists, replace the endpoints or adjuncts.
- e. **Error Type 3841:** a Layer 1 Transmission error is detected for the port. Run the long test sequence, and note the results of the Layer 1 Transmission Error Counter test (#624).
- f. **Error Type 3844:** the circuit pack detects an overflow of its receive buffers. Run the long test sequence, and note the results of the Receive FIFO Overflow Counter test (#625).
- g. **Error Type 3845:** the BRI Port Local LAN Looparound test (#618) fails. Run the long test sequence, and note the results of Test #618.
- h. **Error Type 3846:** the TEI (Terminal Endpoint Identifier) administered for the ASAI endpoint most likely does not match the TEI administered in the ASAI adjunct. Check the switch administration of the TEI against that of the adjunct, and make sure that both are using the same TEI.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the ASAI Port Local LAN Looparound test (#618), you may also clear errors generated from other tests in the testing sequence.

Table 144: System Technician-Demanded Tests: ASAI-PT

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
ASAI Port Local LAN Looparound test (#618)		X	D
Level 1 Status Inquiry test (#621)	X	X	ND
CRC Error Counter test (#623)		X	ND
Layer 1 Transmission Error Counter test (#624)		X	ND
Receive FIFO Overflow Error Counter test (#625)		X	ND
Clear Error Counters (#270)	X	X	ND

1. D = Destructive, ND = Nondestructive

BRI Port Local LAN Loop-Around Test (#618)

This test is **destructive**.

This test verifies the connectivity of a BRI port across the LAN Bus and executes only if the port is out-of-service. The test aborts if calls associated with the port are in-progress. Failures of this test indicate either on-board faults associated with the ASAI-PT hardware on the circuit pack or problems with the LAN Bus, which is used to form connectivity between the switch and the ASAI-PT.

The dotted lines in [Figure 24: BRI Port Local LAN Loop-Around Path](#) on page 480 show how a loop-around test is performed across the packet bus for the D channel.

Figure 24: BRI Port Local LAN Loop-Around Path

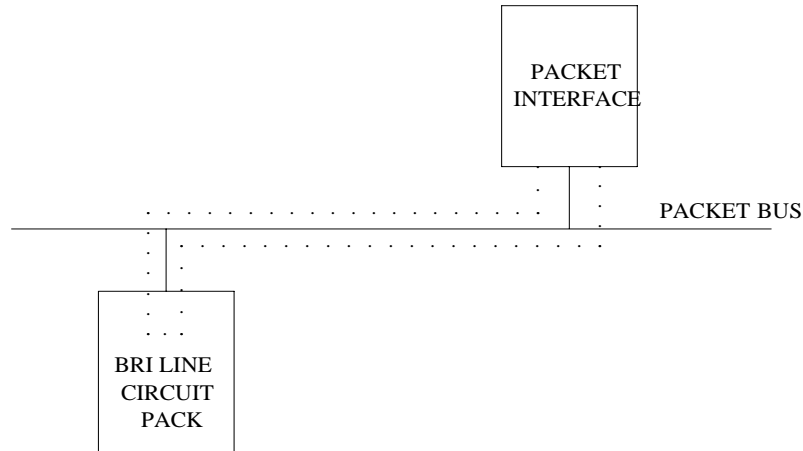

Table 145: Test #618 BRI Port Local LAN Looparound 1 of 2

Error Code	Test Result	Description / Recommendation
1015	ABRT	<p>The port is not in the out-of-service state.</p> <ol style="list-style-type: none"> 1. Display the Port Status screen using <code>status bri-port location</code> to determine which stations or adjuncts are on this port. 2. Use the extension shown on this screen in <code>status station</code> to determine whether the station or adjunct is active. 3. If the port is active, wait until it is idle, and use <code>busyout port location</code> to place it in the out-of-service state and repeat this test. <p>⚠ WARNING: Since the <code>busyout</code> command is destructive, using this command prior to the port being idle causes every transaction associated with the ASAI on the port to be torn down. Note that 3rd-party calls established by an ASAI adjunct remain connected even though the port is taken out-of-service.</p>
		<i>1 of 2</i>

Table 145: Test #618 BRI Port Local LAN Looparound 2 of 2

Error Code	Test Result	Description / Recommendation
1139	ABRT	The PN's packet bus is out-of-service. 1. Follow the repair procedures for the packet bus. 2. After completing step 1, execute test port long location and review the results of the BRI Port Local LAN Looparound test to verify the repair.
1141	ABRT	The PKT-CTRL is out-of-service. 1. Follow the repair procedures for the PKT-CTRL. 2. Enter test port long location and review the results of the BRI Port Local LAN Looparound test to verify the repair.
2012	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	The loop-around test has failed. 1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the board are idle. Reset the circuit pack by issuing the busyout board location and reset board locations . 2. If the test fails again, execute test pkt P on the management terminal. If this fails, follow the failure procedures the in PKT-BUS section. 3. If the tests executed in step 2 pass, the problem is local to the BRI board. Replace the circuit pack.
	PASS	The BRI Port Local LAN Looparound test has passed.
2 of 2		

Level 1 Status Inquiry Test (#621)

This test determines the state of the transmission facility of a BRI port at the Level 1 (L1) or physical layer. L1 can be in one of two possible states: Activated or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI adjunct administered on this port. This test passes if the state of L1 is activated. This test also passes if software has taken this port out of service.

Communication Manager Maintenance-Object Repair Procedures

The Deactivated state indicates a problem with the ASAI circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ASAI port is placed in the out-of-service state, Level 1 is also put into the deactivated state. This could be due either to the system detecting a fault with the port or in response to a `busyout port location` request.

Table 146: Test #621 Level 1 Status Inquiry 1 of 2

Error Code	Test Result	Description / Recommendation
1187	ABRT	<p>The board, port, or station may have been busied-out by a technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (port busied out) for this port and ASAI-BD (board busied out). If this error type is present for ASAI-PT only, then release the port using <code>release port location</code> and run the test again. If the error is present for both ASAI-BD and ASAI-PT, then release the board with <code>release port location</code> and run the test again. <p>Note: When you release a port, you release every port associated with it. If certain ports still need to be busied out, use <code>busyout port location</code> to busy them out.</p> <ol style="list-style-type: none"> 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	<p>Response was not received from the circuit pack within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the test aborts repeatedly up to 5 times, reset the circuit pack using <code>busyout board location</code> and <code>reset board location</code>. 2. If the test aborts again, replace the circuit pack.
2012	ABRT	Internal system error
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 146: Test #621 Level 1 Status Inquiry 2 of 2

Error Code	Test Result	Description / Recommendation
3	FAIL	<p>Received a status of Level 1 Deactivated; the port is out of service.</p> <ol style="list-style-type: none"> 1. Enter <code>status bri-port location</code> to verify that the service state of the port is out-of-service. If the port is not out of service, escalate the problem, or else proceed to step 2. 2. If the port has been placed out-of-service using <code>busyout port location</code>, use <code>release port location</code>. Then enter <code>test port long location</code> and review the results of Level 1 Status Inquiry test. If this test still fails, proceed to step 3. 3. After executing <code>test port long location</code> review the results of every test. Follow the repair procedures for any tests that fail. Verify repair of the problem by executing <code>test port location</code> and by determining that the Level 1 Status test passes. 4. If the test continues to fail for this reason, escalate the problem.
	PASS	This test indicates that Level 1 is activated, or that software has taken the port out of service.
2 of 2		

CRC Error Counter Test (#623)

This test reads and clears the BRI port's CRC error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it receives a frame from the endpoint or adjunct with a bad CRC over the D channel. The test passes if the value of the counter is 0 (the error is cleared). If the counter is not 0, the test fails and the value of the counter is displayed in the `Error Code` field. A CRC error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source (for example, electrical motors or generators), or no termination (open circuit). It usually does not indicate a problem with the BRI circuit pack. This test is used for verifying the repair of the problem.

Table 147: Test #623 CRC Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	<p>Response was not received from the circuit pack within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the test aborts repeatedly up to 5 times, reset the circuit pack using busyout board location and reset board location. 2. If the test aborts again, replace the circuit pack. <p> CAUTION: Do not leave the circuit pack busied out.</p>
2012	ABRT	<p>Internal system error</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	<p>The BRI circuit pack is still detecting CRC errors. The Error Code field contains the value of the counter.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, review the results of other tests in the long test sequence. Pay particular attention to the results of the Level 1 Status Inquiry test. Follow the repair procedures for any of the executed tests if they fail; otherwise, proceed to step 3. 3. If the tests for the endpoints or adjunct pass and the CRC error counter test continues to fail, check the wiring to the endpoints or adjunct. If the wiring appears to be OK, escalate the problem.

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port's Layer 1 Transmission error counter maintained on the ASAI circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY® Communications System Generic 1 and Generic 3i Wiring, 555-204-111*). It does not indicate a problem with the TN800 circuit pack. This test is useful for verifying the repair of the problem.

Table 148: Test #624 Layer 1 Transmission Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	Response was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly up to 5 times, reset the circuit pack using busyout board location and reset board location . 2. If the test aborts again, replace the circuit pack.
2012	ABRT	Internal system error
2100	ABRT	Could not allocate necessary system resources to run test. 1. Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The TN800 circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, review the results of other tests in the long test sequence. Note the results of the Level 1 Status Inquiry test. Follow the repair procedures for any of the executed tests if they fail. Otherwise, go to the next step. 3. Replace the circuit pack.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Receive FIFO Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO error counter maintained on the TN800 circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from a packet bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port or if hardware fault is causing the receive buffers not to be emptied properly. This test is useful for verifying the repair of the problem.

Table 149: Test #625 Receive FIFO Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	<p>Response was not received from the circuit pack within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the test aborts repeatedly up to 5 times, reset the circuit pack using busyout board location and reset board location. 2. If the test aborts again, replace the circuit pack.
2012	ABRT	Internal system error
2100	ABRT	<p>Could not allocate necessary system resources to run test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	<p>The TN800 circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, review the results of other tests in the long test sequence. Note the results of the Level 1 Status Inquiry test. Follow repair procedures for any of the tests that fail. Otherwise, go to the next step. 3. If the tests for the endpoints or adjunct pass and the Layer 1 Transmission Error Counter test continues to fail, check the wiring to the endpoints or adjunct.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Clear Error Counters Test (#270)

There are various error counters associated with each ASAI-PT. This test clears those counters and triggers the auditing of layer-3 reinitialization. This test is used only to send messages to the ASAI-PT and should not abort nor fail. ASAI uses a fixed TEI value of 1.

Table 150: Test #270 Clear Error Counters

Error Code	Test Result	Description / Recommendation
Any	ABRT	This test should never abort.
Any	FAIL	This test should never fail. 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	The message to clear the error counters of the ASAI-PT has been sent.

ASAI-RES/E-DIG-RES (TN800 reserve slot)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ASAI-RES	NONE	NONE	TN800 ASAI reserve slot
E-DIG-RES	NONE	NONE	TN800 DIG reserve slot

There are no tests associated with these MOs. Both the **test board** and **busyout board** commands abort when either is attempted on a reserved slot. An error message indicates the slot is associated with the circuit pack that the TN800 is emulating, but the requested operation is not valid.

The TN800 MAPD (Multi-Application Platform) circuit pack connects to the switch through a single slot in the backplane. The number of slots occupied by the MAPD pack is supplied by the board when inserted. The TN800 in R5EM is three slots wide. The TN800 requires 2 reserve slots to its left. The reserve (blank) slots are to left of the functional slot and are place holders on the switch, and do not have any interaction with the switch.

Each instance of these MOs represents a reserve slot associated with respective circuit pack mode in which the MAPD is working.

ATM-BCH (ATM B-Channel Trunk)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ATM-BCH	MAJ ¹	<code>test port location 1</code>	ATM B-Channel Trunk
ATM-BCH	MIN	<code>test port location 1</code>	ATM B-Channel Trunk
ATM-BCH	WRN	<code>test port location sh</code>	ATM B-Channel Trunk

1. A MAJOR alarm on a trunk means that alarms on these trunks are not downgraded by **set options**, and at least 75% of the trunks in this trunk group are alarmed.

ATM-BCH explains how to test and repair TN230x ATM Interface circuit packs (TN2305 and TN2306) that have ATM B-channel trunks administered for ATM Circuit Emulation Service (CES).

For additional repair information, see also [ATM-DCH \(ATM D-Channel Port\)](#) on page 504, [ATM-SGRP \(ATM Signaling Group\)](#) on page 580 and [PKT-BUS \(Packet Bus\)](#) on page 1748.

For maintenance instructions for TN230x circuit packs that are administered as Expansion Interfaces for ATM network connectivity, see [ATM-INTF \(TN2305/6\)](#) on page 555.

ATM Circuit Emulation Service

Under ATM Circuit Emulation Service, you simulate ISDN-PRI circuits by assigning ATM ports to signaling groups. Each signaling group represents a PRI circuit, and the ports in the group represent the D channel and B channels of that circuit. B channels must also be assigned to ISDN-PRI trunk groups. TN230x circuit packs support up to 248 ports per circuit pack.

Signaling Group Components

B (bearer) channels (ATM-BCH) transmit digitized voice or data, while a separate D channel (ATM-DCH) handles call-control signaling. One D channel handles signaling for a group of B channels that combine to form a signaling group (ATM-SGRP).

B-Channel Service States

The ISDN specification defines two service state categories for B channels as listed in [Table 151: ATM ISDN service states](#) on page 490.

Table 151: ATM ISDN service states

Category	Description
Service states	
In-Service (INS)	B channel is in normal operating state
	Active Idle
	A call is connected over the B channel.
	There is no call on the B channel.
Out-of-Service/ Far-End (OOS/FE)	The switch has not successfully negotiated B-channel connection as of yet. Calls cannot be placed or received. When you first administer a B channel, the switch initializes the B channel to this state while it tries to negotiate a connection to the far end. If the request times out with no response from the far end, the switch leaves the B channel in the OOS/FE state.
Out-of-Service/ Near-End (OOS/NE)	The NPE Crosstalk test has failed, or the trunk is busied out. Calls cannot be placed or received.
Maintenance/ Far-End (MTC/FE)	A request has timed out with no response from the far end after signaling is in place and B channels are in service. Calls can be received but not placed, and stable calls are unaffected.
Maintenance/ Near-End (MTC/NE)	The signaling channel (ISDN-LNK) has been busied out, possibly after <code>test trunk grp#/mem# long</code> . Calls cannot be placed or received, but stable calls are unaffected.
Pending states	The switch is waiting for a reply from the far end. Pending service states remain in effect until the near end receives a response or times out.
Pending-in-Service	The near end is waiting for a response to a transition-to-service request.
Pending-Maintenance	The near end is waiting for a transition-to-maintenance-service request (US and other country-protocol-1 systems).

B-Channel Alarms

The Maintenance/Far-End and Out-Of-Service/Far-End states generate warning alarms displayed with `status trunk grp#/mem#`.

Table 152: ATM-BCH alarms by service state

Service state	Alarm ¹	Possible cause	Possible solution
Out-of-Service/NE	WRN	Trunk busied out	Release the port (<code>release trunk grp#/mem#</code>).
	MIN	NPE Crosstalk test (#6) failed	Replace ATM circuit pack.
	None	ATM circuit pack lost signal or there is a circuit pack problem.	Install circuit pack or cable. Check circuit pack using procedures in ATM-BCH. Check far-end switch status.
Out-of-Service/FE	WRN	Unadministered far end	Administer the corresponding trunk on the far-end switch.
	WRN	Far-end busied out	Check the status of the far-end switch.
Pending/ In-Service Pending/Maint	None	Maintenance message timed out waiting for reply	Wait 2 minutes after the pending state clears, and check the service state.
Maint/NE	None	ISDN test call in progress (<code>test trunk long</code>)	Wait for the test to finish and recheck.
	None	System link busied out	Check link status. Run <code>release link link#</code> .
Maint/FE	WRN	Signaling channel down for over 90 sec.	See ATM-SGRP (ATM Signaling Group) on page 580 or ATM-DCH (ATM D-Channel Port) on page 504.
	WRN	Repeated lack of response to messages sent to the far end	Wait. Maintenance software resends messages periodically. Or run <code>test trunk grp#/mem#</code> or <code>test signaling-grp grp#</code> .
	WRN	The far-end trunk is being tested.	Check status of the far-end switch. Wait for testing to finish.
In-Service	None	Normal operating state	

1. ATM-BCH alarms; alarms against other MOs may also be present.

Error Log Entries and Test to Clear Values

Table 153: ATM-BCH Error Log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<i>test port location</i>
1(b)	Any	None			<i>test port location</i>
18	0	<i>busyout trunk grp/mbr</i>			<i>release trunk grp/mbr</i>
129 (c)		None	WRN	OFF	<i>test port location</i>
130 (d)					<i>test port location</i>
257(e)	Any	Service State Audit test (#256)			<i>test port location</i>
513(f)	Any	None	WRN	OFF	<i>test port location</i>
769(g)	Any	Service State Audit test (#256)			<i>test port location</i>
1793(h)	Any	None			<i>test port location</i>
3073(i)	Any	Service State Audit test (#256)			<i>test port location</i>
3585(j)	Any	None			none
3841(k)	Any	None	WRN	OFF	none

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 1:** the two ends of the ATM trunk do not agree on the ISDN call state. Possible causes:
 - Received a DISConnect or RELease COMplete message with cause value 52 (outgoing calls barred)
 - Received a DISConnect or RELease COMplete message with cause value 54 (incoming calls barred)

- Outgoing call renegotiated by the far end to another B channel in the absence of SETUP message glare
- Near end attempted a call on a B channel that the far end has marked OOS

When running the short test sequence, pay close attention to the results of the Call State Audit test (#257).

- c. **Error Type 129:** the far-end switch changed its ISDN service state to either out-of-service or maintenance. This may be a temporary condition because the far end is testing that trunk or a hardware problem with the trunk. Outgoing calls may not be allowed over that trunk.
1. Investigate the trunk's status (`status trunk grp#/mem#`).
- d. **Error Type 130:** the circuit pack has been removed or has been insane for more than 11 minutes.
1. Reinsert or replace the circuit pack to clear the error.
- e. **Error Type 257:** SETUP received for a B channel that is in an invalid service state. Service states may be incompatible at the two ends of the trunk. A normal call was received while the B channel was MTC/FE, MTC/NE, OOS/FE, or OOS/NE or a test call was received while the B channel was OOS/FE or OOS/NE.
- f. **Error Type 513:** RELease COMplete message received with cause value 82 (nonexistent channel). The B channel may not be administered at the far end. The trunk has been placed in the OOS/FE state.
- g. **Error Type 769:** inconsistent SERvice or SERvice ACKnowledge message. Possible causes:
- SERvice or SERvice ACKnowledge message received containing a change status that is more available than the previously-transmitted SERvice message.
 - Unsolicited SERvice ACKnowledge message received containing a change status that does not match the current B-channel state.
- ISDN-PRI service-state negotiation rules have been violated and may indicate that a pending service-state audit is failing. The system:
- cancels the maintenance timer
 - increments the Service State Audit counter
 - attempts a Service State Audit
- When running the short test sequence, pay close attention to the results of the Service State Audit test (#256).
- h. **Error Type 1793:** TN230x circuit pack failed. The maintenance system
- places the trunk in the OOS/NE state
 - sends a SERvice message to the far end (if possible) containing a change status of OOS for the B channel
 - returns the trunk to service when the ATM trunk circuit pack reports the failure cleared

Communication Manager Maintenance-Object Repair Procedures

i. **Error Type 3073:** Service State Audit attempt failed. See [Service State Audit Test \(#256\)](#) on page 496. Calls can be received but not placed until the test passes and the trunk state returns to In-Service.

1. Check the trunk's status (`status trunk grp#/mem#`).

j. **Error Type 3585:** ISDN RESTART message received. Active calls have been dropped.

The following Aux Data values (Error Type 3585 only) below represent the trunk's ISDN call state at the time Error 3585 occurred. This information can be useful if users report dropped calls on the ISDN-PRI trunks.

Aux Data	Description
0	An idle trunk received a restart.
10	An ISDN RESTART from the far end has unexpectedly cleared a call in the ACTIVE state (call stable, parties talking).
4 7 8 260 263	An ISDN RESTART from the far end has unexpectedly cleared a RINGING call.
1 3 6 9 265	An ISDN RESTART from the far end has unexpectedly cleared a call before the call entered the RINGING state.
11 12 19 531 267 268	An ISDN RESTART from the far end has unexpectedly cleared a call that was already in the process of clearing. If this condition occurs frequently, the far end may be trying to clear trunks that appear to be in the "hung" state.

k. **Error Type 3841:** the far end rejected an ATM CES trunk selected by the near end 10 times. The ATM CES trunk may not be administered on the far end.

1. Get the physical name of the ATM trunk by noting the decimal number in the Aux Data field.
2. Check administration for the named trunk on the far end.
3. If problems persist, then busyout the ATM trunk to take it out of the hunt group.

The WARNING alarm retires automatically whenever a called endpoint answers an outgoing or incoming call that uses the alarmed trunk.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. When you clear one of the error codes associated with a given test, you clear errors generated by other tests in the testing sequence.

Table 154: System Technician-Demanded Tests: ATM-BCH

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Signaling Link State Check test (#255)	X	X	ND
Service State Audit test (#256)	X	X	ND
Call State Audit test (#257)	X	X	ND
ISDN Test Call test (#258)		X	ND

1. D = Destructive, ND = Nondestructive

Signaling Link State Audit Test (#255)

This nondestructive test checks the status of the TN230x ATM-CES Interface circuit pack and the ATM D-channel (ATM-DCH) trunk, which are both important elements to the health of the ATM-BCH trunk.

Table 155: Test #255 Signaling Link State Audit Test 1 of 2

Error Code	Test Result	Description / Recommendation
None	ABRT	Internal system error
0	ABRT	1. Retry the command up to 5 times at 1-minute intervals.
1114	ABRT	Signaling link in transitional state 1. Retry the command up to 5 times at 1-minute intervals.
1018	ABRT	Maintenance disabled 1. Enable maintenance. Enter y in the Maintenance Tests field on the change trunk-group screen.
1 of 2		

Table 155: Test #255 Signaling Link State Audit Test 2 of 2

Error Code	Test Result	Description / Recommendation
4	FAIL	Signaling channel problem 1. Look for errors or alarms against ATM-SGRP (ATM Signaling Group) on page 580 and ATM-DCH (ATM D-Channel Port) on page 504.
8	FAIL	TN230x circuit pack failed 1. See ATM-INTF (TN2305/6) on page 555.
	PASS	Signaling link OK.
		2 of 2

Service State Audit Test (#256)

This test checks the service state of the trunk.

Country protocol 1

If the interface uses country protocol 1 (includes USA), the service-state audit executes in every trunk service state. It queries the service state on the far end and waits 2 minutes for a reply. If the first request times out, the service-state audit asks again. If the request times out again, it logs error 3073 and resends the request every 15 minutes. It places in-service trunks in the MAINTENANCE/FAR-END state (outgoing calls blocked, incoming calls accepted). Incoming calls trigger an immediate service-state audit without waiting for the end of a 15-minute cycle.

Any other country protocol

If the interface uses some other country protocol, the service-state audit executes only on trunks that are in the OUT-OF-SERVICE/FAR-END state. It asks the far-end switch to bring the trunk back into the IN-SERVICE state and waits 2 minutes for a reply. If the first request times out, the service-state audit asks again. If the request times out again, it leaves the trunk in the OUT-OF-SERVICE/FAR-END state and tries again in 1 hour.

Note:

PASS for this test only means that a message to the far end was successfully sent.

To check the service state of the ATM-BCH trunk, run `status trunk grp#/mem#`.

Table 156: Test #256 Service State Audit Test

Error Code	Test Result	Description / Recommendation
1000	ABRT	Needed resources not available, port on a call or initializing <ol style="list-style-type: none"> 1. Run <code>status trunk grp#/mem#</code>. 2. Check the results of Test #255.
1018	ABRT	Maintenance disabled <ol style="list-style-type: none"> 1. Enable maintenance by entering y in the Maintenance Tests field on the change trunk-group screen.
1113	ABRT	Signaling link failed <ol style="list-style-type: none"> 1. Run <code>status trunk grp#/mem#</code>. 2. Check the results of Test #255. 3. See ATM-SGRP (ATM Signaling Group) on page 580.
1114	ABRT	Signaling link in transitional state <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
1116	ABRT	Trunk not in Out-of-Service/Far-end state and country protocol other than 1
1117	ABRT	Service-state audit message outstanding <ol style="list-style-type: none"> 1. Wait 2 minutes, then try again.
2100	ABRT	Could not allocate needed resources <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
1113	FAIL	Signaling link failed <ol style="list-style-type: none"> 1. See ATM-SGRP (ATM Signaling Group) on page 580 and ISDN-PLK (ISDN-PRI Signaling Link Port) on page 1392.
	FAIL	Internal system error <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
	PASS	PASS <ol style="list-style-type: none"> 1. Wait 4 minutes, then check the Error Log for any new Error Type 3073. <ul style="list-style-type: none"> ● If there are none, both sides of the ISDN connection agree on the service state. The negotiation succeeded. ● If there is a new 3073 error, then the negotiation failed (the request timed out).

Call State Audit Test (#257)

This test audits the internal call state by asking the far-end switch for the ISDN call state. The test is particularly useful when you are trying to clear a hung call. If the internal call state on the near end differs from that on the far end, the call is torn down.

The ISDN specification allows up to 2 minutes for a reply. If a reply is not received within the 2 minute window, the test logs a protocol time-out violation against the associated signaling channel (ATM-DCH, Error Type 1).

Note:

PASS simply means that an appropriate message was composed and sent to the far-end switch.

Table 157: Test #257 Call State Audit Test

Error Code	Test Result	Description / Recommendation
1018	ABRT	Maintenance disabled 1. Enable maintenance by entering y in the Maintenance Tests field on the change trunk-group screen.
1019	ABRT	Audit already in progress 1. Wait 2 minutes, and try again.
1113	ABRT	Signaling link failed 1. Check the results of Test #255 (Signaling Link State check).
1114	ABRT	Signaling link in transitional state 1. Retry the command up to 5 times at 1-minute intervals.
1116	ABRT	Trunk out-of-service 1. Check the trunk service state (status trunk grp#/mem#).
2100	ABRT	Could not allocate needed resources 1. Retry the command up to 5 times at 1-minute intervals.
	FAIL	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
	PASS	PASS 1. Wait 4 minutes, then check the Error Log for call-state mismatches. If a call state mismatch is found, the call is torn down.

ISDN Test Call Test (#258)

This nondestructive test performs a far-end loop-around test over an ATM-BCH trunk if:

- The trunk is IN-SERVICE, MAINTENANCE/NEAR-END, or OUT-OF-SERVICE/NEAR-END.
- No calls are active on the trunk.
- The system uses country protocol 1 (including US), or the far end has loop-around capability.

The test sets up a call to a far-end switch over the ATM-BCH trunk. Then the digital port on a TN711D Maintenance/Test circuit pack sends a bit pattern to the far end and back. If the received pattern matches that sent, the test passes. If there are differences, it fails.

Synchronous Test Calls

You can initiate a synchronous outgoing test call (including a test call for ISDN-PRI trunks) with these commands:

- `test trunk grp#/mem# long (repeat#)`
- `test board location long (repeat#)`
- `test port location long (repeat#)`

Table 158: Test #258 ISDN Test Call 1 of 5

Error Code	Test Result	Description / Recommendation
4	ABRT	Signaling channel problem 1. Look for errors or alarms against ATM-SGRP (ATM Signaling Group) on page 580 and ATM-DCH (ATM D-Channel Port) on page 504.
8	ABRT	TN230x circuit-pack problem 1. See ATM-INTF (TN2305/6) on page 555.
1004	ABRT	B channel is active. 1. See if a call is active. Run <code>status trunk grp#/mem#</code> . 2. If the service state is In-Service/Idle, retry the test.
1005	ABRT	Bad configuration (for example, no Maintenance/Test circuit pack) 1. Make sure that the Maintenance/Test circuit pack is inserted. 2. Repeat the test.
1 of 5		

Table 158: Test #258 ISDN Test Call 2 of 5

Error Code	Test Result	Description / Recommendation
1018	ABRT	Test call disabled 1. Set the Maintenance field on the Trunk Group screen to y .
1020	ABRT	TN230x circuit-pack problem 1. See ATM-INTF (TN2305/6) on page 555.
1024	ABRT	Maintenance/Test digital port active 1. Wait until amber and green LEDs on the Maintenance/Test circuit pack are OFF. 2. Rerun the test. 3. If the problem persists, see M/T-DIG (Maintenance/Test Digital Port) on page 1667.
1113	ABRT	Signaling link failed 1. Check the results of Test #255 (Signaling Link State Check test).
1116	ABRT	Switch could not change the service state 1. See if calls are active. Run <code>status trunk grp#/mem#</code> . 2. If a call is active, proceed as for Error Code 1119. If not, check the Error and Alarm Logs and see ATM-TRK (Circuit Emulation Service Circuit Pack) on page 599.
1117	ABRT	ISDN service message outstanding 1. Wait 2 minutes. Then try again.
1118	ABRT	Far-end not administered 1. Check the administration of the far end of the ATM trunk. Run <code>status trunk grp#/mem#</code> . 2. Try the test again.
1119	ABRT	Test call aborted, normal call attempted 1. Wait for the call to finish normally, or drop it by running <code>busyout trunk grp#/mem#</code> . 2. When the trunk is idle, retry the test.
		2 of 5

Table 158: Test #258 ISDN Test Call 3 of 5

Error Code	Test Result	Description / Recommendation
1120	ABRT	Trunk OUT-OF-SERVICE/FAR-END 3. Try to change the service state via Test #256 (Service State Audit test). 4. Try the test again.
1122	ABRT	No test-line number for the far-end switch 1. Check the Trunk Group screen.
1123	ABRT	No Feature Access Code administration for this Facility test 1. Check the Dial Plan and Feature Administration forms.
2000 2012 None	ABRT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2035	ABRT	Call timed out 1. Wait 1 minute, and try again.
2036 – 2037	ABRT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2038 – 2039	ABRT	Problem reading test data 1. Wait 1 minute, and then try again. 2. If the test aborts again, there is a serious internal problem.
2040	ABRT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2041	ABRT	Call timed out 1. Wait 1 minute, and try again.
2066	ABRT	Could not establish test call 1. Retry the command up to 5 times at 1-minute intervals.
2067	ABRT	Call timed out 1. Wait 1 minute, and try again.
		3 of 5

Table 158: Test #258 ISDN Test Call 4 of 5

Error Code	Test Result	Description / Recommendation
2074	ABRT	Bit and Block Error query failed 1. Retry the command up to 5 times at 1-minute intervals. 2. If the test continues to abort, there may be a serious internal problem in the Maintenance/Test Digital port. See M/T-DIG (Maintenance/Test Digital Port) on page 1667.
2075	ABRT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
2201 – 2205	ABRT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2206	ABRT	Could not allocate needed resources 1. Retry the command at 1-minute intervals up to 5 times.
2208	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
2209 – 2210	ABRT	Could not allocate needed resources 1. Follow recommendations for ABORT code 2100.
2211	ABRT	Internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
2212	ABRT	Call terminated by unexpected disconnect 1. Wait 1 minute and then try again.
2213	ABRT	Call timed out 1. Wait 1 minute, and try again.
2214	ABRT	Call terminated by unexpected disconnect 1. Wait 1 minute and then try again.
2215 – 2219	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
		4 of 5

Table 158: Test #258 ISDN Test Call 5 of 5

Error Code	Test Result	Description / Recommendation
2220	ABRT	Call terminated prematurely 1. Wait 1 minute, and try again.
2221 – 2226	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
2227	ABRT	Could not allocate needed resources 1. Retry the command at 1-minute intervals up to 5 times.
2042	FAIL	Test data corrupt
	PASS	Test pattern intact. If the synchronous test call was performed (long test sequence), the communications path is operating properly.
5 of 5		

ATM-DCH (ATM D-Channel Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ATM-DCH	MIN	<code>test port location 1</code>	ATM D-Channel
ATM-DCH	WRN	<code>test port location sh</code>	ATM D-Channel

Note:

TN230x circuit packs are not interchangeable. Always replace an ATM circuit pack with the same type.

ATM-DCH uses the existing ISDN-PLK or D-channel maintenance strategy with modifications. The ATM circuit pack can be administered for up to 8 Circuit Emulation Service (CES) or signaling groups, each with its own D channel, as opposed to one D channel for an entire DS1 circuit pack.

Note:

Due to the dual personalities and the number of D channels that the ATM board can possess, the in-line errors and signaling port LAN loopback test has been moved to the MO [ATM-TRK \(Circuit Emulation Service Circuit Pack\)](#) on page 599. When an in-line error is sent due to packet-bus errors, the ATM circuit pack MO receives the error, not ATM-DCH.

The D-channel ISDN-PRI interface is emulated for ATM-CES and uses out-of-band signaling to transmit control messages between two endpoints. User information or bearer channels (B channels) carry digitized voice and digital data and are assigned to DS1 ISDN trunks or PRI endpoints. Call-control signaling for the B channels is combined and carried over the separate ISDN-PRI Signaling Link port D channel.

Problems with ATM-DCH affects every associated B channel, since call-control signaling cannot reach the far-end switch or terminal adapter. Stable calls can remain operational, but no new calls can be made. In turn, ATM-DCH depends on the:

- TN230X ATM Trunk circuit pack where it resides
- Packet bus that provides the link to the processor

When working ATM-DCH alarms or errors, also investigate

- [ATM-TRK \(Circuit Emulation Service Circuit Pack\)](#) on page 599
- [PKT-BUS \(Packet Bus\)](#) on page 1748

Hardware Error Log Entries and Test to Clear Values

Table 159: ATM D-channel Error Log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<i>test port location</i>
18 (b)	0	<i>busyout port location</i>	WRN	OFF	<i>release port location</i>
130 (c)		None	WRN	ON	<i>test port location</i>
1793 (d)		Signaling Link Board check (#643)			<i>test board location 1</i>

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 18:** D channel busied out; no calls possible over this D channel.
- c. **Error Type 130:** circuit pack removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- d. **Error Type 1793:** ATM Trunk circuit pack failed the Signaling Link Board check (#643). Resolve any ATM-TRK errors in the Error Log.

System Technician-Demanded Tests: Descriptions and Error Codes

The command to test the ATM-DCH MO is *test port location*, where *location* is for ports 9-32.

Table 160: System Technician-Demanded Tests: ATM-DCH

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND
Signaling Link Board check (#643)	X	X	Nondestructive

Signaling Link Board Check (#643)

This nondestructive test checks the health of the ATM TN230X trunk circuit pack's hardware. The test runs on a periodic or scheduled basis, during initialization testing, and upon demand.

Note:

The board-level maintenance is handled independently of the ATM-CES signaling link maintenance, raising the possibility of inconsistent states.

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
8	FAIL	The TN230X circuit pack is not in-service. 1. Check the Error Log for ATM-TRK errors and resolve any using ATM-TRK (Circuit Emulation Service Circuit Pack) on page 599.
	PASS	The ATM TN230X circuit pack is in-service.

ATM-EI (Expansion Interface Circuit Pack)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ATM-EI	MAJ	<code>test board location</code>	ATM Expansion Interface circuit pack
ATM-EI	MIN	<code>test board location</code>	ATM Expansion Interface circuit pack
ATM-EI	WRN	<code>test board location</code>	ATM Expansion Interface circuit pack

ATM-EI covers the ATM circuit pack administered as an Expansion Interface (ATM-EI) for ATM Port-Network Connectivity (ATM PNC). The ATM-EI provides PNC between a S8700 Multi-Connect server and every PN through the ATM switch.

The circuit packs listed in [Table 161: ATM-EI circuit packs for S8700 Multi-Connect](#) on page 507 are ATM-EI boards if they are administered to support ATM Port Network Connectivity (ATM PNC) for **S8700 MC**.

Table 161: ATM-EI circuit packs for S8700 Multi-Connect

Circuit pack	Fiber	Echo cancellation
TN2305	Multimode	Y
TN2306	Single mode	Y

Note:

TN230x circuit packs are not interchangeable. Always replace an ATM circuit pack with the same type.

Note:

ATM switch maintenance is not covered in this section. When S8700 Multi-Connect system maintenance software suspects the ATM switch connections, it raises appropriate Communication Manager alarms. To clear any ATM switch faults, refer to the particular ATM switch's documentation.

LEDs

The ATM Interface circuit pack has three LEDs:

- Red indicates some alarm condition.
- Green indicates maintenance testing in progress.
- Amber provides useful visual information regarding the operating mode of the ATM-EI and possible error conditions.

The possible LED states are in [Table 162](#).

Table 162: ATM Interface LED codes

LED	LED Status	Condition
Red	Steady on	Board is not healthy
	Never on	Normal conditions
Red and Green	Red LED solid on Green LED 200 msec on; 200 msec off	Board is in the processes of booting
Green	Steady on ¹	Maintenance is running tests on the board
	100 msec on - 100 msec off	No links to the board
Amber	100 msec on -100 msec off	Fiber Loss of Signal (LOS), LOF, MS_RDI, MS_AIS, LCD, HP_RDI, HP_AIS, LOP, PSC
Amber	500 msec on; 500 msec off	Signal to the ATM switch is down
Amber	2 sec on; 0.2 sec off	ATM-EI is Expansion Archangel (EAA)
Amber	Steady on	ATM-EI active (Center Stage Switch PN)
Amber	Never on	ATM-EI standby

1. The green LED flashes between tests.

ATM-EI-Related Commands

The following commands can be helpful in resolving ATM-EI problems:

<code>add atm pnc</code>	<code>list measurements atm</code>
<code>busyout/release atm pnc</code>	<code>remove atm pnc</code>
<code>busyout/release board</code>	<code>reset board</code>
<code>change atm pnc (pnc duplication)</code>	<code>status atm pnc</code>
<code>display atm pnc</code>	<code>status cabinet</code>
<code>list atm oam-statistics</code>	<code>status port-network</code>
<code>list atm pnc</code>	<code>test board</code>

Replacing an ATM-EI Circuit Pack

Standard Reliability

1. Enter `busyout atm pn#` (this is service-affecting) at the SAT.
2. Replace the ATM PNC circuit pack, and reconnect the fiber.
3. Enter `release atm pnc`.
4. Wait 2½ minutes for board insertion.
5. Enter `list sys-link` to verify that the links are up.
6. Enter `test board location`, and verify that every test passes.

Duplex or High Reliability

There is 1 ATM-EI circuit pack in each PN.

1. Enter `busyout atm pnc #` at the SAT.

Note:

If the ATM-EI is in a PN, this is service-affecting.

2. Replace the circuit pack.
3. Enter `release atm pnc`.
4. Wait 2½ minutes for board insertion.
5. Enter `list sys-link` to verify that the links are up.
6. Enter `test board location`, and verify that every test passes.

Critical Reliability

There are 2 ATM-EI circuit packs in each PN.

1. Enter `status pnc` at the SAT. If the board is on the active side, enter `reset pnc interchange` to switch the active ATM-EI board to the standby side.
2. Enter `busyout pnc-standby`.
3. Enter `busyout atm pnc # a-pnc` or `b-pnc`.
4. Replace the circuit pack.
5. Enter `release atm pnc #`.
6. Enter `release pnc-standby`.
7. Wait 2½ minutes for board insertion.
8. Enter `test board location`, and verify that every test passes.

Basic ATM PNC Administration

Note:

This section contains basic administration information only. Refer to *ATM Installation, Upgrades, and Administration using Avaya Communication Manager, 555-233-124*, for more detailed information.

ATM PNC connections involve administering

- 1 ATM-EI board in each PN (standard, duplex, or high reliability)
- 2 ATM-EI boards in each PN (critical reliability)

Adding ATM PNC Connections

Standard, Duplex or High Reliability

1. If the ATM-EI circuit pack is absent or if the circuit pack is present but in a PN, use the `change circuit-pack` command to add circuit pack translations.
2. Enter `add atm pnc n` (connection number), and administer the circuit pack's location and its ATM address.

Critical Reliability

1. Enter `change system-parameters duplication`, and change the **Enable Operation of PNC Duplication** field to `n`.
2. If the ATM-EI circuit pack is absent or is present but in a PN that does not yet have PNC connectivity to it, use the `change circuit-pack` command to add circuit pack translation for the missing circuit pack.

3. Enter `add atm pnc n` (connection number), and administer the circuit pack location and ATM address.
4. Enter `change system-parameters duplication`, and change the **Enable Operation of PNC Duplication** field to `y`.

Removing ATM PNC Connections

Standard, Duplex or High Reliability

Note:

These systems are *not* equipped with PNC duplication.

1. Enter `busyout atm pnc n` (connection number).
2. Enter `remove atm pnc n` (connection number).

Critical Reliability

1. Enter `status pnc`, and ensure that the A-PNC is active.
If not, request a PNC interchange using the `reset pnc interchange` command.
2. Enter `busyout pnc-standby`.
3. Enter `change system-parameters duplication`, and change the **Enable Operation of PNC Duplication** field to `n`.
4. Enter `busyout atm pnc n` (PN's number).
5. Enter `remove atm pnc n` (PN's number) to remove both ATM-EI boards, or enter `change atm pnc` to remove the B-side ATM-EI board.
6. Enter `change system-parameters duplication`, and change the **Enable Operation of PNC Duplication** field to `y`.

Changing Circuit Pack Location or ATM Address

Standard, Duplex or High Reliability

Note:

These systems are *not* equipped with PNC duplication.

1. Remove the ATM PNC connection (see [Removing ATM PNC Connections](#) on page 511).
2. Add an ATM PNC connection (see [Adding ATM PNC Connections](#) on page 510).

A-side ATM-EI—Critical Reliability

1. Remove the ATM PNC connection (see [Removing ATM PNC Connections](#) on page 511).
2. Add an ATM PNC connection (see [Adding ATM PNC Connections](#) on page 510).

B-side ATM-EI—Critical Reliability

1. Enter `status pnc`, and ensure that the A-PNC is active.
If not, request a pnc interchange using `reset pnc interchange`.
2. Enter `busyout pnc-standby`.
3. Enter `list config carrier`, and verify that an ATM circuit pack is assigned for the new location. If not, add the ATM circuit pack's translations.
4. Enter `busyout atm pnc n` (connection number) `b-pnc`.
5. Enter `change atm pnc n` (connection number) and change circuit pack location for the B side.
6. Enter `release pnc-standby`.

Changing ATM Address of Standby ATM PNC EI, Critical Reliability

1. Enter `busy pnc-standby`.
2. Enter `change atm pnc n` (connection number), and change the ATM address for the standby side.
3. Enter `release pnc-standby`.

Error Log Entries and Test to Clear Values

Table 163: ATM-EI Error Log Entries 1 of 3

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test board location</code>
2 (b)		None	MIN	ON

Table 163: ATM-EI Error Log Entries 3 of 3

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
2818 (s)	Any	None	MIN	ON	<i>test board location</i>
3329 (t)	3	LANHO critical error	MAJ	OFF	
3585 (u)		ATM Framer Looparound (#1260)	MAJ	ON	<i>test board location 1</i>
3586 (u)		ATM Framer Looparound (#1260)	MAJ	ON	<i>test board location 1</i>
3841 (v)					
3842 (w)					
3843 (x)		None			
3999 (y)	Any	None			
Any (z)	32767	None			
					3 of 3

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 2:** The on-board DUART chip failed. This results in communication failure between the PN's Maintenance board and the ATM-EI board. The Maintenance board should have a red LED lit, because the link to the ATM-EI is down in this PN.
 - 1. Reset the board with *reset board location*.
 - 2. If the board does not recover, replace the board.
- c. **Error Type 18:** The ATM-EI circuit pack has been busied out.
 - 1. Release the circuit pack (*release board location*).
- d. **Error Type 23:** An ATM-EI circuit pack has been administered with the *add atm pnc n* command, but the circuit pack has not been inserted into the system.
 - 1. Insert an ATM-EI circuit pack at this location.

- e. **Error Type 125:** A wrong circuit pack is located in the slot where the ATM-EI circuit pack is logically administered.
 1. Either remove the wrong circuit pack and insert the ATM-EI circuit pack or remove the ATM-EI administration (see [Basic ATM PNC Administration](#) on page 510).
 2. Remove the ATM-INTF administration and re-administer the slot (change circuit-pack) to match the circuit-pack that is physically present in this slot.

- f. **Error Type 131:** An ATM-EI circuit pack has been removed from the slot for 5 minutes.
 1. Insert the ATM-EI circuit pack into its administered slot.
 2. Another way to resolve or prevent this alarm is to remove the ATM-EI administration (see [Basic ATM PNC Administration](#) on page 510), then remove the ATM-INTF administration (change circuit-pack).

It is possible that the ATM-EI could be held in reset by the PN's Maintenance board and is not inserted in the system.

3. Try issuing test maint P long on the maintenance board in the same PN.

- g. **Error Type 257:** Expansion Interface Control Channel test (#316) failed (board cannot communicate on the TDM bus control channel). Follow the suggested test procedures.

Error Type 258: The archangel is out of sequence (Aux Data indicates angel number).

Error type 259: The expansion archangel link (EAL) to the active ATM-EI board is down. See [SYS-LINK \(System Links\)](#) on page 2132.

- h. **Error Type 513:** The ATM Crosstalk test failed. The board is either writing to or reading from a TDM time slot that is not allocated to the board.
 1. Test the board (**test board location**), and follow the test procedures suggested for this test. In random tests of a single DSP during low or high traffic, the same DSP can be tested more than once.

- i. **Error Types 769 and 770:** are board-degraded alarm errors that result when the ATM switch is sending corrupted cells or excessive AAL/LAPD retransmissions (off-board ATM cell corruption errors). These errors indicate the detection of a problem in handling ATM cells that are received from the fiber interface.

Aux Data for these Error Types:

Error Type	Aux Data	Description
769	34	Excessive AAL-5 retransmission requests
769	35	Excessive LAPD retransmission requests
770	25	Uncorrectable ATM cell headers – threshold
771	26	VPI, VCI pair unknown

Communication Manager Maintenance-Object Repair Procedures

The problem is most likely *not* on the ATM-EI circuit pack reporting the errors, but it could be due to one or more of the following reasons:

- The fiber is not snugly connected to either the board or the ATM switch.
- The PN's packet bus is corrupting the cells. See [PKT-BUS \(Packet Bus\)](#) on page 1748 (Aux Data 35 only).
- The fiber between the ATM switch and the ATM-EI is too long (greater than 2 km for multimode fiber). Use loopback to see if the fiber is corrupting the cells.
- Some other ATM-EI board is not receiving the cells properly.
- The intervening ATM switch is dropping the ATM cells due to a shortage of bandwidth, or **S8700 MC** is using more than the subscribed bandwidth.

Error Type 771: The ATM switch is sending cells with unknown VPI and VCI address (wrong connection).

1. Ensure that the ATM-EI board address on the ATM switch matches the ATM-EI (ATM) address on the S8700 Multi-Connect side.

j. **Error Types 1024-1151:** These errors represent problems detected by the ATM-EI board in response to SETUP and ADDPARTY requests from software.

- The Error Types and descriptions are in [Table 164: ATM Error Types 1024 - 1151](#) on page 516.
- Aux Data values represent PN and angel numbers and are in [Table 165: Error Type 1024-1151 Aux Data values \(XXYYY\) converted to slot number](#) on page 518.

Table 164: ATM Error Types 1024 - 1151 1 of 3

Error Type	Description	General problem
1024	Next node unreachable	ATM protocol stack on ATM-EI3 circuit pack
1056	DTL Transit not my node ID	
1 of 3		

Table 164: ATM Error Types 1024 - 1151 2 of 3

Error Type	Description	General problem
1088 1104	ATM-EI circuit pack received a request with an invalid connection identifier.	Firmware-detected problems on the ATM-EI circuit pack. Note: Error Types 1088–1103 are reported by the board that is originating the connection. Error Types 1104–1119 are reported by the board that is terminating the connection. In most cases, when the terminating board reports one of these errors, the originating board also reports an ATM-NTWK error for the same event (usually with Error Type 21).
1089 1105	ATM-EI circuit pack received a request with a reference to an unknown VC token.	
1090 1106	ATM-EI circuit pack did not have enough resources (memory) for the requested operation.	
1091 1107	Internal failure in the local protocol stack. This can occur when the connection to the ATM switch failed, perhaps because the: <ul style="list-style-type: none"> ● ATM switch rebooted ● fiber between the ATM switch and the ATM-EI circuit pack disconnected 	
1092 1108	ATM-EI circuit pack received a request for which the referenced VC was in the wrong call state.	
1093 1109	ATM-EI circuit pack received a request for which the VPI/VCI pair was invalid or out of range.	
1094 1110	ATM-EI circuit pack received a request to add a party to an existing VC. The add party request failed, and a retry was not possible.	
1095 1111	ATM-EI circuit pack in link recovery after the lower ATM layer (Q.SAAL portion of the protocol stack) failed. This can occur when the connection to the ATM switch failed, perhaps because the: <ul style="list-style-type: none"> ● ATM switch rebooted ● fiber between the ATM switch and the ATM-EI circuit pack disconnected 	
1096 1112	ATM-EI circuit pack received an error from the local protocol stack for which no more detailed cause was specified.	
1102	ATM-EI circuit pack asked to create more connections than it was capable of creating.	
1103	ATM-EI circuit pack detected an illegal message from software. Check the Error Log for CONN-M proc errors for more information.	
2 of 3		

Table 164: ATM Error Types 1024 - 1151 3 of 3

Error Type	Description	General problem
1113		Problems detected by the board terminating the connection
3 of 3		

1. Test the ATM-EI circuit pack (**test board location**) and investigate further based on each test's results. If every test passes, the error was a transient problem.

Aux Data values: For Setup and Add Party connection request failure type, the port-network and the angel number of the destination ATM-EI circuit pack are logged Aux Data values in the form XYYYY, where

- port-network number = XX
- angel number = YYY

Aux Data values for WSP Setup (XX = WSP number, YYY = location code).

Since you need to know the slot number also, [Table 165: Error Type 1024-1151 Aux Data values \(XYYYY\) converted to slot number](#) on page 518 converts the Aux Data to slot numbers.

Table 165: Error Type 1024-1151 Aux Data values (XYYYY) converted to slot number 1 of 2

2 of 2															

k. **Error type 1153:** The ATM connection audit found some discrepancy in the firmware's VC token numbers and live VCs. The problem is rectified in firmware and no action is needed.

- I. **Error Type 1281:** The loss of high-level signal indicating operational problems of equipment located outside of the circuit pack and the fiber connected to the board. Aux Data values are listed in [Table 166: Error type 1281 Aux Data and repair procedures](#) on page 520.

Table 166: Error type 1281 Aux Data and repair procedures 1 of 3

Aux Data	Alarm Description	Repair procedure
15	SYSCLOCK failed	<p>The board is not locked to the TDM backplane clock signal. This is probably due to a Tone-Clock problem.</p> <ol style="list-style-type: none"> 1. Check for TDM-BUS or TONE-BD errors in the Error Log. 2. If no other problems are present, reset the circuit pack (reset board location)
16	Loss of Signal: LOS	<p>The fiber is not connected properly to the ATM-EI board or ATM switch (or to the multiplexer section [MUX] if present).It is possible that the board transceivers are not functioning properly.</p> <ol style="list-style-type: none"> 1. Run test board location. 2. If Test #1259 fails, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. If it does the problem is off-board. 3. If the amber LED continues to flash, replace the circuit pack.
17	Loss of Frame: LOF	<p>The fiber signal cannot obtain or maintain STM-1/OC-3 framing.</p> <ol style="list-style-type: none"> 1. Try to move the fiber on the ATM switch side to a different port. This could require administration on the ATM switch. 2. If the problem persists, reset the circuit pack (reset board location).
18	Multiplexer Section Alarm Indication Signal: MS_AIS	<p>There is a major problem on the far end (between multiplexer section [MUX] and the switch) that prohibits the circuit pack from sending a valid signal.</p> <ol style="list-style-type: none"> 1. See if the ports at the MUX and/or the ATM switch are connected snugly. 2. Run test board location. 3. If Test #1259 fails with Error Code 18, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. 4. If it does, the problem is off-board. 5. If the amber LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.

1 of 3

Table 166: Error type 1281 Aux Data and repair procedures 2 of 3

Aux Data	Alarm Description	Repair procedure
19	Multiplexer Section Remote Defect Indicator: MS_RDI	<p>The far end is detecting a major problem with the signal that this board is transmitting.</p> <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-EI board) is the same as the ATM-EI circuit pack's cable interface. 2. Run test board location. 3. If Test #1259 fails with Error Code 19, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. 4. If it does the problem is off-board. 5. If the amber LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.
20	Loss of pointer: LOP	<p>ATM framer chip is unable to access the payload part of the signal.</p> <ol style="list-style-type: none"> 1. Reset the board (reset board location). 2. If the error persists replace the board.
21	Path Signal Error (PSL) (STM1/SONET)	<p>The incoming signal payload is not set up for transmission of ATM data.</p> <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-EI board) is the same as the ATM-EI circuit pack's cable interface.
22	High-level Path Alarm Indication Signal: HP_AIS	<p>The payload is invalid.</p> <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-EI board) is the same as the ATM-EI circuit pack's cable interface. 2. Run test board location. 3. If Test #1259 fails with Error Code 22, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. 4. If it does the problem is off-board. 5. If the amber LED continues to flash, replace the circuit pack.
2 of 3		

Table 166: Error type 1281 Aux Data and repair procedures 3 of 3

Aux Data	Alarm Description	Repair procedure
23	High-level path Remote defect Indicator: HP_RDI	The far end is detecting a major problem with the signal that this board is transmitting. The transmitted payload is invalid. <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-EI board) is the same as the ATM-EI circuit pack's cable interface. 2. Run test board location. If the Test #1259 fails with Error Code 23, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. 3. If it does the problem is off-board. 4. If the amber LED continues to flash, replace the circuit pack.
24	Loss of cell delineation (LCD)	On board ATM framer chip is not able to frame cells based on the cell header. <ol style="list-style-type: none"> 1. Reset the board (reset board location). 2. If the error persists, replace the board.
27	SIGCON_DOWN ATM switch high level signal.	The board cannot communicate with the ATM switch. <ol style="list-style-type: none"> 1. Busyout the board (busyout board location). 2. Test the board (test board long location). 3. If Test #1260 fails, replace the board. 4. If Test #1260 passes, make sure the ATM address on both the S8700 Multi-Connect and the ATM switch sides are the same for this board. 5. If the address is the same, change the port on the ATM switch side. This could require administration on the ATM switch. 6. If the error is resolved, the problem is on the ATM switch port.
3 of 3		

- m. **Error Type 1537:** LAN bus time out. The circuit pack is transmitting a packet larger than 1,024 bytes. Replace the circuit pack.
- n. **Error Type 1538:** A hyperactive ATM-EI circuit pack is generating an abnormal amount of control messages to the processor. When this error is generated, the system automatically resets the ATM-EI.

Duplicated PNC?	Then:
Yes	service to the PN is disrupted
No	the system switches to the standby PNC

1. Enter **reset board location** for this ATM-EI circuit pack.

2. If the same error persists, replace the ATM-EI circuit pack.
- o. **Error Type 1793:** LANHO transmit FIFO overflow error (the transmit FIFO RAM buffers on the circuit pack overflowed). This most likely indicates a hardware problem on the circuit pack, because the speed of the LAN/packet bus is much higher than the speed of the link connected to the port.
 1. Test this ATM-EI circuit pack (*test board location*).
 2. If Test #598 fails again, replace the ATM-EI circuit pack.
- p. **Error Types 2049 and 2050:** The ATM-EI is out of lock with the backplane system clock.
 1. Test this ATM-EI circuit pack (*test board location*).
 2. If Test #304 fails, follow the repair procedures suggested for this test.
- q. **Error Type 2305:** Too many parity errors on data received from the LAN/packet bus (could be due to packet-bus problems).
 1. Test the ATM-EI circuit pack (*test board location*).
 2. If Test #598 fails, follow the repair procedures suggested for this test.
 3. If the test passes, look for and resolve any PKT-BUS (packet bus) alarms/errors.
 4. If there are no PKT-BUS errors and the problem persists, escalate the problem.

Error Type 2309: The packet-interface chip (LANHO) is malfunctioning.

 5. Test the ATM-EI circuit pack (*test board location*).
 6. If Test #598 fails, follow the repair procedures suggested for this test.
- r. **Error Type 2561:** ATM-EI 2-way transmission failure (circuit pack is having problems creating connections to other PNs in the system).
 1. Test the ATM-EI circuit pack (*test board location*).
 2. Follow the repair procedures suggested for Test #241.
- s. **Error Types 2817 and 2818:** A DSP test failure detected along the circuit path of the ATM-EI circuit pack.

Error Type	Description	Aux Data indicates
2817	DSP test failure	The Aux Data field contains the following information about the failed DSPs: X is the number of talker DSPs Y is the number of listener DSPs Z is the number of echo-cancelling DSPs
2818	One or more DSPs failed	DSP number that has failed

1. Test the ATM-EI circuit pack (*test board location*).
2. Follow the repair procedures suggested for Test #1258.

Communication Manager Maintenance-Object Repair Procedures

- t. **Error Type 3329:** The on-board LANHO chip is insane, possibly due to a problem in packet-bus arbitration, the transmission line frame, or the circuit pack itself. The circuit pack cannot talk to the packet bus.

If the packet bus is alarmed:

1. Resolve any PKT-BUS errors. The probability of this error being related to a packet-bus problem increases with the number of other circuit packs using the bus that are also showing this error.

If the packet bus is *not* alarmed:

2. Reset the circuit pack (`reset board location`).
3. If the problem persists, replace the ATM-EI circuit pack.

If the system has a duplicated PNC, and the in-line error received is from an active ATM-EI, the system switches to the standby PNC.

 **CAUTION:**

If the system does not have duplicated PNC, services to the PN could be disrupted.

- u. **Error Types 3585 and 3586:** (Major board alarm) A failure of critical components involved in the operation of the circuit pack, and the switch can no longer recognize the circuit pack. If the system has a duplicated PNC and the in-line error received is from an active ATM-EI, the system switches to standby PNC.

 **CAUTION:**

If the system does not have duplicated PNC, services to the PN could be disrupted.

Error Type 3585

Aux Data (Error Type 3585 only):

Aux Data	Description
1	ATM framer failure
2	NCE failed (only from ATM-EIs in PN)
4	TDM_PLD_FAILED
5	DSP_ALL FAILED
6	Receive Network Processor (RNP) failure
7	Transmit Network Processor (TNP) failure
8	MEMORY read/write failure

1. If the system has duplicated PNC:
 - a. Test the ATM-EI (**test board location 1**).
 - b. If Error 3585 is detected again, or if the board is not recognized anymore, replace the ATM-EI circuit pack.
2. If the system does *not* have duplicated PNC and the circuit pack is in a PN:
 - a. Replace the ATM-EI circuit pack.

Error Type 3586: Framer Looparound test (#1260) failed.

Aux Data (Error Code 3586 only):

Aux Data	Description
2	Packet path failed
3	Circuit path failed
4	TDM loop cannot be created
5	Packet loop cannot be created

3. If Error Type 3586 is detected again, replace the circuit pack.
- v. **Error Type 3841:** The board received a message from the switch that it does not recognize, and the board responded with an inconsistent down link error message. This error does not affect service, and no action is required.
- w. **Error Type 3842:** The circuit pack received data from the packet bus faster than it could distribute the data to its endpoint. This circuit pack should be able to recover by itself, and no action is necessary.
- x. **Error Type 3843:** The firmware on the circuit pack is reporting a resource that is low. This error does not affect service and no action is required.
- y. **Error Type 3999:** The circuit pack sent a large number of control channel messages to the switch within a short period of time.

If	Then
Error Type 1538 is also present	Circuit pack is taken out of service
Error Type 1538 is absent	Circuit pack is not taken out of service, but has generated 50% of the messages necessary to be considered hyperactive. This can be normal during heavy traffic. If the error is logged during light traffic, it can indicate a problem with the circuit pack or the equipment attached to it.

- z. **Aux Data 32767** for any error log entry indicates that an alarmed ATM-EI was busied out and then released. When this occurs, existing service-affecting alarms must be preserved. Typically, every alarm is resolved when the ATM-EI is released. Therefore, the Alarm and Error Logs must be repopulated with the alarms present at time of busyout. This Aux Data indicates that existing Error Type and Error Log time stamps are no longer valid because they were lost when the circuit pack was released.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Expansion Interface 2-Way Transmission test (#241), you can also clear errors generated from other tests in the sequence.

Table 167: System Technician-Demanded Tests: ATM-EI

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
Expansion Interface 2-Way Transmission test (#241)	X	X		ND
ATM Board Framer Looparound test (#1260)		X		D
Expansion Interface Lock Query test (#304)	X	X		ND
ATM Board Error Query test (#1259)	X	X		ND
ATM Expansion Interface Reset (#1256)			X	D
ATM board DSP test(#1293) for TN2305 and TN2306 circuit packs.	X	X		ND
ATM Cross Talk test(#1298) for TN2305 and TN2306 circuit packs		X		ND

1. D = Destructive, ND = Nondestructive

Note:

To get a better indication of a problem’s location, test both ATM-EI circuit packs on the associated fiber link, whether the circuit packs are both ATM-EI circuit packs or not.

Expansion Interface 2-Way Transmission Test (#241)

This test is nondestructive and applies to every ATM-EI, both active and standby. It is run as part of craft short and long testing, periodic, scheduled, initialization, and error analysis testing. The test sets up a connection between a Tone-Clock in one cabinet and a Tone Detector in a separate cabinet and transmits a digital test count between the PNs. The ATM-EIs used to set up this connection are chosen by maintenance, not call processing. After the connection is checked for dial-tone, the connection is torn down and re-established in the opposite direction.

For this test, the second ATM-EI can reside in any PN outside the tested ATM-EI's PN. Therefore, if the test should fail in either direction, the test is repeated with a different PN, if available. This aids the fault isolation procedure.

The test results indicate if the test failed in one or both directions. The test aborts if the ATM-EIs do not exist on both ends (for example, the EIs are not administered correctly). If the test passes, the TDM and ATM framer interfaces of both ATM-EIs are functioning properly. If the test fails, a series of tests are run on the board. [Figure 25: Expansion Interface 2-Way Transmit Test #241 PN X and PN Y represent any of 44 possible PNs.](#) on page 527 shows a schematic of this test.

Figure 25: Expansion Interface 2-Way Transmit Test #241
PN X and PN Y represent any of 44 possible PNs.

Table 168: Expansion Interface 2-Way Transmission Test (#241) 1 of 8

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system could be under heavy traffic conditions or it can have time slots out of service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.
		1 of 8

Table 168: Expansion Interface 2-Way Transmission Test (#241) 2 of 8

Error Code	Test Result	Description / Recommendation
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service.</p> <ol style="list-style-type: none"> 1. Resolve any TTR-LEV errors. 2. Verify that at least one Tone Detector resides in this PN. (Even without a TTR-LEV error, the tested circuit pack's PN could be missing a Tone Detector.) <p>If missing, the test always aborts for this circuit pack, without harming the system.</p> <p>Note: A TN2182 Tone-Clock circuit pack in a PN must be of vintage B or newer. If an earlier vintage resides in a PN, this test always aborts with this abort code.</p> <ol style="list-style-type: none"> 3. Resolve any TONE-PT errors. 4. If neither condition exists, retry the command at 1-minute intervals up to 3 times.
		2 of 8

Table 168: Expansion Interface 2-Way Transmission Test (#241) 3 of 8

Error Code	Test Result	Description / Recommendation
1033	ABRT	<p>The test cannot run because either the ATM-EI board is not administered, or there were no other PNs administered that had its ATM-EI board in-service.</p> <ol style="list-style-type: none"> 1. Ensure that the board is administered as ATM PNC Expansion Interface circuit pack. 2. If the board is administered as ATM-EI circuit pack, then there has been some change in the ability of the ATM-EI circuit pack in the other PNs to communicate with the ATM-EI on the other end of its connection. 3. Using status port x (the port-network number where the board is administered), see if both ACL and EAL are up to this board. If not, see the service procedure for SYS-LINK. 4. Check the Error Log for Error Type 1281 with Aux Data 27 (board cannot talk to the ATM switch). See Table 166: Error type 1281 Aux Data and repair procedures on page 520 for repair procedures. 5. If present, check both the ATM switch and the Communication Manager translations for consistent ATM addresses. Reset the board, and see if the problem resolves. 6. Repeat Test #241. If it continues to abort with this abort code, replace the board.
1394	ABRT	<p>ABORT</p> <ol style="list-style-type: none"> 1. See Table 166: Error type 1281 Aux Data and repair procedures on page 520 (Error Type 1281) with Aux Data 27 (board cannot talk to the ATM switch), and if present, check both the ATM switch and the Communication Manager translations for consistent ATM addresses. 2. Reset the board and see if the problem resolves. 3. Repeat the test.
3 of 8		

Table 168: Expansion Interface 2-Way Transmission Test (#241) 4 of 8

Error Code	Test Result	Description / Recommendation
1395	ABRT	<p>This test cannot run on an ATM-EI circuit pack if it is part of the B-side PNC and Duplicated PNC is not enabled.</p> <ol style="list-style-type: none"> 1. If this test needs to run on this ATM-EI circuit pack, enable PNC with the <code>change system-parameters duplication</code> command. 2. Prevent the system from doing a PNC interchange by executing the <code>set PNC lock</code> command. 3. Repeat this test.
1413	ABRT	<p>This test requires the use of a Tone-Clock circuit in each of the PNs used in this test. This abort code indicates that a Tone-Clock circuit is absent from one of the PNs.</p> <ol style="list-style-type: none"> 1. Verify that an IPSI or Tone-Clock circuit pack resides in the same PN as the ATM PNC Expansion Interface circuit pack under test. 2. In ATM PNC configurations, make sure that there is at least one other PN besides the PN where the ATM-EI circuit pack under test resides that contains a Tone-Clock circuit.
1414	ABRT	<p>The active Tone-Clock circuit in one of the PNs being used for the test has a MAJOR or MINOR alarm logged against it.</p> <ol style="list-style-type: none"> 1. Enter <code>display alarms</code> and resolve any TONE-BD and TONE-PT alarms.
1956	ABRT	<p>ACL to the board is not up. See ACL status with <code>list sys-link</code> and follow the repair procedures for SYS-LINK.</p>
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p>

Error Code	Test Result	Description / Recommendation
40MM	FAIL	<p>Failure code only applies to a system equipped with an ATM Switch. The letters "MM" refer to the distant or far-end PN, and "NN" to the near-end ATM-EI under test.</p> <p>The test failed for the first connection from the ATM-EI board under test to another PN, and the test tone was detected correctly in the reverse direction (data sent from port network MM was detected correctly in the PN where the circuit pack under test resides), but not the opposite direction.</p> <ol style="list-style-type: none"> 1. Test for the Active Tone-Clocks on port network MM and the PN where the ATM-EI under test resides. This determines if dial tone is supplied. 2. Ensure that the ATM address of the active ATM-EI circuit pack in port network MM matches the ATM address on the ATM switch for the port to which this circuit pack is connected. Refer to <i>ATM Installation, Upgrades, and Administration using Avaya Communication Manager, 555-233-124</i>, for the procedure to check the ATM port address on the ATM switch. 3. Run Test #241 on the active ATM-EI in port network MM. If this test fails with Error Code 20NN or 40NN, go back to step 2. <p>If the address was the same, replace the active ATM-EI circuit pack on port network MM.</p> <p>If this test fails with Error Code 10NN or 30NN, replace ATM-EI circuit pack with the initial problem.</p>
	PASS	Tone successfully transmitted in both directions. Both ATM-EI boards and their lightwave transceivers are functioning properly.
0	NO BOARD	<p>No board was detected by the test.</p> <ol style="list-style-type: none"> 1. Resolve either wrong board (Error 125) or no board (Error 131) issues. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use reset board location. 3. Run the test again. If it fails, the ID chip on board could be bad. Replace the board and retest.
		8 of 8

Expansion Interface Lock Query Test (#304)

This test is nondestructive and is used to query the ATM and EI circuit packs (both active and standby) for its status concerning lock to the backplane system clock. It is run as part of periodic, scheduled, initialization, and error analysis testing. When an in-line, “out-of-lock” report comes in, this test is run to check the circuit pack’s status. The ATM-EI responds with “in lock” or “out of lock.” If the response is “in lock,” the test passes; if the response is “out of lock,” the test fails.

Table 169: Test #304 Expansion Interface Lock Query Test (#304) 1 of 2

Error Code	Test Result	Description / Recommendation
2000	ABRT	Response to the test request was not received within the allowable time period.
2100	ABRT	Could not allocate the necessary system resources to run this test.
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
	FAIL	A PN's unduplicated ATM-EI circuit pack responded incorrectly, or a PN's active ATM-EI circuit pack could not communicate with the PN's circuit packs. 1. If the PN's active ATM-EI circuit pack is failing and duplicated PNC is enabled: a. Enter reset PNC interchange to switch to the standby PNC. b. Repeat the short test sequence. c. If test continues to fail, enter reset board location to reset the ATM-EI circuit pack. 2. If the PN's unduplicated ATM-EI circuit pack is failing: a. Enter display errors and display alarms , and follow the associated repair procedures for TDM-CLK, TONE-BD, or SYNC alarms/errors. b. Repeat the short test sequence. c. If test continues to fail, replace the circuit pack or transceiver.
	PASS	Communication from software to the ATM-EI circuit pack is functioning correctly.

Table 169: Test #304 Expansion Interface Lock Query Test (#304) 2 of 2

Error Code	Test Result	Description / Recommendation
0	NO BOARD	No board was detected by the test. <ol style="list-style-type: none"> 1. Check the error log for wrong board (error 125) or no board (error 131). Resolve either of these issues. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (error 1538). If hyperactive, use reset board location. 3. Run the test again. If it fails, the NCE chip on board could be bad. Replace the board and retest.
		2 of 2

Expansion Interface Control Channel Test (#316)

This test is nondestructive. If an ATM-EI circuit pack is an *active* ATM-EI in the PN (amber LED on long/off short), the Expansion Interface Control Channel test checks to see if the ATM-EI circuit pack can communicate with other circuit packs in the PN using the PN's TDM bus.

If the circuit pack is a standby ATM-EI (amber LED off), this test queries the ATM PNC Expansion Interface circuit pack for information about its type and vintage.

If it fails, the NCE chip on board could be bad. Replace the board and retest.
		2 of 2

Packet Interface Test (#598)

This test is nondestructive and attempts to send a data packet from the TN1655 Packet Interface circuit pack through any ATM PNC Expansion Interface circuit packs. The path the data packet takes depends on the location of the ATM PNC Expansion Interface circuit pack being tested and whether the system has duplicated port-network connectivity.

Communication Manager Maintenance-Object Repair Procedures

The Packet Interface Looparound test checks the packet-bus interface circuitry on this board. The on-board LANHO chip sends a data stream to the bus, retrieves it back, and checks for its consistency. If the data is consistent, the test passes; otherwise, it fails. The test aborts if the specified PN's packet bus has an active minor alarm or is out of service. This test runs as a part of initialization, periodic or scheduled error analysis, and demand-test sequences. [Figure 26](#) shows a schematic of the test.

Figure 26: Packet Interface Test (#598)

Table 171: Packet Interface Test (#598)

Error Code	Test Result	Description / Recommendation
2000	ABRT	Response to the test request was not received within the allowable time period. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 3 retries. 2. If the test fails repeatedly, attempt to reset the circuit pack. 3. If the test continues to fail, replace the circuit pack.
2012	ABRT	Internal system error
2100	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
ANY	FAIL	The transmitted data packet was not received correctly by the Packet Interface circuit pack. The failure can be in the ATM-EI under test, the DS1C-BD circuit packs, or the intervening Center Stage components. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to five times. 2. If the test continues to fail, replace the circuit pack.
	PASS	The Packet Interface test passed.

ATM Board Error Query Test (#1259)

This test is nondestructive. The ATM circuit pack firmware maintains counters for some of the on- and off-board errors. The maintenance software queries the board for its health information to do error analysis. These alarms have assigned priority: if a higher priority alarm occurs, the remaining alarms are not reported to the software (through the inline errors), avoiding unnecessary up-link, in-line error message traffic. This is run as a part of a craft demand test sequence periodic testing, initialization, and error analysis.

Table 172: ATM Board Error Query Test (#1259)

Error Code	Test Result	Description / Recommendation
2000	ABRT	Response to the test was not received within the allowable time period.
2100	ABRT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals up to 3 times.
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
XXYY	FAIL	On-board hardware or off-board signaling errors on the board. XX indicates the on-board hardware error, and YY indicates the off-board errors on the as shown in Table 173: XX Error Codes, Test #1259 (ATM Board Error Query Test) on page 540 or Table 174: YY Error Codes, Test #1259 (ATM Board Error Query Test) on page 541. 1. Resolve any errors in error logs.
	PASS	No service effecting errors or alarms were detected on the circuit pack.
0	NO BOARD	No board was detected by the test. 1. Check the Error Log for wrong board (Error Type 125) or no board (Error Type 131). Resolve either of these issues, if applicable. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error Type 1538). If hyperactive, use reset board location . 3. Run the test again. If it fails, the NCE chip on board could be bad. Replace the board and retest.

Table 173: XX Error Codes, Test #1259 (ATM Board Error Query Test)

XX Aux Data	Description
1	ATM framer chip failed
2	NCE chip failed
3	LANHO critical error
4	TDM Prog. logic device failed
5	Every on-board DSP failed
6	Receive network processor failed
7	Transmit network processor failed
8	Memory read failed
9	Dual UART chip failed
10	LANHO receive parity error
11	LANHO FIFO overflow error
12	LAN Bus timeout
13	LANHO Xmit FIFO overflow
14	One or more on-board DSPs failed

Table 174: YY Error Codes, Test #1259 (ATM Board Error Query Test)

YY Aux Data	Description
15	Backplane clock failed
16	Loss of signal
17	Loss of frame
18	Multiplexer Section Alarm indication signal error
19	Multiplexer Section remote defect indicator error
20	Loss of pointer
21	Path signal level mismatch
22	High level path alarm indication signal
23	High level path remote defect indicator
24	Loss of cell delineation
25	Uncorrectable headers sent by the ATM switch
26	Too many cells with invalid Virtual Path Indicator (VPI)/Virtual Circuit Indicator (VCI) combination
27	The signaling link between the board and the ATM switch is down.
28	Board to the ATM switch connection is down
34	Excessive AAL-5 (ATM signaling protocol) retransmission requests
35	Excessive LAPD retransmission requests
37	ATM CLP (cell loss priority) bit. See ATM-NTWK (ATM Network Error) on page 558.
38	ATM congestion indicator. See ATM-NTWK (ATM Network Error) on page 558.
39	ATM cell underrun. See ATM-NTWK (ATM Network Error) on page 558.
40	ATM cell overrun. See ATM-NTWK (ATM Network Error) on page 558.
41	Lost ATM cell. See ATM-NTWK (ATM Network Error) on page 558.

ATM Board Framer Loop-Around Test (#1260)

This test is destructive.

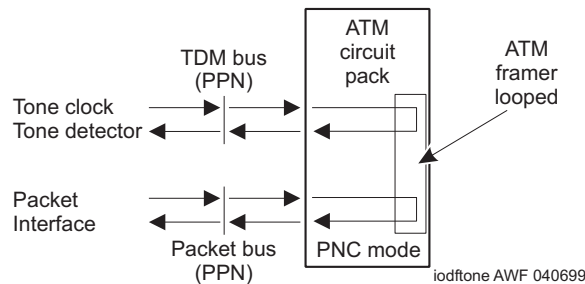

Note:

This test can be run on the standby PNC only if the board is busied out.

This test places the ATM circuit pack in ATM framer loop-around mode. Once the board receives this message, it creates a dummy virtual circuit that originates and ends on the same board, without leaving the board. This test verifies both the TDM path and the Packet Path. If the TDM test path passes, then the packet path is tested. Definitions of each test path are:

- **The circuit (TDM) path:** one of the Tone Generators sends a bit pattern through a TDM bus time slot to the ATM framer. The pattern is converted into ATM cells and looped back to the ATM-EI board, which converts the cell back into the bit pattern and puts it on a pre-determined time slot. A Tone Detector tests for the bit pattern and reports the test result. This test verifies that a large portion of the ATM-EIs circuit paths are functioning correctly. [Figure 27: ATM Board Framer Loop-Around Test \(#1260\)](#) on page 542 shows a diagram of the test.

Figure 27: ATM Board Framer Loop-Around Test (#1260)

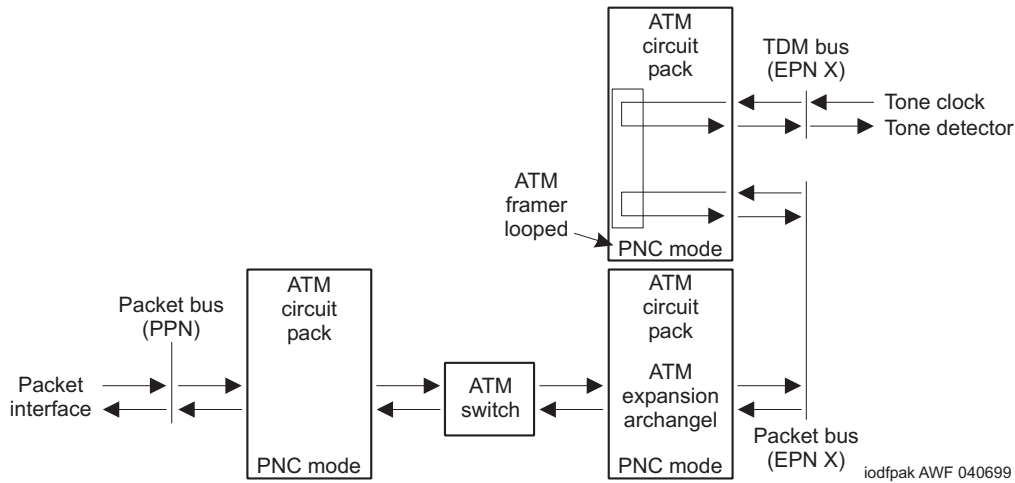

- **Packet path:** the Packet Interface circuit pack sends packet data to the ATM framer interface, where it is mapped into ATM cells and then looped around internally. The cells are converted back to packet data after it has been looped. This portion of the test verifies correct operation of the ATM-EI's packet-bus interface and a large portion of the ATM-EI's packet paths. [Figure 28: ATM Board Framer Loop-Around Test \(#1260\) \(non-EAA, Packet Path\)](#) on page 543 shows the packet switched signal path for the ATM circuit pack.
- This test verifies the operation of a large portion of the ATM-EI circuit and packet paths, but does not verify the optical portion of the lightwave transceiver. If this test passes, the ATM-EI circuit pack is functioning correctly, but faults can exist in the lightwave transceiver. If the test fails, the fault can be on the board. After the test results are reported, the ATM framer is taken out of loopback.

Note:

This test can be run on active or standby ATM-EIs, but it is *not* allowed if an ATM-EI is the Expansion Archangel.

Figure 28: ATM Board Framer Loop-Around Test (#1260) (non-EAA, Packet Path)

Error Code	Test Result	Description / Recommendation
1002	ABRT	<p>The system could not allocate timeslots for the test. The system could be under heavy traffic conditions or it could have timeslots out of service due to TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service.</p> <ol style="list-style-type: none"> 1. Verify that at least one Tone Detector resides in this PN. (Even without a TTR-LEV error, the tested circuit pack's PN could be missing a Tone Detector.) If missing, the test always aborts for this circuit pack, without harming the system. Note: A TN2182 Tone-Clock circuit pack must be of vintage B or newer. If an earlier vintage circuit pack resides in a PN, this test always aborts with this abort code. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals up to 3 times.

1	FAIL	The circuit pack failed to reset.
2	FAIL	The circuit pack failed to restart. <ol style="list-style-type: none"> 1. Execute command again. 2. If the problem persists, replace the circuit pack.
	PASS	The ATM-EI circuit pack is successfully reset. <ol style="list-style-type: none"> 1. If <code>status port-network</code> still indicates that this link is down, it is possible that one or both of the ATM-EI circuit packs are busied out. 2. If the links do not come up after reset, review the error logs and take appropriate diagnostic action.
2 of 2		

ATM Cross Talk Test (#1298)

This test is nondestructive. The ATM board Cross Talk test verifies that the selected TDM bus time slot never crosses over to time slots reserved for other connections. The test also checks for cross connections, where the board talks to time slots other than those specified. Since this test uses many system resources (TDM time slots, Tone Generator, Tone Detector, and others), it runs as a part of demand test only.

This test fails if either the TDM programmable logic and/or the interface to the DSP is not operating properly. Failure of these components can result in 1-way or noisy connections. Refer to [Figure 29: ATM Cross Talk Test #1298 schematic](#) on page 550 for a schematic of this test.

Note:

This test takes approximately 12 minutes and applies only to TN2305 and TN2306 circuit packs.

Figure 29: ATM Cross Talk Test #1298 schematic

Table 177: ATM Crosstalk Test (#1298) 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system could be under heavy traffic conditions or it could have time slots out-of-service due to TDM-Bus errors. Refer to TDM-BUS to diagnose these errors. 1. If the system has no TDM-Bus errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
		1 of 2

Table 177: ATM Crosstalk Test (#1298) 2 of 2

Error Code	Test Result	Description / Recommendation
1003	ABRT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Resolve any TTR-LEV errors in the Error Log. 2. Resolve any TONE-PT errors in the Error Log. 3. If neither condition exists, retry the test at 1-minute intervals up to 5 times.
2000	ABRT	Response to the test was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1962	ABRT	Every TALKER DSP is busy (an unlikely event). 1. Retry the command at 1-minute intervals up to 3 times.
2302	ABRT	Inconsistent uplink message from the ATM-EI board. This is a very unlikely event. 1. Retry the command at 1-minute intervals up to 3 times.
2752	ABRT	The circuit pack in this location is not a TN230X.
1-8 None	FAIL	The board is writing to unauthorized TDM time slots. The error code indicates the number of faulted TALKER DSPs. 1. Retry the command up to 3 times. 2. If the failure persists, replace the circuit pack.
1-8	PASS	The board is not talking to unauthorized time slots on the TDM Bus. The error code indicates the number of TALKER DSPs that were tested.
2 of 2		

ATM Board DSP Test (#1293)

This test is **nondestructive** and is designed to test the board's interface to the TDM bus and the functions of all 24 on-board DSPs (Digital Signal Processors). There are three functional types of DSPs:

- talkers – put data on the TDM bus
- listeners – take data off the TDM bus
- echo cancelers – as implied

Listener and echo cancelers are tightly coupled because firmware allocates *sets* of DSPs. Since there are a total of 24 DSPs on the board, there can be up to 8 triplets allocated.

If the test fails for every DSP, a MAJOR alarm is raised against the board. If the test fails for one or more DSPs, a MINOR alarm is raised. If a DSP is busy, the test for that particular DSP is considered passed. The test aborts if the system resources (for example, the TDM time slots, Tone Generator, and others) are not available.

This test applies to TN2305 and TN2306 ATM-El's, both active and standby, and is run as part of craft short and long testing, periodic, scheduled, initialization, and error analysis testing. Refer to [Figure 30: ATM Board DSP Test \(#1293\)](#) on page 552 for a diagram of this loop-around test.

Figure 30: ATM Board DSP Test (#1293)

Table 178: ATM Board DSP Test (#1293) 1 of 3

Error Code	Test Result	Description / Recommendation
1002	ABRT	<p>The system could not allocate time slots for the test. The system could be under heavy traffic conditions or it could have time slots out of service due to TDM-BUS errors.</p> <p>1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 3 times.</p>

Table 178: ATM Board DSP Test (#1293) 2 of 3

Error Code	Test Result	Description / Recommendation
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service.</p> <ol style="list-style-type: none"> 1. Verify that at least one Tone Detector resides in this PN. (Even without a TTR-LEV error, the tested circuit pack's PN could be missing a Tone Detector.) <p>If missing, the test always aborts for this circuit pack, without harming the system.</p> <ol style="list-style-type: none"> 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals up to 3 times.
1962	ABRT	<p>Every DSPs is busy (an unlikely event).</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 3 times.
2000	ABRT	<p>Response to the test was not received within the allowable time period for some of the DSPs.</p> <ol style="list-style-type: none"> 1. If the board is in standby, reset the board and run the test again. 2. Look into the Error Log for Error Type 1218 (bad DSP). If Error Type 1218 is not logged against this board, run the DSP test again and see if the error persists.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p>
2302	ABRT	<p>Inconsistent uplink message from the ATM-EI board (an unlikely event).</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 3 times.
2500	ABRT	<p>Internal system error</p>
2752	ABRT	<p>The circuit pack in this location is not a TN230X.</p>
		2 of 3

Table 178: ATM Board DSP Test (#1293) 3 of 3

Error Code	Test Result	Description / Recommendation
XYZ	FAIL	<p>A device on the circuit pack is failing. There is at least one bad DSP on the board. Values are as follows:</p> <ul style="list-style-type: none"> ● The X value indicates the number of talker DSPs ● Y indicates the number of listener DSPs ● Z indicates the number of Echo Canceler DSPs that have failed the test. <ol style="list-style-type: none"> 1. Run the tests for the active Tone-Clock in the PN that contains the indicted ATM-EI circuit pack to verify that dial-tone is supplied. 2. If the Tone-Clock is healthy, repeat the short test on the ATM-EI board. 3. If this test continues to fail, replace the ATM-EI circuit pack.
XYZ	PASS	<p>The test passed for some or all DSPs depending on XYZ values. XYZ indicates the number of talker, listener and echo-canceler DSPs for which the test passed, respectively. In the DSPs that passed the test, the test tone was correctly detected by the DSP Listener and by tone-detector for the DSP Talkers on both buses, and the Echo Canceler DSPs are working properly.</p>
0	NO BOARD	<p>No board was detected by the test.</p> <ol style="list-style-type: none"> 1. Check the Error Log for wrong board (Error Type 125) or no board (Error Type 131). Resolve either of these issues, if applicable. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error Type 1538). If hyperactive, use reset board location. 3. Run the test again. If it fails, the circuit pack could be bad. Replace the circuit pack and retest.
		3 of 3

ATM-INTF (TN2305/6)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ATM-INTF	WRN	<code>test board location</code>	ATM interface board

The system recognizes a TN2305/6 as an ATM interface board (ATM-INTF) unless it has an assigned personality (`add atm pnc` or `add atm trunk`). ATM-INTF does not have an associated maintenance strategy, although the:

- `list config` and `change circuit-pack` reveal the board
- `test board` runs an on-demand Control Channel test
- `reset board` resets the board

[Table 179](#) lists circuit packs that are ATM-EI boards if they are administered to provide ATM port-network connectivity (ATM PNC).

Table 179: ATM-EI circuit packs for ATM PNC

Circuit Pack	Fiber	Echo Cancellation
TN2305	Multimode	Yes
TN2306	Single-mode	Yes

Note:

Always replace an ATM-EI circuit pack with the same type.

Error Log Entries and Test-to-Clear Values

Table 180: ATM-INTF Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test-to-Clear Value
23 (a)	0	None	WRN	Off	
125 (b)		None	MINOR	On	
217 (c)	0	None	WRN	Off	

Notes:

- a. **Error Type 23:** The ATM expansion interface circuit pack is administered through a **change circuit-pack** command, but has not been inserted into the system. Insert the circuit pack.
- b. **Error Type 125:** A wrong circuit pack is located in the slot where this circuit pack is logically administered. To resolve this problem either remove the wrong circuit pack or insert the logically-administered circuit pack.
- c. **Error Type 217:** The ATM circuit pack is physically present but has not been given a personality. Remove the circuit pack or administer it using **add atm pnc** or **add atm trunk**.

System Technical Demanded Tests: Descriptions and Error Codes

Test failure is not logged in the error log.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND
Control Channel Loop Around test (#52)	X	X	Nondestructive

Control Channel Loop-Around Test

This test queries the circuit pack for its circuit-pack code and vintage, and verifies its records.

Table 181: Test #52: Control Channel Loop-Around 1 of 2

Error Code	Test Result	Description / Recommendation
2000	ABRT	The response to the test request was not received within the allowable time period.
2100	ABRT	The system resources required to this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
2500	ABRT	Internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
1 of 2		

Table 181: Test #52: Control Channel Loop-Around 2 of 2

Error Code	Test Result	Description / Recommendation
	FAIL	<p>The circuit pack failed to return the circuit pack code or vintage.</p> <ol style="list-style-type: none"> 1. Retry the command up to 5 times. 2. If the problem continues, reset the circuit pack. 3. Retry the command up to 5 times.
	PASS	Communication with this circuit pack is successful.
Any	NO BOARD	<p>This is normal if the test is being executed when:</p> <ol style="list-style-type: none"> 1. The board is not physically in the system. 2. The system is booting. <p>Otherwise, there is some inconsistency in the date stored in the system.</p> <ol style="list-style-type: none"> 1. Verify that the board is physically in the system. 2. Verify that the system is not in the process of booting. 3. Retry the command at 1-minute intervals up to 5 times.

ATM-NTWK (ATM Network Error)

S8700 MC

MO Name in Alarm Log	Physical Name in Error Log ¹	Alarm Level	Full Name of MO
ATM-NTWK	ATUUP	WRN	ATM Network Error
ATM-NTWK	location	WRN	ATM Network Error

1. *AT* indicates it is an ATM switch-related address, *UU* is the connection number. The connection number can be converted into a board location with `display atm pnc uu`, which shows the translations for the board that reported the ATM network error. *P* indicates if the ATM-EI board (reporting the ATM network error) is on the PNC's A side or the B side. If the system is simplex, only A is valid.

In an ATM PNC configuration, a proprietary Center Stage Switch (CSS) is replaced by an ATM network. Because CSS nodes are replaced by the ATM network in the ATM PNC configuration, SNI boards are no longer needed. In place of the SNI boards, ATM Expansion Interface (EI) or ATM Circuit Emulation Service (CES) boards are connected to an ATM switch port over a fiber-optic cable. The ports on the ATM switch are under control of its maintenance software. Refer to *ATM Installation, Upgrades, and Administration using Avaya Communication Manager, 555-233-124*, for more information.

An error against ATM-NTWK indicates a problem in the ATM network (including the ATM switch) that is affecting service quality. These error events are either:

- Reported by the ATM network to an ATM EI or ATM CES board
- Detected by either the ATM EI or ATM CES board itself

Since these errors are **not** related to the ATM EI or ATM CES board, they are not reported against the ATM-EI or ATM-TRK MO. However, some of these errors invoke alarms that require action by the system's maintenance software, while other log-only errors require no action.

Error Codes and Aux Data values

The Cause Code/Error Type information is shown in [Table 182](#). These are the possible errors that can be logged against the ATM-NTWK MO.

If the ATM-NTWK MO receives more than 6 errors, the most recent are discarded.

Table 182: Error codes and Aux Data values ATM-NTWK 1 of 6

Cause Code/ Error Type	Aux Data	Cause Codes Description
NORMAL EVENTS		
0	(a)	Network unreachable
1	(a)	Unallocated (unassigned) number. This cause indicates that the called party cannot be reached because, although the number is in a valid format, it is not currently assigned (allocated).
2	(a)	No route to specified transit network. This cause indicates that the equipment sending this cause has received a request to route the call through a particular network that it does not recognize, either because the transit network does not exist or because that particular transit network does not serve the equipment that is sending this cause. This cause is supported on a network-dependent basis.
3	(a)	No route to destination. This cause indicates that the called party cannot be reached because the network through which the call has been routed does not serve the destination desired. This cause is supported on a network-dependent basis.
10	(a)	VPCI/VCI unacceptable. This cause indicates that the virtual channel most recently identified is not acceptable to the sending entity for use in this call.
16	(a)	Normal call clearing. This cause indicates that the call is being cleared because one of the users involved in the call has requested that the call be cleared. Under normal situations, the source of this cause is not the network.
17	(a)	User busy. This cause indicates that the called party is unable to accept another call because the user busy condition has been encountered. This cause value can be generated by the called user or by the network.
18	(a)	No user responding. This cause is used when a called party does not respond to a call establishment message with a connect indication within the prescribed period of time allocated.
1 of 6		

Table 182: Error codes and Aux Data values ATM-NTWK 2 of 6

Cause Code/ Error Type	Aux Data	Cause Codes Description
21	(a)	<p>Call rejected. This cause indicates that the equipment sending this cause does not wish to accept this call, although it could have accepted the call because the equipment sending this cause is neither busy nor incompatible.</p> <p>Note: If the call was rejected by the far-end ATM-EI or ATM-CES board, there could also be additional information about this rejection in an ATM-EI error log entry. Look for an ATM-EI or error with an Error Type between 1104 and 1119 inclusive, with approximately the same time stamp as this error.</p>
22	(a)	<p>Number changed. This cause is returned to a calling party when the called party's number indicated by the calling user is no longer assigned. The new called party's number can optionally be included in the diagnostic field. If a network does not support this capability, cause number 1 "<i>unassigned (unallocated) number</i>" is used.</p>
23	(a)	<p>User rejects every call with CLIR (calling line identification restriction). This cause is returned by the called party when the call is offered without calling party's number information and the called party requires this information.</p>
27	(a)	<p>Destination out of order. This cause indicates that a user-indicated destination cannot be reached because a signaling message could not be delivered to the remote user over the destination's interface (for example, a physical-layer or SAAL failure at the remote user, or remote user's equipment is off line).</p>
28	(a)	<p>Invalid number format (address incomplete). This cause indicates that the called user cannot be reached because the called party's number is not in a valid format or has insufficient digits.</p>
30	(a)	<p>Response to STATUS ENQUIRY. This cause is included in the STATUS message when the reason for generating the STATUS message was the prior receipt of a STATUS ENQUIRY message.</p>
31	(a)	<p>Normal, unspecified. When no more specific cause values apply, this cause reports a normal event.</p>
32	(a)	<p>DTL transit not-my-node ID</p>
RESOURCE UNAVAILABLE		
35	(a)	<p>Requested VPCI/VCI not available. This cause indicates that the requested VPCI/VCI is not available. This can be caused by mismatched VCI ranges on different ATM switches.</p>
36	(a)	<p>VPCI/VCI assignment failure</p>
2 of 6		

Table 182: Error codes and Aux Data values ATM-NTWK 3 of 6

Cause Code/ Error Type	Aux Data	Cause Codes Description
37	(a)	User Cell Rate not available
38	(a)	Network out of order. This cause indicates that the network is not functioning correctly and that the condition is likely to last a relatively long time. (Immediately retrying the call is unlikely to succeed.)
41	(a)	Temporary failure. This cause indicates that the network is not functioning correctly, but the condition is unlikely to last long. (Immediately retrying the call is likely to succeed.)
43	(a)	Access information discarded. This cause indicates that the network could not deliver access information to the remote user as requested (that is, ATM adaptation-layer parameters, Broadband low-layer information, Broadband high-layer information, or sub-address as indicated in the diagnostic).
45	(a)	No VPCI/VCI available. This cause indicates that no appropriate VPCI/VCI is currently available to handle the call.
47	(a)	Resource unavailable, unspecified. When no more specific cause values apply, this cause reports a resource-unavailable event.
SERVICE OR OPTION UNAVAILABLE		
49	(a)	Quality of Service unavailable. This cause reports that the requested Quality of Service cannot be provided.
51	(a)	User cell rate not available. This cause reports that the requested ATM Traffic Descriptor is unobtainable.
57	(a)	Bearer capability not authorized. This cause indicates that a user-requested bearer capability is implemented by the cause-sending equipment, but the user is not authorized to use the capability.
58	(a)	Bearer capability not currently available. This cause indicates that the user-requested bearer capability is implemented by the cause-sending equipment, but the capability is currently unavailable.
63	(a)	Service or option not available, unspecified. When no more specific cause values apply, this cause reports an unavailable service or option event.
65	(a)	Bearer capability not implemented. This cause indicates that its sending equipment does not support the bearer capability requested.
73	(a)	Unsupported combination of traffic parameters. This cause indicates that the combination of traffic parameters contained in the ATM traffic descriptor information element (IE) is not supported.
3 of 6		

Table 182: Error codes and Aux Data values ATM-NTWK 4 of 6

Cause Code/ Error Type	Aux Data	Cause Codes Description
78	(a)	AAL parameters cannot be supported.
INVALID MESSAGES		
81	(a)	Invalid call reference value. This cause indicates that its sending equipment received a message with a call reference that is currently inactive on the user-network interface.
82	(a)	Identified channel does not exist. This cause indicates that its sending equipment received a request to use a channel not activated for the call's interface.
88	(a)	Incompatible destination. This cause indicates that its sending equipment received a request to establish a call with either Broadband low-layer information, Broadband high-layer information, or other compatibility attributes that cannot be accommodated.
89	(a)	Invalid endpoint reference value. This cause indicates that its sending equipment has received a message with an endpoint reference that is currently idle on the user-network interface.
91	(a)	Invalid transit network selection. This cause indicates that a transit network identification was received in an incorrect format.
92	(a)	Too many pending add-party requests. This cause indicates a temporary condition when the calling party sends an add-party message, but the network rejects the message due to full queues.
93	(a)	AAL parameters cannot be supported. This cause indicates that its sending equipment received a request to establish a call with ATM adaptation-layer parameters that cannot be accommodated.
PROTOCOL ERROR		
96	(a)	Mandatory information element (IE) is missing. This cause indicates its sending equipment has received a message with a missing IE.
97	(a)	Message type either non-existent or not implemented. This cause indicates that its sending equipment received a message with an unrecognized type, either because the type is undefined, or defined but not implemented by the cause-sending equipment.
4 of 6		

Table 182: Error codes and Aux Data values ATM-NTWK 5 of 6

Cause Code/ Error Type	Aux Data	Cause Codes Description
99	(a)	Information element (IE) either non-existent or not implemented. This cause indicates that its sending equipment received a message with an unrecognized IE, either because the IE's identifier(s) are undefined, or defined but not implemented by the cause-sending equipment. This cause indicates that its sending equipment discarded the IE. However, the equipment could still process the message since this IE was not required.
100	(a)	Invalid contents in information element (IE). This cause indicates that its sending equipment received and implemented an IE. However, one or more of the IE's fields are coded in a way that the cause-sending equipment has not implemented.
101	(a)	Message not compatible with call state. This cause indicates receipt of a message that is incompatible with the call state.
102	(a)	Recovery on timer expiration. This cause indicates that a timer's expiration initiated an error-handling procedure.
104	(a)	Incorrect message length
111	(a)	Protocol error, unspecified. When no more specific cause values apply, this cause reports a protocol-error event.
5 of 6		

Table 182: Error codes and Aux Data values ATM-NTWK 6 of 6

Cause Code/ Error Type	Aux Data	Cause Codes Description
257 to 300 (b)	(b)	<p>ATM Impaired Paths</p> <ol style="list-style-type: none"> 1. Examine the error log (<code>display errors</code>), atm setup-events log (<code>list measurements atm svc-setup</code>), and atm pnc-latency (<code>list measurements atm latency</code>) screens to help diagnose the problem, although the switch could be operating normally. In this case, you should consider raising the Activation threshold and/or increasing the Timeout value on the ATM-RELATED System Parameters screen. (<code>change system atm</code>). <p>Use <code>list measurements atm svc-setup</code> to see information about errors associated with connection numbers.</p> <ol style="list-style-type: none"> 2. After entering the above command, note the time stamps shown in the <code>list measurements atm setup-events</code> screen. Execute the above command periodically and note the time stamps. If the time stamps have changed for a particular From Conn-To Conn pair, this indicates there are still setup failures/delays for that connection. 3. After verifying that every associated ATM endpoint is operating correctly, and if errors are still occurring, contact your local service provider.
301 (c)	ANY	<p>System wide ATM Impaired Paths. See the suggestions listed above to trouble shoot these errors.</p>
769 (d)		ATM CLP (Cell Loss Priority) Bit Errors
1025 (e)		ATM Congestion Bit Errors
1281 (f)		ATM Cell Underrun Errors
1537 (g)		ATM Cell Overrun Errors
1793 (h)		ATM Lost Cells
6 of 6		

Notes:

- a. Aux Data values for Setup and Add Party (XX = port network, YYY = location code). Aux Data values for WSP Setup (XX = WSP number, YYY = location code). [Table 183: Location codes from Aux Data values](#) on page 565 is a list of UNI 3.1 location codes:

Table 183: Location codes from Aux Data values

Setup (Location Code)	Add Party (Location Code)	WSP Setup (Location Code)	Location Code Meaning
0	500	800	User
1	501	801	Private network serving the local user
2	502	802	Public network serving the local user
3	503	803	Transit network
4	504	804	Public network serving the remote user
5	505	805	Private network serving the remote user
7	507	807	International network
10	510	810	Network beyond interworking point

- b. **Error Types 257 to 300:** used to determine the destination PNC connection number of an ATM Network connection that is experiencing an impaired path. The connection number is obtained by subtracting 256 from the number that is shown in the Error Type field. See the following example:

If the Error Type field = 263, subtract 256, which equals 7, the PNC destination connection number.

The Aux Data field contains the originating and destination PN number (XXYY). Where XX = the originating PN #, and YY = the destination PN # for example:

1. Aux Data = 302
3 = orig
2 = dest
2. Example Aux Data = 1510
15 = orig
10 = dest

- c. **Error Type 301** indicates that there is a system wide impaired path network problem.

Note:

Under certain circumstances network errors can be against the ATM EI board.

d. **Error Type 769:** ATM CLP (Cell Loss Priority) Bit Errors

The ATM cell header has a bit called the cell loss priority (CLP) bit. The bit indicates one of two states: the cell is eligible for discarding, or it is not. In an ATM configuration, every cell is transmitted into the ATM network with the CLP bit set to 0 indicating that these cells are NOT eligible for discarding. Should the system ever receive a cell from the ATM network with the CLP bit set to 1 (discard eligible), an entity in the ATM network modified the bit during transit. Generally, an ATM network switch sets the CLP bit to 1 (discard eligible) only if the cell fails to conform to the cell rate specified in the traffic contract for the VC. However, Communication Manager cell emissions conform with the VC traffic contract. Therefore, the presence of a non-conforming cell implies that something else in the ATM network switch is setting the CLP bit in some cells, the ATM switch can also be policing out (discarding) cells which do not conform to the traffic contract. This error can occur together with other errors such as:

“Excessive AAL-5 CRC errors” or
“Excessive LAP-D retransmissions”

These errors affect SVCs with Variable Bit Rate (VBRnt) traffic contracts. VBR SVCs transport system links such as EAL, PACL, and PRI links. Again, this indicates problems with cell transmissions in the ATM network.

If cell discard is happening generically in the ATM network, other symptoms can affect the Constant Bit Rate (CBR) SVCs including audible artifacts in talk paths, failure of modems over voice lines, and “Cell Underruns” - see note (f).

e. **Error Type 1025:** ATM Congestion Bit Errors

The ATM cell header has a bit called the congestion bit. In Communication Manager ATM, every cell is transmitted into the ATM network with the congestion bit set to 0 (congestion not experienced). Should the system ever receive a cell from the ATM network with the congestion bit set to 1 (congestion experienced), an entity in the ATM network modified the bit during transit. It simply indicates that the ATM network is experiencing heavy traffic.

During periods of congestion, the ATM network can choose to discard cells even though those cells conform to their traffic contracts. Should the ATM network discard cells, errors such as the following can occur:

“Excessive AAL-5 CRC errors”
“Excessive LAP-D retransmissions”.

These errors affect SVCs with Variable Bit Rate (VBRnt) traffic contracts. VBR SVCs transport system links such as EAL, PACL, and PRI links. Symptoms that can affect the Constant Bit Rate (CBR) SVCs include audible artifacts in talk paths, failure of modems over voice lines, and “cell Underruns” – see note (f).

f. **Error Type 1281:** ATM Cell Underruns

Communication Manager ATM monitors for cell underrun conditions on SVCs with Constant Bit Rate (CBR) traffic contracts or on ATM CES trunks. In either case, cells are expected to arrive at a fixed rate. If cells arrive below that rate, an underrun condition exists. The most likely cause of cell underruns is a problem with cell transmission through the ATM network.

Possible symptoms include audible artifacts in talk paths and failure of modems over voice lines. If cell loss is happening generically in the ATM network, other symptoms like “excessive AAL-5 CRC errors” or “excessive LAP-D retransmissions” are possible on SVCs with Variable Bit Rate (VBRnt) traffic contracts. The VBR SVCs transport system links such as EAL, PACL, and PRI links.

Another ATM board within the system originally generated the arriving cells at the specified traffic contract rate. In order to have arrived at a lower rate, these cells were either slowed during transmission or possibly discarded by the ATM network. This indicates problems with cell transmission in the ATM network. Consult the ATM network vendor. Ask about cell delay variation, cell discard, and traffic policing.

Cell underruns often happen in conjunction with cell overruns. If both occur, it further indicts the ATM network.

g. Error Type 1537: ATM Cell Overruns

Communication Manager ATM monitors for cell overrun conditions on SVCs with Constant Bit Rate (CBR) traffic contracts or on ATM CES trunks. In either case, cells are expected to arrive at a fixed rate. If cells arrive above that rate, an overrun condition exists. The most likely cause of cell overruns is a problem with cell transmission through the ATM network.

Both cell underruns and overruns are typical symptoms of cell transmission problems like cell jitter or delay. The ATM board attempts to compensate somewhat by buffering cells. However, if the ATM network transmission delays are high, the board could conclude that it has seen a cell overrun because it has exhausted all of its buffer space.

If cell underruns or both cell underruns and overruns occur, indict the ATM network. Consult the ATM vendor. Ask about cell delay variation, cell discard, and traffic policing.

Another much less likely cause of cell overruns is that an ATM board is generating cells above the traffic contract rate. Suppose, a board somehow generates cells too quickly. The ATM network likely reacts by at least setting the CLP bit in the cells that exceed the traffic contract (see note (d) for ATM CLP errors). The ATM network can also discard the excess cells.

If only cell overruns occur, locate the ATM board generating those cells. Execute `test board long`. If the board passes, then the ATM network remains the likely cause of transmission problems. Consult the ATM network vendor. Ask about cell delay variation, cell discard, and traffic policing.

h. Error Type 1793: ATM lost cells:

The ATM board receiving the CBR cell stream is detecting out-of-sequence AAL1 sequence numbers, above the defined threshold. This normally indicates that the ATM network has lost the missing cells. In this case, “lost” could mean that the cells were, for example, policed out, lost to congestion, or misdirected to another endpoint.

The likely user-visible symptoms of lost cells are missing talk paths or poor voice quality.

Communication Manager Maintenance-Object Repair Procedures

The “lost cells” error can help you diagnose cell underrun problems. When cell underruns are accompanied by lost cells errors, the lost cells could have caused the underruns. But if you have cell under runs without lost cells, it could indicate that the underruns were due to network jitter instead. It is also possible that network jitter can cause both cell underruns and lost cells, if the jitter is so severe it causes the cells to violate their traffic contract.

When accompanied by congestion or CLP errors, the congestion or CLP can be causing the lost cells.

When accompanied by cell overrun errors, the cell overruns can be causing the TN2305 to discard cells, which in turn can show up as lost cells.

Lost cells without other errors can indicate that cells are being corrupted, especially the AAL1 sequence number.

In any case, consult your ATM network vendor about possible causes. Look for jitter (cell delay variation), cell discard, and traffic policing.

ATM PNC-DUP (ATM PNC Duplication)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
PNC-DUP	NA	<code>status pnc</code>	PNC duplication

The PNC-DUP MO tracks the health of the active and standby PNCs, controls planned and spontaneous interchanges, and manages related functions such as double call refresh and unrefresh, antithrashing, and so on. The main responsibility of PNC-DUP is to recover the system to full service in the event of a fault. In the event of multiple faults, PNC-DUP does its best to maximize service continuity.

Note:

ATM PNC-DUP behaves differently when the system is running the ATM PNC feature. While not a separate MO, this discussion explains the unique behavior of PNC-DUP under the ATM PNC feature.

In critical-reliability systems, the following components comprising the port-network connectivity (PNC), are duplicated:

- ATM-Expansion Interface (ATM-EI) circuit packs in port networks (PNs)
- Fiber-optic cables connecting the above circuit packs to the ATM Switch Interface Modules
- ATM Switch

Although not part of the PNC, Tone-Clock circuit packs are also duplicated in each PN. ATM PNC systems can have up to 64 PNs.

PNC duplication architecture utilizes an active/standby duplication scheme in which one complete set of PNC components supports call processing, while the duplicate PNC is held in reserve. All calls on the active PNC are simultaneously set up, or shadowed, on the standby PNC in order for it to be capable of instantly assuming active status when necessary, allowing for interchanges without service disruption (in the case of single faults).

PNC duplication does not introduce any additional types of hardware or hardware faults, and there are no tests associated with the PNC-DUP MO. Instead, its error log entries contain useful information about the occurrence and causes of interchanges in order to facilitate diagnosis of problems, which can then be addressed by using the documentation for the individual MO involved.

PNC-DUP Related Commands

[Table 184: PNC-DUP Commands](#) on page 570 lists the PNC-DUP related commands and their output forms are fully described in [Maintenance SAT Commands](#) in *Maintenance Commands Reference (03-300191)*.

Table 184: PNC-DUP Commands

Command	Description
<code>status pnc</code>	Shows information about both PNCs' operational status, including state of health, alarms, busyouts and locks.
<code>reset pnc interchange</code>	Initiates a demand PNC interchange. If the standby is healthy (all-zero state-of-health indexes), there is no effect on service. Otherwise, calls may be dropped.
<code>set pnc</code>	Locks or unlocks the active PNC, preventing interchanges. Does not interfere with double call setup.
<code>busyout pnc</code>	Removes the standby PNC from service. See also the section on busyout of PNC components.

Busyouts and PNC-DUP

`Busyout pnc` puts the standby PNC in the busyout state. In this condition:

- Double call set up is turned off.
- The standby PNC is unrefreshed; existing duplicate call connections are removed.
- PNC interchanges are prevented.

Upon release, interchanges are re-enabled and a global refresh of double call setup on the standby is performed.

When PNC duplication is in effect:

- An active PNC component cannot be busied-out.
- A standby PNC component can only be busied-out when the standby PNC is first busied-out.
- The standby PNC cannot be released unless all standby PNC components are released.

Enabling and Removing PNC Duplication

To Enable PNC Duplication

To enable PNC duplication, perform the following sequence of steps:

1. Enable administration of PNC-DUP on the **change system-parameters customer-options** screen.
2. Fully administer duplicate ATM PNC connectivity. Verify by **list atm pnc**. Or for IP duplication, go to step three.
3. Fully administer IPSI duplication (**ipserver-interface duplication**). Verify by using **list ipserver-interface**.
4. Activate PNC-DUP through the **change system-parameters duplication** screen. This is not allowed if any component of either PNC (A or B) is busied out.
5. The system must insert all connectivity-related components for both standby and active PNC, a process that takes up to 5 minutes, depending upon circuit pack insertion. The process finishes when the first terminal login prompt appears.
6. The PNC-DUP initialization anti-thrashing timer must expire (this occurs 5 minutes after completion of board insertion, PNC interchange, or system reset of level 2 or higher).

To Disable PNC Duplication

To disable PNC duplication perform the following sequence of steps:

1. Verify that the A-PNC is active. A forced interchange may be required. See **reset pnc**.
2. Busyout the standby PNC (B-PNC).
3. Turn off the system parameter for PNC-DUP through **change system-parameters duplication**.
4. Remove the B-PNC connectivity by removing the Board Locations on the **change fiber** screen for ATM PNC.
5. Remove the B-PNC circuit packs (ATM-EI boards). Use **change circuit-pack location**.
6. Disable administration of PNC duplication on the **change system-parameters customer-options** screen by changing the **PNC Duplication** field to **n**.

Notes:

- Alterations to PNC that involve only the addition of connectivity can be done with PNC-DUP operational.
- Alterations requiring the removal of connectivity must be done with PNC-DUP removed.
- PNC-DUP must be removed and translations should be saved before making any hardware changes.

Steady State LEDs

The LEDs of PNC components in a stable duplicated system should appear as follows:

- For an **active** ATM EI (functioning as Archangel) in a PN **without** IPSIs, its amber LED's flash pattern is 2 seconds on/200 ms off.
- For a **standby** ATM EI in a PN without IPSIs, it's amber LED is off.
- For an **active** ATM EI in a PN **with** IPSIs, its amber LED is on steady.
- For an **standby** ATM EI in a PN with IPSIs, its amber LED is off.

PNC State of Health

PNC-DUP software monitors the health of the two PNCs as determined by their state-of-health (SOH) vectors, and initiates an interchange when the health of the active falls below that of the standby (unless prevented from doing so by a PNC lock, busyout, or antithrashing mechanism). Potentially service-disrupting faults that occur in a PNC's components are reported to PNC-DUP and incorporated in the affected PNC's state of health. The SOHs of both PNCs are displayed on the `status pnc` screen, as shown in [Figure 31: Status PNC screen with standby PNC fully In-Service](#) on page 572.

Figure 31: Status PNC screen with standby PNC fully In-Service

```
status pnc                                     page 1 of 1
                                PORT-NETWORK CONNECTIVITY
                                Duplicated? yes
                                Software Locked? no
                                Standby Busied? no
                                Standby Refreshed? yes
                                Interchange Disabled? no
                                A-PNC                                     B-PNC
                                Mode: active                             Mode: standby

```

PNC State-of-Health Indexes

The Inter-PN Index screen the state-of-health vector is used to track and compare the states of health of both PNCs. The fields making up the indexes are 2-digit numbers separated by periods (.), with each field representing a different class of faults. The fault class fields are arranged in order of decreasing importance from left to right. In other words, each field in the index supersedes the following fields in determining which PNC is healthiest. A fault class drives an interchange only when all of the higher priority fault classes are equal. A zero entry indicates no faults present for that class. Increasing numbers indicate increasingly higher numbers of faults present in that class.

The Inter-PN Index contains four fields (XX.XX.XX.XX). The Inter-PN Index reports faults in connectivity between PNs.

- The meaning of each fault class field is given in [Table 185: PNC State-of-Health Fault Classes](#) on page 573.
- A zero entry indicates that there are no faults reported.
- Higher numbers indicate increasing number of faults.
- All zeros indicate a perfect state of health.
- Unless the PNCs are locked, the active PNC's state of health should always be equal to or better than the standby's. Otherwise, the system performs a spontaneous interchange.

After a PNC-related alarm is cleared, the system performs a partial refresh of the standby PNC. The corresponding fault class field is not updated to reflect the improved state of health until the refresh is done. The state-of-health indexes do not agree with the current alarm status during this period.

Table 185: PNC State-of-Health Fault Classes

Fault Class	Priority	Description	MOs
FC_EAL	1	Number of PNs with EALs down	EXP-PN
FC_PACL	2	Number of PNs with LINL, RINL, or EI-SNI neighbor link faults	EXP-PN
FC_BFD	3	Number of PNs with BFDL (Bearer Fault Detection Link) faults	SYS-LINK
FC_HW	4	Number of PNs affected by hardware faults in a link having an EI as an endpoint. Use <code>list atm pnc</code> to see endpoint designations.	ATM-EI

Resolving Poor State of Health

When both PNCs do not have an all-zero SOH (perfect health), use the following steps to identify and repair the problem.

1. Look for PNC component alarms (major or minor) for the PNC side without an all-zero SOH. The standby PNC should be repaired first.
2. Busy-out the standby PNC.
3. Follow the appropriate diagnostic and repair procedures for the alarmed PNC components just as with a simplex PNC. Both the alarm and error logs should be examined to isolate the fault.
4. Verify that the related PNC's SOH is restored to all zeros.
5. Release the standby PNC.

Refresh and Unrefresh of the Standby PNC

In a fully-functional PNC with healthy standby and active sides, the standby PNC has a complete set of call connections corresponding to those in the active PNC. If, however, the standby PNC's state of health degrades, a selective unrefresh of those connections that utilize the faulted component(s) is performed. If the standby PNC's health improves, a selective refresh of connections on the affected route is performed so that call setup is consistent between the active PNC and the healthy parts of the standby PNC.

The **Standby Refreshed?** field on the `status_pnc` screen does *not* refer to the selective type of refresh. It refers only to a global refresh that is performed when:

- The system is initialized and PNC duplication is enabled.
- There has been a spontaneous PNC interchange.
- The standby PNC has been released from busy-out.
- A system reset of level 2 or higher has taken place.

The `Refreshed` field may display `yes` when in fact the standby is partially unrefreshed. An interchange into an incompletely refreshed standby results in dropped calls. This can happen when a more severe fault occurs on the active PNC or when `reset_pnc_interchange` is used with the override option.

PNC Interchanges

PNC spontaneous interchanges occur when PNC duplication software determines that the standby PNC's state of health (SOH) surpasses the active PNC's.

- PNC-DUP executes a spontaneous interchange in response to a message from a PNC component MO indicating that either a fault has occurred on the active PNC or a fault has been resolved on the standby PNC.
- The PNC SOH is compared to the standby PNC, and an interchange occurs if the standby PNC's state of health surpasses the active PNC's.
- A corresponding Major or Minor alarm is logged by the reporting MO, stimulating an alarm report.

When the resolution of a fault on the standby renders it more healthy than a simultaneously-faulted active PNC, the error message indicates the type and location of the *improved* component.

Once the interchange completes, the failed component is on the standby PNC. A demand interchange can be requested in the presence or absence of standby PNC faults. The following sequence of actions can be observed during a fault-free interchange:

1. The ATM-Expansion Interfaces currently acting as archangels in the PNs are deactivated as indicated by the amber LEDs going from flashing to on solid.
2. The ATM-EIs in IPSI-connected PNs are interchanged, indicated by the new standby ATM-EI amber LED off and the new active ATM-EI amber LED on steady.
3. One by one, the ATM-EIs in non-IPSI-connected PNs are interchanged as indicated by new standby ATM-EI amber LED turning off and the new active ATM-EI amber LED flashing (2 seconds on / 200 milliseconds off). At this point, the interchange is functionally complete.

Certain conditions may interfere with the normal execution of the interchange:

1. In a faulted spontaneous interchange, it is possible the PN(s) directly affected by the fault will be the last to interchange.
2. A user directly affected by the single fault instigating a PNC interchange can experience a momentary voice path outage during the switch.
3. If faults exist on both the standby and active PNC, it is possible to have some PNs go out of service while others are returned to service.

In any multifault situation, rely on `status pnc` to determine which is the active PNC.

PNC duplication informs Timing Synchronization maintenance when a PNC interchange has been completed and indicates which PNC is active. This causes Synchronization to audit and ensure that the primary source for synchronization of Tone-Clocks in each PN is supplied by a path associated with the active PNC.

Antithrashing and PNC Interchanges

Following a spontaneous PNC interchange, subsequent PNC interchanges are prevented for 5 minutes. This condition is indicated by **y** in the **Interchange Disabled?** field of the **status pnc** screen. After 5 minutes, the antithrashing timer expires, interchange decisions are re-enabled, and the field displays **n**.

Note:

Should a catastrophic failure occur on the active PNC during the period when the Interchange Disabled? field is set to "yes," there will be no spontaneous PNC interchange.

Demand PNC interchanges also invoke anti-thrashing, but only for a period of 30 seconds. During antithrashing mode, demand interchanges are also prevented unless the override option is specified.

CAUTION:

Use of this option may cause a service disruption.

Repairs on the Standby PNC Components

CAUTION:

If there is a TDM-CLK alarm, system timing may be routed through part of the standby PNC, and circuit switched data may be affected by the following repair procedures. This can happen, for example, when a slave tone/clock circuit pack experiences a loss of signal and switches to receive timing from the standby ATM-EI. In this case TDM-CLK 2305 error is logged, and the clock problem should be addressed first, if possible.

To repair PNC components in a duplicated PNC proceed as follows:

1. Most repairs involve fixing a single fault on the standby PNC. Use **set pnc lock** or **busy-out pnc** to prevent an interchange into the PNC being repaired.
2. If a faulty component exists on the active PNC, this also means that the standby PNC is more severely faulted. Normally, the *standby* PNC is repaired first, since it is the most severely impaired.

To repair the active PNC (standby is already repaired), enter **set pnc unlock**, which generates a spontaneous interchange. In a PNC demand interchange with **reset pnc interchange** use the **override-and-lock** qualifier for the active PNC. The **override-and-lock** option ensures that no subsequent interchange can occur during the repair of the standby PNC. A demand interchange may not be necessary if the following conditions drive a spontaneous interchange:

- The anti-thrashing period from the last interchange has expired.

- The global refresh from releasing the standby PNC has completed.
- The standby PNC's state of health surpasses the active PNC's.

At this point, the faulty component is on the standby PNC, and the PNCs are locked in their current active/standby state.

3. Busyout the PNC with `busyout pnc`.
4. Use fault isolation and component testing procedures for the individual PNC components, just as for a simplex PNC. Replacement of components does disrupt operation of the active PNC.
5. Once the failed component is replaced, use `status pnc` to check the health standby PNC component.
6. When confident that the problem has been resolved, as indicated by an all-zero state of health, unlock (`set pnc unlock`) and release (`release pnc`) the PNC. Note that no further PNC interchange is required since you can test the standby PNC as thoroughly as the active.

Interactions: Server Resets and PNC Interchanges

- A system reset of level 1 (warm), 2 (cold2) or 4 (reboot) does not change which PNC is active. If a PNC interchange was in progress when the reset took place, the PNC interchange continued until completion.
- If a `reset system 1` (warm) takes place during a PNC interchange, the reset is escalated to level 2 (cold2).

Fault Isolation Using Duplicated PNC

In some cases, PNC duplication can aid in the fault isolation procedure. PNC interchanges can be used to help isolate the faulty hardware. Two examples demonstrating this technique follow:

1. There is a fault that can occur in either an IPSI-connected PN's ATM-EI or the PKT-INT which cannot be readily attributed to one board or the other. If the packet bus transceivers on either the PKT-INT or ATM-EI fail, the two boards cannot communicate, but it will not be clear which board is at fault. In this case, a planned interchange of the PNC can be used to indicate which of the two boards. If the interchange:
 - Cures the problem, the ATM-EI was at fault
 - Does not cure the problem, the PKT-INT is suspect (provided there are no PKT-BUS faults)
2. A similar relationship exists for the PN Archangel (EAA - the active ATM-EI) and certain TDM-bus problems. If the EAA is unable to communicate with a port board over the TDM bus, either the EAA has a fault, the port board has a fault, or there is a problem with the

TDM bus itself. If TDM bus maintenance tests find no problems with the bus, then it is either the port board or the EAA. It may be simpler to replace the port board than to request a PNC interchange. However, if it is not clear which port board may be at fault or maintenance is being performed remotely, verify that the EAA is not at fault by executing a PNC interchange. If the interchange solves the problem, then the EAA is faulty. If the problem persists after the interchange, but TDM bus maintenance finds no problem, then the port board is faulty.

Error Log Entries

Whenever a PNC interchange takes place, an error is logged against PNC-DUP with a code that conveys information about the cause of the interchange and which PNC became active. There are no alarms associated with PNC-DUP errors, but there should be an alarm against the PNC component that caused the interchange. There are no PNC-DUP test sequences, but `status_pnc` provides information regarding the status of the PNCs. The information in [Table 186: Error Code descriptions and Aux Data correlations](#) on page 578 and [Table 187: Error Log Encode Field Decoding](#) on page 579 can help to identify which areas of the Alarm Log to investigate to find the source of the problem.

Table 186: Error Code descriptions and Aux Data correlations

Error Code	Description	Aux Data ¹
00000	Error in generating error code	None
1cxpp	Spontaneous Interchange in response to a constraint for A-PNC	Active PNC
2cxpp	Spontaneous Interchange in response to a constraint for B-PNC	Active PNC
51000	Spontaneous Interchange at expiration of SOH validation timer	Active PNC
52000	Spontaneous Interchange upon PNC UNLOCK	Active PNC
53000	Spontaneous Interchange at completion of Global Refresh	Active PNC
60801	PNC Demand Interchange	Active PNC
60800	PNC Demand Interchange with override	Active PNC

1. The Aux Data indicates which PNC became active after the PNC interchange: "0" denotes PNC-A; "1" denotes PNC-B.

Table 187: Error Log Encode Field Decoding

Field	Variable Name	Values	Description
c	Alarm Type	0 1	Alarm retired MAJOR or MINOR alarm on any PNC component
x	Fault class; see description for contributing MOs	0	EAL (Expansion Archangel Link - EXP-PN) carries CCMS messages
		1	PACL (ATM-EI) carries ATM signaling commands from Call Processing to the remote ATM-EI circuit packs
		2	PNC hardware (providing connectivity of PN-to-PN or -ATM-EI)
		5	BFDL (bearer fault detection link) solely for the purpose of detecting bearer faults
pp	Port-network number	0–63	0–2 for constraint class (this is an internal number; add 1 for external port number)

Error Log Entries and Test to Clear Values

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
18	None	<code>busy PNC-DUP</code>	WRN	ON	<code>release pnc-dup</code>

Note:

The `list config port-network` command shows the cabinet number associated with a PN.

ATM-SGRP (ATM Signaling Group)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run ¹	Full Name of MO
ATM-SGRP	MIN	<code>test sig-group grp#</code>	ATM-CES Signaling Group
ATM-SGRP	WRN	<code>test sig-group grp#</code>	ATM-CES Signaling Group

1. *grp#* is the signaling group number (1–166); the test sequence can be either short or long.

ATM-SGRP applies when ATM signaling groups have been administered on an ATM circuit pack as ATM trunks.

[Table 188: R7 ATM-SGR circuit packs](#) on page 580 outlines the differences between ATM interface circuit packs:

Table 188: R7 ATM-SGR circuit packs

Circuit pack	Channel types	Interface	Fiber	Echo cancellation
TN2305	B and D channels	24- or 32-channel	Multimode	Y
TN2306	B and D channels	24- or 32-channel	Single-mode	Y

The TN2305 and TN2306 ATM Interface circuit boards are referred to as TN230X for the remainder of ATM-SGRP.

An ATM Signaling Group is a collection of B channels for which a given ISDN-PRI signaling-channel port (ATM D channel) carries signaling information. ATM B channels (ATM-BCH) carry voice or data and are assigned to ISDN trunks. For more information see [ATM-TRK \(Circuit Emulation Service Circuit Pack\)](#) on page 599.

The operation of the entire ATM signaling group depends on several other entities:

- ATM-DCH signaling-channel port
- TN230X Interface circuit pack where a D channel resides
- System link to the processor via the packet bus

When there are problems with ATM-SGRP (ATM signaling group), also investigate:

- [ATM-DCH \(ATM D-Channel Port\)](#)
- [ATM-BCH \(ATM B-Channel Trunk\)](#)
- [SYS-LINK \(System Links\)](#)
- [PKT-BUS \(Packet Bus\)](#)

Error Log Entries and Test to Clear Values

Table 189: ATM-SGRP Signaling Group Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any		<code>test sig-group grp#</code>
1 (a)	Any	None			
18 (c)		MO busied out			
257 (d)	Any	None			<code>test sig-group grp#</code>
769 (e)	Any	Primary Signaling Link Hardware check (#636)			<code>test sig-group grp#</code>
1281 (f)	Any	Secondary Signaling Link Hardware check (#639)			<code>test sig-group grp#</code>
1793 (g)	Any	Layer 2 Status test (#647)	WRN	OFF	<code>test sig-group grp#</code>
2305 (h)	Any	Remote Layer 3 Query test (#637)	MIN	OFF	<code>test sig-group grp#</code>
3585 (i)	Port number	None			
3840 - 3928 (j)	Port number	None			

Notes:

- a. **Error Type 1:** switch sent a message to the far-end switch or terminal adapter, and the far end did not respond in the allotted time. Possible causes include link failure and congestion or outage at the far end. The Aux Data field contains layer-3 protocol information used by internal counters.

If no other symptoms are present, no action is required. If layer-3 communication is down:

- a. Check for alarms and errors against link components
2. Check out other errors against ATM-SGRP, ATM-TRK, and other hardware components on the link.

There is no test to clear these errors. The error counter is decremented by 1 every 15 minutes.

Communication Manager Maintenance-Object Repair Procedures

- c. **Error Type 18:** the ATM circuit pack has been busied out (either `busyout atm sig-grp` or `busyout board location`).
1. Release the ATM signaling group (`release atm sig-grp`) or the circuit pack (`release board location`).
- d. **Error Type 257:** the primary signaling channel connection has been lost for more than 90 seconds.
- The associated B channels are placed in the ISDN Maintenance/Far-End state.
 - The B channels are not usable for outgoing calls, although incoming calls can be accepted.
 - The switch automatically attempts to recover the signaling link.
1. Pay particular attention to the results of Test #636 (Primary Signaling Link Hardware Check) in the test sequence.
 - When the link does recover, the B channels are negotiated back to the In-Service state and their alarms are retired.
 2. When this error occurs, the state of the Signaling Group is changed to out-of-service (verify using the `status sig-group` command).
- e. **Error Type 769:** signaling link hardware error.
Service-affecting failures of the hardware used to transport the D channel are reported to the ATM CES Signaling Group MO. Maintenance logs this error, places the D channel into the OOS state, and raises a board-level alarm. The D channel is returned to service, and the alarm is retired once the hardware failure condition clears.
- f. **Error Type 1281:** Degraded PVC alarms indicate that a particular Permanent Virtual Circuit, or signaling group, has encountered sufficient errors to exceed firmware thresholds. Operations can continue but at a lower level of reliability or performance. Firmware filters these alarms so that only one is reported active at a given time. The following in-line error is considered a Degraded PVC alarm:
- Excessive AAL – The AAL layer is experiencing an excessive number of errors in trying to reconstruct Service Data Units (SDUs). Possible causes:
 - Problem with the ATM switch
 - Noisy communication paths on opposite side of ATM switch
 - Unhealthy sending node
 - Congestion at the ATM switch
- g. **Error Type 1793:** Layer 2 Query test for the primary signaling channel failed.
- Excessive AAL – The AAL layer is experiencing an excessive number of errors in trying to reconstruct Service Data Unit (SDUs). Possible causes:
 - Problem with the ATM switch
 - Noisy communication paths on opposite side of ATM switch
 - Unhealthy sending node
 - Congestion at the ATM switch

h. **Error Type 2305:** The Remote Layer 3 Query test (#637) failed. A specific message was sent to the far-end switch, and it did not respond within the allotted time.

1. Investigate elements of the ATM D channel(s) (ATM-DCH) for both this switch and the far-end switch.

If Test #637 fails twice in a row, the B channels are alarmed and made unavailable for outgoing calls (although incoming calls are still accepted). When Test #637 succeeds and the far-end switch starts responding properly, the ATM trunk (B channels) are placed back into normal operation and their alarms retired.

i. **Error Type 3585:** A SERV or SERV ACK ISDN D-channel message has been received by a non-US-type interface (country option other than 1 on the DS1 administration screen). However, these messages are used only for duplex NFAS signaling, which is supported by country protocol 1.

Thus, there may be a mismatch in administration between the local and far-end switches.

1. Consult with the customer's network provider to determine whether the D channel is set up correctly on the far-end switch.

j. **Error Type 3840-3928:** These error types are used to report certain error messages received by the ATM-SGRP Signaling Group for one of its associated B channels. The Aux Data field is the port number of the B channel from which the message was received.

The error code generated equals 3840+x, where x is a Cause Value defined by the ISDN PRI Specification. Note that there is no Test to Clear Value for these error types; selected ISDN cause values are placed in the log when they are received, but no direct action or alarming is performed solely in response to receiving them. They provide added data that may prove useful when tracking down obscure networking and routing problems. See [Table 190: Descriptions and repair recommendations \(Error Types 3840-3928\)](#) on page 583 for more information.

Table 190: Descriptions and repair recommendations (Error Types 3840-3928) 1 of 5

Error Code	Description	Recommendation
3842	A request has been made to use a transit network or common carrier that cannot be accessed.	From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. <ol style="list-style-type: none"> 1. Check every routing pattern containing this trunk group for validity of interexchange carriers requested (IXC field).
1 of 5		

Table 190: Descriptions and repair recommendations (Error Types 3840-3928) 2 of 5

Error Code	Description	Recommendation
3846	The far-end switch has indicated that the B channel (trunk) is not acceptable for use in the call for which it was requested.	<p>This could indicate</p> <ul style="list-style-type: none"> ● an administration problem (for example, the local switch and the far-end switch have different B channels administered) ● a normal race condition (for example, the local switch has requested use of a B channel that the far-end switch had just reserved for use on another call). <ol style="list-style-type: none"> 1. From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. 2. Enter status trunk for the indicated trunk. 3. Refer to Table 151: ATM ISDN service states on page 490 for recovery suggestions.
3858	Similar to Error Type 1. The switch sent an ISDN message to the far-end switch or terminal adapter that did not respond in the allotted time.	<ol style="list-style-type: none"> 1. Check for alarms and errors against link components 2. Check out other errors against ATM-SGRP (ATM Signaling Group), ATM-TRK (Circuit Emulation Service Circuit Pack), and other hardware components on the link.
3878	The far-end switch has indicated that the network is not functioning correctly and that the condition may last a relatively long period of time (for example, immediately re-attempting the call may not be successful).	<ol style="list-style-type: none"> 1. From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. 2. Consult with the network provider to determine the nature and expected duration of the out of service condition. 3. Consider modifying every routing pattern containing this trunk group, to route calls around the network that is out of service.
2 of 5		

Table 190: Descriptions and repair recommendations (Error Types 3840-3928) 3 of 5

Error Code	Description	Recommendation
3890	A request to use a network service (for example, SDN) has been denied. Administration somewhere in the network has indicated that the requested service has not been subscribed to or purchased for this trunk.	<p>This could indicate</p> <ul style="list-style-type: none"> ● a local administration problem ● a mismatch between the local administration and that of the network provider. <ol style="list-style-type: none"> 1. From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. 2. Display the trunk group screen. <p>If the trunk group is Call-by-Call (the Service Type field is cbc), check every routing pattern screen containing this trunk group to see if the Service/ Feature fields contain the correct network services purchased for this trunk.</p> <p>If the trunk group is not Call-by-Call, check that the Service Type field contains the single network service purchased for this trunk.</p> 3. If local administration appears correct, consult with the customer and/or the network provider to determine the services that the customer has subscribed to for this trunk group.
3892	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	<ol style="list-style-type: none"> 1. If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.
3 of 5		

Table 190: Descriptions and repair recommendations (Error Types 3840-3928) 4 of 5

Error Code	Description	Recommendation
3894	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	<ol style="list-style-type: none"> 1. Eliminate any transitory state mismatch problems (test port location for the trunk port shown in the Aux Data field). Test #256 (Service State Audit) is the important test in the sequence. 2. If Test #256 passes yet the customer continues to complain of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.
3905	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	<ol style="list-style-type: none"> 1. If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.
3906	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	<ol style="list-style-type: none"> 1. If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate to the problem and provide the next tier with this Error Log information.
3909	A request to use a network service has been made, but the network has rejected the request because the requested service is not implemented.	<ol style="list-style-type: none"> 1. Follow the recommendations listed above for Error Type 3890.
4 of 5		

Table 190: Descriptions and repair recommendations (Error Types 3840-3928) 5 of 5

Error Code	Description	Recommendation
3928	A call was denied because of a basic incompatibility between the type of call and either the facilities selected by the routing pattern or the called user itself.	<p>This error might be helpful as a clue if the customer complains of receiving unexpected intercept tone after accessing ISDN trunks or PRI endpoints.</p> <ol style="list-style-type: none"> 1. Determine the trunk group from the circuit pack and port number (in the aux data field) 2. check the BCC fields of the pertinent routing patterns. 3. Also, investigate whether or not the calling and called endpoints are compatible (for example, some ISDN switches may not allow a voice station to call a data extension).
5 of 5		

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Primary Signaling Link Hardware check (#636), you may also clear errors generated from other tests in the sequence.

Table 191: System Technician-Demanded Tests: ATM-SGRP

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND¹
Primary Signaling Link Hardware check (#636)	X	X	ND
Layer 2 Status test (#647)	X	X	ND
Remote Layer 3 Query test (#1291)	X	X	ND

1. D = Destructive, ND = Nondestructive

Primary Signaling Link Hardware Check (#636)

The ATM-SGRP Signaling Group D-channel port depends on the health of the TN230X interface circuit pack on which it resides. This test fails if there are problems with either the ATM-DCH (D-channel port) MO or the TN230X circuit pack. Investigate the ATM TN230X circuit pack (ATM-TRK) anytime there are problems with the ATM D-channel port (ATM-DCH).

Table 192: Primary Signaling Link Hardware Check (#636)

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
8	FAIL	There is a problem with the ATM TN230X circuit pack or the ATM signaling channel (D channel), preventing any ISDN trunk calls until the problem is resolved. 1. Consult the procedures for the TN230X circuit pack (ATM-TRK) and the ATM D channel (ATM-DCH).
	PASS	The basic physical connectivity of the D channel is intact and functional. 1. Try this test repeatedly to ensure the link is up and to uncover any transitory problems.

Layer 2 Status Test (#647)

The Layer 2 Status test checks the layer-2 status of the ATM-SRG signaling channel (D channel). This test fails when:

- there is a hardware failure
- there is a facility problem
- the D channels are not administered correctly

The Signaling Link Hardware Check (Test #637) and the Remote Layer 3 Query test (#1291) detects most problems caused by hardware failures or incorrect administration.

Table 193: Test #647 Layer 2 Status Query Test

Error Code	Test Result	Description / Recommendation
1132	ABRT	Internal system error. The port location for the D channel is not known. This condition should not be possible since an administered ATM circuit pack must be specified when a Signaling Group is administered: <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to five times.
1134	ABRT	Internal system error. The associated ATM circuit pack is not administered. This condition should not be possible, since an administered ATM circuit pack must be specified when administering a Signaling Group. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to three times.
2500	ABRT	Internal system error <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to five times.
1	FAIL	Layer 2 of the signaling channel is down. <ol style="list-style-type: none"> 1. Examine the results of the Signaling test (#636), and follow recommendations provided there. 2. If Test #636 (Primary Signaling Link Hardware Check) passes, the Layer 2 Query test may still fail if the signaling channel at the far end has not been administered correctly or if the signaling channel has been busied out. 3. Verify that the far-end signaling channel (D channel) has been administered correctly. 4. Verify that the ATM-DCH port used for the D channel has not been busied out at the far end.
3	FAIL	The D channel is down. <ol style="list-style-type: none"> 1. Examine the results of the Primary Signaling Link Hardware Check (#636) and follow recommendations provided there. 2. If Test #636 (Primary Signaling Link Hardware Check) passes, the Layer 2 Query test may still fail if the signaling channel at the far end has not been administered correctly or if the signaling channel has been busied out. 3. Verify that the far-end signaling channel (D channel) has been administered correctly. 4. Verify that the far-end ATM-DCH ports used for the Primary and Secondary D channels have not been busied out.
	PASS	The Primary signaling channel is up.

Remote Layer 3 Query (#1291)

This test queries the far-end switch or terminal adapter to determine whether the signaling connection is functioning properly at Layer 3. It selects a B channel in the in-service or maintenance service state and sends an ISDN layer-3 SERVICE message, which requires a response from the far end (similar to performing Test #256 on an ISDN trunk). The test is not performed if there are no B channels in an appropriate ISDN service state (for example, when none are administered or they are all out of service).

Note:

The service state can be displayed by using the `status trunk grp#/mem#` or `status pri-endpoint` command.

As is the case with Test #256 for an ISDN trunk, a PASS only indicates that a message was composed and sent to the far-end switch or terminal adapter. The ISDN PRI Specification allows up to 2 minutes for a response. Check the Error Log for ATM-SGRP errors of type 2305 for evidence of a Remote Layer 3 Query failure.

Test #636 checks the health of the D channels and ATM Interface circuit packs. This test goes one step further by checking the communication path from the processor, through the TDM/packet bus and ATM Interface circuit pack, and on to the far-end switch or terminal adapter. A special ISDN message is sent to the far-end switch or terminal adapter that must respond within a specified amount of time. This test is designed to ensure that the communication path between the switch and the far end is up and operational, and that the two endpoints can properly exchange ISDN control messages.

Table 194: Test #1291 Remote Layer 3 Query 1 of 2

Error Code	Test Result	Description / Recommendation
1006	ABRT	There are no associated B channels in an ISDN “in-service” or “maintenance” service state. This is a NORMAL ABORT. <ol style="list-style-type: none"> 1. Administer or release an ISDN trunk or PRI endpoint before retrying the test. For an ATM trunk, use <code>status trunk grp#/mem#</code> to verify the ISDN trunk state. 2. Retry this test when at least one B channel is in the “in-service” or “maintenance” states.
1113	ABRT	The signaling channel is down. Therefore, no messages can be sent to the far-end switch or terminal adapter. <ol style="list-style-type: none"> 1. Examine the results of Test #636, and follow recommendations provided there.
		1 of 2

Table 194: Test #1291 Remote Layer 3 Query 2 of 2

Error Code	Test Result	Description / Recommendation
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2500, none	ABRT	<p>Internal system error or administration problem</p> <ol style="list-style-type: none"> 1. Determine whether any B channels are administered. 2. If there are none, then this is a normal ABORT, since this test cannot run unless at least one B channel is administered. 3. If at least one B channel is administered, there is an internal system error. Retry the command at 1-minute intervals up to 5 times.
	FAIL	<p>Internal system error</p> <ol style="list-style-type: none"> 1. See description of ABORT with Error Code 2500.
	PASS	<p>A message was sent to the far-end switch or terminal adapter. The ISDN PRI specification allows up to 2 minutes for a reply.</p> <ol style="list-style-type: none"> 1. Check the Error Log for ATM-SGRP errors of type 2305 for evidence of a Remote Layer 3 Query failure. 2. If no new errors were logged since this test was run, then this switch and the far-end switch can exchange call control messages. 3. If there is still a problem with a particular ATM trunk, busyout the trunk and run the long test sequence, paying particular attention to the results of Test #258 (ISDN test call).
		2 of 2

ATM-SYNC (ATM Synchronization)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ATM-SYNC	MIN	<code>display errors</code>	ATM Synchronization
ATM-SYNC	WRN	<code>test synchronization</code>	ATM Synchronization

This section discusses intra-switch synchronization maintenance and the hardware and software components that provide a common reference frequency for reliable digital communications among the G3r system, the ATM switch, and other PBXs, Central Offices (COs) or customer-premises equipment (CPE). Circuit packs involved in synchronization include:

Note:

TN768 or TN780 Tone-Clock circuit packs are not compatible with ATM EIs.

- TN2312 IPSI circuit pack's Tone-Clock circuit
- TN2182 Tone-Clock
- TN722, TN464, and TN767 DS1 Interfaces (all suffixes)
- TN2305/6 ATM Expansion Interface (multimode fiber)

Synchronization is achieved between the S8700 Media Server Multi-Connect IPSI and the port networks (PNs) through the ATM port-network connectivity (ATM PNC) between the networks. Depending on the network's synchronization plan and the status of synchronization sources, the system timing reference may be:

- The clock circuit pack on the ATM switch
- A DS1 or UDS1 interface circuit pack-tapped T1 input signal connected to the ATM switch clock circuit
- An OC-3 interface circuit pack on the ATM switch

Stratum 4 synchronization extracts timing information directly from

- A DS1 or UDS1 reference
- An OC3 reference
- The ATM switch clock

For further information about synchronization including network synchronization, refer to *AT&T Network and Data Connectivity, 555-025-201*.

Stratum 4 Synchronization

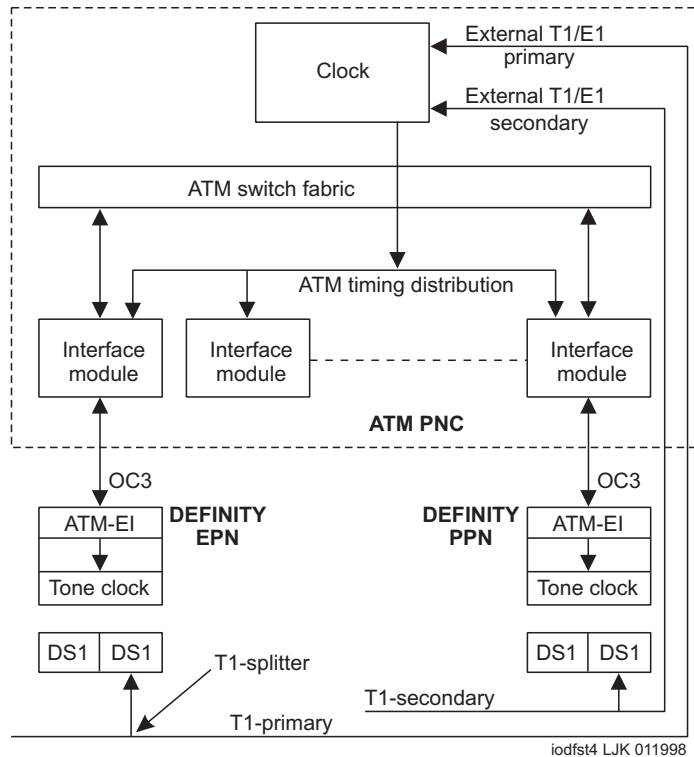

Systems may have primary and secondary synchronization references (DS1/UDS1 interface circuit packs or ATM-Switch) when using Stratum 4 synchronization.

If the primary synchronization reference in [Figure 32: Stratum-4 Synchronization with Unduplicated ATM PNC](#) on page 594 is providing a valid timing signal, then the flow of system synchronization would travel from the DS1 interface circuit pack in the PN to the ATM switch. The primary DS1 interface circuit pack provides a timing signal for the ATM switch clock circuitry. This synchronization source is then distributed to all of its OC3 Interface Modules. Each ATM Expansion Interface circuit pack uses the received data stream from the ATM switch to generate a timing signal. The Tone-Clock circuits in the PNs use this signal to generate timing for every circuit pack in their respective PNs. All PNs, in the above mentioned scenario are designated the *slave* PNs. The ATM switch is the *master* that contains the system synchronization source. If the primary synchronization reference does not provide a valid timing signal, ATM synchronization maintenance infers a switch to the secondary reference.

If the primary synchronization reference is not providing a valid timing signal, the system automatically switches to the secondary synchronization reference. If the primary synchronization reference is invalid, and if the secondary reference does not provide a valid timing signal or is not administered as a synchronization reference, the switch infers that the local oscillator of the ATM switch provides the system timing source. If the system is using the local oscillator of the ATM switch as the system timing source because the primary and secondary references are providing invalid timing signals, when either the primary or secondary reference becomes valid again, the system switches back to the primary or secondary source. When both the primary and secondary source become valid, the system switches to the primary source, since the primary source is always preferred over the secondary source when both sources are equally healthy.

[Figure 32](#) depicts a simplex ATM PNC with T1/OC3 synchronization reference into the ATM switch.

Figure 32: Stratum-4 Synchronization with Unduplicated ATM PNC

Note:

The TN722 DS1 Interface circuit pack does not provide a synchronization reference as reliably as the TN767 or TN464 circuit packs. Therefore, administer the TN767 or TN464 circuit packs as the primary or secondary sources.

Stratum-3 Synchronization

Stratum-3 synchronization is not supported in S8700 Multi-Connect with ATM PNC.

Troubleshooting ATM synchronization

A significant part of the Synchronization Recovery Strategy for a S8700 Multi-Connect with ATM PNC resides in the ATM switch's clock hardware, firmware, and software. S8700 Multi-Connect monitors synchronization performance and alarms any faulty components. See [SYNC \(Port-Network Synchronization\)](#) on page 2100.

ATM-SYNC Commands

Use the commands in [Table 195](#) to help troubleshoot ATM-SYNC problems:

Table 195: ATM-SYNC commands

Command	Description
<code>change synchronization</code>	Allows primary and secondary references to be administered for the Stratum 4 option, or <code>ATM-Switch</code> , indicating that the synchronization references are input directly to the ATM switch
<code>status synchronization</code>	Shows the current inferred synchronization reference
<code>status synchronization</code>	Shows the administered primary and secondary synchronization references
<code>list timing-source</code>	Displays all DS1 and UDS1 locations that are allowed to be administered as primary or secondary references with the <code>change synchronization</code> command
<code>disable/enable synchronization-switch</code>	Prevents or allows switching to another synchronization source
<code>test synchronization</code>	Tests the administered synchronization source

Error Log Entries and Test to Clear Values

Table 196: Synchronization Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test synchronization</code>
1 (b) (h)		None	WRN MINOR	OFF	None
257 (c) (h)		None	WRN MINOR	OFF	None
513 (d) (h)		None	WRN/ MAJOR	OFF	None
1537 (e)		None	WRN	OFF	None
1793 (f)	0-50	None	NONE	OFF	None
2049 (g)	0	None	WRN	OFF	None

Communication Manager Maintenance-Object Repair Procedures

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 1:** problem with the primary DS1 reference. It is cleared when the primary reference is restored. The following steps should give an indication of the source of the problem:
 1. Check if the primary DS1 interface circuit pack is inserted in the carrier with **list configuration board location**.
 2. Verify that the administered primary reference matches the DS1 reference from the network synchronization plan.
 3. Test the primary DS1 interface circuit pack with **test board location long**. Check the Error Log for DS1-BD or UDS1-BD errors and see [DS1-BD \(DS1 Interface Circuit Pack\)](#) on page 953 or [UDS1-BD \(UDS1 Interface Circuit Pack\)](#) on page 2329 to resolve any errors associated with the primary DS1 (DS1 or UDS1) interface circuit pack. If the only errors against DS1-BD or UDS1-BD are slip errors, then follow the procedures described in the troubleshooting section above. If no errors are listed in the Error Log for the primary DS1 interface circuit pack, continue with the following steps.
 4. Test the active Tone-Clock circuit in the master PN with **test tone-clock location long**. Check the Error Log for TDM-CLK errors and verify that TDM Bus Clock Test #148 (TDM Bus Clock Circuit Status Inquiry test) passes successfully. If Test #148 fails with an Error Code 2 through 32, see [TDM-CLK \(TDM Bus Clock\)](#) on page 2208 to resolve the problem.
- c. **Error Type 257:** problem with the secondary DS1 reference. It is cleared when the secondary reference is restored. Refer to note (a) to resolve this error substituting **secondary** for **primary** in the preceding resolution steps.
- d. **Error Type 513:** the ATM switch clock is inferred to be providing the timing source for the system. The primary and secondary (if administered) are not providing a valid timing signal. Investigate errors 1 and 257 to resolve this error.
- e. **Error Type 1537:** over half of the DS1s that are administered with slip detection enabled through the **Slip Detection** field set to **y** are experiencing slips. It may take up to 1 hour for these alarms to clear via the "leaky bucket" strategy.
- f. **Error Type 1793:** inferred excessive switching of system synchronization references has occurred. When this error occurs, it is inferred that the ATM switch clock has become the synchronization reference for the system. It may take up to 1 hour for these alarms to clear via the "leaky bucket" strategy.
 1. Check for timing loops and resolve any loops that exist.

2. Test the active Tone-Clock circuit in the master PN with `test tone-clock location long`.

Check the Error Log for TDM-CLK errors, and verify that TDM Bus Clock Circuit Status Inquiry test (#148) passes successfully.

If Test #148 fails with an Error Code 2–32, see [TDM-CLK \(TDM Bus Clock\)](#) on page 2208 to resolve the problem. If not, continue with the following steps.

3. For Duplicated Tone-Clock circuit packs in the master PN: Switch Tone-Clock circuit packs on the master PN with `set tone-clock location`.

For Simplex Tone-Clock circuit packs in the master PN: replace the primary and secondary (if administered) DS1 Interface circuit packs.

4. Investigate any other SYNC errors.

- g. **Error Type 2049:** the ATM Expansion Interface circuit packs have errors that affect synchronization. Test the ATM Expansion Interface circuit pack with `test board location`.

This error is cleared by a “leaky bucket” strategy and takes up to one hour to clear (leak away) the error counter once it is cleared.

- h. **Error Types 1, 257, and 513:** noise on the DS1 line can cause transient alarms on synchronization. Therefore, when a synchronization problem occurs on Error Types 1, 257, or 513, a WARNING alarm is first raised for 15 to 20 minutes before the alarm is upgraded to a MINOR or MAJOR alarm.

System Technician-Demanded Tests: Descriptions and Error Codes

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Test Synchronization test (#417)	X	X	ND

1. D = Destructive, ND = Non-destructive

Test Synchronization Test (#417)

This test updates all the Synchronization Maintenance component circuit packs with the correct information regarding their role in providing synchronization for the system. All the Tone-Clock, ATM Expansion Interface, DS1 Interface, and UDS1 Interface circuit packs in the system are updated through this test. This test either passes or aborts.

Table 197: Test #417 Test Synchronization Test

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals up to 3 times.
1115	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2500	ABRT	Internal system error
	PASS	The synchronization maintenance component circuit pack parameters have been successfully updated. The system should be synchronized after successful execution of this test. 1. If synchronization problems still exist, refer to the Error Log to obtain information regarding the source of the problem.

ATM-TRK (Circuit Emulation Service Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ATM-TRK	MAJ	<code>test board location</code>	ATM TRUNK (ATM Circuit Emulation Service)
ATM-TRK	MIN	<code>test board location</code>	ATM TRUNK (ATM Circuit Emulation Service)
ATM-TRK	WRN	<code>test board location</code>	ATM TRUNK (ATM Circuit Emulation Service)

ATM-TRK explains how you test and repair TN230x ATM Interface circuit packs (TN2305 and TN2306) that have been administered as virtual ISDN-PRI trunks for ATM Circuit Emulation Service (CES). The maintenance instructions for TN230x circuit packs that have been administered as Expansion Interfaces for WAN connectivity are in the ATM-INTF (TN2305/6) MO.

Description

The TN2305 and TN2306 ([Table 198: R7 ATM-TRK circuit packs](#) on page 599) are dual-purpose ATM circuit packs that can be administered as either:

- [ATM Circuit Emulation Service](#) or virtual ISDN-PRI signaling trunks
- Expansion Interfaces (ATM-EIs) for port-network connectivity (ATM PNC) between the PNs

Either circuit pack “personality” requires SONET OC-3 or SDH STM-1 fiber cable connections between the circuit pack and the ATM switch. As a trunk board, it supports direct connection between ATM CES circuit packs without an intervening ATM switch.

Table 198: R7 ATM-TRK circuit packs

Circuit pack	Channel types	Interface	Fiber	Echo cancellation
TN2305	B and D channels	24 or 32 channel	Multimode	Y
TN2306	B and D channels	24 or 32 channel	Single-mode	Y

Note:

TN230x circuit packs are not interchangeable.

ATM Circuit Emulation Service

Under ATM Circuit Emulation Service (CES), simulate ISDN-PRI circuits by assigning ports to signaling groups. Each signaling group represents a PRI circuit, and the ports in the group represent the D channel and B channels of that circuit.

Virtual D channels

Non-facility associated signaling is not supported under ATM-CES, so you must reserve one port in each signaling group for use as a D channel. Use channel 24 when emulating a T-1 ISDN facility, and channel 16 when emulating an E-1 facility. The D channel can be any physical port from 9 to 32.

Virtual circuits

The TN230x can support a varied number of virtual circuits, depending on the switch and the administration of the circuit pack.

Virtual trunk groups

You cannot bundle physical DS1 ISDN-PRI circuits and virtual ATM-CES circuits into the same trunk groups. Virtual circuits can only be assigned to all-virtual, all-ATM trunk groups.

LEDs

The ATM circuit pack LEDs give you a visual indication of the condition of the TN230x circuit pack ([Table 199: ATM-TRK LED interpretation](#) on page 600).

Table 199: ATM-TRK LED interpretation 1 of 2

LEDs	Condition	LED status
Red	Error (alarm logged)	On
Red & Green	Booting (LEDs being tested)	Blinking (on 200 ms, off 200 ms)
Green	Test/maintenance in progress	On
Amber	Fiber Loss of Signal (LOS), LOF, MS_RDI, MS_AIS, LCD, HP_RDI, HP_AIS, LOP, PSC	Blinking fast (100 ms on, 100 ms off)
Amber	Signal to ATM switch down	Blinking slowly (500 ms on, 500 ms off)
1 of 2		

Table 199: ATM-TRK LED interpretation 2 of 2

LEDs	Condition	LED status
Amber	One or more CES signaling groups administered	On
Amber	CES signaling group not administered or not reporting to firmware	Off
2 of 2		

ATM-TRK-related commands

[Table 200: ATM CES troubleshooting commands](#) on page 601 lists some commands that can be useful in troubleshooting ATM errors and alarms.

Table 200: ATM CES troubleshooting commands

Command	Description
<code>display circuit-packs cabinet</code>	Shows the circuit packs in the cabinet, identifying ATM trunk as well as ATM-EI boards. "ATM Interface" boards have not been administered as CES or PNC.
<code>display atm ports location</code>	Shows the 256 ports on the ATM board with the corresponding signaling and trunk group.
<code>list configuration atm</code>	Lists the ATM boards, identifying equipment location, board code, type, and vintage.
<code>list configuration trunks</code>	Lists boards identifying assigned ports. While the ATM board is listed, the 256 ports are not.
<code>busyout/release atm signaling-group</code>	Busyout or release of an ATM signaling group within a trunk group.
<code>status atm signaling-group</code>	Show current status of an ATM signaling group.
<code>status trunk-group</code>	Shows status of the trunk group (ATM signaling groups are part of trunk groups).

Error Log Entries and Test to Clear Values

Table 201: ATM-TRK Error Log entries 1 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value

3999(y)	Any	None			
					2 of 2

Notes:

- a. **Error Type 1:** the ATM-TRK circuit pack does not appear to be in its assigned slot.
 1. Make sure that the ATM-TRK circuit pack is installed correctly seated in the slot administered for the ATM trunk.
- b. **Error Type 18:** the ATM circuit pack is busied out.
 1. Run *release board location*.
- c. **Error Type 23:** an ATM trunk is administered, but the corresponding ATM-TRK circuit pack does not appear to be physically installed.
 1. Make sure the ATM-TRK circuit pack is installed and correctly seated in the slot.
- d. **Error Type 125:** an ATM trunk is administered but a non-ATM-TRK circuit pack is installed in the corresponding slot. You have two options:
 - Replace the incorrect circuit pack with an ATM-TRK circuit pack.
 - Or re-administer the slot for the circuit pack that is physically present, locate the slot where the ATM-TRK circuit pack is actually installed, and re-administer the ATM trunk.
- e. **Error Type 257:** Control Channel Loop test (#52) failed. The circuit pack is not properly connected with the control channel on the TDM bus.
 1. Take the corrective action specified by Test #52.
- f. **Error Type 513:** ATM Crosstalk test (#1298) failed. The board is writing to or reading from a TDM time slot that is not allocated to the board, or the Digital Signal Processor (DSP) selected for this test has malfunctioned.
 1. Run *test board location*.
 2. Take the corrective action specified for Test #1298.

Communication Manager Maintenance-Object Repair Procedures

- g. **Error Type 769, 770:** the ATM switch is requesting too many LAPD retransmissions (off-board ATM cell corruption errors).

Error Type	Aux Data	Description
769	35	Excessive LAPD retransmission requests
770	25	Uncorrectable ATM cell headers – threshold

1. Check the connections between the fiber cable, the ATM-TRK circuit pack, and the ATM switch.
2. See [PKT-BUS \(Packet Bus\)](#) on page 1748 for test and corrective procedures.
3. Determine what type of fiber is installed between the ATM-TRK circuit pack and the ATM switch.

If	Then
There is multimode fiber	Check the length of the fiber. If the cable is longer than 2 km, it may be causing errors.
There is single-mode fiber or the length of the multimode fiber is less than 2 km	The source of the errors can lie in the ATM facility, the ATM-TRK circuit pack, or the far-end circuit pack.

4. Perform ATM loopback tests on the near-end ATM-TRK circuit pack and on the far-end circuit pack or ATM switch.

If	Then
The ATM-TRK circuit pack fails the loopback test.	The problem is in the ATM-TRK circuit pack. Replace the circuit pack.
The far-end circuit pack or ATM switch fails the loopback test.	The problem is in the far-end circuit pack or ATM switch. Consult the circuit-pack or ATM switch documentation for advice.
The equipment at each end of the ATM span passes the loopback test	The problem is somewhere in the ATM span. Lack of bandwidth can be forcing an intermediate ATM switch to drop cells.

5. Check capacity and peak bandwidth consumption for the ATM span.

If	Then
The capacity of the span is inadequate, or bandwidth consumption is too high.	Reduce traffic on the system to ensure that it is using no more than its subscribed bandwidth.

- h. **Error Type 771:** the ATM switch is sending cells with unknown Virtual Path-Identifier (VPI) and Virtual Channel-Identifier (VCI) addresses.
 1. Make sure that the ATM-TRK circuit-pack address is administered identically on the ATM switch and the S8700 Multi-Connect system.
- i. **Error Type 1281:** Board major signals error (loss of high-level signal). The far end has detected a major problem in transmissions originating from the ATM-TRK circuit pack. The possible Aux Data values for this software counter are listed in [Table 202: Error type 1281 Aux Data and repair procedures](#) on page 605.

Table 202: Error type 1281 Aux Data and repair procedures 1 of 3

Aux Data	Alarm Description	Repair procedure
15	SYSCLOCK failed	The board is not locked to the TDM backplane clock signal. This is probably due to a Tone-Clock problem. <ol style="list-style-type: none"> 1. Check for TDM-BUS or TONE-BD errors in the Error Log. 2. If no other problems are present, reset the circuit pack with reset board location
16	Loss of Signal: LOS	The fiber is not connected properly to the ATM-TRK board or ATM switch (or to the multiplexer section [MUX] if present).It is possible that the board transceivers are not functioning properly. <ol style="list-style-type: none"> 1. Run test board location. 2. If Test #1259 fails with Error Code 16, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. If it does the problem is off-board. 3. If the amber LED continues to flash, replace the circuit pack.
17	Loss of Frame: LOF	The fiber signal cannot obtain or maintain STM-1/OC-3 framing. <ol style="list-style-type: none"> 1. Try to move the fiber on the ATM switch side to a different port. 2. If the problem persists, reset the circuit pack with reset board location.
1 of 3		

Table 202: Error type 1281 Aux Data and repair procedures 2 of 3

Aux Data	Alarm Description	Repair procedure
18	Multiplexer Section Alarm Indication Signal: MS_AIS	<p>There is a major problem on the far end (between multiplexer section [MUX] and the switch) that prohibits the circuit pack from sending a valid signal.</p> <ol style="list-style-type: none"> 1. See if the ports at the MUX and/or the ATM switch are connected snugly. 2. Run test board location. 3. If Test #1259 fails with Error Code 18, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. 4. If it does the problem is off-board. 5. If the amber LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.
19	Multiplexer Section Remote Defect Indicator: MS_RDI	<p>The far end is detecting a major problem with the signal that this board is transmitting.</p> <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface 2. Run test board location. 3. If Test #1259 fails with Error Code 19, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. 4. If it does the problem is off-board. 5. If the amber LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.
20	Loss of pointer: LOP	<p>ATM framer chip is unable to access the payload part of the signal.</p> <ol style="list-style-type: none"> 1. Reset the board with reset board location. 2. If the error persists replace the board.
21	Path Signal Error (PSL) (STM1/ SONET)	<p>The incoming signal payload is not set up for transmission of ATM data.</p> <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface.
2 of 3		

Table 202: Error type 1281 Aux Data and repair procedures 3 of 3

Aux Data	Alarm Description	Repair procedure
22	High-level Path Alarm Indication Signal: HP_AIS	<p>The payload is invalid.</p> <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface. 2. Run test board location. 3. If Test #1259 fails with Error Code 22, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away. 4. If it does the problem is off-board. 5. If the amber LED continues to flash, replace the circuit pack.
23	High-level path Remote defect Indicator: HP_RDI	<p>The far end is detecting a major problem with the signal that this board is transmitting. The transmitted payload is invalid.</p> <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface. 2. Run test board location. <p>If Test #1259 fails with Error Code 23, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the amber LED flash goes away.</p> <ul style="list-style-type: none"> ● If it does the problem is off-board. ● If the amber LED continues to flash, replace the circuit pack.
24	Loss of cell delineation (LCD)	<p>On board ATM framer chip is not able to frame cells based on the cell header.</p> <ol style="list-style-type: none"> 1. Reset the board with reset board location. 2. If the error persists, replace the board.
27	SIGCON_DO WN ATM switch high level signal.	<p>The board cannot communicate with the ATM switch.</p> <ol style="list-style-type: none"> 1. Busyout the board (busyout board location). 2. Test the board (test board long location). 3. If Test #1260 fails, replace the board. 4. If Test #1260 passes, make sure the ATM address on both the S8700 Multi-Connect and the ATM switch sides are the same for this board. 5. If the address is the same, change the port on the ATM switch side. 6. If the error is resolved, the problem is on the ATM switch port.
3 of 3		

Communication Manager Maintenance-Object Repair Procedures

j. **Error Type 1537:** LANHO bus timeout. The circuit pack is transmitting too many bytes on the LAN bus for a single frame. This can be due to:

- an on-board fault.
- a faulty data received on one of the circuit pack's external ports.

If the error occurs three times in 10 minutes, the board is isolated from the packet bus, and the board is alarmed. To clear the alarm:

1. Restore this circuit pack to the packet bus with this command sequence:

- `busyout board location`
- `reset board location`
- `test board location long`
- `release board location`

2. If the problem persists and there are no PKT-BUS or port alarms, replace the circuit pack.

k. **Error Type 1538:** The ATM-TRK circuit pack is hyperactive (sending an abnormal number of control messages to the processor). Use the following command sequence for this ATM-TRK circuit pack:

- `busyout board location`
- `reset board location`
- `test board location long`
- `release board location`

5. If this error persists, replace the circuit pack.

l. **Error Type 1794:** LANHO transmit FIFO overflow. The circuit pack's transmit buffers have overflowed.

1. Run `test board location r 5`

If	Then
Test #598 fails	Replace the circuit pack.

m. **Error Type 2049:** ACL Link Failure (link is down). The ATM Control Link (ACL) has failed, communication has been interrupted between the server and the ATM-TRK circuit packs on the system, and signaling-group parameters are not communicated across the packet bus.

- Check the [PKT-BUS \(Packet Bus\)](#) on page 1748 and [SYS-LINK \(System Links\)](#) on page 2132 MOs, and follow the repair procedures indicated.
- Run `test board location` against the ATM-TRK circuit pack.

If	Then
Test 598 fails.	Follow the repair procedures suggested for that test.

n. **Error Type 2306:** too many parity errors in data received from the LAN/packet bus.

1. Run *test board location*

If	Then
Test 598 fails.	Follow the repair procedures suggested for that test.
Test 598 passes	See PKT-BUS (Packet Bus) and perform the specified repair.
There are no errors against the packet bus MO	This can be a transient condition. Do nothing now, but escalate if the error occurs repeatedly.

o. **Error Type 2561:** Packet Interface Loop Around test (#598) failure. The ATM-TRK circuit pack has failed, the packet bus has a minor alarm active, or the packet bus is out of service.

1. Run *test board location*

If	Then
Test 598 fails	Follow the repair procedures suggested for that test.
Test 598 passes	See PKT-BUS (Packet Bus) and perform the specified repair.
There are no errors against the packet bus MO	This can be a transient condition. Do nothing now, but escalate if the error occurs repeatedly.

p. **Error Type 2817, 2818:** DSP failure detected along the circuit path.

1. Run *test board location*.

2. Follow the repair procedures suggested for Test #1293.

Error Type	Description
2818	One or more DSPs failed. The Aux Data field contains the ID number of DSP that failed
2817	DSP test failure. The Aux Data field contains the following information about the failed DSPs: X is the number of talker DSPs Y is the number of listener DSPs Z is the number of echo-cancelling DSPs

q. **Error Type 3330:** LANHO critical error. The circuit pack reports that the on-board LANHO chip is insane (possibly due to a problem in packet-bus arbitration, in the transmission line frame, or in the circuit pack itself). The circuit pack cannot talk to the packet bus.

Communication Manager Maintenance-Object Repair Procedures

1. Check for PKT-BUS alarms.

If	Then
There is a packet-bus alarm	There is probably a packet-bus problem, particularly if other circuit packs on the packet bus report the same error. See PKT-BUS (Packet Bus) and Isolating and repairing packet-bus faults in Maintenance Procedures (03-300192) for repair procedures.
There are no packet-bus alarms	Run the following command sequence: <ol style="list-style-type: none"> 1. <code>busyout board location</code> 2. <code>reset board location</code> 3. <code>test board location long</code> 4. <code>release board location</code>
The problem persists	Replace the ATM-TRK circuit pack.

- r. **Error Type 3585:** Major board alarm; failure of critical components involved in the operation of the circuit pack. The circuit pack has failed, and the switch can no longer recognize it.

Aux Data	Description
1	ATM framer chip failure
2	NCE failed
4	TDM PLD failed
5	Every DSP on the circuit pack has failed.
6	RNP (Receive Network Processor) failed
7	TNP (Transmit Network Processor) failed
8	MEMORY read/write failure
9	DUART failure

1. Run test board *location* long.

If	Then
Test #1259 fails with Error Code XXYX and XX is an AUX value in the preceding table	Replace the ATM-TRK circuit pack.
The system does not recognize the circuit pack	Replace the ATM-TRK circuit pack.

- s. **Error Type 3841:** the ATM-TRK circuit pack received an unrecognized message from the switch and responded with an inconsistent down-link error message.
 - 1. Do nothing. This error does not affect service.
- t. **Error Type 3842:** LANHO Receive FIFO Overflow error; the packet bus is delivering data to the ATM-TRK circuit pack faster than the circuit pack can distribute it to the endpoint.
 - 1. Do nothing. The circuit pack can recover by itself.
- u. **Error Type 3843:** The firmware on the circuit pack is reporting a resource that is too low. This error does not affect the service and no action is required.
- v. **Error Type 3999:** circuit pack sent a large number of control channel messages to the switch within a short period of time.

If	Then
Error Type 1538 is also present	Circuit pack is taken out of service.
Error Type 1538 is absent	Circuit pack is not taken out of service, but has generated 50% of the messages necessary to be considered hyperactive. <ul style="list-style-type: none"> ● This can be normal during heavy traffic. ● If the error is logged during light traffic, it can indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and error codes

Investigate problems in the order presented. When you clear one of the error codes associated with a given test, you may clear errors generated by other tests in the testing sequence.

Table 203: System Technician-Demanded Tests: ATM-TRK

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
ATM Board Time Of Day Update (#1261)		X		ND
Connection Audit test (#50)		X		ND
Control Channel Loop test (#52)		X		ND
Packet Interface Loop Around test (#598)	X	X		ND
ATM DSP test (#1293)	X	X		ND
ATM Board Framer Looparound (#1260)		X		D
ATM Board Error Query test (#1259)	X	X		ND
ATM Cross Talk test (#1298)		X		ND
ATM Board Reset (#1256)			X	D

1. D = Destructive, ND = Nondestructive

Connection Audit Test (#50)

Nondestructive (in a sane switch environment).

The Connection Audit test updates TDM time slots. It sends network-update Control Channel Message Set (CCMS) messages that tell the ATM-TRK circuit pack to listen to, talk to, or disconnect particular time slots.

The test passes if software successfully sends the downlink network-update messages. It aborts otherwise.

! CAUTION:

Though normally nondestructive, this test could unintentionally tear down an active call if the connection-manager software's tables are corrupt.

Table 204: Test #50 Connection Audit Test

Error Code	Test Result	Description / Recommendation
None, 2100	ABRT	System resources required for this test are not available. 1. Retry the command up to 5 times at 1-minute intervals.
1019	ABRT	The test aborted because a test was already running on the port. 1. Retry the command up to 5 times at 1-minute intervals.
	FAIL	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
	PASS	The circuit pack has been updated with its translation.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check the board translations. 2. If the ATM-TRK circuit pack is not administered, run add atm trunk location . 3. If the ATM-TRK circuit pack is administered correctly, check the error log. 4. If ATM-TRK circuit pack is hyperactive, shut down, and reseal the circuit pack to force re-initialization. 5. If the ATM-TRK circuit pack is correctly inserted, run busyout board location 6. Run reset board location 7. Run release board location 8. Run test board location long to re-establish the linkage between the internal ID and the port.

Control Channel Loop Test (#52)

The nondestructive Control Channel Loop test is part of the maintenance subsystem's Common Port Board Testing feature. The Common Port Board test sends board vintage queries to a port circuit pack and checks the responses. CCMS downlink notifications tell the circuit pack which TDM Bus (A or B) carries the control channel and which carries the touch tones.

The test passes if the port circuit pack responds. The test aborts if the circuit pack does not respond. The test fails otherwise.

Table 205: Control Channel Test #52

Error Code	Test Result	Description / Recommendation
2000	ABRT	Test request timed out.
2100	ABRT	Could not allocate needed system resources. 1. Retry the command at 1-minute intervals up to 3 times.
2500	ABRT	Internal system error 1. Retry the command up to 3 times at 1-minute intervals.
	FAIL	The ATM circuit pack responded incorrectly. 1. Retry the command up to 3 times at 1-minute intervals. 2. If the test continues to fail, reset the ATM-TRK circuit pack with reset board location . 3. If test continues to fail, replace the circuit pack or transceiver.
	PASS	The ATM-TRK circuit pack is communicating correctly with the software.
0	NO BOARD	Circuit pack not detected. 1. Check the error log for Error 125 (wrong board) or Error 131 (no board), and correct any errors found. 2. Make sure that the ATM-TRK circuit pack is properly translated and inserted. 3. Check for Error 1538 (hyperactivity). If hyperactive, run reset board location . 4. Run the test again. If it fails, replace the ATM-TRK circuit pack, and retest.

Packet Interface Loop Around Test (#598)

This nondestructive test checks the ATM-TRK circuit pack's packet-bus interface. The LANHO chip sends data through the bus and back to itself. If the data received is consistent with the data sent, the test passes. The test does not run if the specified PN's packet bus has a minor alarm or is out of service.

Table 206: Packet Interface Loop Around Test (#598)

Error Code	Test Result	Description / Recommendation
2000	ABRT	Test request timed out. 1. Retry the command up to 3 times at 1-minute intervals. 2. If the test fails repeatedly, run <code>reset board location</code> . 3. If the test continues to fail, replace the ATM-TRK circuit pack.
2012	ABRT	Internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate needed system resources. 1. Retry the command up to 5 times at 1-minute intervals.
ANY	FAIL	Data packet not received correctly by the ATM Interface circuit pack. 1. Retry the command up to 5 times at 1-minute intervals. 2. If the test continues to fail, replace the ATM-TRK circuit pack.
	PASS	The Packet Interface test passed.

ATM Board Reset (#1256)

This test is **destructive**.

This test checks the sanity of the angel processor using the Sanity and Control Interface (SAKI) test (Common Port Board test, #53). It resets the circuit pack if the SAKI test fails and runs the test again. The ATM Board Reset test passes if SAKI can successfully reset and retest the board.

Before running the SAKI test, you must:

- Move synchronization off the ATM-TRK circuit pack
- Busyout the ATM-TRK circuit pack

Communication Manager Maintenance-Object Repair Procedures

The test aborts if the ATM-TRK circuit pack is supplying synchronization.

Table 207: ATM Board Reset (#1256) 1 of 2

Error Code	Test Result	Description / Recommendation
1005	ABRT	Wrong circuit pack configuration to run this test. The ATM CES Trunk Interface circuit pack provides timing for the system and cannot be reset without major system disruptions. <ol style="list-style-type: none"> 1. Set synchronization to another ATM CES trunk circuit pack or to the Tone-Clock circuit pack and test again.
1015	ABRT	Test cannot be run because the ATM-TRK circuit pack has not been busied out. <ol style="list-style-type: none"> 1. Busyout out the circuit pack (busyout board location). 2. Repeat the test (test board location long).
None	ABRT	Could not allocate the required system resources <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals. 2. If the test continues to abort escalate the problem.
2000	ABRT	Sanity test timed out. <ol style="list-style-type: none"> 1. Wait 5 minutes. Then see if ATM-TRK circuit pack is visible to the system by running list configuration all. 2. If the ATM-TRK circuit pack is visible (list configuration all), run the test again, and escalate if the problem recurs. 3. If the ATM-TRK circuit pack is not visible to the system (list configuration all), re-seat the ATM-TRK circuit pack, and retest. 4. If the ATM-TRK circuit pack is still not recognized by the system, replace the board.
2100	ABRT	Could not allocate required system resources <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
2500	ABRT	Internal system error <ol style="list-style-type: none"> 1. Try to reset the circuit pack with reset board location.
		1 of 2

Table 207: ATM Board Reset (#1256) 2 of 2

Error Code	Test Result	Description / Recommendation
1	FAIL	The circuit pack failed to reset
2	FAIL	The circuit pack failed to restart. <ol style="list-style-type: none"> 1. Retry command. 2. If the problem persists, replace the ATM-TRK circuit pack.
	PASS	The ATM-TRK circuit pack is successfully reset.
0	NO BOARD	No board detected. <ol style="list-style-type: none"> 1. Check the error log for Error 125 (wrong board) or Error 131 (no board), and perform the appropriate repair, if needed. 2. Ensure that the board is properly translated and inserted. 3. Check for Error 1538 (hyperactivity). If hyperactive, run reset board location. 4. Run the test again. If it fails, replace the ATM-TRK circuit pack, and retest.
2 of 2		

ATM Board Error Query Test (#1259)

This **nondestructive** ATM Error Query test retrieves the most severe, active, on- and off-board problem from the ATM-TRK circuit pack's firmware and increments error counts in the Error Log. The test passes if there are no errors and fails otherwise. A passing test clears the software counters; a failure increments the counter associated with the problem that caused the failure and clears the others.

Table 208: ATM Board Error Query Test (#1259)

Error Code	Test Result	Description / Recommendation
2000	ABRT	Test request timed out.
2031	ABRT	SCD failure. Unable to send down-link message. 1. Retry the command at 1-minute intervals up to 3 times.
2100	ABRT	Could not allocate needed system resources. 1. Retry the command at 1-minute intervals up to 5 times.
2500	ABRT	Internal system error 1. Retry the command up to 3 times at 1-minute intervals.
XXYY	FAIL	On-board error XX (Table 209: Aux Data XX for ATM Board Error Query Test (#1259) on page 619) and/or off-board error YY (Table 210: Aux Data YY for ATM Board Error Query Test (#1259) on page 619). 1. Examine the error logs and repair any errors found.
	PASS	The ATM circuit pack has passed this test. No service effecting errors/alarms have been detected on board.
0	NO BOARD	ATM-TRK circuit pack not found 1. Check the error log, and correct Error 125 (wrong board) or Error 131 (no board), if found. 2. Make sure that the board is properly translated and inserted. 3. Check for hyperactivity (Error 1538). Run reset board location if hyperactive. 4. Run the test again. If it fails, replace the board, and retest.

Aux Data XX**Table 209: Aux Data XX for ATM Board Error Query Test (#1259)**

If XX=	Then
1	ATM framer chip failed
2	NCE chip failed
3	LANHO critical error
4	TDM Programmable Logic Device failed
5	Every on-board DSP failed
6	Receive Network Processor failed
7	Transmit Network Processor failed
8	Memory read failed
9	Dual UART chip failed
10	LANHO receive parity error
11	LANHO FIFO overflow error
12	LAN bus time out
13	LANHO Xmit FIFO overflow error
14	One or more on-board DSPs failed

Aux Data YY**Table 210: Aux Data YY for ATM Board Error Query Test (#1259) 1 of 2**

If YY=	Then
15	Back plane clock failed
16	Loss of signal
17	Loss of frame
18	MS alarm indication signal error
	<i>1 of 2</i>

40	ATM cell overrun – see MO ATM-NTWK (ATM Network Error)
41	Lost ATM cells – see MO ATM-NTWK (ATM Network Error)
2 of 2	

ATM Board Framer Loop-Around Test (#1260)

This test is **destructive**.

This test verifies the board's circuit (Time Division Multiplexing) and packet paths using an on-board, dummy virtual circuit. Before running the test, you must:

- busyout the ATM-TRK circuit pack (**busyout board location**) and
- switch synchronization (**change synchronization**) from the ATM-TRK circuit pack

If the ATM-TRK circuit pack is supplying synchronization, the test aborts.

The test sends a digital counter from one of the Tone Generators via one of the TDM bus time slots. The ATM framer interface converts this digital counter to ATM cells and loops them back internally. The ATM-TRK circuit pack converts the cells back to a digital counter and sends it to the tone receiver for verification. If the circuit pack passes the circuit check, the software checks the packet path by sending a packet from the packet-interface circuit pack to the ATM-TRK circuit pack via the ATM protocol stack.

Table 211: ATM Board Framer Loop-Around Test (#1260) 1 of 4

Error Code	Test Result	Description / Recommendation
1002	ABRT	Time slots could not be allocated. Traffic could be heavy or time slots could be out-of-service. <ol style="list-style-type: none"> 1. Run display errors, and perform repairs associated with TDM-BUS errors. 2. Retry the command up to 3 times at 1-minute intervals.
1003	ABRT	Tone receiver could not be allocated. <ol style="list-style-type: none"> 1. Run display errors, and perform the repairs associated with TTR-LEV and TONE-PT errors. <p>The test cannot run unless there is at least one Tone Detector available in the PN that holds the ATM-TRK circuit pack.</p> <ol style="list-style-type: none"> 2. Retry the command up to 3 times at 1-minute intervals.
1015	ABRT	ATM-TRK circuit pack not busied out <ol style="list-style-type: none"> 1. Busyout the ATM circuit pack. 2. Rerun the command.
1 of 4		

Table 211: ATM Board Framer Loop-Around Test (#1260) 2 of 4

Error Code	Test Result	Description / Recommendation
1033	ABRT	ATM-TRK circuit pack not found 1. See if the switch can see the circuit pack. Run status trunk-group . 2. Retry the command.
1139	ABRT	Major alarm on the PN's packet bus 1. Run display alarms , and perform the repairs associated with PKT-BUS errors. 2. Run display errors , and perform the repairs associated with PKT-BUS errors. 3. Retry the command.
1141	ABRT	Packet-interface circuit pack out of service 1. See PKT-INT (Packet Interface) .
1394	ABRT	ATM-TRK circuit pack out of service 1. Run ATM Board Reset Test #1256.
2000	ABRT	Request timed out. 1. Retry the command up to 3 times at 1-minute intervals.
2060	ABRT	Packet-bus link has failed. 1. Retry the command up to 3 times at 1-minute intervals. 2. If the test continues to abort, run display errors , and perform the repairs associated with PKT-INT errors.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
2500	ABRT	Internal system error 1. Retry the command up to 3 times at 1-minute intervals.
		2 of 4

Table 211: ATM Board Framer Loop-Around Test (#1260) 3 of 4

Error Code	Test Result	Description / Recommendation
1	FAIL	<p>Test tone not detected over the loop around; packet-path test aborted.</p> <ol style="list-style-type: none"> 1. Test the active Tone-Clock in the PN, and verify that a tone is reaching the ATM-TRK circuit pack. If not, correct the condition. 2. Run test board location long. 3. If the test continues to fail, replace the ATM-TRK circuit pack or transceiver. 4. Rerun test board location long.
2	FAIL	<p>TN1655 Packet Interface circuit pack could not detect the correct data packet.</p> <ol style="list-style-type: none"> 1. Test the TN1655 Packet Interface circuit pack to verify that it is functioning properly. If not, correct the condition. 2. Run display errors, and perform the repairs associated with DS1C-BD errors, if applicable. 3. Run display alarms, and perform the repairs associated with DS1C-BD alarms, if applicable. 4. Run test board location long. 5. If this test continues to fail, replace the ATM-TRK circuit pack. 6. Run test board location long.
3	FAIL	<p>Distorted tone returned</p> <ol style="list-style-type: none"> 1. Test the active Tone-Clock in the PN, and verify that a tone is reaching the ATM-TRK circuit pack. If not, correct the condition. 2. Run test board location long. 3. If the test continues to fail, replace the ATM-TRK circuit pack. 4. Run test board location long.
4	FAIL	<p>Unable to create TDM-path loop.</p> <ol style="list-style-type: none"> 1. Retry the command up to 3 times at 1-minute intervals. 2. If this test continues to fail, replace the ATM-TRK circuit pack. 3. Run test board location long.

Table 211: ATM Board Framer Loop-Around Test (#1260) 4 of 4

Error Code	Test Result	Description / Recommendation
5	FAIL	Unable to create packet-path loop. <ol style="list-style-type: none"> 1. Retry the command up to 3 times at 1-minute intervals. 2. If this test continues to fail, replace the ATM-TRK circuit pack. 3. Rerun <code>test board location long</code>.
6	FAIL	A previously established loop around was not released. <ol style="list-style-type: none"> 1. Run <code>reset board location</code>. 2. Retry the command up to 3 times at 1-minute intervals. 3. If this test continues to fail, replace the ATM-TRK circuit pack. 4. Rerun <code>test board location long</code>.
	PASS	The non-optical parts of the ATM-TRK circuit pack are functioning properly.
0	NO BOARD	ATM-TRK circuit pack not found <ol style="list-style-type: none"> 1. Check the error log for Error 125 (wrong board) or Error 131 (no board), and correct as necessary. 2. Check that the board is properly translated and inserted. 3. Check for Error 1538 (hyperactivity), and run <code>reset board location</code> if necessary. 4. Rerun <code>test board location long</code>. 5. If the test fails, replace the board, and rerun <code>test board location long</code>.
4 of 4		

ATM Board Time Of Day Update (#1261)

The nondestructive ATM-TOD-UPD test updates the system time used by the ATM-TRK circuit pack for SDH/SONET performance monitoring and synchronizes the ATM-TRK circuit pack with the S8700 Multi-Connect system's clock. This test is run during initialization, scheduled maintenance, and craft long test.

Table 212: ATM Board Time Of Day Update (#1261)

Error Code	Test Result	Description / Recommendation
2031	FAIL	The attempt to send the message to the ATM-TRK circuit pack was not successful.
2500	FAIL	Internal system error. Did not send the time-of-day information to the board. <ol style="list-style-type: none"> 1. Retry the command up to 3 times at 1-minute intervals. 2. If the test aborts with the same error code, escalate the problem.
	PASS	The ATM-TRK circuit pack is successfully updated with system time. <ol style="list-style-type: none"> 1. If status port-network still indicates that this link is down, one or both of the ATM-TRK circuit packs may have been busied out. 2. If the link still does not come up, reset one or both ATM-TRK circuit packs on the link.
0	NO BOARD	No board detected. <ol style="list-style-type: none"> 1. Check the error log for wrong board (Error 125) or no board (Error 131). Resolve either of these issues, if applicable. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use reset board location. 3. Run the test again. If it fails, the board could be bad. Replace the board and retest.

ATM Board DSP Test (#1293)

This test is **nondestructive**.

There are three kinds of digital signal processors (DSPs): talkers, listeners, and echo cancelers. Talkers put data on the TDM bus, listeners take data off the TDM bus, and echo cancelers filter out echoes of the main transmission. Firmware allocates DSPs in sets of three (one of each type), up to a maximum of 8 sets. This has three parts, one for each type of DSP. If the test fails for every DSP, a MAJOR alarm is raised. If the test fails for one or more DSPs, a MINOR alarm is raised. If a DSP is busy, the test passes for that DSP. The test aborts if system resources are not available. Each part of the test returns the number of DSPs that passed or failed. This test run during initialization, error analysis testing, periodic, scheduled, and craft short and long testing.

Table 213: ATM Board DSP Test (#1293) 1 of 3

Error Code	Test Result	Description / Recommendation
1002	ABRT	<p>Could not allocate time slots. Traffic could be heavy or time slots could be out-of-service.</p> <ol style="list-style-type: none"> 1. Run display errors, and follow associated repair procedures for TDM-BUS. 2. Retry the command up to 3 times at 1-minute intervals.
1003	ABRT	<p>Could not allocate a Tone Detector. Too few Tone Detectors present or Tone Detectors out-of-service.</p> <ol style="list-style-type: none"> 1. Run display errors, and follow the repair procedures associated with any TTR-LEV (TTR Level) errors that appear. 2. Verify that there is at least one Tone Detector in the PN that holds the ATM-TRK circuit pack. 3. Resolve any TONE-PT (Tone Generator) errors listed in the Error Log. 4. Retry the command up to 3 times at 1-minute intervals.
1962	ABRT	<p>Every DSPs is busy. This is a very unlikely event.</p> <ol style="list-style-type: none"> 1. Retry the command up to 3 times at 1-minute intervals.
1 of 3		

Table 213: ATM Board DSP Test (#1293) 2 of 3

Error Code	Test Result	Description / Recommendation
2000	ABRT	<p>Test timed out.</p> <ol style="list-style-type: none"> 1. If the ATM-TRK circuit pack is in standby, reset the board and run the test again after the ATM-TRK circuit pack is inserted. 2. Examine the Error Log for Error 1218 (bad DSP). 3. Run the test again.
2100	ABRT	<p>Could not allocate required system resources.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2302	ABRT	Inconsistent uplink message from the ATM-TRK circuit pack.
2500	ABRT	<p>Internal system error</p> <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
2752	ABRT	Circuit pack not a TN2305A/2306A.
XYZ	FAIL	<p>There is at least one bad DSP on the board. The X value indicates the number of bad talker DSPs, Y indicates the number of bad listener DSPs and Z indicates the number of bad echo canceler DSPs.</p> <ol style="list-style-type: none"> 1. Test the Active Tone-Clock in the PN that contains the ATM-TRK circuit pack for dial-tone. Repair as needed. 2. Repeat the short test on the ATM-TRK circuit pack. 3. If the test continues to fail, check for service-affecting MINOR alarms. If a MINOR alarm is raised for Error Type 2817 or 1818, replace the circuit pack. 4. If a WARNING alarm is raised, this is a non-service-affecting error, and the circuit pack can still process calls.
XYZ	PASS	<p>The test passed for some or all DSPs. XYZ indicates the number of talker, listener, and echo-canceler DSPs for which the test passed (the rest of the DSPs were skipped). The X value indicates the number of good talker DSPs, Y indicates the number of good listener DSPs, and Z indicates the number of good echo canceler DSPs.</p>
2 of 3		

Table 213: ATM Board DSP Test (#1293) 3 of 3

Error Code	Test Result	Description / Recommendation
0	NO BOARD	No board detected. <ol style="list-style-type: none"> 1. Check the Error Log for wrong board Error 125 (wrong board) or Error 131 (no board). Replace or insert the circuit pack if necessary. 2. Check that the board is properly translated and inserted. 3. If Error 1538 (hyperactivity) is listed in the Error Log, and run reset board location. 4. Run the test again, and, if it fails, replace the ATM-TRK circuit pack. 5. Retest.
		3 of 3

ATM Cross Talk Test (#1298)

This nondestructive ATM Cross Talk test makes sure that TDM time slots are correctly allocated to connections. It is useful for diagnosing one-way or noisy connections. The test fails if the TDM programmable logic and/or the interface to the DSP is not operating properly. The test can take more than 10 minutes.

Table 214: ATM Crosstalk Test (#1298) 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate required system resources. <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
1002	ABRT	Could not allocate time slots. Traffic could be heavy or time slots could be out-of-service. <ol style="list-style-type: none"> 1. Identify and correct TDM-bus errors (if any) using the procedures in the TDM-BUS (TDM Bus) MO. 2. Repeat the test up to 5 times at 1-minute intervals.
		1 of 2

Table 214: ATM Crosstalk Test (#1298) 2 of 2

Error Code	Test Result	Description / Recommendation
1003	ABRT	<p>Could not allocate a tone receiver. Too few Tone Detectors installed or Tone Detectors out-of-service.</p> <ol style="list-style-type: none"> 1. Identify and correct any TTR-LEV (TTR Level) errors listed in the Error Log. 2. Resolve any TONE-PT (Tone Generator) errors listed in the Error Log. 3. Retry the test up to 5 times at 1-minute intervals a maximum.
1962	ABRT	<p>Every TALKER DSP is busy.</p>
2000	ABRT	<p>Test timed out.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.

2752	ABRT	<p>The circuit pack in this location is not a TN2305A/2306A.</p>
1-8, None	FAIL	<p>ATM-TRK circuit pack writing on unauthorized TDM time slots. The error code indicates the number of TALKER DSPs that are at fault. These DSPs cannot be used again until this test of the ATM DSP test (#1293) tells the circuit pack to use them again.</p> <ol style="list-style-type: none"> 1. Retry the command up to 3 times at 1-minute intervals. 2. If the failure persists, replace the circuit pack.
1-8	PASS	<p>ATM-TRK circuit pack not talking to un-authorized time slots on the TDM bus. The error code indicates the number of TALKER DSPs tested.</p>
2 of 2		

ATM-WSP (ATM WAN Spare Processor)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ATM-WSP	MAJ	<code>status atm wsp wsp#</code>	ATM WAN Spare Processor
ATM-WSP	MIN	<code>status atm wsp wsp#</code>	ATM WAN Spare Processor
ATM-WSP	WRN	<code>display atm wsp wsp#</code>	ATM WAN Spare Processor

S8700 Multi-Connect systems with multiple PNs connected via ATM PNC have the option of installing up to 15 ATM WAN Spare Processor (WSP) units. Each WSP has the ability to function as the S8700 Multi-Connect server, if the main server is not functional or is not connected to one or more of the other PNs.

ATM WSP is available in S8700 Multi-Connect standard loads. A WSP is capable of running an entire S8700 Multi-Connect system (just as the main server can), or whatever PNs with which it can establish links while the ATM network is impaired. WSPs continually monitor a path to the main server to determine whether it is on-line. In the event of a main server failure, an automatic switch-over to WSP control is neither instantaneous nor call-preserving. Likewise, restoring the system to normal operation (under control of the main server) requires manual intervention, and is neither instantaneous nor call preserving.

Each WSP attempts to establish connections (links) to every other WSP and to the main server. These links are re-established once a minute. If a link cannot be re-established, its status is flagged as “down.”

A WSP or main server is considered “down” if:

1. For standard reliability, links cannot be established on the A-PNC.
2. For a duplex- or high-reliability system and for standard reliability on the other WSPs, links cannot be established:
 - to both A-PNCs of the main server
 - on the A-PNC between other WSPs
3. For a critical-reliability system, links cannot be established on both the A- and B-PNCs.

A WSP becomes active (initiates a fail-over) when every link to a higher-priority WSP and the main server has been in a “down” state for an administered amount of time (as specified in the WSP Activation Timer field of the System-Parameters Maintenance screen).

When a WSP becomes active, a major alarm is raised against ATM-WSP. If it is later determined that the WSP should not be active, or the system is rebooted at a COLD-2 or more severe level, the WSP is returned to a standby state and the alarm retired. This alarm is never activated for the main server.

Operations of the ATM WAN Spare Processors

The WSP has the following operational features:

- The WSP feature is activated/deactivated via license file. You can verify that ATM WSP is enabled by checking the value of the ATM WAN Spare Processor field on the system-parameters customer-options screen.
- Fail-over occurs when the connections with the main server and every higher-priority WSP is lost (for an administrable period of time between 5 and 99 minutes; default = 5 minutes). When the administered threshold is exceeded, the highest-priority standby WSP becomes active. Once the standby WSP becomes active, it takes over control of one or more PNs. Restoration to the normal configuration must be manual.
- A WSP in the standby mode is not intended to be a DCS node. Although DCS could potentially play a role in an effective back-up or re-route strategy, no provision has been made to support DCS connections between parts of a failed switch. A WSP in the active mode can have the DCS functionality of the server.
- The main server makes no attempt to do maintenance on the WSPs.
- A WSP can perform maintenance on itself, and monitor WAN connectivity.
- A WSP is not recognized by the system's hardware or software as a PN when not active, and functions in place of the main server when active. Up to seven WSPs can reside in an ATM PNC configuration. The number of PNs in an S8700 Multi-Connect configuration is not limited by the number of WSPs used (i.e., the number of WSPs used is not subtracted from the total number of PNs to determine the number of PNs that can the system can support).
- Every WSP could potentially take over the entire S8700 Multi-Connect system.
- Links are established between the main server and each WSP, and from every WSP to every other WSP. These links are monitored by the WSPs, as well as by the main server, so that each processor is able to observe and report status.
- Each WSP is assigned a unique priority. WSPs become active if they cannot establish communications both with the main server and with a higher-priority WSP.
- An active WSP attempts to establish EAL connectivity to the PNs.
- Contention for support of PNs is addressed by prioritization, and also by the fact that the PNs accept an EAL connection to only the main server or one WSP at a time.

Note:

Each WSP reports its alarms to INADS as an individual system processor. The INADS database correlates WSPs together as part of a larger network.

Error Log Entries and Test to Clear Values

Table 215: ATM-WSP Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any		
18 (a)		MO busied out			<code>release atm wsp</code>
257 (b)		Active WSP (#1401)	MAJ	OFF	<code>reset system 2</code>
513 (c)		WSP Link Status (#1400)	MIN	OFF	
769 (d)	WSP #	WSP Priority Error	MIN	OFF	
1025 (e)		WSP Error	WRN	OFF	

Notes:

- a. **Error Type 18:** the ATM WSP has been busied out with `busyout atm wsp`. Check for other errors that require that the WSP be made maintenance busy. Clear every related alarm. After every related alarm is clear, or if there are no other alarms, release the ATM circuit pack using `release atm wsp`.
- b. **Error Type 257:** the WSP has become active. When a WSP takes over, the error becomes active and causes an alarm condition. This error is not applicable for the main server. To return the system to normal operation:
 1. Run `status atm wsp` on the active WSP to verify that the main server or a higher-priority WSP that you want to be in control is “up.”
 2. If the main server or the higher-priority WSP is “up,” then run `reset system 2`. The active WSP should relinquish control.
 3. Wait a few minutes, and run `list sys-link` on the main server or higher-priority WSP to verify that the EAL and ACL system links are “up.”
- c. **Error Type 513:** there is a down ATM WSP link status from this WSP to the main server or a higher-priority WSP. If any of the links are considered down, this alarm is logged. When every link probed by this WSP is “up,” the alarm should be cleared.

Remember that more than one link can be down. To get a system-wide view of the status of the network run `status atm wsp`.

Aux Data Values are in the form of XYY where

- X is the PNC: 0 = A-PNC, 1 = B-PNC
- YY is the WSP number

Examples:

- **Aux Data 15:** the B-PNC link to WSP 5 is down.
 - **Aux Data 3:** the A-PNC link to WSP 3 is down.
- d. **Error Type 769:** there are inconsistent translations with regard to WSP's priority. Each WSP keeps a list of every other WSP's priority levels. Inconsistent priorities can exist that result in a WSP receiving an unexpected probe. This causes an alarm to be raised.

Follow the procedures listed below to correct any inconsistency in WSP priorities:

1. Obtain a list of WSP priorities from the system administrator.
 2. Use **display error** to find the WSP number with the incorrect priority (the Aux Data of the error).
 3. Use **status atm wsp** to determine if any administered priorities are incorrect, especially WSP X and the local WSP.
 4. If any are incorrect, use **change atm wsp n** to administer the correct priority, where **n** is the appropriate WSP number. If the priorities for WSP X and the local WSP are both correct, then there is an error in priority administered on WSP X.
 5. On WSP X, use **status atm wsp** to determine whether the priority of WSP X, the local WSP, and the priority of the WSP with the alarm are correct. At least one should be incorrect.
 6. Use **change atm wsp n** to administer the correct WSP priority, where **n** is the appropriate WSP number.
- e. **Error Type 1025:** there is a WSP error. The Aux Data determine the WSP number and error code.

Aux Data Values are in the form of XXYY where

- XX is the WSP number that probed this WSP
- YY is the error code 1: The probing WSP (XX value in Aux Data) contains an ATM address in its message that does not match the translation for that ATM address on this WSP.

Example: This is WSP 1. Aux Data 201 indicates that WSP 2 probed this WSP, and it has a different address in the probe message than WSP 1 has for WSP 2.

1. On WSP X, use **display atm wsp x** to determine its address.
2. On this WSP, use **change atm wsp x** to change the address of WSP X, if they do not match.
3. If the addresses do match, then the ATM switch has a different address administered for WSP X, even though each WSP is consistent.

System Technician-Demanded Tests: Descriptions and Error Codes

There are no system technician-demanded tests associated with ATM-WSP, only tests run by system software.

**ATT-ADJ (AvayaAdjunct),
ATTE-AJ (Ethernet Avaya Adjunct)**

S8700 | 8710 / S8500

See [BRI-SET, BRI-DAT, Various Adjuncts](#) on page 684.

AUDIX-BD (AUDIX Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AUDIX-BD	MIN	<code>test board location sh</code>	AUDIX circuit pack
AUDIX-BD	WRN	<code>test board location sh</code>	AUDIX circuit pack

The AUDIX-BD MO represents a TN566/TN2169 EMBEDDED AUDIX circuit pack combination. For circuit-pack-level problems, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

EMBEDDED AUDIX consists of a combination of two circuit packs that occupy five slots on a port carrier. The tests described in this manual apply only to switch-side maintenance that tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*

AUDIX-PT (AUDIX Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AUDIX-PT	MIN	<code>test port location 1</code>	AUDIX port
AUDIX-PT	WRN	<code>test port location sh</code>	AUDIX port

The AUDIX-PT MO represents a port on a TN566/TN2169 EMBEDDED AUDIX circuit pack operating in digital-port (DP) mode. For circuit-pack-level problems (AUDIX-BD), see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

AUX-BD (Auxiliary Trunk Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AUX-BD	MIN	<code>test board location sh</code>	Auxiliary Trunk circuit pack
AUX-BD	WRN	<code>test board location sh</code>	Auxiliary Trunk circuit pack

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 maintenance information for circuit pack-level errors. See also [AUX-TRK \(Auxiliary Trunk\)](#) on page 639 for related trunk information.

AUX-TRK (Auxiliary Trunk)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AUX-TRK	MAJ ¹	<code>test port location 1</code>	Auxiliary Trunk
AUX-TRK	MIN	<code>test port location 1</code>	Auxiliary Trunk
AUX-TRK	WRN	<code>test port location sh</code>	Auxiliary Trunk

1. A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by **set options** and that at least 75% of the trunks in this trunk group are alarmed.

The TN763B/C/D and TN417 Auxiliary Trunk circuit packs may be used to provide ports for the following features: Music-On-Hold, loudspeaker paging (voice and coded chimes), dictation, automated wake-up with AUDICHRON. Recorder/Announcer, and recorded announcements. TN763C circuit packs support Mu-law companding. TN417 circuit packs support A-law companding. TN763D can support either companding mode and defaults to mu-law on initialization. Companding modes are administered on the **location-parameters** screen.

Use the following commands to administer the features:

Command	Administration
<code>change system-parameters features</code>	Music-On-Hold
<code>change paging loudspeaker</code>	loudspeaker paging
<code>add trunk-group grp#</code> [Customer-Provided Equipment (CPE) Type]	loudspeaker paging
<code>change paging loudspeaker</code>	system-provided paging
<code>add trunk-group grp#</code>	access to otherwise-provided (CPE) paging
<code>change paging code-calling-ids</code>	translation for code chiming
<code>add trunk-group grp# (CPE Type)</code>	Recorded announcement and dictation
<code>change system-parameters hospitality</code>	Automatic wake-up (uses all four ports on a TN763B Auxiliary Trunk circuit pack)

Music-On-Hold provides audible feedback to a held, parked, or otherwise split-away party indicating that the call is still connected. The feedback can be customer-provided music, a recorded message, or other audible indication. Since the Music-On-Hold port is always busy, some of its port tests always abort.

Communication Manager Maintenance-Object Repair Procedures

The Loudspeaker Paging feature provides voice and/or code calling chime paging. If multiple paging zones are provided at a customer's premises, the Loudspeaker Paging feature gives a user the option of paging to a particular zone or to every zone. If a zone is active for one page, it cannot be used at the same time for another.

An Auxiliary Trunk circuit pack contains four ports and uses DTMF signaling. A different hardware interface between the switch and the auxiliary equipment is used for the four types of signaling that the auxiliary trunk circuit pack supports.

The interface used for the Communication Manager loudspeaker paging consists of the following three pairs:

- The Tip-Ring (T-R) pair used for voice transmission.
- The S (S-S1) pair that carries answer supervision and/or make busy information.
- The SZ (SZ-SZ1) pair that provides the external equipment with a seizure indication.

The interface used for recorded announcement, dictation, and other loudspeaker paging consists of the following two pairs:

- The Tip-Ring (T-R) pair used for voice transmission.
- The S (S-S1) pair that carries answer supervision and/or make busy information.

The interface used for Music-On-Hold consists of one pair:

- The Tip-Ring (T-R) pair used for voice transmission.

The interface, used for automatic wake-up using an Audichron recorder/announcer unit, consists of the following two pairs:

- The Tip-Ring (T-R) pair used for voice transmission.
- The S (S-S1) pair that carries the synchronization signal.

Error Log Entries and Test to Clear Values

Table 216: Auxiliary Trunk Error Log Entries 1 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	test port location sh r 1
1(b)	57481	None			
1(c)	57482				
15(d)	Any	Audit Update test (#36)			
					1 of 2

Table 216: Auxiliary Trunk Error Log Entries 2 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
18	0	<code>busyout port location</code>	WRN	OFF	<code>release port location</code>
130(e)		None	WRN	ON	<code>test trunk grp#/mem# sh</code>
769(c)	57482	None

		Circuit test (#33)			
513		NPE Crosstalk test (#6)	MIN WRN 2	ON	<code>test port location 1 r 3</code>
1025		Diagnostic: Auxiliary Trunk (#114)	WRN	ON	<code>test port location sh r 3</code>
					2 of 2

1. Major or Minor alarms may be downgraded to Warning alarms based on the values used in **set options**.

Notes:

- a. **Error Type 0**: Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. ***Error Type 1 with Aux Data 57481** indicates a port fault. Use an empty port if one is available until the circuit pack can be replaced.
- c. **Error Type 1 or 769 with Aux Data 57482** indicates a fault on signaling lead, which is an off-board error. This error should only occur with loudspeaker paging. If the trunk is being used for another application, check that the administration is correct. Otherwise, check the wiring to the external equipment connected to the Auxiliary Trunk and check the external equipment.
- d. **Error Type 15**: software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors.
- e. **Error Type 130**: the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reseal or replace the circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the *Looparound and Conference* test (#33), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Looparound and Conference test (#33)		X	ND
NPE Crosstalk test (#6)		X	ND
Diagnostic test (#114)	X	X	ND
Audit Update test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 217: Test #6 NPE Crosstalk Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times
1000	ABRT	System resources required to run test are not available. The port may be busy with a valid call. 1. Use <code>display port location</code> to determine the trunk group/member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the port is active, wait until it is idle. 2. Retry the command at 1-minute intervals up to 5 times.
1 of 3		

Table 217: Test #6 NPE Crosstalk Test 2 of 3

Error Code	Test Result	Description / Recommendation
1001	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABRT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Resolve TTR-LEV errors. 2. Resolve TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABRT	The port was seized by a valid call during the test. The test has been aborted. 1. Use display port location to determine the trunk group/member number of the port. Use status trunk to determine the service state of the port. If the port is active, wait until it is idle. 2. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2020	ABRT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. 1. Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
2 of 3		

Table 217: Test #6 NPE Crosstalk Test 3 of 3

Error Code	Test Result	Description / Recommendation
Any	FAIL	<p>The Network Processing Element (NPE) of the tested port was found to be transmitting in error. This will cause noisy and unreliable connections. This problem may be caused by defective Tone Detectors.</p> <ol style="list-style-type: none"> 1. Test every Tone-Clock circuit pack, and resolve any errors on these circuit packs before any action is taken on the auxiliary trunk circuit pack. Then, repeat the test. 2. If the test fails again, replace the auxiliary trunk circuit pack.
	PASS	<p>The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and examining station, trunk, or external wiring.</p>
3 of 3		

Looparound and Conference Test (#33)

This test checks the reflective loop around and conference capabilities of an auxiliary trunk port circuit. The test uses 404-Hz, 1004-Hz, and 2804-Hz tones. Each tone is separately transmitted through the loop and checked. All of these tests are performed on-board.

Table 218: Test #33 Looparound and Conference 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	<p>System resources required to run this test are not available. The port may be busy with a valid call.</p> <ol style="list-style-type: none"> 1. Use <code>display port location</code> to determine the trunk group/member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the port is active, wait until it is idle. 2. Retry the command at 1-minute intervals up to 5 times.
1 of 4		

Table 218: Test #33 Looparound and Conference 2 of 4

Error Code	Test Result	Description / Recommendation
1004	ABRT	<p>The port was seized by a valid call during the test. The test has been aborted.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the trunk group/member number of the port. Use status trunk to determine the service state of the port. If the port is active, wait until it is idle. 2. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
7	FAIL	<p>The conference capabilities of the port failed.</p> <ol style="list-style-type: none"> 1. If no service problems exist on the port, continue to use the port until the circuit pack can be replaced.
129	FAIL	<p>The reflective 404-Hz tone test failed, no transmission was detected to or from the port. The problem may be off-board.</p> <ol style="list-style-type: none"> 1. To make sure the problem is on-board, disconnect the port from the auxiliary equipment and retry test. 2. If the test fails, replace the circuit pack. Otherwise, if the test passed after disconnecting the port from the auxiliary equipment, the problem is off-board. Check the wiring and connections to the auxiliary equipment and retry the test after reconnecting the port to the auxiliary equipment. If the test fails, check the auxiliary equipment. See the preceding procedure for a failure with Error Code 7. <p>Note:</p> <p>If the Looparound and Conference test fails for every port on a circuit pack, a -5 Volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, the 631DB AC power unit or the 676B power unit may be defective. The system may contain either a TN736 or a TN752 power unit circuit pack OR a 631DB power unit, <i>but not both types of power units</i>. To investigate power problems, see CARR-POW (Carrier Power Supply) on page 744</p>
		2 of 4

Table 218: Test #33 Looparound and Conference 3 of 4

Error Code	Test Result	Description / Recommendation
131	FAIL	<p>The reflective 1004-Hz tone test failed. No transmission was detected to or from the port. The problem may be off-board.</p> <ol style="list-style-type: none"> 1. To make sure the problem is on-board, disconnect the port from the auxiliary equipment and retry test. 2. If the test fails, replace the circuit pack. Otherwise, if the test passed after disconnecting the port from the auxiliary equipment, the problem is off-board. Check the wiring and connections to the auxiliary equipment and retry the test after reconnecting the port to the auxiliary equipment. If the test fails, check the auxiliary equipment. The system may contain either a TN736 or a TN752 power unit circuit pack OR a 631DB power unit, <i>but not both types of power units</i>. To investigate power problems, see CARR-POW (Carrier Power Supply) on page 744</p>
		3 of 4

Table 218: Test #33 Looparound and Conference 4 of 4

Error Code	Test Result	Description / Recommendation
133	FAIL	<p>The reflective 2804-Hz tone test failed. No transmission was detected to or from the port. The problem may be off-board.</p> <ol style="list-style-type: none"> 1. To make sure the problem is on-board, disconnect the port from the auxiliary equipment and retry test. 2. If the test fails, replace the circuit pack. Otherwise, if the test passed after disconnecting the port from the auxiliary equipment, the problem is off-board. Check the wiring and connections to the auxiliary equipment and retry the test after reconnecting the port to the auxiliary equipment. If the test fails, check the auxiliary equipment. See the preceding procedure for a failure with Error Code 7. <p>Note:</p> <p>If the Looparound and Conference test fails for every port on a circuit pack, a -5 Volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, the 631DB AC power unit or the 676B power unit may be defective. The system may contain either a TN736 or a TN752 power unit circuit pack OR a 631DB power unit, <i>but not both types of power units</i>. To investigate power problems, see CARR-POW (Carrier Power Supply) on page 744.</p>
	PASS	Looparound and Conference test is successful. This port is functioning properly.
4 of 4		

Audit Update Test (#36)

This test sends updates of the auxiliary trunk port translation for every port on the Auxiliary Trunk circuit pack that has been translated. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack. No response message is expected from the circuit pack once it receives translation updates. The port translation data includes:

- Trunk type
- DTMF time slot
- Termination R/RC
- Gain, high/low
- End-to-end signaling, tone, and pause duration
- Trunk state, idle/active/unavailable
- Companding mode (A-law or mu-law)

Table 219: Test #36 Audit Update Test

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1006	ABRT	Port is in out-of-service state as a result of being busied out. This audit cannot be run. 1. Retry the command once the port is in service (release port location has been run).
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	This test passed. Translation information was successfully updated on the circuit pack.

Diagnostic Test—Auxiliary Trunk Test (#114)

The system software sends a message to the on-board microprocessor to operate a relay in the port circuit. If ground is detected, the test passes.

Table 220: Test #114 Diagnostic Test—Auxiliary Trunk Test

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use <code>display port location</code> to determine the trunk group/member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the port is active, wait until it is idle. 2. Retry the command at 1-minute intervals up to 5 times.
1004	ABRT	The port was seized by a valid call during the test. The test has been aborted. 1. Use <code>display port location</code> to determine the trunk group/member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the port is active, wait until it is idle. 2. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	This test failed to detect ground. 1. Try the test once more. 2. If the test fails again, replace the circuit pack.
	PASS	This test passed. Ground was detected.

AXA12-BD/ADX8D-BD/AXD12-BD (AUDIX Circuit Packs)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AXA12-BD	MIN	<code>test board location sh</code>	AUDIX circuit pack
AXA12-BD	WRN	<code>test board location sh</code>	AUDIX circuit pack
ADX8D-BD	MIN	<code>test board location sh</code>	AUDIX circuit pack
ADX8D-BD	WRN	<code>test board location sh</code>	AUDIX circuit pack
AXD12-BD	MIN	<code>test board location sh</code>	AUDIX circuit pack
AXD12-BD	WRN	<code>test board location sh</code>	AUDIX circuit pack

The TN568 is an EMBEDDED AUDIX circuit pack that occupies 2 slots in a port carrier. The tests below apply only to switch-side maintenance, which tests a circuit pack's components related to the TDM-bus interface. The AUDIX system has an extensive maintenance strategy of its own that is described in EMBEDDED AUDIX System Maintenance, 585-300-110.

AXA12-BD

TN568 EMBEDDED AUDIX circuit packs operating in control-link mode appear to the system as TN746 Analog Line circuit packs with vintage greater than 50. For circuit-pack-level problems, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494. The maintenance strategy for ports on the TN568 operating in control-link mode is described in ADXCL-PT.

ADX8D-BD

TN568 EMBEDDED AUDIX circuit packs operating in 8-port digital mode appear to the system as TN754 Digital Line circuit packs with vintage greater than 50. For circuit-pack-level problems, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494. The maintenance strategy for ports on the TN568 operating in 8-port digital mode is described in ADXDP-PT.

ADX12-BD

The ADX12-BD MO represents a TN568 EMBEDDED AUDIX circuit pack operating in 12-port digital (DP) mode. TN568 EMBEDDED AUDIX circuit packs operating in 12-port digital mode appear to the system as TN2181 Digital Line circuit packs with vintage greater than 50. For circuit-pack-level problems, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494. Port-level problems are covered by ADX12D-PT.

AXA12-RS/ADX8D-RS/AXD12-RS (AUDIX Reserve Slots)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
AXA12-RS	NONE	NONE	TN568 12-port analog reserve slot
ADX8D-RS	NONE	NONE	TN568 8-port digital reserve slot
AXD12-RS	NONE	NONE	TN568 12-port digital reserve slot

There are no tests associated with these MOs. Both **test board** and **busyout board** abort when either is attempted on a reserved slot. An error message indicates that the slot is associated with the circuit pack that the TN568 is emulating, but the requested operation is not valid. If there are errors logged against these MOs, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

The TN568 circuit pack connects to the switch through a single slot in the backplane; however, the number of slots physically occupied by the circuit pack is supplied by the board when inserted. The TN568 is 2 slots wide: the functional slot and a reserve slot. The reserve (blank) slot to the left of the functional slot is a place holder on the switch and has no interaction with the switch.

These MOs are place holders for the extra slot needed for the EMBEDDED AUDIX board. Each instance of these MOs represents a reserve slot associated with the respective circuit pack mode in which the TN568 (EMBEDDED AUDIX) is working. They are used for EMBEDDED AUDIX and emulation of respective port types.

BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
BRI-BD	MAJ	<code>test board location 1</code>	ISDN-BRI Line circuit pack
BRI-BD	MIN	<code>test board location 1</code>	ISDN-BRI Line circuit pack
BRI-BD	WRN	<code>test board location sh</code>	ISDN-BRI Line circuit pack
LGATE-BD	MAJ	<code>test board location 1</code>	DEFINITY LAN Gateway
LGATE-BD	MIN	<code>test board location 1</code>	DEFINITY LAN Gateway
LGATE-BD	WRN (See Caution)	<code>test board location sh</code>	DEFINITY LAN Gateway

CAUTION:

A detailed flowchart for isolating and resolving Packet Bus faults is included in [Isolating and repairing packet-bus faults](#) in *Maintenance Procedures (03-300192)*. This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to see [Isolating and repairing packet-bus faults](#). See also [PKT-BUS \(Packet Bus\)](#) on page 1748 for repair procedures.

This section relates to the TN556 ISDN BRI, TN2198 ISDN BRIU, TN2208 Ethernet, (LGATE)-Ethernet Multifunction (MFB) circuit packs.

The TN2208 LGATE MFB provides the system with the interface to Adjunct-Switch Application Interface (ASAI) and Avaya adjuncts (for example, CONVERSANT[®] Voice System). This circuit pack contains 12 ports for line circuit interface (although only 8 are usable by the switch), each of which operates with two B channels and 1 D channel. In this context, the term “ISDN-BRI port” is used to refer to ports on the TN2208 MFB circuit pack that are connected to ASAI or Avaya adjuncts. The TN2208 LGATE MFB is handled by the switch software as if it is an ISDN-BRI compatible board, and every maintenance action referring to ASAI and Avaya adjunct links in this section applies.

The TN556, TN2198, and TN2208 ISDN-BRI Lines are packet port circuit packs that provides access to ISDN-BRI endpoints. The ISDN-BRI Line circuit packs supports 12 ports, each of which provides access to ISDN stations. Voice and circuit-switched data from the ISDN stations are carried on the Time Division Multiplex (TDM) Bus. Signaling is carried over the packet bus.

LEDS

The ISDN-BRI Line circuit pack performs extensive initialization tests and lights both the red and green LEDS during the initialization testing. See [Chapter 3: LEDS](#), for more details on circuit pack status LEDS.

Hardware Error Log Entries and Test to Clear Values

3999 (o)	Any	None			
					2 of 2

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 1:** the circuit pack totally stopped functioning or it was physically removed from the system. The alarm is logged approximately 11 minutes after the circuit pack has been removed and/or SAKI Sanity test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, follow the instructions for "Red (alarm)" in [Circuit pack LEDs](#) on page 249.
- c. **Error Type 18:** This circuit pack has been busied out via *busyout board location*.
- d. **Error Type 23:** Port(s) has (have) been administered on this circuit pack but the circuit pack is not physically present.
- e. **Error Type 257:** transient communication problems between the switch and this circuit pack. Execute *test board location* and see [Control Channel Loop-Around Test \(#52\)](#) on page 2355 for the repair procedures.
- f. **Error Type 513:** An on-board hardware failure has been detected by the circuit pack.
Aux Data 4352: External RAM error
Aux Data 4353: Internal RAM error
Aux Data 4355: ROM Checksum error
Aux Data 4357: Instruction set error

Reset the circuit pack by executing *busyout board location* and *reset board location*. When it is reset, the circuit pack executes a set of tests to detect the presence of any of the above faults. The detection of one of these errors during initialization causes the circuit pack to lock-up and appear insane to the system. See the repair procedure in footnote (a) for error type 1.

Communication Manager Maintenance-Object Repair Procedures

- g. **Error Type 769:** reported by the circuit pack when it detects a program logic error. No action is required, but this error may lead to errors of other types being reported against this circuit pack.
- h. **Error Type 1025:** reported by the circuit pack when it cannot update NPE memory and read it back. No action is required, but this error may lead to errors of other types being reported against the circuit pack.
- i. **Error Type 1293, 1294:** a critical hardware failure has been detected on the circuit pack.
Error Type 1293: On-board auxiliary processor insane.
Error Type 1294: Internal memory access error.
Reset the circuit pack via `busyout board location` and `reset board location`. If the Circuit Pack Restart test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via `test board location long clear`. If the Circuit Pack Restart test (#594) fails, replace the circuit pack.
- j. **Error Type 1537:** Frame overrun at packet-bus interface. This condition may be caused by an on-board fault or by faulty data received on one of the circuit pack's external ports. If any of the ports on this circuit pack are alarmed, refer to the repair procedures for those MOs.
Error Type 1538: Circuit packet is hyperactive; that is, it is flooding the switch with messages sent over the control channel. The circuit pack is taken out-of-service when a threshold number of these errors is reported to the switch. Clear the alarm with `busyout board location`, `reset board location`, `test board location long clear`, `release board location`. If the error recurs within 10 minutes, then replace the circuit pack.
- k. **Error Type 1793, 1794, 1795, 2306:** the circuit pack is having problems transmitting data to the packet bus.
Error Type 1793: Parity errors are detected when transmitting data to the packet bus.
Error Type 1794: Overflow of packet-bus transmit buffers has occurred.
Error Type 1795: Circuit pack cannot find end of frame when transmitting to packet bus. Clear the alarm via the following commands: `busyout board location`, `reset board location`, `test board location long clear`, `release board location`. If the error recurs within 10 minutes, then replace the circuit pack.
Error Type 2306: This error occurs when the circuit pack detects an error in a received frame from the packet bus. These errors are most likely caused by a packet-bus problem, but may be due to a circuit pack fault. An invalid Link Access Procedure Data (LAPD) frame error occurs if the frame contains a bad cyclical redundancy check (CRC), is greater than the maximum length, or violates the link level protocol. When bus parity errors are reported, the LANBIC Receive Parity Error Counter test (#595) should be performed to determine whether the condition had cleared. See [Isolating and repairing packet-bus faults](#) in *Maintenance Procedures (03-300192)* to determine whether the problem is isolated to this circuit pack or is caused by packet-bus faults.

- l. **Error Type 3330:** A critical failure has been detected in the packet-bus interface of the circuit pack. This failure may be due to either a packet-bus or to an on-board fault. If the packet bus is alarmed, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 and [Isolating and repairing packet-bus faults](#) in *Maintenance Procedures (03-300192)* for recommended repair procedures. The probability of this error being related to packet-bus problems increases with the number of ISDN-BRI circuit packs displaying this error.

If the packet bus is not alarmed, reset the circuit pack with **busyout board location** and **reset board location**. If the Circuit Pack Restart test (#594) passes, then the on-board circuitry is healthy. Retire the alarm with **test board location long clear**. If the Circuit Pack Restart test (#594) fails, replace the circuit pack. If the problem persists after complying with the above instructions, then follow normal escalation procedures.

- m. **Error Types 4096, 4097, 4098, 4099, 4100, 4101:** reported by the circuit pack when it receives a bad control channel message from the switch. Not service-affecting, no action is required. The auxiliary data identifies the error events.

Error Type 4096: Bad major heading

Error Type 4097: Bad port number

Error Type 4098: Bad data

Error Type 4099: Bad sub-qualifier

Error Type 4100: State inconsistency

Error Type 4101: Inconsistent downlink message

- n. **Error Type 3843:** bad translation RAM detected, but call continues by using another translation location. This error is not service-affecting. No action is required.

- o. **Error Type 3999:** the circuit pack sent a large number of control channel messages to the switch in a short period of time.

If **Error Type 1538** is also present, the circuit pack was taken out-of-service due to hyperactivity.

If **Error Type 1538** absent, the circuit pack was not taken out-of-service, but has generated 50% of the messages necessary to be considered hyperactive. This may be normal during heavy traffic periods. If traffic is light, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with one test, you may also clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Control Channel Loop-Around test (#52)	X	X	ND
NPE Audit test (#50)		X	ND
LANBIC Receive Parity Error Counter test (#595)		X	ND

1. D = Destructive; ND = Nondestructive

NPE Audit Test (#50)

See the repair procedure described in XXX-BD (Common Port Circuit Pack) as [NPE Audit Test \(#50\)](#) on page 2503.

Control Channel Loop Around Test (#52)

See the repair procedure described in XXX-BD (Common Port Circuit Pack) as [Control Channel Loop-Around Test \(#52\)](#) on page 2506.

SAKI Sanity Test (#53)

Refer to the repair procedure described in XXX-BD (Common Port Circuit Pack) as [SAKI Sanity Test \(#53\)](#) on page 2507.

LANBIC Receive Parity Error Counter Test (#595)

This test is destructive.

The test reads and clears the LANBIC Receive Parity Error Counter on the circuit pack. This counter is incremented by the circuit pack when it detects a parity error in data received from the packet bus.

These errors may indicate a circuit-pack problem, packet-bus problem, or a problem with another circuit pack on the bus. This test is useful for verifying the repair of the problem.

Table 222: Test #595 LANBIC Receive Parity Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	<p>Response to the test was not received from the circuit pack within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the test aborts repeatedly up to five times, reset the circuit pack via <code>busyout board location</code> and <code>reset board location</code>. 2. If the test aborts again, replace the circuit pack.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, escalate the problem.
2012	ABRT	<p>Internal system error.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, escalate the problem.
1–10	FAIL	<p>The circuit pack is still detecting errors of this type. The error code indicates the value of the on-board error counter.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, verify the validity of the packet bus. Run the Packet Bus Maintenance test, <code>test pkt p long</code>. If any packet-bus tests fail, see PKT-BUS (Packet Bus) on page 1748 for recommended repair procedures. 3. If the Packet Bus test passes, check the validity of the circuit pack. Execute a test that involves data transmission onto the packet bus. For example, the BRI may use the connectivity tests of the port-level MO (BRI-PORT) by executing <code>test port location</code>. Refer to the repair procedures for the executed test if it fails. Otherwise, proceed to the next step. 4. Other circuit packs on the packet bus can cause of the parity error. Use <code>display errors</code> to check the Error Log for other circuit packs that are alarmed. If any alarms are present for the other circuit packs, retire those alarms also. Then, rerun the LANBIC Receive Parity Error Counter test (#595) on this circuit pack.
	PASS	<p>No errors detected by circuit pack.</p>

BRI-DAT (ISDN-BRI Data Module)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
BRI-DAT	WRN ¹	<code>test data-module extension</code>	ISDN-BRI Stand-alone Data Module

1. The alarm level for ASAI or Avaya adjuncts may be administered using **set options**. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI adjunct in the system.

Refer to [BRI-SET, BRI-DAT, Various Adjuncts](#) on page 684.

BRI-PORT (ISDN-BRI Port) ABRI-PORT (ASAI ISDN-BRI Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
BRI-PORT	MIN	<code>test port location 1</code>	ISDN-BRI port
BRI-PORT	WRN	<code>test port location sh</code>	ISDN-BRI port
ABRI-PORT	MAJ ¹	<code>test port location 1</code>	ASAI ISDN-BRI port

LGATE-PT	MAJ ¹	<code>test port location 1</code>	Ethernet ASAI port
LGATE-PT	WRN ¹	<code>test port location 1</code>	Ethernet ASAI port
ATTE-PT	MAJ ¹	<code>test port location 1</code>	Ethernet Avaya Adjunct port
ATTE-PT	WRN ¹	<code>test port location 1</code>	Ethernet Avaya Adjunct port

1. The alarm level for ASAI and Avaya adjunct ports may be administered using **set options**. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI and Avaya adjunct port in the system.

All alarming for an ASAI and Avaya adjunct and OFF-BOARD alarming for an ASAI or Avaya port is disabled if the ASAI or Avaya adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI or Avaya adjunct. The Hardware Error and Alarm Logs should be checked to see if the adjunct has disabled alarming.

Note:

Some of the information in this section is reserved for future use.

CAUTION:

The section, [Isolating and repairing packet-bus faults](#) in *Maintenance Procedures (03-300192)*, along with the other information presented in the chapter, can help resolve problems involving more than one station or circuit pack.

WARNING:

If a significant packet-bus failure occurs, errors and alarms may not be logged as expected for BRI-PORT/ABRI-POR/ATT-PORT/ LGATE-PT/ ATTE-PT. Conditions under which this occurs are detailed in [Isolating and repairing packet-bus faults](#) in *Maintenance Procedures (03-300192)*.

Communication Manager Maintenance-Object Repair Procedures

The TN2208 LGATE MFB provides Communication Manager with the interface to Adjunct-Switch Application Interface (ASAI) and Avaya adjuncts (for example, CONVERSANT® Voice System). The circuit pack contains 12 ports of line circuit interface (although only 8 are usable by the switch), each of which operates with two B channels (referred to as B1 and B2 throughout this section) and one D channel. In this context, the term “ISDN-BRI port” is used to refer collectively to ports on the TN2208 circuit pack that are connected to ASAI or Avaya adjuncts.

The TN556 and TN2198 ISDN-BRI Line circuit packs provide the system with the interface to ISDN-BRI endpoints, Adjunct-Switch Application Interface (ASAI) and Avaya adjuncts (for example, CONVERSANT® Voice System). The circuit packs contain 12 ports of line circuit interface, each of which operates with two B channels (referred to as B1 and B2 throughout this section) and one D channel. In this context, the term “ISDN-BRI port” is used to refer collectively to ports on the TN556 and TN2198 circuit packs that are connected to either BRI endpoints, ASAI or Avaya adjuncts.

For BRI endpoints, each B channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B channels are not used on ports connected to ASAI or Avaya adjuncts. The D channel is used for conveying signaling between the switch and a BRI endpoint(s), ASAI or Avaya adjunct. Each ISDN-BRI D channel is connected to the switch processor and the ISDN-BRI port through the packet bus.

ISDN-BRI endpoints are available in various configurations. Every endpoint requires the D channel to convey signaling information to the switch. Only one B channel is required for a voice-only set or a stand-alone data module (BRI-DAT). A voice and data-capable set requires both B channels (one for voice and one for data). Therefore, each TN556 or TN2198 port can support either two voice-only sets, two stand-alone data modules (BRI-DAT), or one voice and data-capable set. Only a single ASAI or Avaya adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

[Figure 33: ISDN-BRI Port Interactions](#) on page 663 illustrates the physical connection (solid line) between an ISDN-BRI port and its associated ISDN-BRI set(s). Each physical connection allows for two B channels and one D channel. Each ISDN-BRI circuit pack can support up to 12 of these *physical* connections to different voice and voice/data sets or ASAI or Avaya adjuncts. On a TN2198 each ISDN-BRI circuit pack can support up to 12 *physical* connections to a NT1 which in turn connects to 2 terminals.

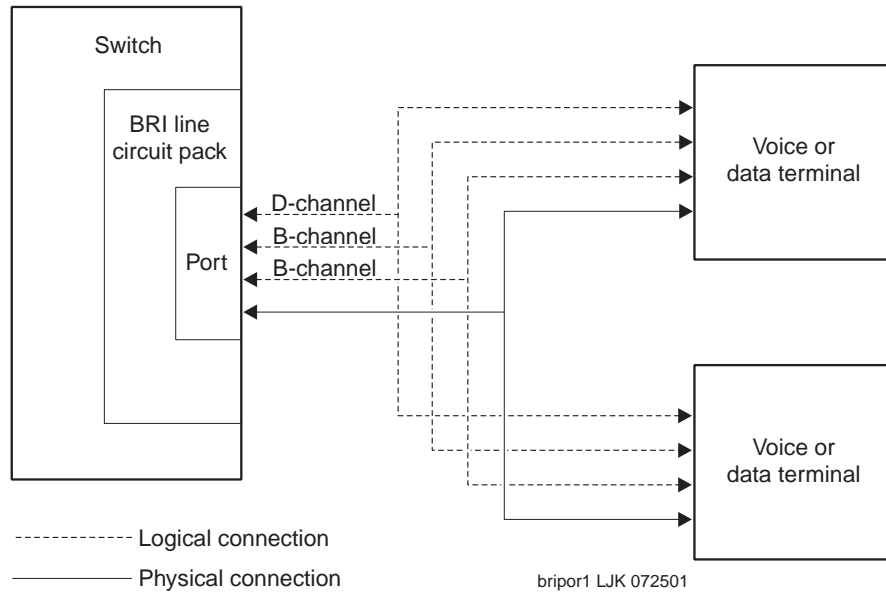

This section covers the maintenance documentation for ISDN-BRI ports. Some of the results of maintenance testing of ISDN-BRI ports may be affected by the health of the ISDN-BRI Line circuit pack (BRI-BD), BRI endpoint (BRI-SET), or ASAI adjunct (ASAI-ADJ/LGATE-AJ/ LGATE-AJ) or Avaya adjunct (ATT-ADJ/ATTE-AJ). These interactions should be kept in mind when investigating the cause of ISDN-BRI port problems. For more information about the circuit pack, see:

- [BRI-BD/LGATE-BD \(ISDN-BRI Line Circuit Pack\)](#) on page 653
- [BRI-SET, BRI-DAT, Various Adjuncts](#) on page 684

and its endpoints, see:

- [ASAI-ADJ \(ASAI Adjunct\)](#) on page 463
- [ATT-ADJ \(AvayaAdjunct\), ATTE-AJ \(Ethernet Avaya Adjunct\)](#) on page 635
- [LGATE-AJ](#) on page 1445

1. Major and Minor alarms on this MO may be downgraded to Warning alarms based on the value used in **set options**.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 1:** the Level 1 Status Inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. Refer to the repair procedures for Test #621.
Aux Data blank: the Level 1 Status Inquiry failed.
Aux Data 32773: message from the BRI-LINE circuit pack indicating Level 1 has been deactivated.

- c. **Error Type 130:** the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.
- d. **Error Type 257:** the EPF Status Inquiry fails due to an overcurrent condition or when the BRI-LINE circuit pack detects that the EPF is in an over current condition. The aux data field contains one of the following values:
- blank – This indicates that the EPF Status Inquiry failed due to an overcurrent condition.
 - 40988 – This indicates that the BRI-LINE circuit pack has detected an overcurrent condition and has turned the EPF off.

Execute the short test sequence, and see the repair procedures for Test #622.

- e. **Error Type 513:** the circuit pack is having problems transmitting data to the packet bus, thus affecting the conveyance of signaling information over the D channel. With Aux Data 46222, this error occurs when the packet-bus transmit buffers overflow. This condition probably indicates a hardware problem. The BRI-PORT Alarm Level for the error with Aux Data 46222 is "MINOR/WARNING," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJOR/MINOR/WARNING." With Aux Data 0, this error occurs whenever the packet-bus transmit FIFO buffers overflow. This condition can be caused by an on-board hardware problem as well as by problems on the packet bus that disrupt the BRI circuit pack's ability to transmit data onto the packet bus. Use troubleshooting procedures for both on-board hardware problems and potential off-board packet-bus problems. See [PKT-BUS \(Packet Bus\)](#) on page 1748 as well as [Isolating and repairing packet-bus faults](#) in *Maintenance Procedures (03-300192)* for more information about troubleshooting the packet bus. The BRI-PORT Alarm Level for the error with Aux Data 0 is "MINOR," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJOR."
- f. **Error Type 769:** the NPE Crosstalk test (#617) fails. Run the long test sequence, and pay particular attention to the results of Test #617.
- g. **Error Type 1281:** a port's associated broadcast-signaling links have too much traffic related to link establishment. This could occur if an endpoint on this port is sending link establishment traffic on a port level broadcast link or if there are Level 1 problems on the port. Check the error logs for Level 1 errors. If Level 1 problems exist, follow the repair procedures listed for Test #621. Software will suspend activity to this port for 75 minutes when the port is alarmed due to this error (note that service suspension does not occur if the port is an ABRI-PORT/LGATE-PT/ATTE-PT/ATT-PORT). If this problem persists, replace the endpoint or endpoints associated with this port. If replacing the endpoints does not fix the problem, follow normal escalation procedures.
- h. **Error Type 1537:** the port receives an invalid frame over the D channel. When CRC errors exceed five within 15 minutes, the port is taken out of service for five seconds. If five more CRC errors are received within 15 minutes of the first set of five errors, the port is taken out of service for one minute. If five more CRC errors are received within 15 minutes of the last five, the port is taken out of service for 15 minutes.

Communication Manager Maintenance-Object Repair Procedures

This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source, or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

- Check the wiring to the endpoints or the adjunct.
 - If the problem persists, replace the endpoints or adjuncts, or escalate the problem.
- i. **Error Type 1793:** the BRI Port Local TDM Loop Around test (#619) fails. Run the long test sequence, and pay particular attention to the results of Test #619.

There are no Test to Clear Values for the following error types. The error types are simply provided as additional data that may prove useful while troubleshooting.

- j. **Error Type 3841:** a Layer 1 Transmission error is detected for the port. Run the long test sequence, and pay particular attention to the results of the Layer 1 Transmission Error Counter test (#624).
- k. **Error Type 3842:** A BRI port supports up to three Terminal Endpoint Identifiers (TEIs). This error occurs when the switch receives a request for a fourth TEI on a port. Check the number of endpoints administered for this port.
- l. **Error Type 3843:** a SPID initialization request is made from an endpoint and the switch determines that the SPID value is invalid or is a duplicate of another SPID that is already initialized at Layer 3 on the port. Check the administration of the endpoints.
- m. **Error Type 3844:** the circuit pack detects an overflow of its receive buffers. Run the long test sequence, and pay particular attention to the results of the Receive FIFO (First In First Out) Overflow Error Counter test (#625).
- n. **Error Type 3845:** the BRI Port Local LAN Loop Around test (#618) fails. Run the long test sequence, and pay particular attention to the results of Test #618.
- o. **Error Type 3846:** most likely occurs when the Terminal Endpoint Identifier (TEI) administered for the ASAI or Avaya endpoint does not match the TEI administered in the ASAI or Avaya adjunct. Check the switch administration of the TEI against that of the adjunct and make sure that both are using the same TEI.
- p. **Error Type 384:** sets on the port do not support layer-3 initialization. Consult the Service Set documentation.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the *NPE Crosstalk* test (#617), you may clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk test (#617)		X	D
BRI Port Local LAN Loop Around test (#618)		X	D
BRI Port Local TDM Loop Around test (#619)		X	D
Electronic Power Feed Restoral test (#620)	X	X	ND
Level 1 Status Inquiry test (#621)	X	X	ND
Electronic Power Feed Inquiry test (#622)	X	X	ND
CRC Error Counter test (#623)		X	ND
Layer 1 Transmission Error Counter test (#624)		X	ND
Receive FIFO Overflow Error Counter (#625)		X	ND
Clear Error Counters (#270)	X	X	ND

1. D = Destructive; ND = Nondestructive

Note:

The NPE Crosstalk test and the BRI Port Local TDM Loop Around test are not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT.

NPE Crosstalk Test (#617)

This test is **destructive**.

One or more NPEs reside on each circuit pack with a TDM-bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's long test sequence and executes in approximately 20 to 30 seconds. Crosstalk testing is performed on both B channels (B1 and B2) associated with a BRI port. If this test fails on either channel, any endpoint connected to the port is taken out-of-service.

Communication Manager Maintenance-Object Repair Procedures

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B channels associated with the port are not used by ASAI or Avaya adjuncts.

Table 224: Test #617 NPE Crosstalk Test 1 of 2

Error Code	Test Result	Description / Recommendation
1000	ABRT	<p>System resources required to run this test are not available. The port may be busy with a valid call.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the station extension or trunk group/member number of the port. Use status bri-port location to determine the service state of the port. If the service state indicates that the port is active, then the port is unavailable for certain tests. (Refer to Maintenance SAT Commands in <i>Maintenance Commands Reference (03-300191)</i> for a full description of every possible state.) Wait until the port is idle before retesting. 2. If the port status is idle, then retry the command at 1-minute intervals up to 5 times. 3. If the test continues to abort, escalate the problem.
1004	ABRT	<p>The port has been seized by a user for a valid call.</p> <ol style="list-style-type: none"> 1. Use status station for the station associated with this port and determine when the port is available for testing. 2. Retry the command at 1-minute intervals up to 5 times. 3. If the test continues to abort and the port is idle, escalate the problem.
1005	ABRT	<p>This test is not valid for this type of translation. Ports administered as “ASAI” or “ADJK” cannot run this test, because the B channels associated with the port are not used by ASAI or Avaya Adjunct Links. This is a normal condition.</p>
2012	ABRT	<p>Internal system error.</p>

Error Code	Test Result	Description / Recommendation
	PASS	<p>The port is correctly using its allocated time slots.</p> <ol style="list-style-type: none"> To verify that this is not an intermittent problem, repeat this test up to 10 times to make sure it continues passing. If complaints still exist, examine the station, connections, and wiring.
		<i>2 of 2</i>

BRI Port Local LAN Loop Around Test (#618)

This test is **destructive**.

This test verifies the connectivity of a BRI port across the LAN Bus and executes only if the port is out-of-service. The test aborts if calls associated with the port are in-progress. Failures of this test indicate either on-board faults associated with the BRI-PORT hardware on the circuit pack, or problems with the LAN Bus, which is used to form connectivity between the switch and the BRI-PORT.

The dotted lines in [Figure 34: Path of the BRI Port Local LAN Loop Around](#) on page 669 show how a Loop Around test is performed across the packet bus for the D channel.

Figure 34: Path of the BRI Port Local LAN Loop Around

Table 225: Test #618 BRI Port Local LAN Loop Around 1 of 2

Error Code	Test Result	Description / Recommendation
1015	ABRT	<p>The port is not in the out-of-service state.</p> <ol style="list-style-type: none"> 1. Display the BRI Port Status screen via <code>status bri-port location</code> to determine what stations or adjuncts are on this port. 2. Use the extension shown on this screen in <code>status station</code> to determine whether the station or adjunct is active. 3. If so, wait until it is idle, and then busyout the port with <code>busyout port location</code> to place it in the out-of-service state and repeat this test. <p>⚠ WARNING:</p> <p>Since the “busyout” command is destructive, execution of this command prior to the port being idle causes every call associated with BRI endpoints and every transaction associated with ASAI or Avaya adjuncts on the port to be torn down. Note that 3rd-party calls established by an ASAI or Avaya adjunct remain connected even though the port is taken out-of-service.</p>
1139	ABRT	<p>The PN's packet bus is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the packet bus. 2. After completing step 1, execute <code>test port long location</code>, and review the results of the BRI Port Local LAN Loop Around test to verify the repair.
1141	ABRT	<p>The PKT-CTRL is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the PKT-CTRL. 2. After completing step 1, execute <code>test port long location</code>, and review the results of the BRI Port Local LAN Loop Around test to verify the repair.
1144	ABRT	<p>The Port Network (PN) Packet Bus is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute <code>test port long location</code>, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1 of 2		

Table 225: Test #618 BRI Port Local LAN Loop Around 2 of 2

Error Code	Test Result	Description / Recommendation
2012	ABRT	Internal system error.
2100	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
	FAIL	The Loop Around test has failed. <ol style="list-style-type: none"> 1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the board are idle. Reset the circuit pack by issuing the <code>busyout board location</code> and <code>reset board location</code>. 2. If the test fails again, execute <code>test port-network pn#</code>. If this fails, follow failure procedures in PKT-BUS (Packet Bus) on page 1748. 3. If tests executed in step 2 pass, the problem is local to the BRI board. Replace the circuit pack.
	PASS	The BRI Port Local LAN Loop Around test has passed.
2 of 2		

BRI Port Local TDM Loop Around Test (#619)

This test is **destructive**.

This test verifies the connectivity of a BRI port across the TDM Bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack.

This Loop Around test runs a series of individual tests on the two B channels (B1 and B2) associated with the port. It is a collection of the following:

- Loop Around test across the TDM Bus for B1.
- Conference Circuit test for B1.
- Loop Around test across the TDM Bus for B2.
- Conference Circuit test for B2.

The tests are run in the above order. If one fails, the remaining tests in the sequence are not executed. An error code is returned at that point.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B channels associated with the port are not used by ASAI or Avaya adjuncts.

Communication Manager Maintenance-Object Repair Procedures

The dotted lines in [Figure 35: Path of the BRI Port Local TDM Loop Around](#) on page 672 show how a Loop Around test is performed for the B channels. The figure shows a terminal connected to a BRI line board using a TN556. If a TN2198 is used the terminal would be connected to a NT1, and the NT1 to the BRI board.

Figure 35: Path of the BRI Port Local TDM Loop Around

1, 2	FAIL	<p>As stated previously, this test runs a TDM Loop Around test on each B channel. This indicates that the loop around failed on one of the channels. Error Code 1 indicates that the TDM Loop Around test failed on B1. Error Code 2 indicates that the TDM Loop Around test failed on B2.</p>
7, 8	FAIL	<p>As stated previously, this test runs a Conference Circuit test on each B channel. A failure here indicates that one of these conference tests failed; Error Code 7 means that the test failed on B1; Error Code 8 means that the test failed on B2.</p> <ol style="list-style-type: none"> 1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the circuit pack are idle. Reset the circuit pack by issuing the busyout board location and reset board location. 2. If the test fails again, replace the circuit pack.
	PASS	The BRI Port Local TDM Loop Around test has passed.
2 of 2		

Electronic Power Feed Restoral Test (#620)

This test attempts to restore the Electronic Power Feed (EPF) on an ISDN-BRI port twice. In this test, the processor requests that the EPF be turned on for a given port. An attempt is made to turn on the power unit to the station or adjunct. If no current is being drawn by a station, this probably indicates that the station is not connected. No current being drawn by an adjunct is the normal condition. If an overcurrent condition is sensed (that is, too much current is being drawn), this condition may indicate a short in the wiring to the endpoint or adjunct. Depending on what condition is sensed, a message is returned stating that either the EPF was turned on successfully with no problems or that an overcurrent condition is sensed. This response is reported by the Electronic Power Feed Inquiry (#622), which follows in the testing sequence. EPF Restoral is attempted again by this test five seconds later. This test always passes for the TN2198 because it has no EPF. This test will always abort when run on the TN2208.

Table 227: Test #620 Electronic Power Feed Restoral

Error Code	Test Result	Description / Recommendation
1005	ABRT	This test is not valid for this port type. The TN2208 does not have an electronic power feed, and the test will abort.
2012	ABRT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
	PASS	The EPF test passed. The message to turn on the power feed to the station or the adjunct was successfully sent to the port. <ol style="list-style-type: none"> 1. Although this test should not return a fail result, after running this test, the Error Log should be checked for any entries with error type 257 to examine the real results of this test. 2. An error type of 257 in the Error Log indicates some problem with the power to the station or the adjunct. Check for a short in the wiring, a damaged jack, a defective voice terminal or adjunct, or an incorrect type of terminal.

Level 1 Status Inquiry Test (#621)

This test determines the state of the transmission facility of a BRI port at the physical layer (that is, Level 1). Level 1 can be in one of three possible states: Activated, Pending Activation, or Deactivated.

Communication Manager Maintenance-Object Repair Procedures

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI or Avaya adjunct administered on this port. This test passes if the state of Level 1 (L1) is Activated. This test also passes if software has taken this port out of service. See the description of the Level 1 “Deactivated State” below for more details.

The Pending Activation state indicates a problem with the endpoints or adjunct, the wiring to the sets or adjunct, or the BRI-LINE circuit pack. When in this state, the Level 1 interface is either not receiving any L1 framing from the endpoint or adjunct (Endpoint Idle), or it is communicating with the endpoint or adjunct but cannot transition to the Activated state (Endpoint Active).

The Deactivated state indicates a problem with the BRI-LINE circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ISDN-BRI port is placed in the out-of-service state, Level 1 is also put into the Deactivated state. This could be due either to the system detecting a fault with the port or to a *busyout port location* request.

Table 228: Test #621 Level 1 Status Inquiry 1 of 4

Error Code	Test Result	Description / Recommendation
1187	ABRT	<p>The board, port or station may have been busied out by a technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (port busied out) for this port and BRI-BD (board busied out). If this error type is present for BRI-PORT only, release the port via <code>release port pp</code> and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the board via <code>release port location</code> and run the test again. <p>Note:</p> <p style="padding-left: 40px;">When you release a port, you release every port associated with it. If certain ports still need to be busied out, use <code>port location</code> to busy them out.</p> <ol style="list-style-type: none"> 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times. 4. If the test continues to abort, escalate the problem.
2000	ABRT	<p>Response to the test was not received from the circuit pack within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the test aborts repeatedly up to five times, reset the circuit pack via the <code>busyout board location</code> and <code>reset board location</code>. 2. If the test aborts again, replace the circuit pack.
1 of 4		

Table 228: Test #621 Level 1 Status Inquiry 2 of 4

Error Code	Test Result	Description / Recommendation
2012	ABRT	Internal system error.
2100	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, escalate the problem.
1	FAIL	<p>Received a status of Level 1 Pending Activation-Endpoint Idle which indicates a problem with the BRI endpoint or ASAI or Avaya adjunct, the wiring to the endpoint or adjunct, or the ISDN-BRI port.</p> <p>The TN2198, received a status of Level 1 Pending Activation. interface down, which indicates a problem with a connection between the switch and the NT1.</p> <p>Note:</p> <p>An NT1 is a 2- to 4-wire converter that is used to connect 4-wire Avaya terminals to a 2-wire TN2198 circuit pack. The NT1 also has status lamps to determine the health of the unit.</p> <ol style="list-style-type: none"> 1. For the TN556, verify that an endpoint is connected to the port. If an endpoint is connected to the port then proceed to step 2. For the TN2198 verify that the connections are good between the switch and the NT1. Verify that the NT1 has power. 2. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. If a TN2198 is used the set must have been plugged in for at least 15 seconds before it will stabilize. Execute test port PCSSpp, and review the results of the Level 1 Status Inquiry test to verify the repair. If this test is still failing, proceed to step 3. 3. For BRI endpoints, replace the BRI endpoint(s) connected to the port or the NT1 if a TN2198 is used. For ASAI or Avaya adjuncts, follow the recommended repair procedures of the manufacturer for link communication problems. For the NT1, follow the manufacturers repair procedures. Then execute test port PCSSpp and review the results of the Level 1 Status Inquiry test to verify repair. If this test is still failing, proceed to step 4. 4. Escalate the problem to the next tier.
		2 of 4

Table 228: Test #621 Level 1 Status Inquiry 3 of 4

Error Code	Test Result	Description / Recommendation
2	FAIL	<p>For the TN556 or TN2208, received a status of Level 1 Pending Activation-Endpoint Active which indicates a problem with the BRI endpoint or ASAI or Avaya adjunct, the wiring to the endpoint or adjunct, or the ISDN-BRI port.</p> <p>For the TN2198, received a status of Level 1 Pending Activation. U interface up S/T interface down, which indicates a problem with the NT1 or the wiring between the NT1 and the BRI endpoint (S/T interface).</p> <ol style="list-style-type: none"> 1. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. Execute test port location, and review the results of the Level 1 Status Inquiry test to verify the repair. If this test is still failing, proceed to step 2. 2. For BRI endpoints, try replacing the BRI endpoint(s) connected to the port. For ASAI or Avaya adjuncts, follow the recommended repair procedures of the manufacturer for link communication problems. For the NT1, follow the recommended repair procedures of the manufacturer. Then execute test port location, and review the results of the Level 1 Status Inquiry test to verify repair. If this test is still failing, proceed to step 3. 3. Escalate the problem to the next tier.
3	FAIL	<p>Received a status of Level 1 Deactivated; the port is out-of-service.</p> <ol style="list-style-type: none"> 1. Enter status bri-port location to verify that the service state of the port is out-of-service. If the service state of the port is not out-of-service, escalate the problem to the next tier. Otherwise, proceed to step 2. 2. If the port has been placed out-of-service via busyout port location, try releasing the port by executing the release port location. Then enter test port long location, and review the results of Level 1 Status Inquiry test. If this test is still failing, proceed to step 3. 3. After executing test port long location, review the results of every test. Follow the repair procedures for any tests that fail. Verify repair of the problem by executing test port location and by determining that the Level 1 Status test passes. If the test continues to fail for this reason, proceed to step 4. 4. Escalate the problem to the next tier.
		3 of 4

Table 228: Test #621 Level 1 Status Inquiry 4 of 4

Error Code	Test Result	Description / Recommendation
4	FAIL	For the TN2198 only: Received a status of Level 1 Pending Activation, the NT1 has a loss of power indicating a problem with the NT1. <ol style="list-style-type: none"> 1. For the NT1 follow the manufacturers recommended repair procedures. 2. Execute test port location, and review the results of the Level 1 Status Inquiry test to verify the repair. If the test is still failing proceed to step 3. 3. Escalate the problem to the next tier.
	PASS	This test indicates that Level 1 is activated, or that software has taken the port out of service.
4 of 4		

Electronic Power Feed Inquiry (#622)

This test queries the BRI-LINE circuit pack for the status of the Electronic Power Feed (EPF) supplied to a BRI endpoint or an ASAI or Avaya adjunct. If the EPF is on and no overcurrent condition exists, this test passes. All other states are not normal and indicate a problem with the endpoint or adjunct, the wiring to the endpoint or adjunct, or the BRI-LINE circuit pack. This test is not run on the TN2208 circuit pack or the TN2198 and will always return a pass for the TN2198. The TN2208 has no power feeds.

Table 229: Test #622 Electronic Power Feed Inquiry 1 of 2

Error Code	Test Result	Description / Recommendation
1005	ABRT	This test is not valid for this port type. Ports on the TN2208 cannot run this test because this board does not have an electronic power feed.
2000	ABRT	Response to the test was not received from the circuit pack within the allowable time period. <ol style="list-style-type: none"> 1. If the test aborts repeatedly up to five times, reset the circuit pack via busyout board location and reset board location. 2. If the test aborts again, replace the circuit pack.
1 of 2		

Table 229: Test #622 Electronic Power Feed Inquiry 2 of 2

Error Code	Test Result	Description / Recommendation
2012	ABRT	Internal system error.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
1	FAIL	The BRI-LINE circuit pack reports that it has detected an overcurrent condition and has turned off the EPF. 1. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. Check the endpoints and replace one or both sets if the sets are drawing too much current. Execute test port location and review the results of the EPF Inquiry test to verify the repair. If this test is still failing, proceed to step 2. 2. Execute test port location , and review the results of the Level 1 Status Inquiry test. If this test is also failing, then follow the repair procedure for the Level 1 Status Inquiry test. Otherwise, escalate this problem to the next tier.
	PASS	The Electronic Power Feed Inquiry test reports that the EPF is on.
2 of 2		

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port’s Layer 1 Transmission error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or the endpoint or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY® Communications System Generic 1 and Generic 3i Wiring, 555-204-111*. It does not indicate a problem with the ISDN-BRI circuit pack. This test is useful for verifying the repair of the problem.

Table 230: Test #624 Layer 1 Transmission Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	<p>Response to the test was not received from the circuit pack within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the test aborts repeatedly up to five times, reset the circuit pack via busyout board location and reset board location. 2. If the test aborts again, replace the circuit pack.
2012	ABRT	Internal system error.
2100	ABRT	<p>Could not allocate necessary system resources to run test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, escalate the problem.
value	FAIL	<p>The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, review the results of other tests in the long test sequence. Pay particular attention to the results of the Level 1 Status Inquiry test. Follow repair procedures for any of the executed tests if they fail. Otherwise, go to the next step. 3. If the tests for the endpoints or adjunct pass and the Layer 1 Transmission Error Counter test continues to fail, check the wiring to the endpoints or adjunct. If the wiring appears to be fine, escalate the problem.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Receive FIFO Overflow Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO Overflow error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is non-zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from the packet bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port OR if a hardware fault is causing the receive buffers not to be emptied properly by the circuit pack. This test is useful for verifying the repair of the problem.

Table 231: Test #625 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	Response to the test was not received from the circuit pack within the allowable time period. <ol style="list-style-type: none"> 1. If the test aborts repeatedly up to five times, reset the circuit pack via busyout board location and reset board location. 2. If the test aborts again, replace the circuit pack.
2012	ABRT	Internal system error.
2100	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, escalate the problem.
value	FAIL	The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, run the long test sequence, and pay particular attention to the Loop Around tests (#618 and #619). See the repair procedures for the executed test if it fails. Otherwise, go to the next step. 3. Replace the circuit pack.
	PASS	The Receive FIFO Overflow error counter was read correctly and has a value of 0.

Clear Error Counters Test (#270)

This test is not an actual test in the strict sense of the word. There are various error counters associated with each BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT. This test clears those counters and triggers the auditing of Terminal Endpoint Identifier (TEI) values and layer-3 reinitialization. This test is used only to send messages to the BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT and, therefore, should neither abort nor fail.

Table 232: Test #270 Clear Error Counters

Error Code	Test Result	Description / Recommendation
Any	ABRT	This test should never abort.
Any	FAIL	This test should never fail. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, escalate the problem.
	PASS	The message to clear the error counters of the BRI-Port/ABRI-Port/ATT-PORT/LGATE-PT/ATTE-PT has been sent.

BRI-SET, BRI-DAT, Various Adjuncts

S8700 | 8710 / S8500

ATTE-AJ	WRN ²	<code>test station extension</code>	Ethernet Avaya-Adjunct

1. **The alarm level for ASAI and Avaya adjuncts may be administered using **set options**. The alarm level can be set independently for on- and off-board alarms to WARNING, MINOR, or MAJOR for every ASAI and Avaya adjunct in the system.
2. Alarming for an ASAI and Avaya adjuncts is disabled if the adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm are logged against the endpoint. Busing out and releasing the ASAI station or ADJLK station will clear the alarm.

WARNING:

Information for isolating and resolving packet-bus faults is included in [Isolating and repairing packet-bus faults](#) in *Maintenance Procedures (03-300192)*. The Troubleshooting Packet Bus Problems flowchart, along with the other information presented in the chapter, can help resolve problems that involve more than a single station or circuit pack.

WARNING:

If a significant packet-bus failure occurs, errors and alarms may not be logged as expected for BRI-PORT/ABRI-POR/ATT-PORT/ LGATE-PT/ ATTE-PT. Conditions under which this occurs are detailed in the [Isolating and repairing packet-bus faults](#) in *Maintenance Procedures (03-300192)*.

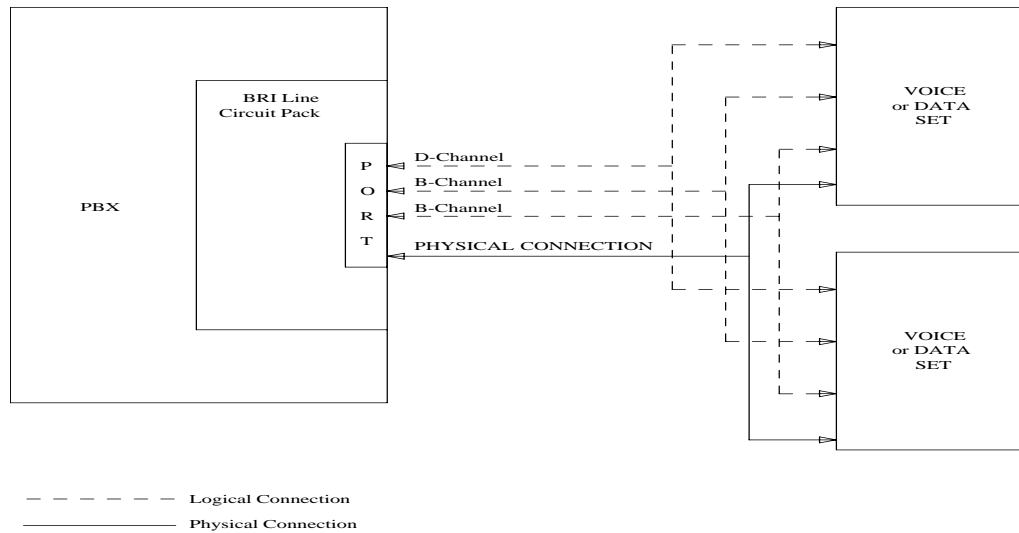

The TN2208 ESAI MFB provides the system with an Ethernet interface to Adjunct-Switch Application Interface (ASAI) and Avaya adjuncts (for example, CONVERSANT[®] Voice System). This circuit pack contains 8 ports of line circuit interface, each of which operates with two B channels (referred to as B1 and B2 throughout this section) and one D channel. In this context, the term “ISDN-BRI port” is used to refer collectively to ports on the TN2208 MFB circuit pack that is connected to ASAI or Avaya adjuncts. The TN2208 ESAI MFB is handled by switch software as it is an ISDN BRI compatible board and every maintenance action referring to ASAI and Avaya Adjunct Links in this section applies.

In G3iV1.1-286 and G3iV2-386, two types of ISDN-BRI endpoints may be connected to ISDN-BRI (ISDN Basic Rate Interface Line) TN556 and TN2198 circuit packs: ISDN-BRI station endpoints, ASAI (Adjunct-Switch Application Interface) and Avaya adjuncts (for example CONVERSANT[®] Voice System). These circuit packs contain 12 ports of line circuit interfaces, each of which operates at 192 kilobits per second (kbps) with two B channels and one D channel. For BRI endpoints, each B channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B channels are not used by ASAI or Avaya adjuncts. The D channel is used for conveying signaling between the switch and a BRI endpoint(s) or ASAI or Avaya adjuncts. Each ISDN-BRI D channel is connected to the switch processor and the ISDN-BRI port through the PKT-BUS (packet bus).

ISDN-BRI endpoints come in a number of configurations. Every endpoint requires the D channel to convey signaling information to the switch. A voice-only set requires only one B channel. A voice and data-capable set requires both B channels (one for voice and one for data). Therefore, each TN556 port can support either two voice-only sets or one voice and data-capable set. Only a single ASAI or Avaya adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

[Figure 36: ISDN-BRI Set Interactions](#) on page 686 illustrates the physical connection (solid line) between an ISDN-BRI circuit pack and a voice or voice/data set. Each physical connection allows for two B channels, as stated above, plus one D channel. Each ISDN-BRI circuit pack can support up to 12 of these PHYSICAL connections to different voice and voice/data sets or ASAI and Avaya adjuncts.

Figure 36: ISDN-BRI Set Interactions

This section contains the ISDN-BRI Set, ASAI Adjunct and Avaya Adjunct Maintenance documentation. Some of the results of maintenance testing of the ISDN-BRI Set or the ASAI and Avaya Adjunct may be affected by the health of the ISDN-BRI circuit pack and port. These interactions should be kept in mind when investigating the cause of ISDN-BRI Set problems.

1. Major and Minor alarms on this MO may be downgraded to Warning alarms based on the value used in **set options**.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

Communication Manager Maintenance-Object Repair Procedures

- b. **Error Type 2:** violations of the ISDN-BRI signaling protocol; timers associated with certain layer-3 messages have expired before a required response was received. In the following table, the aux data field indicates what timer has just expired.

Aux Data	Timer Type
2	First T303 (SETUP timer)
3	Second T303 (SETUP timer)
4	T305 (DISConnect timer)
5	First T308 (RELease timer)
6	Second T308 (RELease timer)
10	T316 (REStart timer)
12	T309 (Layer-2 Failure timer)
16	TM100 (Management Information message Timer 1)
17	TM200 (Management Information message Timer 2)
102	TASAI (ASAI Routing timer)

The switch sent a message to the endpoint that did not respond in the allotted time. This can happen occasionally due to failure of the point-to-point signaling link or because of a problem in the BRI endpoint or ASAI adjunct or Avaya adjunct. Execute `test station extension sh` and pay particular attention to the results of the BRI Layer 3 Query test (#629). If this test fails, follow the repair procedure for Test #629.

- c. **Error Type 130:** the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.
- d. **Error Type 257:** the endpoint does not respond to the service state query message sent to the adjunct or the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or the adjunct.

For BRI endpoints, the Aux Data field for this error contains "0." When it occurs, execute `test station extension sh` and pay particular attention to the results of the BRI Layer 3 Query test (#629). If this test fails, follow the repair procedure for Test #629.

When this error occurs for an ASAI or Avaya adjunct, the Aux Data field indicates the state of the ASAI link or Avaya link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

Aux Data	ASAI Link State	Error
102	13-restarting	No response to RESTART message
104	13-restarting	Invalid response to RESTART message
152	13-restarted	No response to layer-3 query
154	13-restarted	Invalid response to layer-3 query
202	13-established	No response to layer-3 query
204	13-established	Invalid response to layer-3 query

See [Maintenance SAT Commands](#) in *Maintenance Commands Reference (03-300191)* for an explanation of the ASAI link states.

For ASAI or Avaya adjuncts, the switch automatically queries the adjunct every two minutes (and therefore the Layer 3 Query test is not executed for ASAI or Avaya adjuncts via a command entered from the G3MT terminal). While alarmed for this error, the switch momentarily (for five seconds) takes the associated port out-of-service every 15 minutes. This action is taken in an attempt to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or Avaya adjunct:

1. Execute **test station extension** and pay particular attention to tests that fail. Perform the associated repair procedures for those tests.
 2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.
 3. If the above steps do not resolve the problem and the alarm persists, follow normal escalation procedures.
- e. **Error Type 351** and associated WARNING alarm are logged against an ASAI or Avaya endpoint when the adjunct has asked the switch to suspend Maintenance on the ASAI or Avaya endpoint. Busy out and release the ASAI station or ADJLK station to clear the alarm.
- f. **Error Type 513**: the endpoint sends more messages than the switch can handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.
- g. **Error Type 769**: a BRI endpoint's signaling-associated link has too much traffic related to link establishment. This could occur if the signaling link is bouncing between assigned and established states. Software suspends activity to this endpoint for 75 minutes when the endpoint is alarmed due to this problem. Note that service suspension does not occur if the endpoint is an ASAI or Avaya adjunct. If this problem persists, replace the endpoint. If replacing the endpoint does not fix the problem, follow normal escalation procedures.

Communication Manager Maintenance-Object Repair Procedures

- h. **Error Type 2561:** the ASAI-ADJ or ATT-ADJ or LGATE-AJ or ATTE-AJ message is not transmitted because the PKT-CTRL (Packet Control circuit pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or Avaya adjunct. Attempt to resolve the problem by following the repair procedures for the PKT-CTRL. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- i. **Error Type 2562-2566:** the ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow controlled. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or Avaya adjunct. Attempt to resolve the problem by following the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- j. **Error Type 2817:** there is a layer-2 problem over the D channel between the switch and the endpoint. When this error occurs, an alarm is raised against the station or adjunct. Execute **test station extension short** and pay particular attention to the results of the BRI XID test (#628). If this test fails, follow the repair procedure for Test #628.
- k. **Error Type 3073:** there is a problem with the B-channel connection between the switch and the endpoint. When this error occurs, a warning alarm is raised against the endpoint. Execute **test station extension long** and pay particular attention to the results of the BRI Remote Loop Back test (#627). If this test fails, follow the repair procedure for Test #627.
- l. **Error Type 3329:** occurs whenever the point-to-point signaling link to the endpoint goes down (except when it goes down because either the PKT-CTRL or the PKT-BUS has failed or has been busied out by system technician). When this error occurs, an alarm is raised against the endpoint or adjunct. Execute **test station extension short** and pay particular attention to the results of the Signaling Link Status test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is reestablished to the endpoint or adjunct.
- m. **Error Type 3585-3839:** Certain ASAI protocol-specific cause codes are logged by switch software. The cause code can be determined from the following formula:

If the error type is greater than 3712, then the ASAI cause code is equal to the error type minus 3712. This code was sent to the adjunct by the switch.

If the error type is less than 3712, then the ASAI cause code is equal to the error type minus 3584. This code was sent to the switch by the adjunct.

A description of the various ASAI cause values is contained in the [Table 234: ASAI CAUSE VALUES; \(BRI-SET/ASAI-ADJ Error Log Entries Notes\)](#) on page 691. This table also contains recommended system technician actions associated with the cause value. In addition, the Aux Data field of the Error Log entry contains additional diagnostic information additional diagnostic.

Table 234: ASAI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes) 1 of 2

Error Code	Test Result	Description / Recommendation
0	Unrecognized ASAI Protocol Operation	<p>Requested ASAI protocol operation is not implemented by the switch or adjunct. Aux Data field of Error Log entry contains protocol identifier for unrecognized operation.</p> <ol style="list-style-type: none"> 1. Consult switch and adjunct documentation to determine which set of operations is supported by the switch and the adjunct. Adjunct administration turning off operations not implemented by the switch may resolve the problem. 2. If step 1 does not resolve the problem, escalate to the next tier.
40	Resources not available	<p>No available internal resources to service switch or adjunct request. System transaction capacity for adjunct or switch is exceeded.</p> <ol style="list-style-type: none"> 1. Re-engineering of adjunct services may be required. If problem persists, escalate problem to the next tier.
63	SERVICE OR OPTION NOT AVAILABLE	<p>Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resources. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct.</p> <ol style="list-style-type: none"> 1. Verify that no overlapping administration of switch resources (e.g., requesting notifications on a single domain by multiple adjuncts or multiple adjuncts attempting to control a single call) exists across any adjunct connected to the switch. If an overlap exists, then re-administer the adjuncts to guarantee that each adjunct is associated with a unique set of switch resources. 2. If step 1 does not resolve the problem, escalate to the next tier.
79	SERVICE OR OPTION NOT IMPLEMENTED	<p>Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct.</p> <ol style="list-style-type: none"> 1. Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Re-administration of the switch-administered capabilities (see Customer Optional Feature screen) or those of the adjunct may be necessary to correct the problem. 2. If step 1 does not provide the set of desired services due to deficient implementation, escalate the problem to the next tier.
1 of 2		

Table 234: ASAI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Entries Notes) 2 of 2

Error Code	Test Result	Description / Recommendation
87	Internal switch audit	There is an inconsistency in switch data records. <ol style="list-style-type: none"> 1. There is no action needed since the switch has corrected the data inconsistency. 2. If a number of these errors continue to occur, then escalate to next tier.
2 of 2		

n. **Error Type 3840-4095:** Certain ISDN-BRI cause codes are logged by switch software. The cause code can be determined from the following formula:

If the error type is greater than 3968, then the ISDN-BRI cause code is equal to the error type minus 3968. This code was sent to the endpoint by the switch.

If the error type is less than 3968, then the ISDN-BRI cause code is equal to the error type minus 3840. This code was sent to the switch by the endpoint.

A description of the various ISDN-BRI cause values is contained in [Table 235: ISDN-BRI CAUSE VALUES; \(BRI-SET/ASAI-ADJ Error Log Notes\)](#) on page 692. This table also contains recommended system technician actions associated with the cause value. In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

o. **Error 3847:** sets on the port do not support level 3 initialization. Consult the Set Service documentation.

p. **Error 2567:** the version of ASAI is not supported, check version of the software running on the ASAI or Avaya adjunct.

Table 235: ISDN-BRI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Notes) 1 of 3

Error Code	Test Result	Description / Recommendation
1	Channel in use	Another station is using requested channel on the BRI-PORT. (Not applicable for ASAI or Avaya adjuncts.) For BRI endpoints: <ol style="list-style-type: none"> 1. Try to originate a call to or from this port. 2. If the error persists, busyout and release the port. 3. If the problem still persists, replace stations on the port. 4. If the problem still persists, escalate to the next tier.
1 of 3		

Table 235: ISDN-BRI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Notes) 2 of 3

Error Code	Test Result	Description / Recommendation
34	No circuit or channel available	<p>A resource on the switch is unavailable for a call. For BRI endpoints: This cause value is not logged. For ASAI or Avaya Adjuncts: This condition means that there are no available trunks for an outgoing call request.</p> <ol style="list-style-type: none"> 1. Verify that the adjunct is administered to support the trunk capabilities of the switch. 2. Investigate trunk group status by issuing status trunk commands from the SAT or by requesting a trunk group query or queries from the adjunct. 3. Perform trunk diagnostic procedures outlined in this manual. 4. If step 3 does not resolve the problem, escalate to the next tier.
42	Switch Equipment Congestion	<p>Switch takes control to limit received traffic. For BRI endpoints: This cause value is not logged. For ASAI or Avaya Adjuncts:</p> <ol style="list-style-type: none"> 1. Refer to the CallVisor protocol reference manual. 2. If step 1 does not resolve the problem, escalate to the next tier.
50	Requested Facility Not Subscribed	<p>Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct. For BRI endpoints:</p> <ol style="list-style-type: none"> 1. Verify the switch administration of endpoint using display station or display data-module. 2. If step 1 does not resolve the problem, refer to the endpoint's service manual and verify administration on the endpoint. 3. If step 2 does not resolve the problem, escalate to the next tier. <p>For ASAI adjuncts:</p> <ol style="list-style-type: none"> 1. Display the Customer Optional Features screen (administration screen) on the switch to determine which ASAI capabilities are turned on in the switch. 2. Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administered capabilities, then re-administer the switch and/or the adjunct to establish a consistent set of desired capabilities on both the switch and the adjunct. 3. If step 2 does not resolve the problem, escalate to the next tier. <p>For Avaya adjuncts:</p> <ol style="list-style-type: none"> 1. Display the Customer Optional Features screen (administration screen) on the switch to determine whether the Avaya adjunct is set enabled on in the switch. 2. If error type 2567 or 2568, verify the Avaya adjunct version, and re-administer if needed. 3. If step 2 does not fix the problem, escalate to the next tier of support

2 of 3

Table 235: ISDN-BRI CAUSE VALUES; (BRI-SET/ASAI-ADJ Error Log Notes) 3 of 3

Error Code	Test Result	Description / Recommendation
58	Bearer Capability Not Currently Available	Requested bearer capability is implemented, but not administered. No B channel is administered. See recommendation for Error Code 50 above.
65	Bearer Service Not Implemented	Requested service not implemented in switch or endpoint.
69	Requested Facility Not Implemented	Requested service not supported in switch or endpoint. 1. Consult switch and endpoint documentation to determine service support. 2. If step 1 does not resolve the problem, escalate to the next tier.
81	Invalid CRV	An invalid CRV was sent by the adjunct. 1. This may indicate a CRV inconsistency between the switch and the adjunct. Refer to the CallVisor protocol reference manual. 2. If step 1 does not resolve the problem, escalate to the next tier.
3 of 3		

- q. **Error 2568:** the adjunct ID is invalid, check the vender ID or software running on the Avaya adjunct.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors associated with the circuit pack and port first. Clearing these error codes first may also clear errors generated against the endpoint. When every circuit pack and port error has been cleared, and errors still exist against the endpoint, investigate errors in the order they are presented in the table below. By clearing error codes associated with the *Signaling Link Status* test (#626), you may also clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Signaling Link Status test (#626)	X	X	ND
BRI XID test (#628)	X	X	ND
BRI Layer 3 Query (#629)	X(a)	X(a)	ND
1 of 2			

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
BRI Remote Loop Back (#627)		X(a)	ND
BRI Set Audits (#630)	X(a)	X(a)	ND
BRI Vendor ID test (#631)		X(a)	ND
BRI Model/Vintage ID test (#632)		X(a)	ND
			2 of 2

1. D = Destructive; ND = Nondestructive

Note:

(a) Execute **test port long location**, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is “bound” to an endpoint and fails if the link is “not bound.”

The definition of the term “bound” for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of “bound” for each type of endpoint is as follows:

- BRI endpoints administered for MIM (management information messages) initialization (multipoint):

Note:

An MIM is a level 3 message that conveys management and maintenance information between a communications system and a BRI terminal.

For endpoints of this type, the signaling link is “bound” when the link is connected at Layer 2 and the link has been associated with an endpoint, [that is, the endpoint has completed SPID initialization (L3 established)].

- ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):

For endpoints of this type, the signaling link is “bound” when the link is connected at Layer 2 (L2 established).

For every endpoint type, a signaling link becomes “unbound” when it is disconnected at Layer 2. For BRI endpoints supporting MIM initialization, a signaling link may also become “unbound” if a subsequent attempt to perform SPID initialization on a “bound” link fails (that is, wrong SPID is entered into the endpoint by the user).

Table 236: Test #626 Signaling Link Status Test 1 of 2

Error Code	Test Result	Description / Recommendation
1139	ABRT	<p>The PN's packet bus is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the packet bus. 2. After completing step 1, use test port long location, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABRT	<p>The PKT-CTRL is out-of-service.</p> <ol style="list-style-type: none"> 1. Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. 2. If step 1 does not resolve the problem, escalate to the next tier.
1187	ABRT	<p>The circuit pack, port or station may have been busied out by a technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. <ol style="list-style-type: none"> a. If this error type is present for BRI-SET only, then release the station via release station. b. If this error type is present for BRI-PORT and BRI-SET, then release the port via release port location and run the test again. c. If the error is present for BRI-BD, BRI-PORT, and BRI-SET, then release the circuit pack via release port location and run the test again. If the error is present for BRI-SET only, then release the circuit pack via release port location and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via release board location and run the test again. <p>Note: When you release the circuit pack, you release every port associated with it. If certain ports still need to be busied out, use busyout port location to busy them out.</p> 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times. 4. If the test continues to abort, escalate the problem.
		1 of 2

Table 236: Test #626 Signaling Link Status Test 2 of 2

Error Code	Test Result	Description / Recommendation
2012	ABRT	Internal system error.
2100	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
1113	FAIL	The signaling link is not “bound” to the adjunct or endpoint. For BRI endpoints supporting MIM initialization, this error indicates that the endpoint has not been bound to a signaling link (that is, SPID initialization has not been completed). Since the signaling link associated with the endpoint is not identified until SPID initialization completes, this error does not imply that the signaling link is connected or disconnected at Layer 2 nor does it provide the status of TEI assignment for the endpoint. For ASAI adjuncts and BRI endpoints not supporting MIM initialization, this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified via administration, the link is only “unbound” from the endpoint when it is disconnected. <ol style="list-style-type: none"> 1. Execute <code>status bri-port location</code> and see the associated procedures in BRI-PORT (ISDN-BRI Port) ABRI-PORT (ASAI ISDN-BRI Port) on page 661.
	PASS	The signaling link is connected at Layer 2 and “bound” to the BRI endpoint or ASAI adjunct.
2 of 2		

BRI Remote Loop Back Test (#627)

This test checks the integrity of a circuit-switched B-channel connection between the switch and the endpoint.

In this test, the endpoint is put in the “maintenance busy” state to prevent the switch from issuing calls to the endpoint during the test. An application message containing a loop back activate request for the appropriate B channel is sent to the endpoint. The endpoint responds with a loop back activated response. Maintenance then sends data to the endpoint over the B channel under test. Since the B channel is looped back at the endpoint, maintenance should receive the data that it sent. If no data is detected, the test fails. An application message containing a loop-back deactivate request is then sent to the endpoint to discontinue the remote loop-back test. The endpoint responds with an MIM message containing a loop-back deactivate response. Maintenance then releases the endpoint so that it is available to terminate calls.

Communication Manager Maintenance-Object Repair Procedures

This test is not executed for ASAI adjuncts because adjuncts do not support MIMs upon which this test is based.

Table 237: Test #627 BRI Remote Loop Back 1 of 3

Error Code	Test Result	Description / Recommendation
1000	ABRT	Could not seize the endpoint or B channels for test. <ol style="list-style-type: none">1. Retry the command at 1-minute intervals up to 5 times.2. If the test continues to abort, escalate the problem.
1005	ABRT	The endpoint's MIMs Supported field is administered to "no." <ol style="list-style-type: none">1. Use change station extension to change parameter only if the endpoint documentation reflects support for ISDN-BRI Management and Maintenance Procedures.
1113	ABRT	The signaling link between the switch and the endpoint is down. <ol style="list-style-type: none">1. Use test port location long to clear any errors that prevent establishment of the signaling link.2. Examine the results of the Signaling Link Status test (#626) that is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626.3. If the XID test (#628) continues to abort, escalate the problem.
1139	ABRT	The PN's packet bus is out-of-service. <ol style="list-style-type: none">1. Follow the repair procedures for the packet bus.2. After completing step 1, execute test port long location, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABRT	The PKT-CTRL is out-of-service. <ol style="list-style-type: none">1. Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation.2. If step 1 does not resolve the problem, escalate to the next tier.

2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
2 of 3		

Table 238: Test #628 BRI XID 3 of 3

Error Code	Test Result	Description / Recommendation
2000	FAIL	The XID-RESPONSE message was not received from the endpoint. 1. Consult the endpoint's documentation to determine whether layer-2 XID and XID-RESPONSE messages are supported. If the documentation reflects no support for these messages, use change station extension and change the XID Testing field to n . 2. If the endpoint supports these layer-2 messages and the test continues to fail, assume the endpoint is defective and replace it. 3. If the test continues to fail, escalate the problem.
	PASS	The switch can successfully pass messages over the D channel to the BRI endpoint.
3 of 3		

BRI Layer 3 Query Test (#629)

This test is used to check the application layer communications between the switch and the endpoint or adjunct.

For BRI endpoints, an application message containing the appropriate endpoint service state is sent by the switch to the endpoint. The endpoint responds with an acknowledgment to the application message.

For ASA1 and Avaya adjuncts, this test is not executed from the administration terminal. Rather, a query message is automatically sent by the switch every two minutes. Failure of the switch to receive a response to a query from the adjunct is logged in the Hardware Error Log.

Table 239: Test #629 BRI Layer 3 Query 1 of 4

Error Code	Test Result	Description / Recommendation
1005	ABRT	The endpoint's MIMs Supported? field is administered to "no." 1. Use change station extension to change the parameter only if the endpoint documentation reflects support for ISDN-BRI Management and Maintenance Procedures.
1 of 4		

Table 239: Test #629 BRI Layer 3 Query 2 of 4

Error Code	Test Result	Description / Recommendation
1113	ABRT	<p>The signaling link between the switch and the endpoint or adjunct is down.</p> <ol style="list-style-type: none"> 1. Use <code>test port location long</code> to clear any errors that prevent establishment of the signaling link. 2. Examine the results of Test #626 that are executed with the command. If this test aborts or fails, follow the repair procedure for the Signaling Link Status test. 3. Escalate problem if BRI Layer 3 Query test continues to abort.
1139	ABRT	<p>The PN's packet bus is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the packet bus. 2. After completing step 1, execute <code>test port location long</code>, and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABRT	<p>The PKT-CTRL is out-of-service.</p> <ol style="list-style-type: none"> 1. Consult the repair procedure for PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. 2. If step 1 does not resolve the problem, escalate to the next tier.
		2 of 4

Table 239: Test #629 BRI Layer 3 Query 3 of 4

Error Code	Test Result	Description / Recommendation
1187	ABRT	<p>The circuit pack, port or station may have been busied out by a technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. <ol style="list-style-type: none"> a. If this error type is present for BRI-SET only, then release the station via release station. b. If this error type is present for BRI-PORT and BRI-SET, then release the port via release port location and run the test again. c. If the error is present for BRI-BD, BRI-PORT, and BRI-SET, then release the circuit pack via release port location and run the test again. If the error is present for BRI-SET only, then release the circuit pack via release port location and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via release board location and run the test again. <p>Note: When you release the circuit pack, you release every port associated with it. If certain ports still need to be busied out, use busyout port location to busy them out.</p> <ol style="list-style-type: none"> 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times. 4. If the test continues to abort, escalate the problem.
2012	ABRT	Internal system error.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
2068	ABRT	<p>The endpoint has rejected the switch sent application message. This indicates that the endpoint does not support the ISDN-BRI Management and Maintenance Procedure for Endpoint Service messages.</p> <ol style="list-style-type: none"> 1. Use change station extension and change the MIMs Supported field to n.
3 of 4		

Table 239: Test #629 BRI Layer 3 Query 4 of 4

Error Code	Test Result	Description / Recommendation
2069	ABRT	<p>The endpoint has returned an error response to the switch sent application message.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
2000	FAIL	<p>No response is received from the endpoint or the adjunct. For BRI endpoints:</p> <ol style="list-style-type: none"> 1. Consult the endpoint's documentation to determine whether ISDN-BRI Management and Maintenance Procedures are supported. If not supported, use change station extension to change the MIMs Supported field to n. Use busyout station extension and release station extension to busyout and release the endpoint to resolve any endpoint alarms resulting from failure of this test. 2. If the endpoint supports these procedures and the test continues to fail, assume the endpoint is defective and replace it.
	PASS	<p>The endpoint has successfully responded to the switch's application message.</p>
4 of 4		

BRI Set Audits Test (#630)

This is a series of two tests that are classified as audits. The switch sends messages to the BRI endpoint to perform the following tests:

- Ringer Audit – This audit insures that both the switch and the endpoint agree as to the current state of the endpoint's ringer.
- Lamps Audit – This audit insures that both the switch and the endpoint agree as to the current state of the endpoint's lamps.
- Call Activity Audit – This audit insures that the state of calls is consistent between the switch and the endpoint.

This test is not executed for ASAI or Avaya adjunct because adjuncts do not employ ringers or lamps, or establish calls on the B channels associated with the BRI interface.

Table 240: Test #630 BRI Set Audits 1 of 2

Error Code	Test Result	Description / Recommendation
1113	ABRT	<p>The signaling link between the switch and the endpoint is down.</p> <ol style="list-style-type: none"> 1. Use <code>test port location long</code> to clear any errors that prevent establishment of the signaling link. 2. Examine the results of the Signaling Link Status test (#626) that is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626. 3. If the BRI Set Audits test continues to abort, escalate the problem.
1139	ABRT	<p>The PN's packet bus is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the packet bus. 2. After completing step 1, execute <code>test port location long</code> and review the results of the BRI Port Local LAN Loop Around test (#618) to verify the repair.
1141	ABRT	<p>The PKT-CTRL is out-of-service.</p> <ol style="list-style-type: none"> 1. Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. 2. If step 1 does not resolve the problem, escalate to the next tier.
1 of 2		

Table 240: Test #630 BRI Set Audits 2 of 2

Error Code	Test Result	Description / Recommendation
1187	ABRT	<p>The circuit pack, port or station may have been busied out by a technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. <ol style="list-style-type: none"> a. If this error type is present for BRI-SET only, then release the station via release station. b. If this error type is present for BRI-PORT and BRI-SET, then release the port via release port location and run the test again. c. If the error is present for BRI-BD, BRI-PORT, and BRI-SET, use release port location to release the circuit pack, and run the test again. If the error is present for both BRI-BD and BRI-PORT, use release board location to release the circuit pack, and run the test again. <p>Note: When you release the circuit pack, you release every port associated with it. Use busyout port location if ports still need to be busied out.</p> <ol style="list-style-type: none"> 2. Make sure the terminal is connected. 3. 2012	ABRT	Internal system error.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to abort, escalate the problem.
	PASS	The switch has successfully executed the BRI station audits.
2 of 2		

SPID Facility Test

This test is used to verify the wiring and operation of the signaling link between the switch and an endpoint or adjunct on a BRI interface. This test is not executed from the administration terminal, but rather is executed by using a BRI test set equipped with a display. The test set may replace the BRI set, ASAI or Avaya adjunct under test by plugging it into the same jack or by bridging it onto the wiring at some point between the switch and the endpoint (or adjunct), thereby creating a pseudo-BRI multipoint configuration.

When plugged into the port in this manner, the test set establishes a signaling link connection with the switch and attempts to complete Service Profile Identifier (SPID) initialization by using the Service SPID administered for the system (see the System Maintenance Administration screen). If the test set displays the correct administered port address for the endpoint or adjunct under test, the test passes (see [Table 242: Service SPID Display](#) on page 710). If after one minute nothing is displayed on the test set, the test fails.

Table 241: SPID Facility Test

Test Result	Description / Recommendation
FAIL	No response is received from the endpoint. <ol style="list-style-type: none"> 1. Check the physical wiring between the switch and the endpoint or adjunct. 2. If test continues to fail, escalate to the next tier.
FAIL	Display does not match administered port address for the endpoint or adjunct. <ol style="list-style-type: none"> 1. Change station administration for endpoint or adjunct to match displayed port address. 2. If test continues to fail, escalate the problem.
PASS	Display matches administered port address for the endpoint or adjunct. <p>For BRI endpoints:</p> <ol style="list-style-type: none"> 1. Verify that the SPID values administered in the switch and the endpoint are consistent. 2. If the SPID values are correct, replace the endpoint. 3. If test continues to fail, escalate the problem. <p>For ASAI adjuncts:</p> <ol style="list-style-type: none"> 1. Verify that the TEI values administered in the switch and the adjunct are consistent. 2. If the TEI values are correct, consult the recommended repair procedures of the manufacturer for the adjunct. 3. If test continues to fail, escalate the problem.

Communication Manager Maintenance-Object Repair Procedures

The abbreviations used in Service SPID Display have the following meanings:

UU Universal cabinet number (1 – 44 for PNs)
 C Carrier (A,B,C,...)
 SS Slot (01, 02,...)
 pp port (01 – 12)
 ext extension one and two (1 – 99999)
 SPID service profile identifier

CAB-CALM (Customer alarm)

G650

MO name in alarm log	Alarm level	Initial SAT command to run	Full name of MO
CAB-CALM		<code>test customer-alarm location</code>	Customer Alarm

CAB-CALM provides control of a relay contact between a pair of leads from the TN2312BP IPSI that can be wired to an external alarming device that is provided by the customer (CPAD). A contact closure is provided between the leads when the alarm exceeds the level specified in the **CPE Alarm Activation Level** field on the **change system-parameters maintenance** screen.

CAB-CALM is not associated with any background or demand tests that are used to clear alarms. CAB-CALM becomes active when any other MO reaches a predetermined level (none, warning, minor, or major) and generates an alarm. Clear the MO that is generating the alarm to retire the contact closure across the CPAD relay contact.

If you think that there is a problem with the CPAD, you can test it by executing the `test customer-alarm` command that activates the device closing the relay on the TN2312BP IPSI for one minute. You can specify the `repeat` parameter to close the relay contact for a longer time. The number of repeats that you specify is the number of minutes the external device is activated.

System technician-demanded test: Descriptions and error codes

The `test customer-alarm location (short | long) r#` command causes the TN2312BP IPSI to:

- Close the CPAD relay contact for one minute
- Return to the state determined by the active alarm level specified by the **CPE Alarm Activation Level** field on the **change system-parameters maintenance** screen

Order of investigation	Short test sequence	Long test sequence	D/ND
Customer Provided Alarming Device Test (#115)	X	X	Nondestructive

Customer Provided Alarming Device Test (#115)

The CPAD test closes the relay that activates the CPAD for one minute. If more than one minute is necessary to verify the CPAD activation, you can change the `repeat` number on `test customer-alarm location` to close the relay for up to 99 minutes. For example, specifying `r99` repeats for 99 minutes.

Table 243: Test 115 Customer provided alarming device

Error Code	Test Result	Description / Recommendations
1000	ABRT	<p>This is an internal system error.</p> <ol style="list-style-type: none"> 1. Repeat the command at one-minute intervals 1 to 3 times.
2000	ABRT	<p>The response to a query was not received in the time allowed.</p> <ol style="list-style-type: none"> 1. Repeat the command at one-minute intervals 1 to 3 times.
	PASS	<p>(When the command returns a PASS result, the relay contact remains closed for one minute after the command is executed.)</p> <p>The software successfully sent the request to the TN2312BP IPSI circuit pack to turn on the CPAD. You must inspect the CPAD to verify that it is operating.</p> <ol style="list-style-type: none"> 1. If the CPAD is operating, but a customer complains that the CPAD did not indicate an actual system alarm: <ol style="list-style-type: none"> a. Enter display system-parameters maintenance to check the administered alarm-activation level b. Compare administered alarm level with the customer's specifications. If the administered alarm level does not match the customer's specifications, change the alarm level using the change system-parameters maintenance screen. 2. If Test 115 passes, but the CPAD is not being activated, check the CPAD connection to the TN2312BP IPSI circuit pack. 3. If the CPAD can be activated but not deactivated, enter status cabinet or status health to verify that emergency transfer is not activated in the affected media gateway. Note that you can force emergency transfer to manual OFF using set emergency-transfer cabinet. 4. If Emergency Transfer is OFF and the CPAD still cannot be deactivated: <ol style="list-style-type: none"> a. Enter display system-parameters maintenance to check the administered CPAD alarm levels. b. Enter display alarms to compare CPAD levels against those currently in the system.

CAB-EXFR (emergency transfer)

G650

MOs name in alarm log	Alarm level	Initial SAT command to run	Full name of MO
CAB-EXFR	MIN	<code>test environment location sh</code>	Emergnncy Transfer
CAB-EXFR	MAJ	<code>test environment location 1</code>	Emergency Transfer

The emergency transfer feature connects some central office trunks directly through to analog user stations when the system has a serious problem or experiences a total power failure.

Emergency transfer is activated by the TN2312BP IPSI when:

- The system is booting.
- The cabinet containing the TN2312BP IPSI board is in power failure.
- The TN2312BP IPSI has detected a loss of control connectivity for more than 70 seconds.
- The server has detected a serious problem in the cabinet.
- A request is made from a SAT command to set the state of emergency transfer.

Refer to [Figure 122: G650 Cabinet Environmental Hardware Components](#) on page 1916 for further information.

On, off, and auto in emergency transfer

This is introduced to set the state of emergency transfer (`set emergency-xfr on | off | auto location`), because a physical switch is not provided on the faceplate of the TN2312BP IPSI circuit pack to control the state of emergency transfer.

The TN2312BP IPSI supplies -48V DC voltage to an emergency transfer panel. This -48V supply keeps relays within the emergency transfer panel operating which, in turn, keep analog stations and CO trunks wired to ports (station and trunk respectively) on the system. When the TN2312BP IPSI is supplying -48V, the state of emergency transfer is off. When a problem is detected and the TN2312BP IPSI stops supplying -48V the state of emergency transfer is on. When the TN2312BP IPSI is in the auto state, it is usually supplying -48V to the emergency transfer panel, but automatically switches to the on state and stops supplying -48V if it detects a problem.

Error log entries and test-to-clear values

Table 244: CAB-EXFR Error Log Entries

Error type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
1 (a)	—	Emergency transfer query test (#1532)	MAJ	On	<i>test environment location</i>
2 (b)	—	Emergency transfer query test (#1532)	MAJ	On	<i>test environment location</i>
257 (c)	—	Emergency transfer query tesst (#1532)	WRN	On	<i>test environment location</i>

Notes:

- a. **Error Type 1** – Manual on. Run *test environment location* and follow the repair steps for Test #1532.
For information on specifying a location, see [Command Syntax](#) on page 319.
- b. **Error Type 2** – Firmware has activated emergency transfer. This error is not expected. Run *test environment location* and follow the repair steps for Test #1532.
- c. **Error Type 257** – Manual off. Run *test environment location* and follow the repair steps for Test #1532.

System technician-demanded test: Descriptions and error codes

Order of investigation	Short test sequence	Long test sequence	D/ND
Emergency transfer query test (#1532)	X	X	Nondestructive

Emergency Transfer Query test (#1532)

There is only one test associated with the MO CAB-EXFR. The emergency transfer query test queries the maintenance module on the TN2312BP IPSI to determine if the emergency transfer is set in MANUAL-ON or MANUAL-OFF mode. If emergency transfer is set to MANUAL-ON, a major alarm is generated. If emergency transfer is set to MANUAL-OFF, a warning alarm is generated.

Table 245: Test 1532 Emergency transfer query 1 of 3

Error code	Test result	Description and recommendation
1000	ABRT	This is an internal system error. 1. Repeat the command at one-minute intervals 1 to 3 times.
2000	ABRT	The response to a query was not received in the time allowed. 1. Repeat the command at one-minute intervals 1 to 3 times.
1	FAIL	The emergency transfer is set to Manual-Off. 1. Use the <code>status cabinet cab</code> or <code>status health cab</code> command to display the status of the emergency transfer select switch: <ul style="list-style-type: none"> ● “on” means that emergency transfer was manually activated by the <code>set emergency-transfer on</code> command. ● “off” means that emergency transfer was manually deactivated by the <code>set emergency-transfer off</code> command. ● “auto+” means that the system has a serious alarm that causes Communication Manager to activate emergency transfer. ● “auto-” means that emergency transfer is not active and is not being controlled by the <code>set emergency transfer</code> command. 2. If "off", enter <code>set emergency auto cab</code> command to return control of emergency transfer to Communication Manager.
1 of 3		

Table 245: Test 1532 Emergency transfer query 2 of 3

Error code	Test result	Description and recommendation
2	FAIL	<p>The emergency transfer is set to Manual-On.</p> <ol style="list-style-type: none"> 1. Use the <code>status cabine cab</code> or <code>status health cab</code> command to display the status of the emergency transfer select switch: <ul style="list-style-type: none"> ● “on” means that emergency transfer was manually activated by the <code>set emergency-transfer on</code> command. ● “off” means that emergency transfer was manually deactivated by the <code>set emergency-transfer on</code> command. ● “auto+” means that the system has a serious alarm that causes Communication Manager to activate emergency transfer. ● “auto-” means that emergency transfer is not active and is not being controlled by the <code>set emergency transfer</code> command. 2. If "on", enter the <code>set emergency transfer auto cab</code> command to return control of emergency transfer to Communication Manager.
16	FAIL	<p>Embedded software (firmware) has activated emergency transfer. This is an internal error, since Communication Manager should have set the state to "Manual-on", "Manual-off", or "auto" at the time the TN2312BP was initiated.</p> <ol style="list-style-type: none"> 1. Run <code>test maintenance cab</code> to see if communications with the TN2312BP are up. 2. Reset the TN2312BP circuit pack with the <code>reset ipserver</code> command.
		2 of 3

Table 245: Test 1532 Emergency transfer query 3 of 3

Error code	Test result	Description and recommendation
	PASS	<p>System software has control of Emergency Transfer within this cabinet. If Emergency Transfer is currently invoked (the emergency transfer LED is on), the cause could be a major alarm.</p> <ol style="list-style-type: none"> 1. The following shows the error types that can cause Emergency Transfer. If any of these errors appear in the log, then see TONE-BD (Tone-Clock Circuit) on page 2282, and resolve these error types first: <ul style="list-style-type: none"> ● Error Type 3848, Aux Data 0 ● Error Type 2305, Aux Data 0 <p>These errors indicate the loss of one or more clock signals from the reported TN2312BP circuit pack.</p> <ol style="list-style-type: none"> a. Examine the Hardware Error Log for errors reported against circuit packs in the same port network, especially TDM-CLK, TONE-BD, and EXP-INTF. Follow the repair or replacement procedures indicated for any such errors found. b. If the error is not corrected by resolving errors found in step 1, the TN2312BP circuit pack should be replaced. See Replacing the IPSI or Tone-Clock Circuit Pack on page 2292. 2. If none of the previous errors appear in the log, then check the Emergency Transfer hardware.
		3 of 3

CAB-MTCE (Media Gateway Maintenance)

G650

MO name in alarm log	Alarm level	Initial SAT command to run	Full name of MO
CAB-MTCE	MIN	<code>test maintenance location sh</code>	Media Gateway Maintenance
CAB-MTCE	MAJ	<code>test maintenance location 1</code>	Media Gateway Maintenance

Avaya Communication Manager 2.0 introduces the G650 media gateway. The G650 media gateway does not support the traditional maintenance board (TN775D), therefore environmental maintenance is performed by the TN2312BP IPSI circuit pack. The CAB-MTCE MO is used to allow the alarming and logging of environmental maintenance errors for the TN2312BP IPSI in a G650 media gateway. Since the TN2312BP IPSI supports environmental maintenance in the G650 media gateway, trouble with the TN2312BP IPSI may cause environmental maintenance to falsely detect problems. The following environmental MOs may be affected:

- [CAB-EXFR \(emergency transfer\)](#) on page 713
- [CAB-CALM \(Customer alarm\)](#) on page 711
- [CAB-PFL \(Power Fan Lead\)](#) on page 723
- [SER-BUS \(Serial communication bus\)](#) on page 1914
- [EXT-DEV \(External device alarm\)](#) on page 1207

When the TN2312BP is used in the SCC1 and MCC1 media gateways the collocated TN775D Maintenance circuit pack performs environmental maintenance.

When the TN2312BP IPSI is used in a G600 or CMC1 media gateway it monitors environment maintenance (power supply and fans) using the AuxSig lead.

Initialization

Initialization Test (#1548) is executed when an IPSI is inserted and the board and media gateway type is determined. When a TN2312AP is inserted in a CMC1, G600, or G650 the Power Fan Lead (AuxSig) environmental maintenance is enabled.

When a TN2312BP IPSI is inserted in either a CMC1 or G600, Communication Manager sends the following messages to the embedded software (firmware) on the board:

- Enable environmental maintenance (Power Fan lead)
- A query to verify that environmental maintenance is enabled

When a TN2312BP IPSI is inserted in a G650, Communication Manager sends the following messages to embedded software (firmware) on the board:

- Enable environmental maintenance
- Enable power supply insertion
- Enable power supply audits
- A query to verify that environmental maintenance is enabled
- A query to verify that power supply insertion is enabled
- A query to verify that power supply audits are enabled

Error log entries and test-to-clear values

Table 246: CAB-MTCE Error Log Entries

Error Type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
1 (a)	—	Correct board test (#1546)	MIN	ON	<i>test maintenance location</i>
257 (b)	—	Sanity test (#1547)	MIN	ON	<i>test maintenance location</i>
513 (c)	Any	All	NONE	—	—
769 (d)	Any	All	NONE	—	—
1025 (e)	—	Reset test (#1545)	MIN	ON	<i>test maintenance location</i>
1281 (f)	—	Initialization test (#1548)	MIN	ON	<i>reset maintenance location</i>

Notes:

- a. **Error Type 1**—When a TN2312AP IPSI is inserted into a CMC1 or G650 Media Gateway a minor alarm is raised. Full environmental maintenance is NOT available. Replace the TN2312AP IPSI with a TN2312BP IPSI. NOTE: A TN2312AP inserted in a G600 media gateway DOES not raise any alarm or error.
- b. **Error Type 257**—This error indicates the inability to communicate with the TN2312BP IPSI board. NOTE: The board must be a TN2312BP IPSI for this test to run.
- c. **Error Type 513**—This error indicates that the op-code for messages received from the TN2312BP was not equal to any known op-code. The unknown op-code is recorded under Aux data.

Communication Manager Maintenance-Object Repair Procedures

- d. **Error Type 769**—This error indicates that a message with a valid op-code was received but some other part of the message was indecipherable. The op-code with the error is recorded under Aux data.
- e. **Error Type 1025**—This error indicates that an unsuccessful attempt was made to reset environmental maintenance.
- f. **Error Type 1281**—This error indicates that environmental initialization failed. Run the Reset Environmental Maintenance Test (#1545), which calls the Initialization Test (#1548).

System technician-demanded tests: Descriptions and error codes

Investigate tests in the order presented. When you clear error codes associated with the Correct Board Test (1546), you might also clear errors generated from other tests in the testing sequence.

Order of investigation	Short test sequence	Long test sequence	D/ND ¹
Correct Board Test (#1546)	X	X	ND
Sanity Test (#1547)	X	X	ND
Reset Environmental Maintenance Test (#1545)	—	X	D

1. D = Destructive, ND = Nondestructive

Reset Environmental Maintenance test (#1545)

This test resets the environmental maintenance on the TN2312BP IPSI board.

Table 247: Test #1545 Reset test 1 of 2

Error code	Test result	Description and recommendation
1000	ABRT	There is an internal software problem. 1. Repeat the command at one-minute intervals 1 to 3 times.
1 of 2		

Table 247: Test #1545 Reset test 2 of 2

Error code	Test result	Description and recommendation
1982	ABRT	The board being tested is NOT a TN2312BP IPSI or later. 1. Insert a TN2312BP IPSI circuit pack.
1986	ABRT	The TN2312BP IPSI failed to set emergency transfer to AUTO at initialization. 1. Enter <code>reset maintenance</code> 2. If the reset maintenance command aborts again enter <code>set emergency</code> command to see if emergency transfer can be activated or deactivated. 3. If the reset maintenance command continues to abort escalate the problem.
2000	ABRT	The response to a query was not received in the time allowed. 1. Run <code>reset maintenance</code> 2. Escalate the problem if the test continues to abort.
2500	ABRT	An internal operation failed (Possible unknown cabinet type). 1. Repeat the command at one-minute intervals 1 to 3 times. 2. Escalate the problem if the test continues to abort.
1	FAIL	The TN2312BP IPSI environmental maintenance initialization failed. 1. Repeat the command at one-minute intervals 1 to 3 times.
2	FAIL	The TN2312BP IPSI failed a sanity test. 1. Run <code>reset maint</code> command. 2. If the problem persists, replace the circuit pack.
	PASS	Environmental maintenance has been enabled and passes a sanity test.
2 of 2		

Correct Board test (#1546)

The TN2312BP IPSI board is required for the environmental functions to work in the G650 media gateway. This test verifies that the proper IPSI is inserted in the G650.

Table 248: Test #1546 Correct board test

Error code	Test result	Description and recommendation
2500	ABRT	An internal operation failed. 1. Repeat the command at one-minute intervals 1 to 3 times.
1	FAIL	For G650 or CMC1 media gateways: A TN2312AP IPSI has been inserted.
	PASS	For G600 media gateways: Either a TN2312AP or TN2312BP IPSI is present.
	PASS	For CMC1, G600, and G650 media gateways: A TN2312BP IPSI is present.

Sanity test (#1547)

The TN2312BP is queried to determine whether or not it can sustain basic sanity.

Table 249: Test #1547 Sanity test

Error code	Test result	Description and recommendation
1000	ABRT	There is an internal system error. 1. Repeat the command at one-minute intervals 1 to 3 times.
1981	ABRT	The TN2312BP IPSI is busied out. 1. Enter the <code>release ipserver-interface</code> command.
1982	ABRT	The board being tested is NOT a TN2312BP IPSI or later. 1. Insert a TN2312BP IPSI circuit pack.
2033	ABRT	There is an internal system error.
2500	ABRT	An internal operation failed (Possible unknown cabinet type). 1. Repeat the command at one-minute intervals 1 to 3 times.
	FAIL	The TN2312BP in carrier A is missing. If an incorrect or no response from firmware is received back when the board is queried, this test will also fail.
	PASS	The correct board is present and a valid response was received for a sanity query.

CAB-PFL (Power Fan Lead)

G650

MOs name (in alarm log)	Alarm level	Initial SAT command to run	Full name of MO
CAB-PFL	MIN	<code>test environment location</code>	Power Fan Lead
CAB-PFL	MAJ	<code>test environment location</code>	Power Fan Lead

The CAB-PFL represents the state of a combined power/fan lead. This lead is known as the AuxSig lead. On a G650, the AuxSig output signal is a ground referenced relay contact closure indicating a failure of the 655A power supply outputs, hot spot thermal warning, hot spot thermal shutdown, or failure of the fan assembly in a G650.

Use the AuxSig lead to determine the alarm state of the power supplies and fans if the serial bus or the interface to the serial bus of the TN2312BP IPSI in a G650 fails. If there is a CAB-PFL alarm in a G650 carrier, there should also be a SER-BUS, POW-SUP, CAB-TEMP, or PS-RGEN alarm indicating the source of the failure.

Refer to [Figure 122: G650 Cabinet Environmental Hardware Components](#) on page 1916 for further information.

When the TN2312BP IPSI is used in a CMC1 or a G600 carrier, use the CAB-PFL MO to determine the status of the power supply and fans, but the repair procedure should be the same as that for [RMC-ENV \(Power/Fan Sensors\)](#) on page 1909.

Note:

Fan/filter replacement procedures for the CMC1 and G600 media gateways are to be found under [Variable-speed fans](#) in *Maintenance Procedures (03-300192)*.

Error log entries and test-to-clear values

Table 250: CAB-PFL Error Log Entries

Error Type	Aux data	Associated test	Alarm level ¹	On/Off board	Test-to-clear value
1 (a)		Power/Fan lead query test (#1533)	MAJ MIN	OFF	<code>test environment location</code>

1. The alarm level of CAB-PFL is adjusted to be the same as the highest active alarm level for SER-BUS, POW-SUP, CAB-TEMP, or PS-RGEN, or it will be a MAJOR alarm if no G650 alarms in that category are found.

Note:

- a. **Error Type 1**—The AuxSig lead is active. Run `test environment location` and follow the repair steps for Test #1533.

**System technician-demanded tests:
Descriptions and error codes**

S8700 | 8710

Order of Investigation	Short test sequence	Long test sequence	D/ND
Power/Fan lead query test (1533)	X	X	Nondestructive

Power/Fan lead query test #(1533)

The Power/Fan Query test sends a request for the state of the power/fan lead (AuxSig) to the TN2312BP IPSI board in the G650 with an A carrier address. If the lead is on, the test fails. If the lead is off, the test passes.

Table 251: Test 1533 Power/Fan lead query 1 of 3

Error code	Test result	Description and recommendation
1000	ABRT	This is an internal system error. 1. Repeat the command at one-minute intervals 1 to 3 times.
2000	ABRT	The response to a query was not received in the time allowed. 1. Repeat the command at one-minute intervals 1 to 3 times.
1	FAIL	G650: In a G650 carrier, this indicates a failure in any of the following MOs: <ul style="list-style-type: none"> ● SER-BUS ● POW-SUP ● CAB-TEMP ● PS-RGEN Use the diagnostic procedures for those MOs to clear the problem.
1 of 3		

Table 251: Test 1533 Power/Fan lead query 2 of 3

Error code	Test result	Description and recommendation
1	FAIL (Cont)	<p>G600 / CMC1</p> <p>In a G600 or CMC1, this error code indicates a failure in either:</p> <ul style="list-style-type: none"> ● Power supply ● Fan Assembly <p>There is a fan, temperature, power, or voltage problem in one or more of the cabinets. The power supply's LEDs may indicate the problem's source.</p> <ol style="list-style-type: none"> 1. If none of the fans are running, then: <ol style="list-style-type: none"> a. Verify 8- to 14-Volt DC power is available to the fan units by checking the wiring connector. If there is 8- to 14-Volt DC power at the connector, there should be power to the fans. If the fans still do not run, replace the fan assembly. b. If not, then the power unit's fan output is defective or thermally shut down. Let the power unit cool, and recycle AC input power. If no fan output, replace the power unit. If the fans still do not run, escalate the problem. 2. If only 1 of the fans is not running, replace the fan. 3. If every fan can be started, wait 5 minutes and rerun the test. If the test fails again, proceed to Step 4 or 5 as applicable.
		<ol style="list-style-type: none"> 4. If the fans are not at high speed, measure the cabinet's temperature at the air intake and the air exhaust at the top of the cabinet. <ol style="list-style-type: none"> a. If the 5- to 60⁰-C criteria is met, there is a problem with the fans that is preventing the fans from operating at high speed. Replace the fans. If the fans run at high speed, wait 5 minutes to give the cabinet time to cool down and, rerun the test. If the problem persists, go to step 5. b. If not, the Processor circuit pack is incorrectly reporting this condition. Look for and resolve every error on these MOs first, then rerun the test.
2 of 3		

Table 251: Test 1533 Power/Fan lead query 3 of 3

Error code	Test result	Description and recommendation
		<p>5. If the fans are running at high speed, check the items on following list. Any one of these could be restricting or redirecting the cabinet's air flow.</p> <p>Check filter. If the filter is dirty or clogged it should be cleaned or replaced. The filter can either be washed with soap and water or vacuumed.</p> <ul style="list-style-type: none"> a. Verify that nothing other than circuit packs in the carrier slots that could be restricting air flow. b. Verify that no circuit-pack blanks or carrier faceplates are missing. Install and/or replace them as necessary. c. Be sure the cabinet's doors are properly closed. The doors must be closed to enable the fans to properly cool the cabinet. Wait 5 minutes to allow the fans to cool the cabinet. Rerun the test. If the test still fails, proceed to 6.
		<p>6. At this point, there should be nothing impeding the air flow, and the fans should be running at high speed. Check the temperatures for the 5- to 60⁰-C criteria.</p> <ul style="list-style-type: none"> a. If the 5- to 60⁰-C criteria exists, a temperature problem exists, and the fans (at high speed) should cool down the switch. Wait 5 minutes, and rerun the test. If the test still fails, the ambient room temperature is probably too high, and the room should be cooled. b. If not, the fans are defective. Replace the fan assembly, and rerun the test. Failures can occur on the Processor circuit pack that is not detected by the respective MO, but that cause many, if not every, environment test to fail. If many environment tests are failing, the suspected circuit pack (depending on the system configuration) should be replaced and the test rerun.
		<p>7. There is a problem with the environment of the power system:</p> <p>8. The power unit for the cabinet may be defective.</p> <ul style="list-style-type: none"> a. Verify and, if necessary, replace the power unit. b. Rerun the test. If the test still fails, escalate.
	PASS	This indicates that the power/fan lead is off and there are no failures in the G650 or G650 stack.
3 of 3		

CAB-TEMP (Cabinet Temperature)

G650

MO name (in alarm log)	Alarm level	Initial SAT command to run	Full name of MO
CAB-TEMP	MIN	<code>test board location</code>	Cabinet Temperature
CAB-TEMP	MAJ	<code>test board location</code>	Cabinet Temperature

The MO CAB-TEMP monitors the G650 and the 655A for the following:

- The power supply
 - Inlet temperature
 - Hot spot temperature status
 - Fan speed
 - Fan alarm lead
- The G650 carrier exhaust temperature

The serial bus is used by the TN2312BP IPSI to obtain this information from each power supply in a G650 media gateway. There is only one outlet temperature sensor and fan assembly in a G650, so information obtained from dual power supplies (slot 0 and 15) is redundant.

Refer to [Figure 122: G650 Cabinet Environmental Hardware Components](#) on page 1916 for further information.

Note:

Fan/filter replacement procedures for the CMC1 and G600 media gateways are to be found under [Variable-speed fans](#) in *Maintenance Procedures (03-300192)*.

Error log entries and test-to-clear values

Table 252: CAB-TEMP Error Log Entries

Error Type	Aux data	Associated test	Alarm level	On/Off board	Test-to-clear value
1 (a)		Power supply temperature test (#1537)	MIN	OFF	test enviroment location test board location
257 (b)		Power supply temperature test (#1537)	MIN	ON	test enviroment location test board location
513 (c)		Power supply temperature test (#1537)	MIN/MAJ ¹	ON	test enviroment location test board location
769 (d)		Power supply fan test (#1538)	MIN	ON	test enviroment location test board location

1. This is a minor alarm if there is a redundant power supply, and a major alarm if there is only one power supply.

Notes

- a. **Error Type 1:** the inlet temperature is over the threshold—120° Fahrenheit (49° Celsius). Run `test board` and check results of Test #1537.
- b. **Error Type 257:** the exhaust temperature is over the threshold—120° Fahrenheit (49° Celsius). Run `test board` and check results of Test #1537.
- c. **Error Type 513:** the hot spot temperature is over the threshold. Run `test board` and check results of Test #1537.
- d. **Error Type 769:** the fan alarm is active. Run `test board` and check results of Test #1537.

System technician-demanded tests: Descriptions and error codes

Investigate tests in the order presented

Order of investigation	Short test sequence	Long test sequence	D/ND
Power supply temperature test (#1537)	X	X	Nondestructive
Power supply fan test (#1538)	X	X	Nondestructive

Power supply temperature test (#1537)

The power supply temperature test provides the status of the following temperatures:

- Inlet to the power supply (120F/49C)
- Carrier exhaust (120F/49C)
- Power supply hot spot status

Table 253: Test #1537 Power Supply Temperature 1 of 2

Error code	Test result	Description and recommendation
1000	ABRT	There is an internal software error. 1. Repeat the command at one-minute intervals 1 to 3 times.
1035	ABRT	The port network is not available. 1. Use status port-network to verify that the network is not up. 2. Look for alarms against EXP-PN, EXP-INT, PK-INT, etc. 3. Use diagnostic procedures for those MOs to clear the problem.
2028	ABRT	There is a problem communicating with the environmental maintenance firmware.
2100	ABRT	The system could not allocate resources. 1. Repeat the command at one-minute intervals 1 to 3 times.
2319	ABRT	The EPN is out of range.
2500	ABRT	An internal operation failed. 1. Repeat the command at one-minute intervals 1 to 3 times.
1	FAIL	The inlet temperature is over threshold. 1. Use test board location to check the temperature. 2. If redundant power supplies are present, there may be a problem with the backplane. Verify that each power supply can detect the problem by using recycle carrier , specifying the slot number of the power supply to be shut down. Refer to the notes and cautions for this command in <i>Maintenance Commands Reference (03-300191)</i> before executing recycle carrier . 3. Replace the power supply. 4. If the problem persists, check the backplane for shorts.
1 of 2		

Table 253: Test #1537 Power Supply Temperature 2 of 2

Error code	Test result	Description and recommendation
2	FAIL	<p>The exhaust temperature is over threshold.</p> <ol style="list-style-type: none"> 1. Use the <code>test board location</code> command to check the temperature. 2. Replace the power supply. <p>If the problem persists, check the backplane for shorts.</p>
4	FAIL	There is a hot spot temperature warning.
8	FAIL	There is a hot spot temperature shutdown.
	PASS	The inlet, exhaust, and hot spot temperatures are within limits.
	NO BOARD	<p>The power supply is administered but not detected.</p> <ol style="list-style-type: none"> 1. Verify that the power supply is plugged in. 2. Replace the power supply.
2 of 2		

Power supply fan test (#1538)

The power supply fan test verifies that the fan alarm lead from the fan assembly is not active.

Table 254: Test #1538 power supply fan

Error code	Test result	Description and recommendation
1000	ABRT	This is an internal software error.
1035	ABRT	The port network is not available.
2028	ABRT	There is a problem communicating with the environmental maintenance firmware.
2100	ABRT	The system could not allocate resources. 1. Repeat the command at one-minute intervals 1 to 3 times.
2319	ABRT	The EPN is out of range.
2500	ABRT	An internal operation failed. Retry the command.
	FAIL	The fan alarm lead from the fan assembly is active. 1. Verify proper operation of the fan assembly. 2. Replace the fan assembly. See G650 fan removal/replacement in <i>Maintenance Procedures (03-300192)</i> .
	PASS	The fan alarm lead from the fan assembly is not active.
	NO BOARD	The power supply is administered but not detected. 1. Verify that the power supply is plugged in. 2. Replace the power supply.

CABINET (Cabinet Sensors)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CABINET	MAJ	<code>test environment location</code>	Cabinet Sensors
CABINET	MIN	<code>test environment location</code>	Cabinet Sensors

This maintenance object covers environmental maintenance for S8700, and S8500 media servers equipped with multicarrier cabinets (MCCs), and for media servers equipped with CMC1 or G600 carriers.

S8700 | 8710 / S8500

Note:

The CABINET MO for S8700 and S8500 media servers is valid only for multicarrier cabinets (MCCs). For information about environmental maintenance on single-carrier cabinets (SCCs), see [DC-POWER \(Single-Carrier Cabinet Environment\)](#) on page 855.

The cabinet sensors monitor cabinet temperature and fan rotation. Variable-speed fans are used extensively in S8700 systems.

The Maintenance circuit pack in an MCC PN monitors a temperature sensor (S1) at the top of the cabinet and generates a major alarm if the exit air temperature exceeds 65 degrees Celsius (149 degrees Fahrenheit). Another temperature sensor in the top of the cabinet (S2) also monitors exit air temperature. If it exceeds 70 degrees Celsius (158 degrees Fahrenheit), the power-distribution unit turns off all cabinet power and invokes emergency transfer. Other sensors monitor fan performance.

The repair procedures that follow rely on your ability to distinguish between high and low fan speeds by the sound of the fans. Experience will allow you to distinguish between the high and low pitches generated by high and low speeds. A thermometer is also required for some of the procedures that follow.

In making replacements, observe the following rules:

- New fan assemblies accept *only* variable-speed fans.
- Old fan assemblies accept either variable- or constant-speed fans.
- Replace a fan assembly (carrier) *only* with a fan assembly of the same type (new for new, old for old).

Variable-Speed Fans

A variable-speed fan is identified by the following features:

- A fan and air filter assembly with product code ED-67077-30, Group 4 or greater, labeled on the front of the carrier
- A 5-pin white connector mounted next to each fan on the fan assembly cover plate for speed control and alarm circuitry
- A 2-pin black -48 V power connector to each fan
- A power filter (ED-1E554-30, G1 or G2) located in a metal box mounted behind the fans on the right-hand cable trough as you face the rear of the cabinet
- The AHD1 circuit pack and the two S4 sensors used with older fan assemblies are absent.

Alarm leads from each fan are tied together into a single lead that registers a minor alarm against CABINET whenever a fan's speed drops below a preset limit or fails altogether.

Note:

The front fans may run at a different speed than the rear fans since they are controlled by different sensors.

Note:

Fan/filter replacement procedures for the CMC1 and G600 media gateways are to be found under [Variable-speed fans Maintenance Procedures \(03-300192\)](#).

Error Log Entries and Test to Clear Values

Table 255: [S8700 | 8710 / S8500](#): Cabinet Sensors Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any	Any	test environment UU
1	0 or 1	Cabinet Temperature Query (#122)	MIN	ON	test environment UU s r 3
257	0 or 1	Cabinet Temperature Query (#122)	MAJ	ON	test environment UU s r 3

CMC1

Table 256: CMC1: Cabinet sensors error log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	test environment
1(b) 257 (c) 513 (d) 769 (e) 1025 (f) 1281 (g) 1537 (h) 1793 (i)	Any	Cabinet Temperature or Voltage Query Test (#122)	MAJ	ON	test environment

Notes:

- a. **Error Type 0:** Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- b. **Error Type 1:** the Power/Fan Status lead indicates that the power supply of one or more CMC1 cabinets has detected an alarm condition. The condition can be caused by the failure of any fan or the failure of any power supply output. If more than one CMC1 cabinet exists, all of the Power/Fan Status leads are tied together (the fan and power lead is an O-ring of all cabinets' status leads). Since an error condition on a fan or power supply output could be the result of a temporary overload (e.g. during board insertion) or caused by the location of the equipment (e.g. fan blockage), a single event may be an anomaly that eventually clears. However, a repeating condition will cause a major alarm.
- c. **Error Type 257:** temperature Sensor 1: Since temperature alarms can be transient, a single event may be an anomaly that eventually clears. However, a repeating condition will cause a major alarm and may indicate a need to replace one or more components (e.g. a Cabinet Fan may be bad, or check to see if the equipment room air conditioning supply/unit is functional).
- d. **Error Type 513:** temperature Sensor 2: Since temperature alarms can be transient a single event may be an anomaly that eventually clears. However, a repeating condition will cause a major alarm and may indicate a need to replace one or more components (e.g. a Cabinet Fan may be bad, or check to see if the equipment room air conditioning supply/unit is functional).

Note:

An out-of-tolerance voltage condition may be caused by transient conditions (e.g. board insertion or electrical noise). Voltage problems can cause serious damage to the TN2314 or highly unpredictable failure modes. Therefore, a repeating condition will cause a major alarm. The following Error Types 769 through 1793 represents the various system voltages and are listed below:

- e. **Error Type 769:** Out-Of-Tolerance voltage condition for -48 VDC.
 - f. **Error Type: 1025:** Out-Of-Tolerance voltage condition for -5 VDC.
 - g. **Error Type: 1281:** Out-Of-Tolerance voltage condition for +5 VDC.
 - h. **Error Type: 1537:** Out-Of-Tolerance voltage condition for +12 VDC.
 - i. **Error Type: 1793:** Out-Of-Tolerance voltage condition for +3.3 VDC.

Error Code	Test Result	Description / Recommendation
<p>S8700 8710 S8500:1 (cont'd)</p>	<p>FAIL (cont'd)</p>	<p><i>If some of the fans are running and some are not:</i></p> <ol style="list-style-type: none"> 1. Replace the defective fans. If every fan can then be started, wait 5 minutes and rerun the test. If the test fails again, proceed to the next step. 2. Remove all six white 5-pin connectors on the front and back of the fan assembly. This will cause every fan to run at high speed and the alarm to be cleared. S8700 MC: If the alarm does not clear, a PN's Maintenance circuit pack is incorrectly reporting the problem. Check for and resolve every error against MAINT, and then rerun the test. 3. One at a time, replace the 5-pin connectors and check to see if the alarm recurs. Replace each fan whose reconnection causes a recurrence of the alarm.
		4 of 7

Table 257: Test #122 Cabinet Temperature Query Test 5 of 7

Error Code	Test Result	Description / Recommendation
S8700 8710 S8500:1 (cont'd)	FAIL (cont'd)	<p>NONVARIABLE-SPEEDFAN ASSEMBLIES (older or upgraded cabinets): The AHD1 circuit pack has reported an air-flow problem. The temperature difference between the air intake and the air exhaust is at least 15⁰C (59⁰F)) and the absolute temperature at the top of the cabinet is at least 50⁰C (122⁰F). The fans should be running at high speed. If none of the fans are running then:</p> <ol style="list-style-type: none"> 1. Look for an resolve every alarm against CARR-POW. S8700 IP Look for an resolve every alarm against RMC-ENV. 2. Verify that 48 VDC is available to the fan wiring harness connector between pin pairs 2/3, 8/9, and 10/11. The tolerable range for this measurement is -42.5 V to -52.5 V. If 48 VDC is present and the fans are not running, replace the AHD1 circuit pack. 3. If the fans still do not run, escalate the problem. 4. If 48 VDC is absent, replace the CFY1B current limiter card. If the fans still do not run, escalate the problem. If some fans are running and some not, replace the defective fans. 5. If every fan can then be started, wait 5 minutes, and rerun the test. If the test fails again, proceed to the next step. 6. If every fan is running but not at high speed, measure the cabinet temperature at the air intake and the air exhaust at the top of the cabinet. <ol style="list-style-type: none"> a. If the 15⁰-/50⁰-C criteria is met, there is a problem with the AHD1 circuit pack or the fans. Replace the AHD1 circuit pack and/or fans. If the fans run at high speed, wait 5 minutes for the cabinet to cool, then retest. If the test fails, escalate the problem. b. If the 15⁰-/50⁰-C criteria is not met, then environmental maintenance is incorrectly reporting this condition. Resolve every error (S8700 MC: MAINT) and retest. If the test fails, escalate the problem.
		5 of 7

Table 257: Test #122 Cabinet Temperature Query Test 6 of 7

Error Code	Test Result	Description / Recommendation
<p>S8700 8710 S8500:1 (cont'd)</p>	<p>FAIL (cont'd)</p>	<p>NONVARIABLE-SPEEDFAN ASSEMBLIES (continued): If the fans are running at high speed, check the following items, any of which can restrict or redirect airflow within the cabinet.</p> <ol style="list-style-type: none"> 1. Check both filters. If a filter is dirty or clogged, clean with soapy water or a vacuum. 2. Ensure that there is nothing other than circuit packs in the carrier slots that could be restricting the airflow. 3. Ensure that there are no missing circuit-pack faceplates or blanks. 4. The cabinet door must be closed for proper cooling. 5. Wait 5 minutes for the cabinet to cool and rerun the test. 6. If the test fails, check temperatures for the 15⁰-/50⁰-C criteria. If the 15⁰-/50⁰-C criteria is present, then the fans should be running at high speed. 7. Wait 5 minutes, and rerun the test. 8. If the test still fails, then the ambient room temperature is probably too high. Cool the room. 9. If the 15⁰-/50⁰-C criteria does not exist, one of the following components is defective: <ul style="list-style-type: none"> ● AHD1 circuit pack ● fans ● S3 sensors ● S4 sensors <p>Replace these items one at a time in the order listed, running the test after each replacement.</p> <p>S8700 MC: If many environmental tests are failing, it can be a problem that is undetected by maintenance on a PN's Maintenance circuit pack. Replace the circuit pack. Escalate if the problem persists.</p>
		<p>6 of 7</p>

Table 257: Test #122 Cabinet Temperature Query Test 7 of 7

Error Code	Test Result	Description / Recommendation
S8700 8710 S8500:2	FAIL	<p>A temperature problem due to the S1 sensor detecting a temperature of at least 65⁰ C (149⁰ F) has been reported. The entire cabinet is in danger of power-down if the temperature reaches 70⁰ C (158⁰ F).</p> <ol style="list-style-type: none"> 1. If any of the fans are not running, there should be a FAIL with Error Code 1 present. Follow the procedures for that Error Code, noting the differences for variable- and constant-speed fan assemblies. 2. If the fans are running, check the temperature at the top of the cabinet. <ol style="list-style-type: none"> a. If the temperature is at least 65⁰ C (149⁰ F), the ambient room temperature is too high and the fans cannot cool the system. Unless the room temperature is reduced, the system will shut down soon. 3. If the temperature at the top of the cabinet is less than 65⁰ C (149⁰ F), the S1 sensor, or a PN's Maintenance circuit pack is incorrectly reporting the problem. <ol style="list-style-type: none"> a. Resolve any errors against the S1 sensor or against MAINT), then rerun the test. b. If there are still errors, replace the S1 sensor and retest. If the test fails, escalate.
S8700 8710 S8500:3	FAIL	<p>Fan failures and temperature alarms have been reported.</p> <ol style="list-style-type: none"> 1. Resolve the fan failure (Error Code 1). This should also resolve the temperature alarm. (With constant-speed fan assemblies, fan failures correspond to air-flow problems.)
	PASS	Temperature measurements and fan performance are satisfactory.
7 of 7		

CARR-POW (Carrier Power Supply)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CARR-POW	MAJ	<code>recycle carrier location</code>	Carrier Port Power Supply

S8700 Multi-Connect systems support two different cabinet types for PNs. Both cabinet types may be powered by either AC or DC external power source. Environmental maintenance differs according to cabinet type and external power supply.

 **CAUTION:**

Before powering down a cabinet or carrier that contains EMBEDDED AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging the AUDIX software. Instructions for powering down this unit are in the [Removing and restoring EMBEDDED AUDIX power](#) in [Chapter 7: General troubleshooting](#) in *Maintenance Procedures (03-300192)* on the circuit pack, and in *DEFINITY AUDIX System Release 3.2.4 Maintenance, 585-300-110*.

The CARR-POW MO represents the pair of power supplies that supply +5V, -48V and -5 VDC power to each carrier in a multicarrier cabinet. In AC-powered cabinets, these are called Off Line Switches (OLS); in DC-powered cabinets, they are DC/DC converters.

Cycling Power Supplies

When a port carrier power supply problem is reported by hardware, the system can cycle the power supplies in that carrier. When a carrier is cycled, the power supplies are turned off for 2 seconds and then turned back on. The system cannot cycle the power supplies on any of the following types carriers even if they are duplicated:

- Expansion control carrier
- Switch node carrier
- Single-carrier cabinet

WARNING:

When port carrier power is cycled, all service dependent upon circuit packs in that carrier is disrupted.

Table 258: Carrier Port Power Supplies for Multicarrier Cabinets

Code	System Power	Output (VDC)	Location
631DA	AC	+5	Left side
631DB	AC	-48/-5	Right side
644A	DC	+5	Left side
645B	DC	-48/-5	Right Side
TN755B		165	Slots 17 and 18
631WA/AR	AC	+5	Left side
631WB/BR	AC	-48	Right side
TN736	AC	-5	Used with 631
TN752	AC	165/-5	WA/WB or AR/AB
649A	AC	-48 at 10 Amps +5 VDC and -5 VDC at 6 Amps	Right side on control and port carriers. Left and right side on switch node carriers.

AC-Powered Cabinets

AC Power-Distribution Unit and Battery Charger (J58890CE-2)

[Figure 37: AC Power-Distribution Unit \(J58890CE-2\): Front](#) on page 746 shows an AC power-distribution unit (List 9 or List 10). This unit sits at the bottom of some multicarrier cabinets.

Figure 37: AC Power-Distribution Unit (J58890CE-2): Front

The AC power-distribution unit contains the following components:

- Circuit breaker
- Electromagnetic Interference (EMI) filter
- Ring generator
- AC input fuse
- 20-Amp fuses
- Signal connector
- -48 VDC fan power

The optional battery charger (List 11) sits at the bottom of some multicarrier cabinets. See [Figure 38: Battery Charger \(Optional Part of J58890CE-2\): Front](#) on page 747.

Figure 38: Battery Charger (Optional Part of J58890CE-2): Front

battchar RBP 031996

The charger is used only without an uninterruptible power supply (UPS). The charger contains:

- Three 48 VDC batteries for backup power to the cabinet
- A DC power relay to automatically switch the batteries into the power circuit if a main power failure is detected

[Figure 39: AC Power Distribution in Multicarrier Cabinets](#) on page 748 shows AC power distribution in some multicarrier cabinets. The DC power-distribution cables are on both sides of the cabinet. **These cables supply power to each of the carriers.** The optional battery charger is at the right side of the power-distribution unit.

Figure 39: AC Power Distribution in Multicarrier Cabinets

Power Backup

If AC power fails, three 48-V DC batteries power the system for:

- 15 seconds in a PN cabinet
- 10 minutes in the expansion control carrier in the "A" position of a PN cabinet

Uninterruptible Power Supply

An external UPS provides a longer backup time than holdover batteries and can replace the batteries and battery charger. The unit connects from the AC power source to a cabinet's AC power cord. If AC power fails, the unit supplies its own AC power to the cabinet.

J58890CH-1

In AC-powered cabinets, the power-distribution unit (J58890CH-1), distributes 170 to 264 VAC from a wall outlet to a set of BU3200A Battery Interface Units (BIU). See [Figure 40: AC Power-Distribution Unit \(J58890CH-1\): Front](#) on page 749 and [Figure 41: Power-Distribution Unit \(J58890CH-1\)](#) on page 750.

Figure 40: AC Power-Distribution Unit (J58890CH-1): Front

Figure 41: Power-Distribution Unit (J58890CH-1)

Power Backup

The small battery is at the center rear of the multicarrier cabinet. This 8-AH (Amp Hour) battery is fused for short circuit protection and is charged by the J58890CH-1. The batteries also contain a thermal sensor that changes the charging voltage depending on battery temperature.

The small batteries provide short-term battery holdover. If AC power fails, 48-V DC batteries power the system for:

- 15 seconds in a PN cabinet
- 10 minutes in the expansion control carrier in the "A" position of a PN cabinet

[Figure 42: Small Battery Assembly](#) on page 751 shows the small battery assembly.

Figure 42: Small Battery Assembly

DC-Powered Cabinets

DC Power-Distribution Unit (J58890CF-2)

[Figure 43: DC Power-Distribution Unit \(J58890CF-2\): Front](#) on page 752 shows a power-distribution unit in some DC-powered multicarrier cabinets. The unit sits at the bottom of the cabinet and contains the ring generator, 20-Amp circuit breakers, terminal blocks, and system fan power.

Figure 43: DC Power-Distribution Unit (J58890CF-2): Front

Some carriers may contain two power supplies, the 644A and the 645B, that together supply the required voltages to the carrier. Other carriers may contain one 649A power supply located on the right side of the carrier. In these systems, an additional 649A is located on the right of the optional switch node carriers.

[Figure 44: Typical Multicarrier Cabinet with 649A Power Units](#) on page 753 shows a typical AC-powered multicarrier cabinet.

Figure 44: Typical Multicarrier Cabinet with 649A Power Units

The table below shows what carriers are protected by each circuit breaker on the J58890CF-1. The ring generator is protected by a fuse located next to the main circuit breaker on the front of the unit.

Circuit Breaker	Associated Carriers
CB1	Carrier A, both sides
CB2	Carrier B, both sides
CB3	Carrier C, both sides
CB4	Carrier D, both sides
CB5	Carrier E, both sides
CB6	Level F (Fans) and Level G (Ring Generator)

Communication Manager Maintenance-Object Repair Procedures

The table below shows what carriers are protected by each circuit breaker on the J58890CH-1. The ring generator is protected by a fuse located next to the main circuit breaker on the front of the unit.

Circuit Breaker	Associated Carriers
CB1	Carrier A, both sides
CB2	Carrier B, both sides
CB3	Carrier C, both sides
CB4	Carrier D, both sides
CB5	Carrier E, both sides
CB6	Level F (Fans) and Level G (Ring Generator)

Neon Lamp Power

The system can also support neon message waiting lamps on analog telephones. Any carrier containing a TN769 Neon Analog Line circuit packs must also be supplied with 150 Volts from a TN755B power supply circuit pack. See the table above for other supported neon power circuit packs.

Error Log Entries and Test to Clear Values

Table 259: Carrier Port Power Supply Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 ¹	0 or 1	OLS Query test (#127)	MAJ	ON	test environment UU r 2 recycle carrier UUC

1. Run the OLS Query test (#127) using **test environment UU r 2**. If a carrier must be recycled to clear the CARR-POW alarm, use **recycle carrier UUC** to run the OLS Recycle test (#126). The OLS Recycle test (#126) is not included in either the long or short test sequences.

WARNING:

The OLS Recycle test (#126) is destructive. For more information, see [OLS Recycle Test \(#126\)](#) on page 756.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the *Battery & Battery Charger Query* test (#5), you may also clear errors generated from other tests in the sequence.

- f. Refer to [RING-GEN \(Analog Ring Generator\)](#) section for a description of this test.

OLS Recycle Test (#126)

This test is **destructive**.

This test removes power from the specified carrier and causes every circuit pack in the recycled carrier to be removed and inserted. These actions cause every call originating from or terminating to circuit packs in this carrier to be dropped. The pair of OLSs in the specified carrier is recycled. Both OLSs in the carrier are turned off for 2 seconds and then back on again. After the OLSs have been turned back on, the test queries a PN's Maintenance circuit pack for the status of the pair of OLSs in the specified carrier. If both OLSs are on and functioning, then the test passes. If both OLSs are not on and functioning, the test fails, and BOTH OLSs are turned off.

Table 260: Test #126 OLS Recycle Test 1 of 2

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
1366	ABRT	Indicates that the active Tone-Clock for the PN is in requested carrier. 1. If duplicated Tone-Clock boards or IPSIs exist, use <code>set tone-clock</code> to switch Tone-Clocks, otherwise the power cannot be cycled. 2. If the switch succeeds, rerun the test.
1367	ABRT	Indicates that the active Expansion Interface link for the PN is in requested carrier. 1. If duplicated EIs exist, use <code>reset pnc interchange</code> to switch EIs, otherwise the power cannot be cycled. 2. If the switch succeeds, rerun the test.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2029, 2319, 2320, 2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 260: Test #126 OLS Recycle Test 2 of 2

Error Code	Test Result	Description / Recommendation
	FAIL	<p>There is a problem with one or both OLSs on the cycled carrier.</p> <ol style="list-style-type: none"> 1. Since the OLS Recycle test failed, both OLSs in the cycled carrier should have been powered off by the system software. Both OLSs should be showing a red status LED, instead of an amber one. Since the OLS Query test is a subset of the OLS Recycle test, the OLS Query test (#127) should also fail. Run the OLS Query test by using test environment UU where UU is the appropriate cabinet number. 2. If Test #127 fails, follow the repair procedures described for Test #127.
	PASS	<p>Both OLSs in the recycled carrier were found to be healthy by a PN's Maintenance circuit pack after the OLSs were powered down and back up. If the status LEDs on both OLSs are not showing amber, then the MAINT (Maintenance) circuit pack may have incorrectly reported the state of the OLSs. Resolve any alarms on these MOs.</p>
		2 of 2

Off-Line Switcher (OLS) Query Test (#127)

This test queries the the PN's Maintenance for the status of the pair of OLSs in the specified carrier. If both OLSs are on and functioning, then the test passes. If both are not on and functioning, it fails.

Table 261: Test #127 OLS Query Test 1 of 5

Error Code	Test Result	Description / Recommendation
1000	ABRT	<p>System resources required for this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 5

Table 261: Test #127 OLS Query Test 2 of 5

Error Code	Test Result	Description / Recommendation
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to ABORT with error code 2000, check for system powering problems with the PN's A carrier. Resolve every AC-POWER and CARR-POW alarm in a multicarrier-cabinet system or DC-POWER alarm in a single-carrier cabinet system. Then, repeat the test. 3. If the test continues to ABORT with a 2000 error code, resolve any errors against the PN's MAINT (Maintenance circuit pack). Then, repeat the test.
2029, 2500	ABRT	<p>Internal system error</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	<p>AC-POWERED SYSTEMS There is a problem with one or both OLSs on the tested carrier.</p> <ol style="list-style-type: none"> 1. For each OLS that has every status LED OFF, check the AC input to the OLS at the OLS outlet. If there is no AC, then check the appropriate fuses for the affected OLS. Replace open fuses. If the fuses open again or AC does not show up at the OLS outlet, then there is probably a power wiring problem in the cabinet. 2. At this point, AC should be present at the OLS outlet. Use recycle carrier UUC (where <i>UUC</i> is the appropriate cabinet and carrier) in an attempt to bring back the OLSs for this carrier. If the test passes, the trouble is cleared. If the test does not pass, one OLS or both, in the tested carrier is defective. If only one OLS is defective, then the status LEDs on the healthy OLS will light green for a moment. When the recycle test determines that both OLSs are defective, the software will turn off power to both the good and defective OLSs. This will cause the status LED(s) on the good OLS to light red. 3. Unplug both OLSs, and wait approximately 1-minute to allow the OLSs to cool down. Plug in the OLSs. If either OLS is operating properly (the status LEDs show green), then replace the defective OLS(s). See OLS Replacement Procedures in this section.
		2 of 5

Table 261: Test #127 OLS Query Test 3 of 5

Error Code	Test Result	Description / Recommendation
	FAIL (cont'd)	<p>4. If the replaced OLS(s) still do not operate properly, then a circuit pack or a defective telephone connected to a circuit pack in the affected carrier could be causing an electrical load that is preventing the OLS from operating properly. Unseat every circuit pack in the carrier, and enter recycle carrier.</p> <p>a. If the recycle passes, then the OLSs are healthy, and the problem is with one of the circuit packs. Reinsert the circuit packs one at a time. If the status LED shows red after reinserting a circuit pack, then replace the defective circuit pack. If the status LED still shows red, then remove the amphenol connector on the back of the slot containing this circuit pack and enter recycle carrier. If the status LED shows green, then the problem is with one of the telephones or the wiring to one of the telephones on this slot.</p> <p>b. If either OLS still shows a red status LED, then check for bent pins and cable placement in the affected carrier. There are failures that can occur on the PN's Maintenance circuit pack that <i>will not</i> be detected by their respective maintenance, but that will cause many, if not every, environment test to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun.</p>
3 of 5		

Table 261: Test #127 OLS Query Test 4 of 5

Error Code	Test Result	Description / Recommendation
	FAIL	<p>DC-POWERED SYSTEMS</p> <p>There is a problem with one or both port carrier power supplies on the tested carrier.</p> <ol style="list-style-type: none"> 1. For each port carrier power supply that has every status LED OFF, check the DC input to the port carrier power supply at the port carrier power supply outlet. If there is no DC, then check the appropriate circuit breakers for the affected port carrier power supply. If the circuit breaker has tripped, reset the circuit breaker. If the circuit breaker trips again or if DC is absent at the port carrier’s power supply outlet, then there is probably a power wiring problem in the cabinet. 2. At this point, DC should be present at the port carrier power supply outlet. Use recycle carrier <i>UUC</i> where <i>UUC</i> is the appropriate cabinet and carrier, to attempt to bring back the port carrier power supplies for this carrier. If the test passes, the trouble is cleared. If the test does not pass, one port carrier power supply, or both, in the tested carrier is defective. If only one port carrier power supply is defective, then the status LEDs on the healthy port carrier power supply will light green for a moment. When the recycle test determines that both port carrier power supplies are defective, the software will turn off power to both the good and defective port carrier power supplies. This will cause the status LED(s) on the good port carrier power supply to light red. 3. Unplug both port carrier power supplies, and wait approximately 1-minute to allow the power supplies to cool down. Plug in the power supplies. If either power supply is operating properly (the status LEDs show green), then replace the defective power supplies). 4. If the replaced port carrier power supply(s) still do not operate properly, then a circuit pack or a defective telephone connected to a circuit pack in the affected carrier could be causing an electrical load that is preventing the power supply from operating properly. Unseat every circuit pack in the carrier, and enter recycle carrier.

CLAN-BD (Control LAN Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CLAN-BD	MIN	<code>test board location long</code>	Control LAN circuit pack
CLAN-BD	WRN	<code>test board location short</code>	Control LAN circuit pack

Control LAN circuit pack

The TN799 Control LAN (C-LAN) packet port circuit pack provides TCP/IP connection to adjunct applications such as CMS, INTUITY, and DCS Networking. The C-LAN circuit pack has one 10baseT Ethernet connection and up to 16 DS0 physical interfaces for PPP connections. C-LAN also extends ISDN capabilities to csi models by providing packet-bus access.

An RSCL (remote socket control link) links the C-LAN and the server to pass call- control and other management information. Because one link serves every port on the circuit pack, maintenance of the RSCL is part of the C-LAN circuit-pack maintenance.

The TN799 C-LAN circuit pack combines the functions of the PGATE and PI circuit packs into one circuit pack. Use a PGATE or PI with a C-LAN to create an X.25-to-TCP/IP bridge for adjunct and DCS connectivity.

C-LAN socket load balancing

Prior to Communication Manager Release 2.0, IP endpoints registered to C-LANs (TN799x) on a round-robin algorithm, where an IP endpoint registers to the next available C-LAN within a list of available C-LANs. In a system with two or more C-LANs, this distribution method can result in one C-LAN controlling the majority of IP endpoints. This skewed distribution of endpoints among available C-LANs results in a vulnerability to a higher loss of telephony resources in the event of a C-LAN failure than if the IP endpoints were more uniformly distributed across the available C-LANs.

With Communication Manager Release 2.0, a new feature provides for a more uniform balancing of the load across the available C-LANs. With this feature, an IP endpoint registers to the C-LAN with ***the least number of used sockets*** (regardless of the number of available sockets). This will apply to the following IP endpoints:

- H.245, H.248, and H.323 signaling groups
- H.323 stations
- SIP endpoints

Communication Manager Maintenance-Object Repair Procedures

Socket counts will include H.245 and H.248 endpoints but the load-balancing algorithm will not be used for registering these endpoints. Sockets used by adjuncts will not be included in the socket count.

Note:

This allocation is performed for the C-LANs assigned within each network region, independently of the C-LANs assigned to other network regions.

A new field, **Number of CLAN Sockets Before Warning**, has been added to the **ip-interfaces** form. The system logs a warning to the hardware error log when a TN799x circuit pack has reached the socket usage specified in this field. The warning can be viewed using **display errors**.

Note:

IP endpoints can still register to this circuit pack after the warning has been issued.

The presence of the warning in the error log indicates that the customer needs to look at the network configuration. The **status clan-usage** command displays socket usage for C-LAN circuit packs in a system. This allows the customer to verify that IP endpoint registration has been evenly distributed, or to determine whether additional TN799x circuit packs are needed.

Also, even though all CLANs may be available, all endpoints are configured to be in a few specific network regions, and may possibly be overloading the CLANs in those network regions. This would indicate that additional capacity is required in the affected network regions, or that network configuration and administration needs to be altered to make it more balanced. Additional C-LANs can be administered, or existing administration of C-LANs can be changed using the **add/change ip-interfaces** commands (see *Maintenance Commands Reference (03-300191)* for details).

Note:

When a TN799x is replaced or added, re-balancing does not occur. That is, the system does not un-register an IP endpoint for the purpose of load balancing. Replaced or added TN799x circuit packs will be detected as the least-used C-LANs, and IP endpoints will register with them until the socket load is evenly balanced.

C-LAN congestion controls

The switch activates congestion controls on a C-LAN when it detects a buffer exceeding the threshold. The switch releases the congestion controls when the C-LAN reports that its buffers have returned to normal levels.

If congestion:	Then the switch:
Persists for a 14-minute interval,	Raises MINOR alarm.
Exhausts buffers,	Raises MINOR alarm.
Ceases for 12 minutes,	Retires MINOR alarm.

3865 (ad)	Any				
3866 (ae)	Any				
					3 of 3

Notes:

- a. **Error Type 1:** Circuit pack stopped functioning or is not physically present.
 - 1. Verify that the circuit pack is present. If circuit pack is present, reset the circuit pack with **reset board location**.
 - If the error persists, replace the circuit pack.
- b. **Error Type 18:** The C-LAN circuit pack busied out.
- c. **Error Type 217:** applies to 10 circuit packs:
 - 1. Remove the circuit pack(s) against which the error is logged.
- d. **Error Type 257:** Transient communication problem between switch and circuit pack; does not affect service and can be ignored.
 - 1. Ignore this error, unless the Control Channel Loop Test (#52) fails.
 - 2. If Test #52 fails, replace the circuit pack.

Repetitive failures of the Control Channel Loop test indicate circuit pack hardware failure.
- e. **Error Type 513:** Circuit pack detected and reported hardware failure.
 - 1. Reset the circuit pack with **reset board location**.

Aux Data:

4352	External RAM error
4353	Internal RAM error
4355	ROM Checksum error
4356	Angel Message Corruption error
4357	Instruction set error

- f. **Error Type 769:** Logic error. By itself this error may be ignored, but it may result in other error types being reported.

Communication Manager Maintenance-Object Repair Procedures

g. **Error Type 1293-1297:** Critical hardware or firmware error.

If the switch detects:	Then the switch:
1 error,	Resets circuit pack.
3 errors in 15 minutes,	Raises MINOR alarm.

Error Type descriptions are as follows:

- 1293 Insane onboard processor
- 1294 Onboard translation RAM error
- 1295 (Aux 3) RSCL link down
Software requested a reset of the CLAN because it failed to get a keep-alive response from the CLAN for over a minute.
(Aux 0) RSCL keep alive failure
- 1296 Software requested a reset of the CLAN.
- 1297 Software requested a reset of the CLAN

1. Attempt to clear the alarm with **reset board location**.
2. If alarm persists, replace circuit pack.

h. **Error Type 1537:** Switch removed hyperactive circuit pack that reported threshold number of errors.

1. Attempt to clear the alarm with **reset board location**.
2. If the error recurs within 15 minutes, replace the circuit pack.

i. **Error Type 1794:** Packet-bus transmit buffers have overflowed.

1. Attempt to clear the alarm with **reset board location**.
2. If the error recurs within 15 minutes, replace the circuit pack.

j. **Error Type 1796, Aux Data 42611:** DLCI out of range. The switch activates congestion controls on CLAN when it detects buffers exceeding the threshold. The switch releases the congestion controls when the CLAN reports that its buffer level has returned to normal. A minor alarm is raised if congestion persists for 14 minutes or if buffers are exhausted because of congestion. The alarm is retired when the alarm condition ceases for 12 minutes.

1. Attempt to clear the alarm with **reset board location**.
2. If the alarm recurs within 15 minutes, replace the circuit pack.

Aux Data Any: Bad DLCI.

3. Reset circuit pack with the **busyout board location**, **reset board location**, and **release board location** commands.
 4. Clear alarms using the test board long clear command.
 5. If the error returns within 15 minutes, replace the circuit pack.
- k. **Error Type 1797**: Invalid layer 2 frame received.
- l. **Error Type 1798**: Unable to write translation RAM.
1. Attempt to clear alarm with **reset board location**.
 2. If alarm recurs within 15 minutes, replace the circuit pack.
- m. **Error Type 2049**: Packet Interface test (#598) failed.
1. Attempt to clear the alarm (**test board location 1 r 3**).
 2. If alarm does not clear, reset the circuit pack with **reset board location**.
 3. If circuit pack resets, execute Packet Interface test (#598) several times.
 4. If Packet Interface test (#598) continues to fail, replace the circuit pack.
- n. **Error Type 2305-2306**: Error in received frame from packet bus.

Error Type	Description
2305	Received invalid LAPD frame.
2306	Detected parity error on received frame.

This may be due to a packet-bus problem or circuit-pack fault.

Invalid LAPD frame errors occur when the frame:

- contains a bad Cyclic Redundancy Check (CRC)
 - is greater than the maximum length
 - violates the link level protocol
1. Retry **test board location** and see if the condition clears.
 2. If condition persists, execute PPE/LANBIC Receive Parity Error Counter test (#597), and determine whether the condition clears.
 3. If condition persists, execute Packet Interface test (#598) to verify circuit pack integrity.
 4. If Packet Interface test (#598) fails, consult repair procedure for the packet bus.
- o. **Error Type 2561-2668**: System software received an indication that the socket was closed due to an error. Errors are reported as log only. Errors logged here are for the sockets that had *no* processor channels associated with them, for example, sockets to read SNMP data. The counter base is offset by the application type of the application associated with this socket that is down. The Aux Data field of the log entry contains this application's number, for example, a SNMP application would have its application number in the Aux Data field.

Communication Manager Maintenance-Object Repair Procedures

Note:

2561 - 2668 is a range of reserved numbers for future applications. 2570 currently represents an SNMP socket failure.

p. **Error Type 2817-2819:** Congestion Query test (#600) failed.

The Error Types correspond to the descriptions:

2817	All buffers exhausted.
2819	Utilized buffers exceed threshold.

If:	Then:
Active buffers exceed threshold	C-LAN enters congested state.

1. Refer to Congestion Query test (#600) for Abort and Fail codes 3601.

q. **Error Type 3073:** RSCL (Remote Socket Control Link) or Link Status test (#601) failed.
This failure may be due to:

- This circuit pack
- The packet bus
- The Packet Interface circuit pack.

If:	Then:
RSCL disconnects at link level	Link fails
Link cannot be reconnected quickly	Switch raises MINOR alarm

r. **Error Type 3330:** Critical failure in packet-bus interface.

Below, Error Types correspond to descriptions.

If the switch detects:	Then it:
1 error,	Resets circuit pack.
2 errors in 15 minutes,	Raises MINOR alarm.

1. Attempt to clear the alarm with **reset board location**.
2. If alarm persists, replace circuit pack.

s. **Error Type 3586 and 3999:** Switch removed hyperactive circuit pack that reported threshold number of errors. One or more of the following symptoms may be present:

- Circuit pack port tests return NO BOARD.
- List configuration command shows circuit pack and ports are installed properly

If Error Type 3999:	And traffic volume is:	Then:
Does not accompany Error Type 3586,	Heavy	Circuit pack is in service, but sent at least half hyperactive threshold. With heavy traffic, this is normal.
Does not accompany Error Type 3586,	Light	Circuit pack is in service, but sent at least half hyperactive threshold. With light traffic, this error indicates a problem with the circuit pack, its links, or the equipment attached to the links.
Accompanies Error Type 3586,	Light or Heavy	Switch removed hyperactive circuit pack.

1. Busyout (**busyout board location**) and release (**release board location**) circuit pack
2. Allow 30 minutes for condition to clear itself.
3. To re-establish circuit pack into service manually, busyout (**busyout board location**), reset with **reset board location**, and release (**release board location**) the circuit pack.
4. If error recurs within 15 minutes, replace the circuit pack.
5. If the same error occurs on a different circuit pack, follow normal escalation procedures.

t. **Error Type 3840:** Circuit pack received bad control channel message from switch.

Aux Data:

4096	Bad major heading
4097	Bad port number
4098	Bad data
4099	Bad sub-qualifier
4100	State inconsistency
4101	Bad logical link
4102	Bad application identifier

Communication Manager Maintenance-Object Repair Procedures

- u. **Error Type 3841-3843:** errors do not affect service.

Below, Error Types correspond to descriptions.

3841 Internal firmware error.

3843 Bad translation RAM. Call uses another translation location.

These errors do not affect service, however, they may cause reports of other errors that do affect service.

If Error Type 3843 begins to affect service, it escalates to Error Type 1294.

- v. **Error Type 3842:** Packet interface receive buffers overflowed.

If this error occurs frequently, the overflow may be congesting the circuit pack.

1. Refer to Receive FIFO Overflow Error Counter test (#596).

- w. **Error Type 3844:** LAPD frame contains LAPD protocol error.

By themselves, these errors do not affect service.

- x. **Error Type 3845:** Angel interprocessor error.

By themselves, these errors do not affect service.

- y. **Error Type 3846:** High CPU occupancy.

By themselves, these errors do not affect service.

- z. **Error Type 3848:** Interprocessor LAPD protocol error.

By themselves, these errors do not affect service.

- aa. **Error Type 3849:** Interprocessor LAPD frame error.

By themselves, these errors do not affect service.

- ab. **Error Type 3850 - 3861:** IBL error.

By themselves, these errors do not affect service. These errors can occur only on a G3csi machine that has an Interboard Link (IBL).

- ac. **Error Type 3862:** Memory allocation failure.

By themselves, these errors do not affect service.

- ad. **Error Type 3865:** [S8700](#) | [8710](#) / [S8500](#): CLAN DLCI audit action has removed CIP only DLCIs.

By themselves, these errors do not affect service.

- ae. **Error Type 3866:** [S8700](#) | [8710](#) / [S8500](#): CLAN DLCI audit action has removed CLAN only DLCIs. By themselves, these errors do not affect service.

- af. **Error Type 2820:** A threshold number of sockets in use for IP endpoint registration per C-LAN can be administered by the customer. When the threshold is reached, a warning message is logged, but IP endpoints can still register with that C-LAN if it has additional sockets available. The warning can be viewed using **display errors**.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors in the order they appear in the table below.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Control Channel Loop-Around test (#52)	X	X	ND
Circuit Pack Restart test (#252)			D
Invalid LAPD Frame Error Counter test (#597)		X	ND
PPE/LANBIC Receive Parity Error Counter test (#595)		X	ND
Receive FIFO Overflow Error Counter test (#596)		X	ND
Packet Interface test (#598)	X	X	ND
Congestion Query test (#600)	X	X	ND
Link Status test (#601)	X	X	ND

1. D = Destructive; ND = Nondestructive

Control Channel Loop-Around Test (#52)

This nondestructive test fails if the circuit pack does not return to a sane state after being reset. This test queries the circuit pack for its code and vintage, and verifies its records.

Table 263: Test #52 Control Channel Loop-Around Test

Error Code	Test Result	Description / Recommendation
None, 2100	ABRT	Could not allocate the necessary system resources to run test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
	FAIL	The circuit pack failed to return the code or vintage. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. Reset the board with <code>reset board location</code>. 3. If reset aborts with error code 1115, busyout (<code>busyout board location</code>), reset with <code>reset board location</code>, and release board (<code>release board location</code>). 4. If test continues to fail, replace the circuit pack. 5. Escalate the problem if failures continue.
	PASS	Test successful.

Circuit Pack Restart Test (#252)

This test is **destructive**.

Execute this test (not part of either short or long demand test sequence) to reset the circuit pack only if there are PPCPU errors. This test fails if the circuit pack does not return to a sane state after being reset. The circuit pack resets through the SAKI Sanity test (#53).

Table 264: Test #252 Circuit Pack Restart Test

Error Code	Test Result	Description / Recommendation
None	ABRT	Could not allocate the necessary system resources to run test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
1015	ABRT	Port is not out-of-service. <ol style="list-style-type: none"> 1. Busyout the circuit pack (busyout board location). 2. Retry the command at 1-minute intervals up to 5 times. 3. If the problem persists, escalate the problem.
2100	ABRT	Could not allocate the necessary system resources to run test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
1, 2	FAIL	The circuit pack failed to reset. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, pull out and reseal the circuit pack. 3. If the problem persists, replace the circuit pack.
	PASS	The circuit pack initialized correctly.

PPE/LANBIC Receive Parity Error Counter Test (#595)

This test is nondestructive. When the C-LAN circuit pack detects a parity error with a received frame, it increments the PPE/LANBIC Receive Parity error counter. This test reads and clears the counter, and may verify repair of problem.

Errors may indicate a problem with:

- This circuit pack
- A packet bus
- Another circuit pack on the bus

Table 265: Test #595 PPE/LANBIC Receive Parity Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	Did not receive circuit pack test response within the allowable time period. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, reset the circuit pack with reset board location. 3. If the problem persists, replace the circuit pack.
2100	ABRT	Could not allocate the necessary system resources to run test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2500	ABRT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
1-10	FAIL	Circuit pack detects parity errors. The Error Code indicates the value of the on-board error counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, execute Packet Interface test (#598) (test board location). 3. If Packet Interface test (#598) fails, see packet-bus repair procedures.
	PASS	Circuit pack detects no errors.

Receive FIFO Overflow Error Counter Test (#596)

This test is nondestructive. When the C-LAN circuit pack detects packet-bus buffer overflow, it increments the error on the FIFO Overflow error counter. This test reads and clears the counter.

If errors are:	Then they may be due to:
Occasional	Statistical buffer sizing
Persistent	Circuit pack congestion that requires redistribution of traffic load

Table 266: Test #596 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	Did not receive circuit pack test response within the allowable time period. 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, reset the circuit pack with reset board location . 3. If the problem persists, replace the circuit pack.
2100	ABRT	Could not allocate the necessary system resources to run test. 1. Retry the command at 1-minute intervals up to 5 times.
2500	ABRT	Internal system error. 1. Retry the command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
1-10	FAIL	Circuit pack detects overflow errors. The error code indicates the value of the on-board error counter. 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, execute Packet Interface Test #598 (test board location). 3. If Packet Interface Test #598 fails, see PKT-BUS (Packet Bus) on page 1748 for repair procedures.
	PASS	Circuit pack detects no errors.

Invalid LAPD Frame Error Counter Test (#597)

This test is nondestructive.

A C-LAN detects an invalid frame when it receives:

- a frame with a CRC error
- an unrecognizable frame
- a recognizable frame in an unexpected state

When the C-LAN circuit pack detects an invalid LAPD frame, it increments the Invalid LAPD Frame error counter. This test reads and clears the counter, and verifies the repair of the problem.

Errors may indicate a:

- circuit-pack problem
- packet-bus problem
- problem with another circuit pack on the bus

Table 267: Test #597 Invalid LAPD Frame Error Counter Test

Error Code	Test Result	Description / Recommendation
2000	ABRT	Did not receive circuit pack test response within the allowable time period. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, reset the circuit pack with <code>reset board location</code>. 3. If the problem persists, replace the circuit pack.
2100	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2500	ABRT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
		1 of 2

Table 267: Test #597 Invalid LAPD Frame Error Counter Test

Error Code	Test Result	Description / Recommendation
1-10	FAIL	The circuit pack detects LAPD frame errors. The error code indicates the value of the on-board error counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to fail, execute the Packet Interface test (#598) (<code>test board location long</code>). 3. If the Packet Interface test (#598) fails, see PKT-BUS (Packet Bus) on page 1748 for repair procedures.
	PASS	Circuit pack detects no errors.
2 of 2		

Packet Interface Test (#598)

This nondestructive test checks the packet-bus interface circuitry on the C-LAN circuit pack. Test failure indicates faulty circuit pack.

Table 268: Test #598 Packet Interface Test 1 of 2

Error Code	Test Result	Description / Recommendation
2000	ABRT	Did not receive circuit pack test response within the allowable time period. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, reset the circuit pack with <code>reset board location</code>. 3. If the problem persists, replace the circuit pack.
2012	ABRT	Could not allocate the necessary system resources to run test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
1 of 2		

Table 268: Test #598 Packet Interface Test 2 of 2

Error Code	Test Result	Description / Recommendation
	FAIL	Circuit pack has detected a failure of Packet Interface Test #598. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, reset the circuit pack with reset board location. 3. If the test continues to fail, replace the circuit pack.
	PASS	Packet Interface Test #598 passed.
2 of 2		

Congestion Query Test (#600)

This nondestructive test queries the number of used buffers to determine whether the C-LAN circuit pack is congested.

If:	Then:
Used buffers are, or are nearly, exhausted	The test fails
The test fails	The switch redirects outgoing calls to another available C-LAN, and denies new incoming calls

Normal call handling resumes when the C-LAN circuit pack has recovered from congestion.

Table 269: Test #600 Congestion Query Test 1 of 2

Error Code	Test Result	Description / Recommendation
2000	ABRT	Did not receive circuit pack test response within the allowable time period. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, reset the circuit pack with reset board location. 3. If the problem persists, replace the circuit pack.
1 of 2		

Table 269: Test #600 Congestion Query Test 2 of 2

Error Code	Test Result	Description / Recommendation
2012	ABRT	Could not allocate the necessary system resources to run test. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Internal system error. 1. Retry the command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
1, 2	FAIL FAIL	The buffer level is nearly exhausted. The C-LAN is congested, and no buffers are available. 1. Retry command at 1-minute intervals up to 5 times. 2. If command continues to fail, examine the C-LAN port measurements to determine what ports are heavily utilized and the processor occupancy of the circuit pack. <i>Low processor occupancy</i> when C-LAN congested indicates circuit pack failure. 1. If the problem persists, reset the circuit pack with reset board location . 2. If congestion recurs, replace the circuit pack. <i>High processor occupancy</i> indicates the C-LAN is congested due to traffic load. 1. To relieve congestion in the short term, selectively busyout ports (busyout port location) on the Control LAN circuit pack. 2. To achieve a more permanent resolution, it may be necessary to move ports on this circuit pack to other Control LAN circuit packs. 3. Consider replacing affected C-LAN ports with new ports.
3	FAIL	The C-LAN circuit pack is not operating normally and is congested.
	PASS	Hardware setting and attached cable type match C-LAN circuit pack administration. The circuit pack detects no errors.
		2 of 2

Link Status Test (#601)

This nondestructive test determines the state of the call-control signaling link for Control LANs. If the signaling link is physically connected, the test sends a test frame over the link and checks for a response. The test passes only if both the signaling link is connected and the test frame is successfully transmitted.

A failure may indicate a problem with:

- this circuit pack
- the packet bus
- the Packet Interface circuit pack

Table 270: Test #601 Link Status Test 1 of 2

Error Code	Test Result	Description / Recommendation
1125	ABRT	RSCL link or C-LAN board not in service. <ol style="list-style-type: none"> 1. Release the board. 2. Repeat the test. 3. Escalate if the problem persists.
2012	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Internal system error. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, escalate the problem.
2	FAIL	The RSCL control link disconnected. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals up to 5 times. 2. If the test continues to fail, execute Packet Interface test (#598) (test board location) to determine if the problem is due to the circuit pack. 3. If Packet Interface test (#598) fails, see PKT-BUS (Packet Bus) on page 1748 for repair procedures. 4. If Packet Interface test (#598) passes, refer to Packet Control circuit pack and packet-bus repair procedures.
		1 of 2

Table 270: Test #601 Link Status Test 2 of 2

Error Code	Test Result	Description / Recommendation
3	FAIL	Received no response to RSCL control link test frame. 1. Retry command at 1-minute intervals up to 5 times. 2. If the problem persists, reset the circuit pack with reset board location . 3. If test continues to fail, replace the circuit pack.
	PASS	RSCL control link connected.
2 of 2		

CLSFY-BD (Call Classifier Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CLSFY-BD	MIN	<code>test board location sh</code>	Call Classifier circuit pack
CLSFY-BD	WRN	<code>test board location sh</code>	Call Classifier circuit pack

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for circuit pack-level errors. See also [CLSFY-PT \(Call Classifier Port\)](#) on page 785 for related port information.

CLSFY-PT (Call Classifier Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CLSFY-PT	MAJ	<code>test port location sh</code>	Call Classifier Port
CLSFY-PT	MIN	<code>test port location sh</code>	Call Classifier Port
CLSFY-PT	WRN	<code>test port location sh</code>	Call Classifier Port

The TN744 Call Classifier is a service circuit pack that provides specialized tone detection capabilities to support the Outbound Call Management (OCM) and Inbound Call Management (ICM) features. The TN744 supports both A-law and Mu-law companding.

The TN744 has eight ports (CLSFY-PTs), each capable of supporting call classification, touch-tone reception and MFC-tone generation and detection. The CLSFY-PT MO implements a set of tests designed to ensure proper operation of the Call Classifier.

Error Log Entries and Test to Clear Values

Table 271: Call Classifier Port (CLSFY-PT) Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1	any	Tone Detector Audit/Update test (#43)	MAJ / MIN (a)	ON	<code>test port location r 2</code>
18		<code>busyout port</code>	WRN	OFF	<code>release port location</code>
257 (b)	17666	Tone Detection Audit/Update test (#43)	MAJ / MIN (a)	ON	<code>test port location r 3</code>
513 (c)	any	Tone Detection Verification test (#42)	MAJ / MIN (a)	ON	<code>test port location r 3</code>

Notes:

- a. A major alarm is raised if the total number of call classifier ports currently in-service is less than or equal to 1/2 of the administered threshold number. For major or minor alarm, run the short test sequence on the alarmed port and follow the error code procedures for the individual tests.

The in-service threshold number for alarming call classifier ports is administered using the `change system-parameters maintenance`.

Communication Manager Maintenance-Object Repair Procedures

1. Enter these commands in order: **busyout board**, **reset board**, **release board**. The board reset is required to reload on-board RAM associated with the TN744's DSPs. This takes all 8 Tone Detector ports out of service for a few seconds. Only 4 of the 8 would be out of service due to the alarm. (There are five Tone Detectors on each of the two DSPs.) Other than the unlikely potential of running out of Tone Detector resources in the switch, there is no other effect when the board is reset.
 2. Test the board with **test board location long**.
 3. If the test still fails, replace the board.
- b. **Error 257:** The CLSFY-PT lost its translation. Testing the CLSFY-PT is sufficient to reload its translation. If testing the call classifier port does not clear the error, then the call classifier circuit pack containing the defective call classifier port should be replaced.
- c. **Error 513:** This error indicates the call classifier port is having problems detecting call classification tones or detecting and generating R2-MFC tones This is usually accompanied by failures of some incoming or outgoing calls. If this error type is persistently logged, then replace the call classifier circuit pack containing the defective CLSFY-PT.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Tone Detection Verification test (#42)	X	X	ND
Tone Detection Audit/Update test (#43)	X	X	ND

1. D = Destructive; ND = Nondestructive

Tone Detection Verification Test (#42)

This test checks the operation of the TN744 in touch-tone receiver, call classifier and R2-MFC modes. It verifies the circuit pack's ability to detect DTMF, ring back, busy reorder and modem answer tones and to generate and detect forward and backward MFC tones.

Table 272: Test #42 Tone Detection Verification Test 1 of 2

Error Code	Test Result	Description / Recommendation
none	ABRT	The system was not able to allocate every resource needed for this test, OR there was an internal system error.
1	ABRT	The system could not allocate every resource needed to test the tones. 1. Retry the command at 1-minute intervals up to 5 times.
1001	ABRT	The system was unable to put the call classifier port in the appropriate mode to test it. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test connection. This situation could occur when the system is heavily loaded. If the system is not heavily loaded, use <code>test tdm</code> to test the TDM-BUS. 1. Retry the command at 1-minute intervals up to 5 times.
1003	ABRT	The system could not allocate a Tone-Clock for the test connection. This may be caused by a heavy load on the system or by a faulted Tone-Clock. 1. Check to see if there are any alarms against the Tone-Clock in the PN where the test aborted. If so, see TONE-BD (Tone-Clock Circuit) on page 2282 and TONE-PT (Tone Generator) on page 2308 for recommended procedures. 2. If a new Tone-Clock has been inserted, allow about 1-minute for maintenance to run on the newly inserted circuit pack. 3. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	Call classifier circuit pack's response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 272: Test #42 Tone Detection Verification Test 2 of 2

Error Code	Test Result	Description / Recommendation
2006	ABRT	<p>Indicates that the active Tone-Clock circuit pack or a Tone Detector circuit pack may not be functioning properly.</p> <p>If there is more than one Tone Detector circuit pack in the system, then the problem can be either with the Tone-Clock circuit pack or the Tone Detector circuit pack. This could also be caused by the mode administered for the system not matching that of the Tone Detector circuit pack.</p> <ol style="list-style-type: none"> 1. Test the <i>active</i> Tone-Clock circuit pack in the PN with <code>test tone-clock vvc</code>. See TONE-BD (Tone-Clock Circuit) on page 2282 for failures. 2. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1-3	FAIL	<p>DTMF digits were not detected correctly. This may or may not impact reception of R2-MFC calls.</p> <ol style="list-style-type: none"> 1. Run the short test sequence via <code>test port location sh r 1</code>. 2. If the problem persists, the system is still operating properly but capacity will be reduced. To restore performance to normal, replace the call classifier circuit pack containing the defective CLSFY-PT (Call Classifier Port).
S8700 S8710 S8500 102	FAIL	<p>2225-Hz Modem Answer tone was not detected correctly. This will impact call-classification operation.</p> <ol style="list-style-type: none"> 1. Run the short test sequence with <code>test port location sh r 1</code>. 2. If the problem persists, the system can still operate properly but capacity will be reduced. In order to restore performance to normal, replace the call classifier circuit pack containing the defective port.
101- 122 130	FAIL	<p>Forward or backward R2-MFC signals were not correctly generated or detected. This will impact R2-MFC calls.</p> <ol style="list-style-type: none"> 1. Run the short test sequence with <code>test port location sh r 1</code>. 2. If the problem persists, the system can still operate properly but capacity will be reduced. In order to restore performance to normal, replace the call classifier circuit pack containing the defective port.
	PASS	<p>Tone detection verification is successful. The call classifier port is able to detect and generate every necessary tone.</p>
2 of 2		

Tone Detector Audit/Update Test (#43)

This test performs a sanity audit on the CLSFY-PT (Call Classifier Port).

Table 273: Test #43 Tone Detector Audit/Update Test

Error Code	Test Result	Description / Recommendation
none	ABRT	The system was not able to allocate the resources for this test. 1. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	Hardware audit failed. 1. Enter these commands in order: busyout board, reset board, release board . The board reset is required to reload on-board RAM associated with the TN744's DSPs. This takes all 8 Tone Detector ports out of service for a few seconds. Only 4 of the 8 would be out of service due to the alarm. (There are five Tone Detectors on each of the two DSPs.) Other than the unlikely potential of running out of Tone Detector resources in the switch, there is no other effect when the board is reset. 2. Test the board with test board location long . 3. If the test still fails, replace the board.
	PASS	The call classifier port has passed the sanity inquiry.

CO-BD (Central Office Trunk Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CO-BD	MIN	<code>test board location sh</code>	Central Office Trunk circuit pack
CO-BD	WRN	<code>test board location sh</code>	Central Office Trunk circuit pack

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for circuit pack-level errors. See also [CO-TRK \(Analog CO Trunk\)](#) on page 809 for related trunk information.

CO-DS1 (DS1 CO Trunk)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CO-DS1	MAJ ¹	<code>test trunk grp#/mem# 1</code>	DS1 CO Trunk
CO-DS1	MIN	<code>test trunk grp#/mem# 1</code>	DS1 CO Trunk
CO-DS1	WRN	<code>test trunk grp#/mem#</code>	DS1 CO Trunk

1. A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by `set options` and that at least 75 percent of the trunks in this trunk group are alarmed. For more information about `set options`, see *Maintenance Commands Reference (03-300191)*.

Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end. Refer to “*Chapter 12, Managing Trunks*”, in the *Administrator’s Guide for Avaya Communication Manager, 555-233-506* for information on how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

A DS1 CO (central office) trunk provides a link for digitized voice or data communications between the system and a central office switch. There are two types of DS1 interfaces:

- 24 DS0 channels on a 1.544-Mbps link
- 31 DS0 channels + 1 framing channel on a 2.048-Mbps link

32-channel mode is supported on the TN464C or higher suffix, TN2207, and TN2464 circuit packs ([S8300/G700](#): and on MM710 Media Modules).

The DS1-CO MO monitors and maintains a CO trunk port on a TN767 DS1 Interface circuit pack, a TN464 UDS1 Interface circuit pack, or on [S8300 / G700](#): MM710 Media Module. Throughout this discussion, the term DS1 applies to all. For more information, see one of the following maintenance objects:

Circuit Pack/Media Module	Maintenance Object
TN767 DS1 Interface Circuit Pack	DS1-BD
TN464 UDS1 Interface Circuit Pack	UDS1-BD
S8300 / G700 : MM710 DS1 Media Module	MG-DS1

The DS1 circuit pack or media module supports low level CO trunk signaling interfaces for both ground-start and loop-start trunks. This maintenance strategy covers the in-line errors log, initialization tests, periodic tests, scheduled tests, demand tests, and alarm resolution.

S8300 / G700

The MM710 supports T1/E1, and delivers the same functionality as the TN464 circuit pack. Although CO-DS1 is provided for G700/G350 Media Gateways, CO-DS1 only partially supports the MM710 DS1 Media Module.

Three trunk service states are specified by DS1 CO trunk maintenance:

- out-of-service The trunk is in a deactivated state and cannot be used for either incoming or outgoing calls.
- in-service The trunk is in an activated state and can be used for both incoming and outgoing calls.
- disconnect
(ready-for-service) The trunk is in an activated state but can only be used for an incoming call.

Error Log Entries and Test to Clear Values

Table 274: DS1 CO Trunk Error Log Entries 2 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1793 (j)					test board location 1
2562 (j)	16665				
2817 (k)	52992				
3840 (l)		Port Audit and Update (#36)			
					2 of 2

1. Major alarms MO may be downgraded to Warning alarms based on the value used in **set options**.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
 - b. **Error Type 1:**
 - Aux Data 57408:** No tip ground is detected on an outgoing call.
 - Aux Data 57487:** PBX could not get "loop close" signal.

If the error occurred on a port of a TN767 DS1 or TN464 UDS1 Interface circuit pack, the circuit pack detected a hardware fault. These errors will cause Dial Tone Test #314 to run and are only considered a problem if the Dial Tone test fails (in which case Error Type 1025 will also show up). In this case, the trunk may be put in the ready-for-service state (shown as "disconnected" by **status**), which allows only incoming calls. Run Dial Tone Test #314, and follow the procedures.

S8300 / G700: If the error occurred on a port of an MM710 DS1 Media Module, Test #314 will abort with Error Code 1412. Escalate the problem.
 - c. **Error Type 15:** software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors (if any).
 - d. **Error Type 18:** the trunk was busied-out to the out-of-service state. No calls can be made on this trunk except Facility Access Test Calls.
 - e. **Error Type 130:** the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack or media module.
 - f. **Error Type 257:** the DS1 Interface circuit pack detects a hardware fault. Aux Data 57392 indicates no external release on PBX disconnect. This alarm will only be raised when the System-Parameter Country screen has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.
- S8300 / G700:** On an MM710 DS1 Media Module, Associated Test #314 will abort with Error Code 1412. Escalate the problem.

Communication Manager Maintenance-Object Repair Procedures

- g. **Error Type 513:** The DS1 Interface circuit pack detects a hardware fault. Aux Data 57393 indicates belated external release on PBX disconnect. This alarm will only be raised when the System-Parameter Country screen has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.

S8300 / G700: On an MM710 DS1 Media Module, Associated Test #314 will abort with Error Code 1412. Escalate the problem.

- h. **Error Type 769:** The DS1 Interface circuit pack or media module detects a hardware fault. The Aux Data contains the following error type:—57484, fault is detected on tip/ring.
- i. **Error Type 1793:** DS1 Interface circuit pack or media module is out-of-service. Look in the Hardware Error Log:

If port is on	Look in
TN767 DS1 Board	DS1-BD
TN464 UDS1 Board	UDS1-BD
S8300 / G700: MM710 DS1 Media Module	MG-DS1

- j. **Error Type 2562:** Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from call processing and is generated when a second attempt (retry) to seize an outgoing trunk fails.
- k. **Error Type 2817:** Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a 2-way trunk from both the near and far ends. Attempt to place the call again. If the error persists, execute the Dial Tone Seizure test (#314), and follow those procedures.

S8300 / G700: If the error occurred on a port of an MM710 DS1 Media Module, Test #314 will abort with Error Code 1412. Escalate the problem.

- l. **Error Type 3840:** Port Audit and Update test (#36) failed due to an internal system error. Enter **status trunk** to verify the status of the trunk. If the trunk is out-of-service, then enter **release trunk** to put it back into in-service. Retry the test command.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order they are presented. By clearing error codes associated with the NPE Crosstalk test (#6), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk test (#6) S8300 / G700 aborts with Error Code 1412		X	ND
Conference Circuit test (#7) S8300 / G700 aborts with Error Code 1412		X	ND
DS1 CO Trunk Seizure test (#314) S8300 / G700 aborts with Error Code 1412	X	X	ND
Port Audit and Update test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

Note:

S8300 / G700: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 275: Test #6 NPE Crosstalk Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 4

Table 275: Test #6 NPE Crosstalk Test 2 of 4

Error Code	Test Result	Description / Recommendation
1000	ABRT	<p>System resources required to run this test were not available. The port may be busy with a valid call.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the trunk group/member number of the port. Use status trunk to determine the service state of the port. If the port is active, wait until it is idle before testing. 2. If the port status is active but the port is idle (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1001	ABRT	<p>System resources required for this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Use status health to determine whether the system is experiencing heavy traffic.</p> <ol style="list-style-type: none"> 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service.</p> <ol style="list-style-type: none"> 1. Enter list measurements tone-receiver to see information about the system's tone receivers. 2. Resolve any TTR-LEV errors. 3. Resolve any TONE-PT errors. 4. If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABRT	<p>The port was seized by a user for a valid call.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the trunk group/member number of the port. Use status trunk to determine the service state of the port. If the port is active, wait until it is idle before testing. 2. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
2 of 4		

Table 275: Test #6 NPE Crosstalk Test 3 of 4

Error Code	Test Result	Description / Recommendation
1020	ABRT	<p>The test did not run due to a previously existing error on the specific port or a more general circuit pack error.</p> <ol style="list-style-type: none"> 1. Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the already existing error.
S8300 G700 1412	ABRT	<p>This test does not execute on a G700 Media Gateway.</p>
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>System resources required for this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2053	ABRT	<p>At least one of the following errors was found on the DS1 circuit pack: Loss of signal (1281), Blue alarm (1793), Red alarm (2049), Yellow alarm (2305), or Hyperactivity (1537).</p> <ol style="list-style-type: none"> 1. Look for the previous error types in the Hardware Error Log, and follow the procedures given in the appropriate DS1-BD or UDS1-BD maintenance documentation for the listed error types.
	FAIL	<p>The NPE of the tested port was found to be transmitting in error. This will cause noisy and unreliable connections.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	<p>The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and examining station, trunk, or external wiring.</p>
3 of 4		

Table 275: Test #6 NPE Crosstalk Test 4 of 4

Error Code	Test Result	Description / Recommendation
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Enter <code>list config</code>, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, enter <code>busyout board location</code> 3. Enter <code>reset board location</code> 4. Enter <code>release board location</code> 5. Enter <code>test board location long</code> <p>This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.</p> <p>Note:</p> <p>Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after entering <code>list config</code> but the <code>Vintage</code> field reports that there is no board (when there really is a board), then <code>busyout board</code> and <code>release board</code> do not work, but <code>reset board location</code> works. The software puts the hyperactive board back in service after the hyperactivity clears.</p>
		4 of 4

Conference Circuit Test (#7)

Note:

S8300 / G700: This test aborts with Error Code 1412.

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

Table 276: Test #7 Conference Circuit Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	<p>System resources required for this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.

Enter <code>test board location long</code> <p>This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.</p> <p>Note:</p> <p>Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing <code>list config</code> but the Vintage field reports that there is no board (when there really is a board), then <code>busyout board</code> and <code>release boards</code> will not work (even though <code>reset board location</code> will work). The software will put the hyperactive board back in service after the hyperactivity clears.</p>
		4 of 4

Port Audit and Update Test (#36)

This test sends port level translation data from switch processor to the DS1 Interface circuit pack or media module to assure that the trunk's translation is correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of trunk.

Table 277: Test #36 Port Audit and Update Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test were not available. The port may be busy with a valid call. 1. Enter display port location to determine the trunk group/member number of the port. Use status trunk to determine the service state of the port. If the port is active, wait until it is idle before testing. 2. If the port status is active but the port is idle (no calls), check the error log for error type 1025. The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1006	ABRT	The DS1 CO trunk is out of service. 1. Use status trunk to verify that the trunk is out of service. 2. If the trunk is out of service, determine why. 3. If it is OK to put the trunk back in service, enter release trunk to put the trunk back in service, and then retry the test.
2000	ABRT	Response to the test was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	Test failed due to internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 277: Test #36 Port Audit and Update Test 2 of 2

Error Code	Test Result	Description / Recommendation
	PASS	<p>Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack or media module and switch software are consistent. If the trunk is busied out, the test will not run but will return PASS. To verify that the trunk is in-service:</p> <ol style="list-style-type: none"> 1. Enter <code>status trunk</code> to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service. 2. Enter <code>release trunk</code> to put the trunk back into in-service. 3. Retry the test command.
0	NO BOARD	<p>The test could not relate the internal ID to the port. This result could be due to incorrect translations, no board inserted, an incorrect board inserted, an insane board inserted, or the board is hyperactive.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Enter <code>list config</code>, and resolve any problems that are found. 2. Enter <code>busyout board location</code> 3. Enter <code>reset board location</code> 4. Enter <code>release board location</code> 5. Enter <code>test board location long</code> <p>This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted. Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing <code>list config</code> but the <code>Vintage</code> field reports that there is no board (when there really is a board), then <code>busyout board</code> and <code>release board</code> do not work, even though <code>reset board</code> does work. The software puts the hyperactive board back in service after the hyperactivity clears.</p>

DS1 CO Dial Tone Seizure Test (#314)

Note:

S8300 / G700: This test aborts with Error Code 1412.

The DS1 CO Dial Tone Seizure test checks the trunk's signaling capability provided by the DS1 Interface circuit pack. The maintenance software initiates the test by sending a "seizure" message to the DS1 Interface circuit pack and expects an "active" reply from the DS1 interface circuit pack. If the "active" message is received, then the test passes. If no message is received and the timer expires, the test is aborted. If the DS1 Interface circuit pack sends a "reorder" message back to maintenance software, then the test fails.

This test cannot be run on a trunk in any of the following conditions:

1. The trunk direction is administered as an incoming only trunk.
2. The trunk has been seized by a normal trunk call.
3. The trunk is administered with maintenance test disabled.
4. **S8300 / G700:** The trunk is on a port of an MM710 DS1 Media Module.

Table 278: Test #314 DS1 CO Dial Tone Seizure Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	The test was aborted because system resources required to run this test were not available. The port may be busy with a valid call. 1. Use display port location to determine the trunk group/member number of the port. Use status trunk to determine the service state of the port. If the port is active, wait until it is idle before testing. 2. If the port status is active but the port is idle (no calls), check the error log for error type 1025. The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
		1 of 4

Table 278: Test #314 DS1 CO Dial Tone Seizure Test 2 of 4

Error Code	Test Result	Description / Recommendation
1004	ABRT	<p>The test was aborted because the port was seized by a user for a valid call.</p> <ol style="list-style-type: none"> 1. Use display port location to determine the trunk group/member number of the port. Use status trunk to determine the service state of the port. If the port is active, wait until it is idle before testing. 2. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1005	ABRT	<p>Test failed due to incompatible configuration administered in trunk group screen.</p> <ol style="list-style-type: none"> 1. Look at the trunk group administration form and see whether the trunk is incoming only, port 24 on a DS1 Interface with common control channel signaling, or an automatic CO type such as FX. Under any of these conditions this is a normal abort.
1018	ABRT	<p>Test is disabled via translation. You may want to determine why the test has been disabled before you enable it.</p> <ol style="list-style-type: none"> 1. Verify that the Maintenance Test field on the Trunk Group screen is n. To enable the test, enter change trunk-group <x> (<x> is the number of the trunk group to be tested). Change the Maintenance Test field on the screen to y. 2. Repeat the test.
1020	ABRT	<p>The DS1 Interface circuit pack is out-of-service.</p> <ol style="list-style-type: none"> 1. Look for DS1-BD/UDS1-BD errors in the Hardware Error Log. If present, see the appropriate DS1-BD/UDS1-BD (DS1/UDS1 Trunk circuit pack). 2. Retry the command.
1040	ABRT	<p>The test was aborted because this port may be an access endpoint.</p> <ol style="list-style-type: none"> 1. Verify that this port is an access endpoint by issuing display port location 2. If the port has been administered as an access endpoint, then this is a normal abort.
		2 of 4

Table 278: Test #314 DS1 CO Dial Tone Seizure Test 3 of 4

Error Code	Test Result	Description / Recommendation
S8300 / G700 1412	ABRT	This test does not execute on a G700 Media Gateway.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2012	ABRT	The test was aborted due to an internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources for this test. 1. Retry the command at 1-minute intervals up to 5 times.
2000	FAIL	Response to the seizure message was not received within the allowable time period. 1. Enter list configuration board location . If the circuit pack is a TN767B vintage 8 or 9, a failure of test 314 causes a subsequent failure of test 7 due to a firmware bug. Eventually, the board and all of its ports will be taken out of service and extraneous on-board alarms will be generated. Replace the circuit pack with a TN767C V3 or later. 2. Verify that the Trunk Type field on the Trunk Administration form matches the trunk type administered on far-end switch. 3. Look for DS1-BD or UDS1-BD errors in the hardware error log. If present, see DS1-BD (DS1 Interface Circuit Pack) on page 953 or UDS1-BD (UDS1 Interface Circuit Pack) on page 2329. 4. Retry the command at 1-minute intervals up to 5 times.
2053	FAIL	At least one of the following errors was found on the DS1 circuit pack: Loss of signal (1281), Blue alarm (1793), Red alarm (2049), Yellow alarm (2305), or Hyperactivity (1537). 1. Look for these error types in the hardware error log, and then follow the procedures given in the maintenance documentation that is appropriate for the error type that was found.
3 of 4		

Table 278: Test #314 DS1 CO Dial Tone Seizure Test 4 of 4

Error Code	Test Result	Description / Recommendation
	FAIL	<p>The trunk cannot be seized for an outgoing call. This could cause in-line failures to be reported against the trunk (no answer would report error type 257 with auxiliary data 57487 in the error log).</p> <ol style="list-style-type: none"> 1. Verify the <code>Trunk Type</code> field on the trunk administration screen matches the trunk type administered on far-end switch. 2. Look for DS1-BD/UDS1-BD errors in Error Log. If present, see DS1-BD (DS1 Interface Circuit Pack) on page 953. 3. Retry the command at 1-minute intervals up to 5 times.
	PASS	<p>The trunk can be seized for an outgoing call.</p>
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Enter <code>list config</code>, and resolve any problems that are found. 2. Enter <code>busyout board location</code> 3. Enter <code>reset board location</code> 4. Enter <code>release board location</code> 5. Enter <code>test board location long</code> <p>This should re-establish the linkage between the internal ID and the port. If not, dispatch to verify that a valid board is inserted.</p> <p>Note:</p> <p>Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing <code>list config</code> but the <code>Vintage</code> field shows that there is no board (when there really is a board), <code>busyout board</code> and <code>release board</code> do not work, even though <code>reset board</code> does work. The software puts the hyperactive board back in service after the hyperactivity clears.</p>
		4 of 4

CO-TRK (Analog CO Trunk)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CO-TRK	MAJ ¹	<code>test port location</code>	Analog CO Trunk
CO-TRK	MIN	<code>test port location</code>	Analog CO Trunk
CO-TRK	WRN	<code>test port location</code>	Analog CO Trunk

1. A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by **set options** and that at least 75% of the trunks in this trunk group are alarmed.

S8700 | 8710 / S8500

For systems supporting circuit packs:

If ATMS testing is enabled, check the error log for ATMS errors 3840 and 3841. If the error log indicates that measurements exceeded acceptable thresholds, and no other trouble is found with `test trunk`, run the ATMS test call with `test analog-testcall port location full`.

Note:

Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end.

Analog CO trunks are 2-wire analog lines to the CO that support both incoming and outgoing calls. CO trunk circuit packs have eight ports, each of which provides an interface between the 2-wire CO line and the 4-wire TDM bus. The system supports the following CO trunk circuit packs:

TN438 TN2138
 TN447 TN2147
 TN465 TN2148
 TN747

S8300 / G700

For systems supporting Media Modules:

Analog CO trunks are 2-wire analog lines to the CO which support both incoming and outgoing calls. CO trunk MM711 Analog Media Modules have eight ports.

Note:

Although the CO-TRK MO is provided for G700 and G350 media gateways, this MO only partially supports the MM711 Analog Media Module.

The following sequences show the interactions between the switch and the CO during call setup for both loop-start and ground-start trunks.

Loop Start Operation

Idle State: Tip = ground, Ring = CO Battery

Outgoing Call:

1. PBX Off-Hook (Seize message): Closes the Tip-Ring Loop
CO response: DC loop current + Dial tone
2. PBX On-Hook (Drop message): Open Tip-Ring loop, no loop current
CO response: CO goes to idle state (see Note)

Incoming Call:

1. CO Applies Ringing Voltage
PBX response: Detect ringing current
2. PBX Off-Hook (Answer message): Close loop
CO response: Trip ringing, provide loop current
3. PBX On-Hook (Drop message): Open Tip-Ring loop, no loop current
CO response: CO goes to idle state

Note:

CO does not normally provide an On-Hook (Disconnect) signal. Exceptions to this rule include Netherlands loop start and UK loop-calling guarded-clearing.

Ground Start Operation

Idle state: Tip = open, Ring = CO Battery

Outgoing Call:

1. PBX Off-Hook (Seize message): Places ground on Ring
CO response: Places ground on Tip
PBX response: Close the loop
CO response: Provide loop current
PBX response: Dial out digits
2. PBX On-Hook first (Drop message): Open the Tip-Ring Loop, no loop current
CO response: Open circuit on Tip
3. CO On-Hook first (Disconnect): Open circuit on Tip, no loop current
PBX response: Open Tip-Ring loop

Incoming Call:

1. CO Off-Hook (Seizure): CO applies ground on Tip and applies ringing voltage to the Ring lead.
PBX response: Make trunk busy for outgoing calls
2. CO Ringing: CO applies ringing voltage to the Ring lead.
PBX response: Detect ringing, ring destination (Attendant, hunt group, etc.)
3. PBX Off-Hook (Answer message): Close loop
CO response: Trip ringing, provide loop current
4. PBX On-Hook first (Drop message): Open the Tip-Ring Loop, no loop current
CO response: Open circuit on Tip
5. CO On-Hook first (Disconnect): Open circuit on Tip, no loop current

Table 279: CO Trunk Error Log Entries 2 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3073 (e)	57376	None			
3329 (e)	57408	None			
3329 (e)	57484	Dial Tone Test (#0)	MAJ MIN WRN	OFF	test port location 1 r 1
3585 (e)	57424	None			
The ATMS Transmission Tests are not supported on the G700/G350, and abort with Error Code 1412.					
3840 (g)	8000	Transmission Tests (ATMS) (#844-848)		OFF	test analog-testcall
3841 (g)		Transmission Tests (ATMS) (#844-848)	MIN	OFF	test analog-testcall
					2 of 2

1. Major alarms may be downgraded to Warning alarms based on the value used in **set options**.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. These are in-line errors that have no specific test associated with them. Numerous Error Types have these errors. Refer to [Table 280: CO Trunk Errors with No Tests](#) on page 814 for an explanation and appropriate action.
- c. **Error Type 15:** software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate associated errors.
- d. **Error Type 130:** the circuit pack has been removed or has been insane for at least 11 minutes. To clear the error, reinsert or replace the circuit pack.
- e. Numerous Error Types have these errors.
 - **Aux data 57345:** Single polarity ringing current
 - **Aux data 57376:** No loop current on incoming call
 - **Aux data 57408:** No tip ground detected on outgoing call
 - **Aux data 57424:** No loop current on outgoing call
 - **Aux data 57484:** No dial tone on outgoing call

These errors will cause Dial Tone Test #0 to run and are only considered a problem if the Dial Tone test fails (in which case Error Type 1537 will also show up). In this case, the trunk may be put in "Ready-for-Service" state (shown as "disconnected" by status command), that allows only incoming calls. Run Dial Tone Test #0, and follow its outlined procedures.

Communication Manager Maintenance-Object Repair Procedures

If error count associated with this error type is very high (i.e., 255) and if Alarm Status on the Hardware Error Report is “n” (not alarmed), then the existence of this error type indicates that, despite the fact that many in-line error messages have been received, every Call Seizure test has passed. Problems at the CO may cause this condition rather than problems with the PBX.

- f. **Error Types 1025/1281:** logged for every version of the CO-TRK/CO-BD. However, no MINOR alarms will be generated for Central Office Trunks [TN747B] with vintages V8 or greater. Any failures received by this test will still be logged as Error type 1025/1281.

Check for the use of MFT/Range extenders. If there are extenders present, and there are no other complaints or maintenance errors against this trunk, then there is a good chance that Test #3 failed due to excessive loop current and may be ignored.

- g. **Error Type 3840:** test calls made by the Automatic Transmission Measurement System (ATMS) returned measurements in the unacceptable range.

Error Type 3841: measurements were in the marginal range. Use `list testcall detail` to examine the specific transmission parameters that are out of spec, and investigate the trunk for that kind of noise. If the noise is acceptable, then the AMTS thresholds administered on the trunk group screen should be changed.

S8300 / G700: The associated tests for these error types do not run on a G700 Media Gateway, and abort with Error Code 1412.

Table 280: CO Trunk Errors with No Tests 1 of 3

Error Type	Aux Data	Error Description and Repair Action
1	57347	Port error. Ringing without ground. This error is detected on an incoming call on a ground-start CO trunk. The CO trunk circuit pack has not detected a Tip ground before ringing current is detected. This may indicate that the ground detector is not working. However, the call will be accepted. Busyout the affected port, and run a long test. Observe the test results. If any tests fail, refer to the description of the tests and the associated error codes. Release the port. If users continue to report troubles, check for other errors and make test calls to determine whether the problem should be referred to the CO.
257	50176	Battery reversal detected. This is usually caused by the CO (often seen with step-by-step and cross-bar offices in connection with outgoing calls). This is detected if the direction of the loop current changes from normal to reverse for at least 40 msec. Could occur if the trunk was just installed and for some reason the Tip and Ring wires were reversed at the PBX. If battery reversals occur during dialing, wrong numbers may result. Refer problem to CO. Ask them to remove the battery reversal option.
1 of 3		

Table 280: CO Trunk Errors with No Tests 2 of 3

Error Type	Aux Data	Error Description and Repair Action
513	57364	Ground detector stuck active. After several occurrences, an on-board minor alarm is generated. Run the short test sequence. If test aborts with Error Code 1000, disconnect Tip and Ring and repeat short test. If test still aborts, replace circuit pack. If test passes, refer problem to CO. If any other error code is received, pursue that problem.
769	57392	CO not releasing after call is dropped from PBX end, or the loop is not open after a disconnect. After several occurrences, an off-board or on-board warning alarm is generated. Refer problem to CO.
2561	57345	Single polarity ringing current. This error results from abnormal ringing current, but does not prevent the incoming call from being accepted. One cause could be that the reverse current detector associated with the port is failing. (Will not be detected by any tests.) Another cause could be that normal current is not detected. In this case, neither incoming nor outgoing calls can be completed, and the dial tone test will also fail. The last cause could be that certain types of noise are present on the CO line during the silent period of ringing. First check for other errors. If the count for this error is very high (255), and every test passes, then either the reverse current detector is defective or the CO line is noisy. If the CO line is suspect, make Tip and Ring observations. If the line is determined to be noisy, refer the problem to the CO. If the reverse current detector is defective, ignore this error.
2817	57360	Ground but no ringing. This error occurs on an incoming call on a ground-start trunk. If ringing is not detected within 5 seconds of the Tip being grounded, the call is still accepted. If the CO is of the No. 5ESS switch type, ringing delays of more than 5 seconds during heavy traffic are fairly common. Check for other errors.
2817	57393	The loop is opening too slowly after a disconnect. This error indicates an on-board problem, although the trunk may be functional. Check for other errors.
3073	57376	No loop current on incoming call. The incoming destination has already answered and no loop current has been detected. If this is a hard fault, the dial tone test and every outgoing call should also fail. Check for other errors.
2 of 3		

Table 280: CO Trunk Errors with No Tests 3 of 3

Error Type	Aux Data	Error Description and Repair Action
3329	57408	<p>Trunk error. No Tip ground detected on outgoing call. This error occurs when an attempt is made to seize a ground-start CO trunk for an outgoing call and Tip ground is not detected or the caller hangs up before Tip ground is detected.</p> <ol style="list-style-type: none"> 1. Busyout the affected port, and run a long test. Observe the test results. If any tests fail, refer to the description of the tests and the associated error codes. Release the port. 2. If users continue to report troubles, check for other errors and make test calls to determine whether the problem should be referred to the CO. Busyout the affected port, and run a long test. If Dial Tone Test #0 passes, ignore this error. Release the port.
3585	57424	<p>No loop current on outgoing call. This error occurs on attempt to seize a loop or ground-start trunk for an outgoing call. An error occurs if loop current is not detected or the caller hangs up before it is detected. Busyout the affected port, and run a long test. If CO Demand Diagnostic Test #3 passes and this error keeps occurring, refer problems to CO. Release the port.</p>
3 of 3		

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with NPE Crosstalk test (#6), you may clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk test (#6) S8300 / G700 aborts with Error Code 1412		X	ND
Dial Tone test (#0)		X	ND
CO Demand Diagnostic test (#3)	X	X	ND
Looparound and Conference test (#33) S8300 / G700 aborts with Error Code 1412		X	ND
1 of 2			

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Audit Update test (#36)	X	X	ND
Transmission test - ATMS (#844-848) S8300 / G700 aborts with Error Code 1412			ND
			2 of 2

1. D = Destructive; ND = Nondestructive

Note:

A Demand Diagnostic test (#3) will always return a PASS indication for CO-TRK/CO-BD [TN747B] version 8 or greater. However, any errors produced as a result of this test will be logged and produce no alarms.

If errors logged by Test #3 are the only complaints against this trunk, then the system technician should check if MFT/Range Extenders are being used. If extenders are present, then there is a good chance that there is excessive loop current, which will cause Test #3 to log errors.

However, all else being normal, these errors should not affect the customer.

Note:

The ATMS tests are not part of either test sequence. They are run either on demand with `test analog-testcall` or by the ATMS schedule.

Dial Tone Test (#0)

This test attempts to seize a port and checks for the return of a dial tone.

Table 281: Test #0 Dial Tone Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.

Enter <code>test board location</code> <p>This should re-establish the linkage between the internal ID and the port.</p>
4 of 4		

CO Demand Diagnostic Test (#3)

For ground start trunks, circuit pack or media module port relays are operated and checks are made to see if the port can detect and apply ground on the Tip lead. This test also verifies that there is no external ground on the Ring lead. In the absence of other failures, the circuit pack or media module should be replaced only if this test fails with the CO line disconnected.

This test also checks the on-board programmable transmission circuits that allow the circuit pack or media module to support transmission characteristics of several different countries.

NPE Crosstalk Test (#6)**Note:**

S8300 / G700: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in approximately 20 to 30 seconds.

4 of 4		

Port Audit Update Test (#36)

This test will send updates of the CO port translation for every port on the circuit pack or media module that has been translated. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack or media module. No response message is expected from the circuit pack or media module once it receives translation updates. The port translation data includes: ground or loop start trunk, tone or rotary dialing trunk, rotary dialing inter-digit timing, network balance R/RC, and disconnect timing.

Table 285: Test #36 Port Audit Update Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1006	ABRT	The port has been placed out of service, perhaps by craft busyout. 1. Use <code>display port location</code> to determine the trunk group/member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the service state indicates that the port is active, wait until it is idle before testing. 2. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
2100	ABRT	System resources required to run this test were not available. 1. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	This test passed. Translation information was successfully updated on the circuit pack or media module. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring. If the trunk is busied out, the test will not run, but will return PASS. To verify that the trunk is in-service: 1. Enter <code>status trunk</code> to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to step 2. 2. Enter <code>release trunk</code> to put trunk back into in-service. 3. Retry the test command.

Transmission Test (#844-848)

This test is nondestructive.

Note:

S8300 / G700 The G700 Media Gateway does not support the Automatic Transmission Measurement System. These tests abort with Error Code 1412.

Note:

Tests #844 – 848 are not supported on an International switch.

These tests are run by the ATMS (Automatic Transmission Measurement System). They are not part of the long or short trunk test sequences. Instead, they are run on demand with `test analog-testcall` or as part of ATMS scheduled testing. For more information, see [Automatic Transmission Measurement System](#) in Maintenance Procedures (03-300192).

The test call is run from an analog port on a TN771 Maintenance/Test circuit pack. It attempts to seize a port and make a call to a TTL (terminating test line) on the trunk's far end. Transmission performance measurements are made and compared to administered thresholds. Errors are generated when results fall outside of "marginal" or "unacceptable" thresholds. Detail and summary measurement reports are obtainable via `list testcalls`.

Table 286: Test #844-848 Transmission Test 1 of 4

Error Code	Test Result	Description / Recommendation

Table 286: Test #844-848 Transmission Test 4 of 4

Error Code	Test Result	Description / Recommendation
1947	ABRT	Noise with tone self check failed. 1. Test the TN771 circuit packs or.
2000	ABRT	The test timed out while waiting for a response from the TN771 circuit pack. Retry the command at 1-minute intervals up to 5 times.
2012	ABRT	An internal software error occurred. 1. Retry the command at 1-minute intervals up to 5 times.
2053	ABRT	The test call could not be established, but an explanation is unavailable. 1. Retry the command at 1-minute intervals up to 5 times.
2056	ABRT	An error occurred while trying to obtain results from the TN771 circuit pack. Test the TN771 circuit packs.
	FAIL	Measured transmission performance was in the unacceptable range as administered on the trunk group screen. Retrieve a measurement report via list testcalls . Make sure that ATMS thresholds are set properly on page 4 of the trunk group screen. Besides the facility, test failures can be caused by faulty test lines or switch paths. If the measurements point to a facility problem, report the results to the trunk vendor.
8000	FAIL	Measured transmission performance was in the marginal range as administered on the trunk group screen. This generally means that the trunk is usable but has an undesirable amount of noise or loss. If the user does not report unacceptable effects, it may not be necessary to take any action. Retrieve a measurement report via list testcalls . Make sure that ATMS thresholds are set properly on page 4 of the trunk group screen.
4 of 4		

CONFIG (System Configuration)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
CONFIG	none	none	System Configuration

The System Configuration MO oversees logical insertion and removal of circuit packs in the system. When Switch Control detects that a circuit pack is present in a port slot, it informs System Configuration and System Configuration queries the circuit pack to determine the type and vintage of the circuit pack. Similarly, when Switch Control detects that a circuit pack has been removed from a port slot, it informs System Configuration.

There are no alarms or tests for System Configuration, but three types of errors are logged to the Hardware Error Log.

Error Log Entries and Test to Clear Values

Table 287: System Configuration Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	none	none	N/A	none
1–119 (b)	0–21	none			
257 (c)		none	MAJ		
1001–1119 (d)	0–21	none			

Notes:

- a. This error should not occur. It indicates that an attempt was made by software to raise an alarm against CONFIG without first logging a CONFIG error.
- b. **Error Types 1-119:** a port circuit pack in the system did not respond to a circuit pack type inquiry. Follow the procedures outlined in (c) to determine whether there is an error.
- c. **Error Type 257:** less than 25% of trunk group is available.

d. **Error Types 1001 - 1119:** a port circuit pack in the system did not respond to a vintage inquiry.

As a result of any of these errors, a port circuit pack may be physically inserted in a port slot, but the system may not recognize its existence. The `Aux Data` field specifies the circuit pack's port-network number as indicated in the following table.

Converting Aux Data to Port-Network Number

Aux Data	Port-Network Number
0	1
1	2
2	3
3	4
4	5

1 of 2

Converting Aux Data to Port-Network Number

Aux Data	Port-Network Number
21	22

2 of 2

The **Error Type** field specifies the carrier and slot location of the circuit pack that caused the error as indicated in [Table 288: Converting Error Types To Carrier Locations](#) on page 838. If the **Error Type** is greater than 1000, subtract 1000 from the **Error Type** field before consulting the table.

S8700 MC: Before proceeding, if multiple CONFIG errors are simultaneously logged with an Aux Data of 1, investigate any EXP-INTF (Expansion Interface) errors.

Once the port's circuit-pack location has been determined from [Table 288: Converting Error Types To Carrier Locations](#) on page 838, use `list configuration all` to determine whether the circuit pack is inserted. If the circuit pack has already been inserted but the error persists, replace the circuit pack. If not, insert the pack.

Notes:

- a. **Error Types 1, 23, 25, 25, 26, 32, 33, 55, 64, 65, 87, 96, 97, 119** do not represent physical port circuit pack slots and are not logged against CONFIG..
- b. If **Error Type 28** occurs in a PN, it refers to the circuit pack in slot A01.
- c. If **Error Type 61** occurs in a PN, it refers to the circuit pack in slot A10.
- d. **Error Type 22, 54, 86, 118**: Slots B00, C00, D00, and E00 refer to the *Service Slots* in the B, C, D, and E carriers.
- e. **Error Type 27**: In a PN's A carrier, slot A00 is the Tone Generator's slot.

CUST-ALM (Customer-Provided Alarming Device)

S8700 | 8710 / S8500

See [MAINT \(PN's Maintenance Circuit Pack\)](#) on page 1458 for information about this maintenance object.

DAT-LINE (Data Line Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DAT-LINE	MIN	<code>test port location 1</code>	Data Line port
DAT-LINE	WRN	<code>test port location 1</code>	Data Line port

The TN726 Data Line circuit pack has eight ports, each of which supports an RS-232 interface to asynchronous CPE (customer-premises equipment). Each of these ports and the equipment connected to it constitute a data line. For DT-LN-BD (Data Line circuit pack) errors, see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494. Check circuit pack-level errors first since the usability of the ports depend on the health of the circuit pack.

Use `add data-module` to administer data line ports at the terminal. The data module type is *data-line*. The `list data-module` command shows every administered data module in the system.

The TN750 Announcement circuit pack has one data line-type port on it. This data line port is used for saving and restoring announcements. This data line port is not supported on the S8500 and S8700 media server products. For a description of and repair instructions for the TN750, see [ANL-BD \(Analog Line Circuit Pack\)](#) on page 386.

Note:

If the tests for the data line port in question pass, and user-reported complaints persist, there is probably an external problem. Test the ADU (asynchronous data unit), using the procedures in [User Manual Z3A Asynchronous Data Unit, 555-401-701](#). If the ADU appears to be working properly, check the external wiring, then check the equipment.

Error Log Entries and Test to Clear Values

Table 289: Data Line Port Error Log Entries 1 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location sh r 1</code>
1		Digital Looparound test (#171)	MIN	ON	<code>test port location s r 2</code>
					1 of 2

Table 289: Data Line Port Error Log Entries 2 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
15 (b)	Any	Audit Update test (#36)			
18	0	<i>busyout port location</i>	WRN	OFF	<i>rel port location</i>
130 (c)		None	WRN	ON	<i>test port location sh</i>
257		Conference Circuit test (#7)	MIN	ON	<i>test port location 1 r 2</i>
513		NPE Crosstalk test (#6)	MIN	ON	<i>test port location 1 r 2</i>
769 (d)	40983	None			
					2 of 2

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test’s description, and follow its recommended procedures.
- b. **Error Type 15:** This is a software audit error that does not indicate any hardware malfunction. Run the short test sequence, and investigate errors.
- c. **Error Type 130:** the circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, reseal or replace the circuit pack.
- d. **Error Type 769:** the data line circuit pack found an error in the transmit/receive circuitry of an administered data line when the circuit pack was inserted. Perform the following:
 - 1. Enter *busyout board location* for the circuit pack on which the port resides.
 - 2. Enter *reset board location*. Check the Error Log to determine whether Error Type #769 is logged again for DAT-LINE. Verify that the **Active Alarms Only** field is **n**.
If Error Type #769 reappears, replace the data line circuit pack. If not, proceed to Step [3](#).
 - 3. Enter *release board location*.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Digital Looparound test, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Digital Looparound test (#171)	X	X	ND
NPE Crosstalk test (#6)		X	ND
Conference Circuit test (#7)		X	ND
Audit Update test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 290: Test #6 NPE Crosstalk Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run test are not available. The port may be in use on a valid call. Use <code>status data-module</code> to determine when the port is available for testing. 1. Retry the command at 1-minute intervals up to 5 times.
1001	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1 of 2		

Table 290: Test #6 NPE Crosstalk Test 2 of 2

Error Code	Test Result	Description / Recommendation
1002	ABRT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. Resolve any TDM-BUS errors. 2. If the system is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present, or some tone detectors may be out-of-service.</p> <ol style="list-style-type: none"> 1. Resolve any TTR-LEV and TONE-PT errors. 2. If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1004	ABRT	<p>The port was in use on a valid call.</p> <ol style="list-style-type: none"> 1. Determine whether the port is available for testing (status data-module). 2. When available, retry the command at 1-minute intervals up to 5 times.
1020	ABRT	<p>An existing Error Type 769 on this port prevented the test from running.</p> <ol style="list-style-type: none"> 1. Follow the procedures for Error Type 769.
2000	ABRT	<p>Response to the test command was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	<p>The NPE of the tested port was transmitting in error, which can cause noisy and unreliable connections.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	<p>The port is correctly using its allocated time slots.</p> <ol style="list-style-type: none"> 1. Investigate user-reported troubles on this port using other port tests and examining the ADU, external wiring, and customer equipment.
2 of 2		

Conference Circuit Test (#7)

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a tone detector port. If the level of the tone is within a certain range, the test passes.

Table 291: Test #7 Conference Circuit Test

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be in use on a valid call. Use status data-module to determine when the port is available for testing.
1004	ABRT	The port has been seized by a user for a valid call. Use status data-module to determine when the port is available for testing. 1. Retry the command at 1-minute intervals up to 5 times.
1020	ABRT	An existing Error Type #769 on this port prevented the test from running. 1. Follow the procedure following the Error Log Table for Error Type #769.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	The conference circuit test failed (possible off-board problem). 1. Busyout and release the port (data line), and then retest. 2. Replace the circuit pack if the test continues to fail.
	PASS	The port can correctly conference multiple connections. Investigate user-reported troubles on this port using other port tests and examining the ADU, external wiring, and customer equipment.

Audit Update Test (#36)

This audit verifies that the hardware state of the data line is consistent with the system translations. The audit queries the port for the switchhook state, the software state is updated according to the returned value. Also, the audit data line options down to the port.

Table 292: Test #36 Audit Update Test

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals up to 5 times. 2. Escalate the problem if the test continues to abort.
1006	ABRT	An existing Error Type #769 on this port prevented the test from running. 1. Follow the procedure following the Error Log Table for Error Type #769.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	ABRT	Internal system error 1. Try the command again at 1-minute intervals up to 5 times.
7	FAIL	Internal system error 1. Try the command again at 1-minute intervals up to 5 times.
	PASS	The hardware port state is consistent with the software state. Investigate user-reported troubles on this port using other port tests and examining the ADU, external wiring, and customer equipment.

Digital Loop-Around Test (#171)

The Digital Looparound test checks the data line port's ability to transmit and receive data on the TDM Bus. Data is sent through an available Maintenance/Test digital port over the TDM Bus, internally looped through the data line port back onto the TDM Bus, and received again by the same Maintenance/Test digital port.

Only one of the two digital ports on a Maintenance/Test circuit pack is used for this test, and that port must be the first such port; such as port 02. If port 02 is in use, out-of-service, or not present, the test aborts. This test may fail if the Maintenance/Test digital port used by the test is not functioning properly. If there are any M/T-DIG errors in the Error Log, see [M/T-BD \(Maintenance/Test Circuit Pack\)](#) on page 1663 to clear them first.

This test will pass regardless of any customer equipment that may be connected to the port, as long as the equipment is not using the port.

Table 293: Test #171 Digital Loop-Around Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run test are not available. The port may be in use on a valid call. Use <code>status data-module</code> to determine when the port is available for testing. 1. Retry the command at 1-minute intervals up to 5 times.
1005 1007	ABRT	Data Channel 3 is not administered. This port is required to run this test. 1. Verify that data channel 3 is not administered with <code>list data-module</code> . Administer data channel 3 with <code>add data-module</code> , and run this test again.
1016	ABRT	Data Channel 3 is busy. The port may be in use on a valid call. Use <code>status data-module</code> to determine when the port is available for testing. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1020	ABRT	An existing Error Type #769 on this port prevented the test from running. 1. Follow the procedure following the Error Log Table for Error Type #769.
1 of 4		

Table 293: Test #171 Digital Loop-Around Test 2 of 4

Error Code	Test Result	Description / Recommendation
1042	ABRT	<p>Port under test is a TTI port and has only default translations with no assigned extension. The executed test requires an assigned extension associated with the port being tested. Therefore, this test cannot successfully execute.</p> <ol style="list-style-type: none"> 1. If there is a need to execute the test on this particular port, then the tester must ensure that the port is fully translated such that the port has an assigned extension.
1180	ABRT	<p>There is no Maintenance/Test circuit pack digital port available to carry out the test.</p> <ol style="list-style-type: none"> 1. Check to see if the Maintenance/Test digital ports are present. (Enter <code>list config</code>; ports 02 and 03 should show). 2. If the digital ports (02 and 03) on the Maintenance/ Test circuit pack are not present, see M/T-BD (Maintenance/Test Circuit Pack) on page 1663. 3. If the digital ports are present, retry the command at 1-minute intervals up to 5 times.
1181	ABRT	<p>No time-slots available to connect digital ports for the test.</p>
1182	ABRT	<p>Internal system error. Failed to connect the digital ports with time-slots.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1340	ABRT	<p>No Maintenance/Test digital port is currently available to perform this test.</p> <ol style="list-style-type: none"> 1. Use <code>list config</code> to determine whether any Maintenance/Test digital ports (ports 02 and 03 on the Maintenance/Test circuit pack) are present in the system. At least one Maintenance/Test circuit pack must be present in PN 1 of the system. There should be at least two such ports present. If the ports are present, proceed to step 2. Otherwise, determine why no ports appear in the <code>list config</code> display. Refer to “M/T-DIG” and “M/T-BD”. 2. Look for M/T-DIG errors in the Error Log. If present, see M/T-DIG (Maintenance/Test Digital Port) on page 1667. 3. If the ports are present and no errors are logged against them, retry the command at 1-minute intervals up to 5 times. 4. If the test continues to abort, replace the Maintenance/Test circuit pack.
		2 of 4

Table 293: Test #171 Digital Loop-Around Test 3 of 4

Error Code	Test Result	Description / Recommendation
1392	ABRT	<p>This port is currently a TTI port and the test will not execute on it.</p> <ol style="list-style-type: none"> 1. Verify that the port is a TTI port using either <code>display port</code> (the display shows that the port is a TTI port) or <code>list config</code> (the display shows a "t" for the port). 2. If either <code>list config</code> or <code>display port</code> indicates that the port is not a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct for the test, and no action is necessary.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. Escalate the problem if the test continues to abort.
2003	ABRT	<p>Failed to receive an off-hook from the Data Line.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
2004	ABRT	<p>Off hook was not received from the data line device.</p> <ol style="list-style-type: none"> 1. Busyout the digital port being tested on the data line circuit pack. Retry the command at 1-minute intervals up to 5 times. 2. If the test still aborts, replace the circuit pack.
2005	ABRT	<p>The handshake between the Maintenance/Test circuit pack digital port and the data line port failed.</p> <ol style="list-style-type: none"> 1. Resolve any M/T-DIG errors. 2. Retry the command at 1-minute intervals up to 5 times. 3. If the test still aborts, replace the data line circuit pack.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
2312	ABRT	<p>Test did not finish, did not receive loop back data.</p> <ol style="list-style-type: none"> 1. Resolve any M/T-DIG errors. 2. Retry the test, if still aborts, replace the Data Line circuit pack.
3 of 4		

Table 293: Test #171 Digital Loop-Around Test 4 of 4

Error Code	Test Result	Description / Recommendation
2313	ABRT	<p>Failed to receive a response from the Maintenance/Test digital port.</p> <ol style="list-style-type: none"> 1. Resolve any M/T-DIG errors. 2. Retry the command at 1-minute intervals up to 5 times. 3. If the test continues to abort, replace the Maintenance/Test circuit pack.
2314	ABRT	<p>Data line port did not respond to downlinked message.</p> <ol style="list-style-type: none"> 1. Busyout the digital port being tested on the data line circuit pack. Retry the command at 1-minute intervals up to 5 times. 2. If the test still aborts, replace the circuit pack.
2500	ABRT	<p>Internal system error.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2000	FAIL	<p>The test failed waiting for the transmitted data to be looped back.</p> <ol style="list-style-type: none"> 1. Look for DATA-CHL errors in the Error Log. If present, refer to DATA-BD (Data Channel Processor circuit pack) Maintenance documentation. 2. Repeat this test. 3. If the test fails again, replace the Data Line circuit pack.
	FAIL	<p>The test failed because the data received did not match the data sent. This would indicate that there is a fault somewhere in the transmit/receive path to the TDM Bus, which will probably result in data corruption over this port. This test may fail if the Maintenance/Test digital port used by the test is not functioning properly.</p> <ol style="list-style-type: none"> 1. Resolve any M/T-DIG errors. 2. Repeat Test #171. 3. If the test fails again, replace the data line circuit pack.
	PASS	<p>The port can correctly transmit/receive data. Investigate user-reported troubles on this port using other port tests and examining the ADU, external wiring, and customer equipment.</p>
4 of 4		

DC-POWER (Single-Carrier Cabinet Environment)

S8700 MC only

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DC-POWER	MAJ	<code>test environment UU</code> (UU is the universal cabinet number in the PORT field of the alarm log)	Single-Carrier Cabinet Environment

The S8700 Sever in a Multi-Connect configuration supports two different cabinet types: multicarrier and single-carrier. Single-carrier cabinets are used only for PNs. Both cabinet types may be powered by either AC or DC external power source. Environmental maintenance differs according to cabinet type and external power supply. Refer to the following table to determine which MO documentation to use for environmental maintenance.

Cabinet Type	Power Source	Environmental Maintenance Objects
Single-carrier (PN)	AC or DC	DC-POWER (all environmental maintenance)
Multicarrier	AC	AC-POWER for AC-powered systems (external power source) POWER for AC-powered systems (battery backup) CARR-POW (carrier port power supply) CABINET (temperature and fan sensors)
Multicarrier	DC	CARR-POW (carrier port power supply) CABINET (temperature and fan sensors)

The DC-POWER MO represents all environmental maintenance for single-carrier cabinets, whether the external power supply is AC or DC. This includes the external power supply and every Carrier Port Power Supply in an PN composed of a single-carrier cabinet stack. A Carrier Port Power Supply provides +5, -5, and/or -48 Volts DC to the circuit packs on the carrier. The following power supplies are used:

WP-91153 Accepts AC power input

676B Accepts DC power input

Each power unit has one amber LED. A lit LED signifies normal operation. An unlit LED signifies a loss of external power to the cabinet, or a fault in the power unit. When hardware detects a problem with any of these components, it reports the information to the system software through a single lead. System software does not differentiate between different environmental failures. Since several environmental elements of single-carrier cabinets are logged against the DC-POWER MO, it is possible to have a DC-POWER alarm while there is still power to the system.

Communication Manager Maintenance-Object Repair Procedures

If a Carrier Port Power Supply is physically removed from a carrier in a single-carrier cabinet, there will not be a DC-POWER alarm. DC-POWER maintenance cannot distinguish between removal of the power supply and the physical absence of the cabinet.

There is a nominal power holdover of .25 second in an PN single-carrier cabinet.

Hardware Error Log Entries and Test to Clear Values

Table 294: Single-Carrier Cabinet Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value ¹
0 ²	0	Any	Any	Any	test environment UU
513	0 or 1	Single-Carrier Cabinet Power Query Test (#79) on page 857	MAJ	ON	test environment UU r 2

1. UU is the universal cabinet number indicated in the PORT field of the Alarm Log.

2. Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description and recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Single-Carrier Cabinet Power Query test, you may also clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Single-Carrier Cabinet Power Query test (#79)	X	X	ND
Emergency Transfer Query test (#124) (a)	X	X	ND
External Alarm Lead Query test (#120) (b)	X	X	ND
Analog Ring Generator Initialization test (#117) (c)	X	X	ND
Analog Ring Generator Query test (#118) (c)	X	X	ND

1. D = Destructive; ND = Nondestructive

Notes:

- a. See [EMG-XFER \(Emergency Transfer\)](#) on page 1108 for a description.
- b. See [EXT-DEV ADMIN? Y \(External Device Alarm\)](#) on page 1213 for a description.
- c. See [RING-GEN \(Analog Ring Generator\)](#) on page 1900 for a description.

Single-Carrier Cabinet Power Query Test (#79)

This test queries an PN's Maintenance circuit pack about the power's status in a single-carrier cabinet PN. This test can only detect power problems in the carriers of the PN where the Carrier Port Power Supply physically resides.

Table 295: Test #79 Single-Carrier Cabinet Power Query Test 1 of 2

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to ABORT with a 2000 error code, check for and resolve every MAINT (Maintenance circuit pack) error. Repeat the test. 3. If the test still aborts with this error code, escalate the problem.
2029 2319 2320 2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 295: Test #79 Single-Carrier Cabinet Power Query Test 2 of 2

Error Code	Test Result	Description / Recommendation
1	FAIL	<p>There is currently a problem with the environment of the power system.</p> <ol style="list-style-type: none"> 1. The power supply to any one of the carriers may have been lost. <ol style="list-style-type: none"> a. Verify, and if necessary restore, AC power at the wall outlet for each carrier. b. Rerun the test. If the test still fails, proceed to step 2. 2. One of the WP-91153 or 676-B power units for one of the carriers could be defective. <ol style="list-style-type: none"> a. If the yellow status LED on a WP-91153 or 676-B power unit is off, replace the power unit. See Chapter 12: Component replacement in Maintenance Procedures (03-300192). b. Rerun the test. If the test still fails, proceed with Step 3. 3. The PN's MAINT (Maintenance circuit pack) could be incorrectly reporting this error. Resolve every alarm on these MOs, and rerun the test. There are failures that can occur on the PN's Maintenance circuit pack that will not be detected by their respective maintenance, but that will cause many, if not all, environment tests to fail. If more than two environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If the test still fails, follow normal escalation procedures.
	PASS	The PN's MAINT (Maintenance circuit pack) has reported no problem with the power.
2 of 2		

DETR-BD (Tone Detector Circuit)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DETR-BD	MIN	<code>test board location</code>	Tone Detector circuit
DETR-BD	WRN	<code>test board location</code>	Tone Detector circuit

For proper tone detection, the companding mode administered for the system must match that of the DETR-BD circuit. The companding mode is administered on the `location-parameters` screen.

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for DETR-BD (Tone Detector circuit) errors.

DID-BD (Direct Inward Dial Trunk Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DID-BD	MIN	<code>test board location sh</code>	Direct Inward Dial Trunk circuit pack
DID-BD	WRN	<code>test board location sh</code>	Direct Inward Dial Trunk circuit pack

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for circuit pack-level errors. See [DID-TRK \(Direct Inward Dial Trunk\)](#) on page 873 for related trunk information.

DID-DS1 (Direct Inward Dial Trunk)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DID-DS1	MAJ ¹	<code>test trunk grp#/mem# long</code>	Direct Inward Dial Trunk
DID-DS1	MIN	<code>test trunk grp#/mem# long</code>	Direct Inward Dial Trunk
DID-DS1	WRN	<code>test trunk grp#/mem#</code>	Direct Inward Dial Trunk

1. A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by `set options` and that at least 75 percent of the trunks in this trunk group are alarmed.

The DID-DS1 trunk provides a digital Direct Inward Dial (DID) trunk from a CO switch to the system through a DS1 link. A 24-channel DS1 link can support up to 24 DID-DS1 trunk calls simultaneously. A 32-channel link can support up to 30.

A DID-DS1 trunk can be used for digitized voice and data communications with DS1 signaling mode (for example, common-channel signaling). The TN767 and TN464 series circuit packs, and the MM710 Media Module, support wink-start and immediate-start trunks and Avaya™ Communication Manager signaling. Throughout this section, the term DS1 applies to all. For more information, see one of the following maintenance objects:

Circuit Pack/Media Module	Maintenance Object
TN767 DS1 Interface Circuit Pack	DS1-BD
TN464 UDS1 Interface Circuit Pack	UDS1-BD
S8300 / G700 MM710 DS1 Media Module	MG-DS1

S8300 / G700 Although the DID-DS1 MO is provided for a G700 Media Gateway, the DID-DS1 only partially supports the MM710 DS1 Media Module.

Information included in this section covers the in-line errors log, initialization tests, periodic tests, scheduled tests, system technician demand tests, and alarms escalation and elimination. Two trunk service states are specified in the DID-DS1 trunk maintenance:

- out-of-service The trunk is in a deactivated state and cannot be used for incoming calls.
- in-service The trunk is in an activated state and can be used for incoming calls.

If a DS1 is out-of-service, then every trunk on the circuit pack or media module is put into the out-of-service state, and a Warning alarm is raised.

Error Log Entries and Test to Clear Values

Table 296: DID-DS1 Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test trunk grp#/mem#</code>
1 (b)	Any				
15 (c)	Any	Port Audit and Update test (#36)			
18 (d)			WRN	OFF	<code>release trunk grp#/mem#</code>
130 (e)		None	WRN	ON	<code>test trunk grp#/mem#</code>
257 (f)	57474 57473				
513 (g)	57392		MAJ MIN ¹		
769 (h)	57393		MAJ MIN ₁		
1281		Conference Circuit test (#7)	MIN WRN ²	ON	<code>test trunk grp#/mem# l r 4</code>
1537		NPE Crosstalk test (#6)	MIN WRN ₂	ON	<code>test trunk grp#/mem# l r 3</code>
1793 (i)					<code>test board location 1</code>
2305 (j)	50944	None	MAJ MIN ₁	OFF	
3840 (k)		Port Audit and Update test (#36)			

1. This alarm is raised only when the Base Tone Generator field is 4 (Italy) on the System-Parameter Country screen. This alarm is a MINOR alarm unless 75% or more trunks in this trunk group are out of service, when the alarm is upgraded to a MAJOR alarm.

2. Major alarms may be downgraded to Warning alarms based on the value used in `set options`.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.
- b. **Error Type 1:** DS1 Interface circuit pack or media module detects a hardware error on the DS1 DID trunk. The `Aux Data` field indicates the following:

- 57476 On-hook before wink
- 57477 On-hook before ready to receive digits
- 57485 Wink too short for valid signal

Maintenance does not start any testing or generate any alarms in response to these errors.

- c. **Error Type 15** is a software audit error that does not indicate hardware malfunction. Run short test sequence, and investigate any errors.
- d. **Error Type 18:** The trunk has been taken out of service by a demand busyout. No calls can be made on this trunk.
- e. **Error Type 130** indicates that the circuit pack or media module has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack or media module.
- f. **Error Type 257:** DS1 Interface circuit pack or media module detects a hardware error on the DS1 DID trunk. The `Aux Data` field indicate the source of the error:

- 57474 Rotary dial rate above 12 pulses per second
- 57473 Rotary dial rate below 8 pulses per second

- g. **Error Type 513:** DS1 Interface circuit pack or media module detects a hardware error on the DS1 DID trunk. `Aux Data 57392` indicates no external release on PBX disconnect.
- h. **Error Type 769:** DS1 Interface circuit pack or media module detects a hardware error on the DS1 DID trunk. `Aux Data 57393` indicates belated external release on PBX disconnect.
- i. **Error Type 1793:** DS1 Interface circuit pack or media module is out-of-service. Look in the Hardware Error Log:

If port is on	Look in
TN767 DS1 Board	DS1-BD
TN464 UDS1 Board	UDS1-BD
S8300 / G700: MM710 DS1 Media Module	MG-DS1

- j. **Error Type 2305** indicates that a signaling change was detected by the PBX trunk circuit pack or media module which is inconsistent with the present state of the trunk.
- k. **Error Type 3840:** Port Audit and Update test (#36) failed due to an internal system error. Enter `status trunk` to verify the status of the trunk. If the trunk is out-of-service, enter `release trunk` to put it back to in-service. Retry the test command.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order they are presented. By clearing error codes associated with NPE Crosstalk, you may also clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk test (#6) S8300 / G700 Test aborts with Error Code 1412.		X	ND
Conference Circuit test (#7) S8300 / G700: Test aborts with Error Code 1412.		X	ND
Port Audit and Update test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

Note:

S8300 / G700: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 297: Test #6 NPE Crosstalk Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.

If the board was found to be correctly inserted in step 1, enter busyout board location 3. Enter reset board location 4. Enter release board location 5. Enter test board location long <p>This should re-establish the link between the internal ID and the port. If not, check to see that there is a valid board inserted.</p>
4 of 4		

Port Audit and Update Test (#36)

This test sends port-level translation data from the switch processor to the DS1 Interface circuit pack or media module to assure that a trunk's translations are correct. The port audit operation verifies the consistency of the current state of the trunk as kept in the DS1 Interface circuit pack or media module and in switch software.

Table 299: Test #36 Port Audit and Update Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	The port may be busy with a valid call. 1. Enter <code>display port location</code> to determine the trunk group/member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the port is in use, wait until it is idle before testing. 2. If the port status is active but the port is idle (no calls), check the error log for Error Type #1025. The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1006	ABRT	The test was aborted because the trunk is out of service. 1. Use <code>status trunk</code> to verify that the trunk is out of service. 2. If the trunk is out of service, determine why. 3. To put the trunk back in service, enter <code>release trunk</code> . Retry the test.
2000	ABRT	Response to the test was not received in the allowable time period. 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	Test failed due to internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 299: Test #36 Port Audit and Update Test 2 of 2

Error Code	Test Result	Description / Recommendation
	PASS	<p>Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack media module and switch software are consistent. If the trunk is busied out, the test will not run but will return PASS. To verify that the trunk is in-service:</p> <ol style="list-style-type: none"> 1. Enter status trunk to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service. 2. Enter release trunk to put the trunk back into in-service. 3. Retry the test command.
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, enter busyout board location 3. Enter reset board location 4. Enter release board location 5. Enter test board location long <p>This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.</p>

DID-TRK (Direct Inward Dial Trunk)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DID-TRK	MAJ ¹	<code>test port location 1</code>	DID Trunk
DID-TRK	MIN	<code>test port location 1</code>	DID Trunk
DID-TRK	WRN	None	DID Trunk

1. A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by `set options` and that at least 75 percent of the trunks in this trunk group are alarmed.

Note:

Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end. Refer to *Administrator's Guide for Avaya Communication Manager, 555-233-506*, for information about how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

Direct Inward Dial (DID) trunks coming from the Central Office (CO) allow outside parties to call directly to an extension in the system. DID Trunk circuit packs include:

TN753	United States
TN2146	Belgium and the Netherlands
TN2139	Italy
TN 436	Australia
TN459	United Kingdom

DID trunk circuit packs and the MM711 Media Module support eight incoming-only ports. Each port provides an interface between the 2-wire analog CO line and the 4-wire TDM bus on the switch.

S8300 / G700 Although the DID-TRK MO is provided for a G700/G350 Media Gateway, this MO only partially supports the MM711 Analog Media Module.

DID Trunk Operation

The DID port receives three to seven digits from the CO that are used to directly connect an outside caller to the called station without assistance from an attendant. For each call, the CO switch signals the system by opening and closing individual DID loops (one of the eight ports), causing the starting or stopping of loop current.

DID Trunk Testing

The system uses technician-invoked tests of on-board circuitry to diagnose the health of the trunk. These are described in the following sections. Additionally, in-line testing which can generate errors, is performed while a call is in progress. See the Error Log table for a description of these errors. These errors may be reproduced by placing a call on the trunk and checking the Hardware Error Log.

Problems detected during signaling may be caused by off-board faults in the CO switch or connections for which a Warning alarm is raised.

Before a maintenance test can be run on a port, the port must be idle. If an incoming call seizes a port that is being tested, the test will abort and the incoming call will proceed.

For transmission and signaling standard specification, refer to [Digital PBX Standards, RS4648](#).

Ports Out-of-Service without Errors or Alarms

A common trouble on DID trunks that produces no errors or alarms occurs when the CO busies out (disconnects) the port. This situation occurs when the CO thinks there are problems with the DID port. In this case, no incoming calls will be possible through this port. This may result in complaints from outside callers trying unsuccessfully to call in. This problem can be diagnosed by listing measurements on lightly used trunks. If a particular port is detected as idle, a call to the CO will be necessary to get the connection back in service.

					2 of 2

1. Major alarms may be downgraded to Warning alarms based on the value used in **set options**.

Communication Manager Maintenance-Object Repair Procedures

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence.
- b. **Error Type 1; Aux Data - Any** occurs when the tone detector times out waiting for digits. Change wink/immediate-start parameter to wink/immediate-start and rotary/tone-dial parameters.
 1. Verify trunk administered wink/immediate-start parameter.
 2. Test trunk using BUTT set.
 3. Refer problem to CO.
- c. **Error Type 1; Aux Data - 57476:** Rotary dial before wink occurs when the CO starts dialing before the PBX sends wink on a wink-start trunk.
 1. Verify trunk administered wink/immediate-start parameter.
 2. Refer problem to CO.
- d. **Error Type 1; Aux Data - 57477:** Rotary dial too early occurs when the CO starts dialing too soon after seizure on an immediate-start trunk.
 1. Verify trunk administered wink/immediate-start parameter.
 2. Refer problem to CO.
- e. **Error Type 1; Aux Data - 57483:** Rotary dial pulse during wink occurs when the CO sends rotary dial digits too soon after seizure on a wink-start trunk.
 1. Verify trunk administered wink/immediate-start parameter.
 2. Refer problem to CO.
- f. **Error Type 15** is a software audit error that does not indicate a hardware malfunction. Run short test sequence, and investigate any associated errors.
- g. **Error Type 130** indicates that the circuit pack or media module has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack or media module.
- h. **Error Type 257; Aux Data - 57472:** Rotary dial pulse on-hook longer than 105 msec, the break between rotary pulses is too long.
 1. Test trunk by performing an incoming test call.
 2. Refer problem to CO.
- i. **Error Type 257; Aux Data - 57473:** Rotary dial rate below 8 pulses/sec, more than 135 msec between two successive breaks.
 1. Verify trunk administered interdigit-timing parameters.
 2. Refer problem to CO.

- j. **Error Type 257; Aux Data - 57474:** Rotary dial rate above 12 pulses/sec, less than 75 msec between two successive breaks.
 1. Verify trunk administered interdigit-timing parameters.
 2. Refer problem to CO.
- k. **Error Type 257; Aux Data - 57475:** Digit detection, CO is starting new rotary dial digit within 150 msec of previous digit.
 1. Verify trunk administered interdigit timing parameters.
 2. Refer problem to CO.
- l. **Error Type 513; Aux Data - 57392:** Loop current active, CO is not releasing trunk after PBX disconnect. Occurs when the PBX end drops first and the CO does not release the trunk within 4 minutes.
 1. Verify the interface to the network with a hand telephone set. If calls are placed correctly, then refer problem to the CO.
 2. If unable to place calls or this equipment is not available, check the status on port using **status trunk**. If active but not connected, disconnect bridging clips at the network interface. Check status on the trunk. If trunk went idle, then replace clips. If trunk is still active but unable to place calls, refer problem to the CO.
- m. **Error Type 513; Aux Data - 57393:** Late CO trunk release occurs only after the occurrence of Error Type 513. The CO released the trunk 4 minutes after the PBX dropped the call. This event decrements the severity (error count) of Error Type 513, or may mean the problem related to Error Type 513 has been fixed.

Verify that Error Type 513 does not occur again. Refer to Error 513.
- n. **Error Type 1793:** Incomplete Dial timer expired, applies only to TN459 and indicates a problem with incoming dialing stream. Refer the problem to the CO.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the NPE Crosstalk, you may also clear errors generated from subsequent tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk test (#6) S8300 / G700: This test aborts with Error Code 1412.		X	ND
Port Diagnostic test (#35)	X	X	ND
			1 of 2

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Looparound and Conference Circuit test (#33) S8300 / G700 : This test aborts with Error Code 1412.		X	ND
Port Audit Update test (#36)	X	X	ND
			2 of 2

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

Note:

S8300 / G700: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot on the TDM bus and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 301: Test #6 NPE Crosstalk Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources for this test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Enter display port location to determine the station extension, attendant number, or trunk group/member number of the port. Enter status station , status attendant , or status trunk to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. 2. If the port status is active but the port is idle (no calls), check the Error Log for Error Type 513. The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1 of 3		

Table 301: Test #6 NPE Crosstalk Test 2 of 3

Error Code	Test Result	Description / Recommendation
1001	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of- service due to TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service.</p> <ol style="list-style-type: none"> 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals up to 5 times.

Table 301: Test #6 NPE Crosstalk Test 3 of 3

Error Code	Test Result	Description / Recommendation
Any	FAIL	<p>This test can fail due to off-board problems, including EXP-PN and EXP-INTF faults RMC-ENV faults (S8700 IP), TDM-BUS faults, and Tone Detectors/Tone Generators. Clear every off-board problem before replacing the board. A TDM-BUS problem is usually a faulty board or bent pins on the backplane.</p> <ol style="list-style-type: none"> 1. Resolve any EXP-PN and EXP-INTF, RMC-ENV (S8700 IP), TDM-BUS, TONE-BD, and TONE-PT errors in the error log. 2. Retest the board. Replace the board if the test fails.
	PASS	<p>The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and by examining station, trunk, or external wiring.</p>
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board).</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Translate the board if necessary. 2. Enter busyout board location. 3. Enter reset board location. 4. Enter release board location. 5. Enter test board location. <p>This should re-establish the linkage between the internal ID and the port.</p>
3 of 3		

Looparound and Conference Circuit Test (#33)

Note:

S8300 / G700: This test aborts with Error Code 1412.

This test checks the reflective and non-reflective loop-around and conference capabilities of a DID port circuit. The test that uses 404-, 1004-, and 2804-Hz tones is an on-board test only. Each tone is separately transmitted to and from the port (loop around within the port) and verified.

This test may fail due to noise induced by adjacent electric power lines. Resolve this problem with the local power company. To temporarily alleviate the alarm caused by the failure of this test, disable the test from the trunk administration `Test` field. This also disables the port diagnostic test.

Table 302: Test #33 Loop-Around and Conference Circuit Test 1 of 5

Error Code	Test Result	Description / Recommendation
	ABRT	<p>Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
3	ABRT	<p>System resources required to run this test are not available. The seized tone detector did not respond. This abort code is usually associated with tone-clock (TONE-BD, TONE-PT, and TDM-CLK) resources.</p> <ol style="list-style-type: none"> 1. Clear any tone errors in the error log. 2. Retry the command a 1-minute intervals up to 5 times. 3. If the test continues to abort, escalate the problem.
1000	ABRT	<p>System resources required to run this test are not available. The port may be busy with a valid call.</p> <ol style="list-style-type: none"> 1. Enter display port location to determine the station extension, attendant number, or trunk group/member number of the port. Use status station, status attendant, or status trunk to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. 2. If the port status is active but the port is idle (no calls), check the Error Log for Error Type 513. The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1004	ABRT	<p>The port was seized by a valid call during the test.</p> <ol style="list-style-type: none"> 1. Port Diagnostic Test (#35)

This test checks a port's battery feed circuitry for on-/off-hook detection, battery shutdown, and battery reversal (wink) capabilities.

Table 303: Test #35 Port Diagnostic Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	System resources required to run this test were not available. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test were not available. The port may be busy with a valid call. 1. Enter display port location to determine the trunk group/member number of the port. Use status trunk to determine the service state of the port. If the port is in use, wait until it is idle before testing. 2. If the port status is active but the port is idle (no calls), check the error log for Error Type 513. The port may be locked up. 3. If the port status is idle, busyout and release the trunk, and retry the command at 1-minute intervals up to 5 times. 4. If the test continues to abort, check for wiring errors toward the CO which may cause the trunk to lock up. 5. If the wiring is good and the test continues to abort, replace the circuit pack or media module.
1004	ABRT	The port was seized by a valid call during the test. 1. Enter display port location to determine the station extension, attendant number, or trunk group/member number of the port. Use status station , status attendant , or status trunk to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busyout. 2. Retry the command at 1-minute intervals up to 5 times.
1018	ABRT	Test disabled via administration. Verify that the Maintenance Tests field on the Trunk Group form is set to n . To enable the test, enter change trunk-group x , where x is the trunk group number. Change the entry in the Maintenance Tests field to y .
1 of 3		

Table 303: Test #35 Port Diagnostic Test 2 of 3

Error Code	Test Result	Description / Recommendation
2000	ABRT	Response to the test was not received within the allowable time period. 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
61446	FAIL	Battery feed test failed. A loop current fault was detected. This is most probably an incoming CO-line problem. This failure code is only reported by the TN2139 Italian DID circuit pack. 1. Check the incoming CO-line for loop current. If none is detected refer the problem to the CO. 2. If the CO-line checks out OK, the failure must be on the DID port. Replace the circuit pack.
61456	FAIL	Battery feed test failed. An on-board problem was detected. This port is out-of-service. 1. Replace the circuit pack or media module.
61472	FAIL	Battery feed test failed. A problem with the incoming CO-line was detected. 1. Check the incoming CO-line for proper operation. If warranted, refer the problem to the CO. 2. If the CO-line is not at fault, the failure must be on the DID port. Replace the circuit pack or media module.
	PASS	Current flow was detected for this port. 1. User-reported troubles on this port should be investigated using other port tests and by examining connections. 2. Refer problem to the CO.

Enter <code>test board location</code> <p>This should re-establish the linkage between the internal ID and the port.</p>
		3 of 3

Port Audit Update Test (#36)

This test sends updates of the DID port translation for every port on the circuit pack or media module that has been translated. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack or media module. No response message is expected from the circuit pack or media module once it receives translation updates. The port translation data includes:

- Wink or immediate start trunk
- Dial tone or rotary dialing trunk
- Rotary dialing inter-digit timing
- Network balance R/RC
- Disconnect timing

DIG-BD (Digital Line Circuit Pack)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIG-BD	MIN	<code>test board location sh</code>	Digital Line circuit pack
DIG-BD	WRN	<code>test board location sh</code>	Digital Line circuit pack

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for circuit pack-level errors. See also [DIG-LINE \(Digital Line\)](#) on page 899 in this chapter for related line information.

Note:

The separate, but equivalent, MG-DCP MO can reside in slots 1–4 of a [G700](#). See [MG-DCP \(Digital Line Media Module\)](#) on page 1558 for information about G700 MOs.

DIG-IP-STN (Digital IP Station)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIG-IP-STN	WRN	<code>test station extension</code>	Digital IP Station

The DIG-IP-STN MO represents Softphone and Avaya 46XX phones. Softphone has some DCP maintenance capability in the form of audits, updates, error log entries, and test to clear values. Avaya 46XX IP phones communicate to the switch via an IP LAN and emulate DCP signaling carried over TCP.

The IP phone is not attached to a port board. Insertion of the phone is driven by successful registration of the endpoint, not by board insertion. It is maintained via a set of explicit TCP/IP ping requests and errors reported by the User Manager software, which terminates the H.323 signaling portion of each endpoint. The MO follows standard maintenance methodology and supports `test`, `busyout`, `release` and `status` commands.

A registered extension has a port number or ID in the form of `SNNNNN`, where `N` is a digit from 0–9. This ID indicates that the extension is a virtual port and a station.

Note:

A port number or ID of `SNNNNN` does not necessarily indicate that the extension is registered. A registered extension retains the `SNNNNN` port number or ID, even if the extension later unregisters.

Maintenance for Softphone includes Error Log Entries and Test to Clear Values.

Table 305: DIG-IP-STN Digital IP Station Error Log Entries 1 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any		<code>test station extension</code>
1 (a)		Registration Status Inquiry (#1372)	WRN	OFF

1537 (h)	40968		WRN	OFF	<i>test port station</i>
2305 (i)	Any	None			
2817 (j)		Station Hyperactivity			
					2 of 2

Notes:

- a. **Error Type 1** reports the registration status of the endpoint. If Communication Manager software claims the endpoint is registered and receives keep-alive handshakes from the endpoint, the test passes. If keep-alive handshaking has failed, the test fails. If the user has intentionally un-registered from the S8700 media server, the station is now basically an AWOH station and is no longer being maintained; no tests run for this station.
- b. **Error Type 18** is logged when the port/station is busied out by maintenance personnel. Make sure the port/station is released from busy via *release port | station* (IP terminal only).
- c. **Error Type 257** tracks failures of the signaling path PING test. The test attempts to send a PING packet to the endpoint IP address, as reported during registration. The PING packet originates with the C-LAN board through which the endpoint is registered. If the PING response packet is received, the test passes. If the PING response packet times out, the test fails.
- d. This refreshes the lamp state of every lamp on a virtual DCP station. If successful, the update always passes. It can abort, but it never fails. This update (test number 16) is the same one used for existing DCP stations.
- e. This refreshes the ringer state on a virtual DCP station and queries the virtual station's switch-hook state. If successful, the update always passes. It can abort, but it never fails. This runs a subset of the entire audit update that runs for standard DCP sets.
- f. **Error Type 513** indicates that the terminal failed to respond to the ID Query request. This implies that there is something wrong with the terminal or the communication path. (IP terminal only).
- g. **Error Type 1281** indicates that the terminal is reporting a bad state of health (IP terminal only).

- h. **Error Type 1537** indicates that the link has gone down between the terminal and its gateway to the switch. This likely means that the terminal has unregistered (IP terminal only).
- i. **Error Type 2305** indicates that there was an unsolicited Link Reset even though switch software believed the terminal to be functional and in service. This error can be ignored if no user complaints are received (IP terminal only).
- j. **Error Type 2817** tracks failures of the port hyperactivity counter. If a port generates more than 50 uplink CCMS messages within 10 seconds, the port is taken out-of-service for 30 seconds. Even though the Softphone actually signals over a TCP/IP link, DCP CCMS messages received over the TCP link are counted as regular CCMS uplinks and can cause the station to be marked as hyperactive.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with one test, you can also clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Registration Status Inquiry (#1372)	X	X	ND
Signaling Path PING Test (#1373)	X	X	ND
Digital Terminal Lamp Update Test (#16)	X	X	ND
Digital Terminal Audits Test (#17)		X	ND

1. D = Destructive; ND = Nondestructive

Registration Status Inquiry (#1372)

The Registration status inquiry reports the H.323 registration status of the endpoint. An endpoint must be registered and authenticated in order to receive service from the system.

Registration is initiated when the endpoint user attempts to login using the Avaya registration software application running on the endpoint PC. The user must provide a valid extension and security code. The registration messages are sent to the IP address of a C-LAN's Ethernet port.

Communication Manager Maintenance-Object Repair Procedures

An extension that is registered, or has been registered in the past, has a port number or ID that appears as SNNNNN, where N is a digit from 0–9 and is an indication that the port is virtual and a station.

Table 306: Test #1372 Registration Status Inquiry

Error Code	Test Result	Description / Recommendation
1 2 3	FAIL	The endpoint is not successfully registered. <ol style="list-style-type: none">1. Verify that the user is entering the:<ul style="list-style-type: none">● Correct extension and security code● C-LAN's IP address2. Verify that the extension has been enabled for IP softphone operation.3. If many endpoints cannot register, investigate any errors of the C-LAN's Ethernet port.4. Examine the Ethernet cabling from the endpoint PC to the Ethernet hub.
	PASS	The endpoint is successfully registered and continues to respond to registration handshaking.

Signaling Path PING Test (#1373)

This test is nondestructive.

The test determines the local C-LAN through which the signaling originates and the endpoint's IP address. It then requests the local C-LAN to execute a PING on the endpoint's address. If the PING is successful, the test passes, if the PING is not successful, the test fails.

Note:

Multiple failures of this test can take the Digital IP Station out of service.

This test checks the circuitry involved in the data path of a peer-to-peer IP layer connection.

Note:

This nondestructive test runs due to in-line errors, during periodic and schedule maintenance, and on demand.

Table 307: Test #1373 Signaling Path PING Test

Error Code	Test Result	Description / Recommendation
2100	ABRT	Could not locate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. Escalate if the problem persists.
2500	ABRT	Internal system error <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 3 times. 2. Escalate if the problem persists.
1003	FAIL	Ping to the destination failed. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 3 times. 2. Investigate any errors of the C-LAN's Ethernet port.
1007	FAIL	The system could not PING the registered endpoint via the CLAN. <ol style="list-style-type: none"> 1. Verify that at least one destination is reachable through this port. PING this destination (<code>ping ip-address xxx.xxx.xxx.xxx</code>). 2. If a PING to any destination is successful through this port, the link is up. 3. If a PING to every destination fails, test the CLAN port (<code>test port location short</code>), and follow repair procedures for Session Status test (#1286) failures. 4. If only this station cannot be pinged: <ul style="list-style-type: none"> ● Make sure the PC is up. ● Make sure the PC has a network connection (Ethernet or dial-up). ● Check the Ethernet cabling.
	PASS	The system can successfully send IP packets to the registered endpoint from the C-LAN.

Digital Terminal Lamp Update (#16)

This test updates internal lamp states that can or cannot be shown on the actual PC graphical user interface. The lamp updates run only if the station is in-service. The status of the station is checked and the lamp updates are blocked from taking place if the station is not in the in-service state. This test does not affect the status of the Message Waiting lamp.

Table 308: Test #16 DIG-LINE Station Lamp Updates Test

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1	ABRT	This port could have been busied out by system technician. 1. Look in the Error Log for Error Type 18 (port busied out) for this port. If this error type is present, then release the port via release station extension and run the test again. 2. Make sure that the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times.
3	ABRT	Station could be in ready-for-service or out-of-service state. 1. Use status station to verify state of station. 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port could be busy with a valid call. 1. Use display port location to determine the station extension of the port. Use status station to determine the service state of the port. If the port is in use, wait until it is idle before testing. 2. If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	The message to light every station lamp was successfully sent to the port.

Digital Terminal Audits Test (#17)

This is a series of tests that are classified as audits. The media server sends messages to the softphone application or IP phone to perform the following tests. These audits run only if the station is in-service.

- Switchhook Inquiry test updates the media server's records according to the softphone switch-hook state.
- Ringer Update test updates the softphone's ringer state according to the media server's records.
- ID Request queries the station for its status. The terminal returns its configuration information and health information. The information is checked, and a PASS/ABORT result is provided. If the result is ABORT, an error is logged in the hardware error log (IP terminal only).

Table 309: Test #17 Station (Digital) Audits Test 1 of 2

Error Code	Test Result	Description / Recommendation
1	ABRT	Switchhook audit timed out.
2	ABRT	ID request fails, health bit returned from voice terminal is bad (IP Terminal only). <ol style="list-style-type: none"> 1. Make sure voice terminal is connected, and repeat test. 2. If test fails, replace the voice terminal, and repeat test.
4	ABRT	Internal system error <ol style="list-style-type: none"> 1. Resolve any outstanding circuit pack maintenance problems. 2. Retry the command at 1-minute intervals up to 5 times.
5	ABRT	Ringer update aborted due to station being in ready-for-service or out-of-service state.
6	ABRT	This port could have been busied out by system technician. <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (port busied out) for this port. If this error is present, then release the port via release station extension. 2. Make sure that the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required for this test are not available.
		1 of 2

Table 309: Test #17 Station (Digital) Audits Test 2 of 2

Error Code	Test Result	Description / Recommendation
2000	ABRT	Response to the test was not received in the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	Station Audits passed. 1. If complaints persist, investigate by using other port tests, and by examining the station, wiring, and connections.
2 of 2		

DIG-LINE (Digital Line)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIG-LINE	MIN	<code>test port location 1</code>	Digital Line
DIG-LINE	WRN	<code>test port location sh</code>	Digital Line

DIG-LINE monitors and tests ports on digital line circuit packs or digital line media modules and on hardware administered as a digital station on those ports. These include stations with only a digital phone and stations with a digital phone linked to a data module.

S8700 | 8710 / S8500

Standalone data modules, and data adaptors in standalone mode, are covered by [PDMODULE \(Processor Data Module\)](#) [TDMODULE \(Trunk Data Module\)](#) on page 1709. Circuit pack-level maintenance is covered by [DIG-BD \(Digital Line Circuit Pack\)](#) on page 890, the strategy for which is described in [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

The following circuit packs support digital lines:

Table 310: Digital Line Circuit Packs

Code	Ports	Type	Companding	Endpoints
TN754 TN754B TN2181 TN2224B/ CP	8 8 16 24	4-wire DCP 4-wire DCP 2-wire IDCP 2-wire IDCP	mu-law A-law/ mu-law A-law/ mu-law A-law/ mu-law	7400 series digital voice terminals, attendant consoles, 510D personal terminals, MT515 BCTs, DCP data modules
TN2136 TN2181 TN2224B/ CP	8 16 24	2-Wire IDCP 2-wire IDCP 2-wire IDCP	A-law/ mu-law A-law/ mu-law A-law/ mu-law	Data Adaptors (DA), Italtel Digital Telephone Models 1 and 2 (IDT1/2).

Communication Manager Maintenance-Object Repair Procedures

Each digital line port supports two 64 kbps information channels (primary and secondary) and one 8kbps signaling channel. Digital voice terminals always use the primary information channel, and only one voice terminal can be connected to each port. The secondary information channel can be used to connect a data terminal via a Digital Terminal Data Module (DTDM) or a Data Adaptor (DA). All other devices currently supported by Digital Line circuit packs communicate on the primary information channel. [Figure 45: Digital Line Connectivity](#) on page 900 shows examples of digital line connectivity.

Use only the TN754B or TN2136 circuit packs in out-of-building applications.

The TN2181 and TN2224B/CP support both modes as shown in [Figure 45: Digital Line Connectivity](#) on page 900 and [Figure 46: Digital Line Connections](#) on page 901.

Figure 45: Digital Line Connectivity

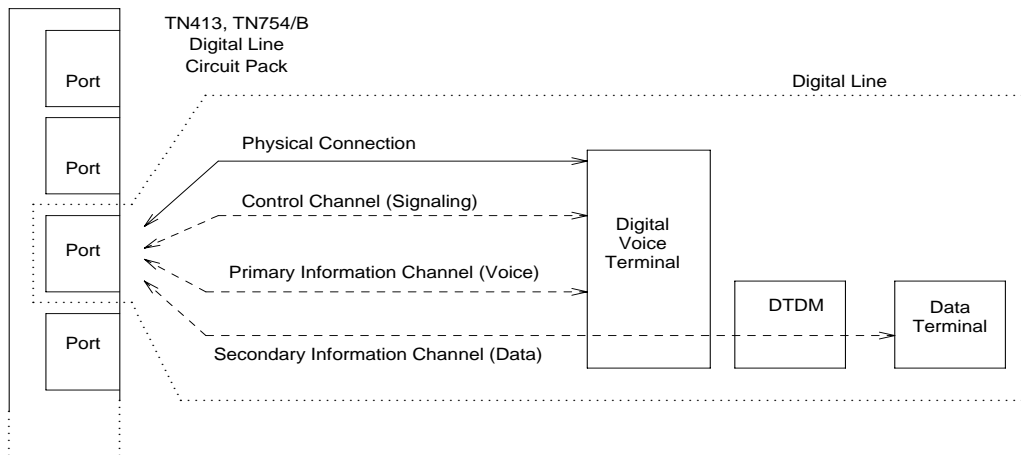

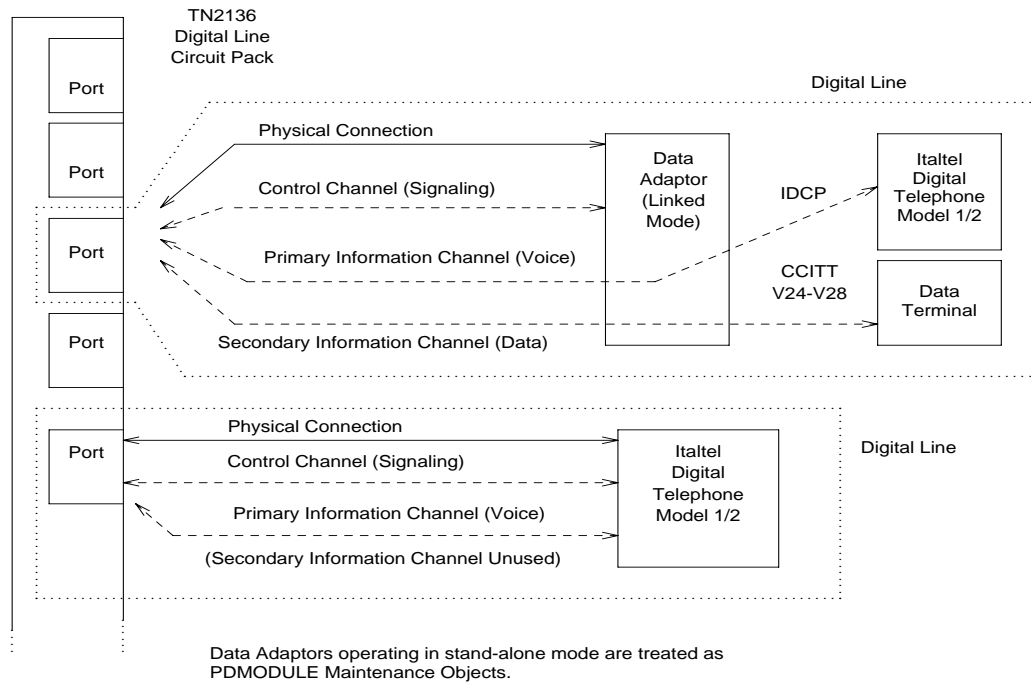

Figure 46: Digital Line Connections

Only 2-wire Italtel Digital Telephone Models 1 and 2 (IDT1/2) or DAs can directly connect to a TN2136 circuit pack. Avaya DCP (4-wire) digital voice terminals and data modules can connect to these circuit packs via Italtel's 2/4-wire adapter. DAs operate in either of 2 modes, and are covered by different MOs:

DA Mode	Administered as:	Endpoint	MO
Standalone	PDM	Data endpoint only	PDMODULE
Linked	DTDM	IDT1/2 and optional data terminal	DIG-LINE

S8300 / G700

For Media Gateway-level maintenance, see [MG-DCP \(Digital Line Media Module\)](#) on page 1558, the strategy for which is described in [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

Note:

DIG-LINE MO is provided for **G700**, but this MO only partially supports the **G700's** MM712 DCP media module.

Service States

Digital line maintenance interacts with digital line circuit pack (DIG-BD), or with digital line media module (MG-DCP) maintenance. The health of the digital-line circuit pack or media module can affect the results of DIG-LINE testing. Keep this in mind when investigating digital-line problems.

It is sometimes important to know the service state of a station. These service states apply to digital-line stations:

Out-of-Service state	The port, and thus the station, have been removed from service. Busyout puts the port in the out-of-service state.
Ready-for-Service state	The port on the circuit pack or media module has been put into service, but the voice terminal has not yet established signaling communications with the port.
In-Service state	The voice terminal has established signaling communications with the port, and the system is ready to process calls to and from that station. A terminal in the ready-for-service state will progress to the in-service state if it is functioning normally. It can also be forced into the in-service state by going off-hook.

Downloading Terminal Parameters

This section explains how maintenance software interacts with terminal parameter downloading.

For Systems Supporting Circuit Packs

Terminal Types:

Software can interact with the following terminal types:

- 84xx multi button digital voice terminals (8403D01A, 8410B, 8410D02A, 8434D01A) with optional expansion module.
- 603A1 and 603D1 Callmaster terminals for telemarketing applications.
- 302B1 and 302C1 attendant console.

Circuit Packs:

- 8400x, 302B1 Terminals
 - TN754 (4-wire, mu-law)

Note:

Minimum usable vintage for 8410D and 8434D terminals - V11

- TN413 (4-wire, A-law)
- TN754B (4-wire, A-law/mu-law selectable)
- TN2177 (2-wire, 16-port, A-law/mu-law selectable)
- TN2181 (2-wire, 16-port, A-law/mu-law selectable)
- TN2224 (2-wire, 24-port, A-law/mu-law selectable)
- 603A1/D1 Terminals
 - TN754 (4-wire, mu-law),
 - TN413 (4-wire, A-law)
 - TN754B (4-wire, A-law/mu-law selectable)

S8300 / G700

The MM712 Media Module supports 8410D and 8434D terminals (2-wire, 8-port, A-law/mu-law selectable).

Programmable Terminals

The following parameters are downloaded to programmable terminals.

Table 311: Parameters Downloadable to Programmable Terminals

Parameter	Scope	Terminal
International Flags (A-law/mu-law, Display Mode, DLI Voltage level)	System level	84xx, 603x, 302B1
Primary Levels (Transmission & Sidetone)	System level	84xx, 603x, 302B1
Adjunct Levels (Transmission & Sidetone)	System level	84xx
Handset Expander Option	System level	84xx
Administrable Options (Speakerphone & Mute Button)	Per-terminal	84xx
Administrable Softkeys	Per-terminal, System level	8410D, 8434D

Nonvolatile Memory

Nonvolatile memory stores downloadable parameters in programmable terminals. Once the terminal is downloaded, it is not necessary to download it again, even if power is removed from the terminal. If nonvolatile memory fails with power still present, the terminal reverts to its default factory settings except for its A-law/mu-law companding settings which are stored in RAM. If power is removed after the nonvolatile memory fails, the terminal reverts to its factory default settings.

Note:

The mu-law companding mode is assigned as a default setting at the factory. For the United States, a programmable terminal can place calls even though it has not been downloaded from the system.

Download Actions

There are several different scenarios that cause a terminal to be downloaded. These can occur as part of background maintenance activity or on demand from the system access terminal or from a station.

For the following background actions, the terminal downloads automatically if a download retry flag for the terminal is set in software. This flag is set:

- At boot time when translation is loaded
- When translation that affects the parameters of a terminal is changed as part of system administration action
- When a port is inserted in software as a result of board insertion or translation change

Automatic Download Actions

This section describes download actions that occur automatically.

System Reboot/Restart

A global download action is started when periodic maintenance tests start after a system reboot/restart regardless of whether the parameters have been downloaded previously.

Periodic Tests

If the download flag is still set when periodic tests are run on a terminal, a download action will occur. This operation is required in case a terminal could not be downloaded previously either:

- Because it was off-hook at the time the system first booted
- Because the terminal was off-hook at the time translation associated with downloadable parameters was changed

Note:

It may take more than 1 hour for periodic tests to reach the terminal that needs to be downloaded.

Terminal Administration

A downloadable terminal is automatically downloaded when translation changes associated with downloadable parameters are made as part of system administration. As shown in [Table 311: Parameters Downloadable to Programmable Terminals](#) on page 903, these changes can be for a specified terminal or may be system-wide. If the change is for system-level parameter, a background global update request is made to download all programmable terminals.

This global update may take more than an hour for a system with several thousand programmable terminals.

Port Insertion

Whenever maintenance software initiates a request to place a port into service, a terminal download action is started on that terminal if that terminal is programmable. This port insertion action occurs under the following circumstances:

- A digital line circuit pack or media module that is physically inserted into the system has ports currently administered for programmable terminals.

If more than 20 port insertion requests are received within a few seconds, a global download request is started up as a background task. This action updates all programmable terminals instead of just those being inserted. This is done to avoid system overload for situations where there is massive board insertion. This could occur when connectivity to an PN is re-established after that PN was down.

- A station port is added to the system by `add station` or `change station`.
- A TTI port is activated.

Audits

As part of periodic maintenance, the hardware status audit test queries programmable terminals to determine what levels and/or options are being used. If the reported values are not equal to the administered values, the system will initiate a terminal download action. This audit does NOT check the parameters used for softkeys.

Activation of TTI

A terminal is downloaded automatically when it is activated using the Terminal Translation Initialization feature. Therefore, no special user actions are required for TTI.

Note:

Plugging the station cord into a terminal does not automatically cause the terminal to be downloaded. If this terminal has factory defaults or if the terminal has been previously downloaded with parameters different from those desired, use one of the following demand download actions to download the terminal.

Demand Download Actions

Busyout/Release Command

A maintenance demand busyout/release request for a station causes the terminal to be downloaded regardless of its previous download status.

Feature Access Code

A Refresh Terminal Parameters Feature Access Code can be used to request a terminal download action. When this code is followed by a pound sign (#), the programmable parameters for the current terminal are downloaded when the terminal goes on hook. When this code is followed by an extension, the programmable parameters for the specified station are downloaded.

Assign the Refresh Terminal Parameters Feature Access Code on the Feature Access Codes form.

A confirmation is returned if the download request is accepted. A busy tone is returned if the request is made from a different station when the target station is off-hook.

Note:

For systems supporting circuit packs, the first three green call appearance LEDs on the 84xx 603x terminal will be turned on for three seconds if the station was successfully downloaded as a result of an entry of a Refresh Terminal Parameters Facility Access Code. This is not true for the 302B1 terminal.

There is no visible display on a station for the other background or demand download actions. Use **status station** and **status attendant** forms to check the download status of a specified terminal.

Status of Parameter Downloads

The **status station** and **status attendant** forms show the current download status of individual 84xx terminals (**S8300** / **G700**: MM712 Media Module), and 84xx, 603, and 301B1 terminals (**S8700** | **8710** / **S8500**) in the **Download Status** field. Possible download states are:

Status	Explanation
Complete	Terminal successfully downloaded sometime in the past.
Pending	System waiting to download the terminal. This may require the execution of a background periodic test which could take more than an hour. A demand download as previously described may also be used to initiate an immediate download.
Not Applicable	Not a programmable terminal.

Possible reasons for a terminal not being downloaded include:

- Terminal is off-hook.
- Terminal detected a bad checksum.
- Terminal detected a bad or missing EEPROM (refer to hardware error log).
- Terminal is busy programming data from a previous PROGRAM message.
- Terminal is in the Programming Disabled state.
- Terminal is in the Local Program Options mode.
- Terminal is disconnected or out of service (use `status station`).

					2 of 2

1. Major alarms may be downgraded to Warning alarms based on the value used in `set options`.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence.
- b. **Error Type 1; Aux Data - 40987** could indicate a noisy port or link. This is an off-board problem detected by the port circuit. Check for defective wiring, a defective voice terminal, or move voice terminal closer to the switch (in terms of feet of wire from the jack to the switch). If the problem still exists, replace the circuit pack. Once the problem is resolved, the alarm is retired after a predetermined amount of time.
- c. **Error Type 1; Aux Data - 1 to 20** occurs when at least 15 off-board problems with the link to the terminal have been detected. When an error with the link is detected, an on-board counter is incremented.

The user could experience a noisy port or link. This is an off-board problem detected by the port circuit. Check for defective wiring, a defective voice terminal, or move voice terminal closer to the switch (in terms of feet of wire from the jack to the switch). If the problem still exists, replace the circuit pack. Once the problem is resolved, the alarm is retired after a predetermined amount of time.
- d. **Error Type 18** is logged when the port in question is busied out by maintenance personnel. Use `release port location` to release the port from busyout.

- e. **Error Type 130** indicates that the circuit pack or media module has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the circuit pack or media module.
- f. **Error Type 257** indicates problems transmitting to the voice terminal. This can be caused by defective wiring, which can cause varying degrees of problems on different types of sets. Sets such as the 7410 appear to be more susceptible to wiring problems than other sets. This is usually an on-board problem and can be ignored if no user complaints are received.
- g. **Error Type 767** is an in-line event that produces this error type when a favorable response is received from running the Digital Line Electronic Power Feed test (#11). No *craft* action is necessary. This alarm is resolved with the passing of time.
- h. **Error Type 769** with Aux Data 40963 is a result of an unfavorable response to the Electronic Power Feed/ Positive Temperature Coefficient test (#11).
- i. **Error Type 769** with Aux Data 40988 indicates that the EPF/PTC circuit has been turned off due to an overcurrent condition.

S8700 | 8710 / S8500

For TN754 vintage 13 or earlier and TN413, the EPF circuit senses an overcurrent condition at the voice terminal. Check for a short in the wiring, a damaged jack, an incorrect type of voice terminal, or a defective voice terminal.

For TN754 vintage 14 or later, TN754B and TN2136, the PTC will open if there is a short on the power line for 1/2 second or longer. The voice terminal is probably not operating properly. Unplug the voice terminal for 30 seconds and then plug it back in. If the voice terminal still does not operate, then check for a short in the wiring, a damaged jack, an incorrect type of voice terminal, or a defective voice terminal.

Once the problem has been resolved, it may take up to 1 hour for the alarm to clear. If the problem cannot be resolved by one of the previous steps, then replace the circuit pack or media module.

- j. **Error Type 1026:** There is a problem with the voice terminal EEPROM. When the voice terminal is repaired the alarm will be resolved with the passing of time.
- k. **Error Type 1537:** An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice terminal. This can be ignored if no user complaints are received. Otherwise, make sure the voice terminal is connected, check for defective wiring, check for a defective voice terminal, and move voice terminal to a jack that is closer to the switch (in terms of feet of wiring between the jack and the switch). If the problem still exists, replace the circuit pack or media module. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.
- l. **Error Type 2304:** Internal system error. No action is necessary.

Communication Manager Maintenance-Object Repair Procedures

- m. **Error Type 2305; Aux Data - 32770:** This indicates that the station went off-hook while it was in the ready-for-service state. Use **status station** to determine the state of the station. The off-hook should have moved the station to ready-for-service. No *craft* action is necessary.
- n. **Error Type 2305; Aux Data - 40967:** An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice terminal. This can be ignored if no user complaints are received. Otherwise, make sure the voice terminal is connected, check for defective wiring, check for a defective voice terminal, and move voice terminal to a jack that is closer to the switch (in terms of feet of wiring between the jack and the switch). If the problem still exists, replace the circuit pack or media module. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.
- o. **Error Type 2817:** Port Level Hyperactivity. Fifty or more CCMS uplink messages were received from the port within ten seconds. The user is taken out of service for a short interval of time (default 30 seconds).
- p. **Error Type 3585:** This error type indicates that an attempt to execute a firmware download of a DCP terminal has failed. The DCP terminal must be replaced before the firmware download can be executed successfully. Replace the DCP terminal and re-execute the firmware download.
- q. **Error Type 3840; Aux Data - 40965:** No terminal is connected to the Digital Line board. No maintenance action is required.
- r. **Error Type 3840; Aux Data - 40989:** An uplink message has been logged indicating that the Electric Power Feed (EPF) is on with no load on it. No action is necessary.
- s. **Error Type 3841:** The circuit pack's or media module's message buffer is full. This may be caused by having many display phones with heavy traffic connected to the circuit pack or media module. No action is necessary.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Voice and Control Channel Local Loop-Around test, you may also clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Digital Terminal Remote Loop-around Test (#1201) S8300 / G700: This test aborts with Error Code 1412.		X	D
Voice and Control Channel Local Loop-Around Test (#13) S8300 / G700: This test aborts with Error Code 1412.		X	ND
Digital Line NPE Crosstalk Test (#9) S8300 / G700: This test aborts with Error Code 1412.		X	ND
Digital Line Electronic Power Feed Test (#11)		X	ND
DIG-LINE Station Lamp Updates Test (#16)	X	X	ND
Station (Digital) Audits Test (#17)	X	X	ND

1. D = Destructive; ND = Nondestructive

Digital Terminal Remote Loop-around Test (#1201)

Note:

On the G700/ G350, this test aborts with Error Code 1412.

This test checks the connection between the media server and the digital terminal and the ability of the terminal and the associated port to send and receive data. This test is based on procedure 622 to isolate digital terminal problems.

A request is presented to the terminal to go into loop-back mode. Data is sent to the terminal and when received back, checked for consistency. This test is run as a part of the test long procedure. It is not included in any error recovery strategy and generates no error log entries or alarms. To begin the test, Maintenance will ask Communication Manager to make the associated endpoint and port Maintenance Busy. This test succeeds if the endpoint is "idle". If the reserve request fails then the test aborts. If the request succeeds then the media server sends a message to loop around both information channels for the digital terminal.

1. First the primary information (voice information channel 1 or I1) channel loop-back test is run. The test is performed by sending a digital count from the Tone-Clock circuit on the primary information channel time slot and receiving the same digital count with a general purpose tone detector.

Communication Manager Maintenance-Object Repair Procedures

- If the primary information channel test is successful, the loop-around test for the secondary information (data, Information Channel 2 or I2) channel is then performed. This is the same test as the primary information channel's loop around test and is performed only if a DTDM is administered. This is also the case for a linked DA.

Only one value (Pass, Fail, or Abort) is generated as a result of the two tests run. If any test fails aborts, the sequence is stopped. Upon completion of this test, the associated endpoint and port are moved back into the previous service state.

Table 313: Test #1201 Digital Terminal Remote Loop-around Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use display port location to determine the station extension or attendant number of the port. Use status station or status attendant to determine the service state of the port. If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. 2. If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1001	ABRT	System resources required to run this test are not available. 1. If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out of service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals up to 5 times.
1003	ABRT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals up to 5 times.
1 of 3		

Table 313: Test #1201 Digital Terminal Remote Loop-around Test 2 of 3

Error Code	Test Result	Description / Recommendation
1004	ABRT	The port was seized by a valid call during the test. 1. Enter <code>display port location</code> to determine the station extension or attendant number of the port. Use <code>status station</code> or <code>status attendant</code> to determine the service state of the port. If the port is in use, wait until it is idle before resetting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. 2. Retry the command at 1-minute intervals up to 5 times.
1005	ABRT	The installed circuit pack does not support this operation.
S8300 / G700 1412	ABRT	This test does not execute on a G700 media gateway.
2000	ABRT	Response to the test was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	System resources required to run this test are not available. 1. Make sure terminal is connected and repeat test. 2. If test fails replace terminal and repeat test. 3. Retry the command at 1-minute intervals up to 5 times.
14	FAIL	The primary channel is not operating properly. User impact may range from noticing nothing to not being able to use the port. 1. Check the results of "Voice and Control Channel Local Loop test (#13). 2. If that test fails, suspect the Digital Line circuit pack. If that test passes then replace the terminal. 3. If both tests fail, and component replacement does not change the results, then: a. Run circuit pack tests to check the tone generator circuit and the Tone Detector circuit using <code>test board location</code> . b. Resolve any problems that are detected on the Tone Generator circuit or Tone Detector circuit.
1015	ABRT	The station is not busied out (<code>busyout station</code>).
2 of 3		

Table 313: Test #1201 Digital Terminal Remote Loop-around Test 3 of 3

Error Code	Test Result	Description / Recommendation
16	FAIL	<p>The secondary channel is not operating properly. User impact may range from noticing nothing to not being able to use this terminal.</p> <ol style="list-style-type: none"> 1. Check the results of Voice and Control Channel Local Loop test (#13). 2. If that test fails, suspect the Digital Line circuit pack. If that test passes then replace the terminal. 3. If both test fail, and component replacement does not change the results, then: <ol style="list-style-type: none"> a. Run circuit pack tests to check the tone generator circuit and the Tone Detector circuit pack using test board location. b. Resolve any problems that are detected on the Tone Generator circuit or Tone Detector circuit.
	PASS	<p>Voice and Control Channel Local Loop test passed. All channels are transmitting properly.</p> <ol style="list-style-type: none"> 1. To verify that this is not an intermittent problem, repeat this test up to ten times. 2. If complaints persist (noisy connections for voice. corrupted data transfer for data), examine the station, connections, and wiring.
3 of 3		

Digital Line NPE Crosstalk Test (#9)

Note:

S8300 / G700: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Crosstalk testing is performed on both the primary information channel (voice) and the secondary information channel (data) associated with each digital station port. If this test fails on either channel, the station and the DTDM are taken out-of-service.

Table 314: Test #9 Digital Line NPE Crosstalk Test 1 of 2

Error Code	Test Result	Description / Recommendation
1	ABRT	<p>During testing of the primary information channel, system resources were not available. Also, the port may have been busy during the test.</p> <ol style="list-style-type: none"> 1. Enter display port location to determine the station extension of the port. Use status station to determine the service state of the port. 2 of 2		

Digital Line Electronic Power Feed/Positive Temperature Coefficient/PPF Test (#11)

S8700 | 8710 / S8500

For TN413, and TN754 vintage 13 or earlier, this is an Electronic Power Feed (EPF) restoral test. In this test, the processor requests that the EPF be turned on for a given port, and an attempt is made to turn on the power supply to the station. If no current is drawn, the station is probably not connected. If an overcurrent condition is sensed, there may be a short in the loop. A message is returned reporting that either the EPF was successfully turned on, or that an overcurrent condition was sensed. This test is repeated again 5 seconds later.

For TN754 vintage 14 or later, TN754B and TN2136 this is a Positive Temperature Coefficient (PTC) restoral test. In this test, the processor requests that the PTC be turned on for a given port, and an attempt is made to turn on the power supply to the station. If an overcurrent condition is sensed, there is probably a short on the power line that causing the PTC to open and disconnect the voice terminal. Since the PTC does not have self-restoral capability, the voice terminal must be manually unplugged for 30 seconds and then plugged back in to restore the PTC. A message is returned reporting that either the PTC was successfully turned on successfully with no problem or an overcurrent condition was sensed. This test is repeated again 5 seconds later.

TN2181 and TN2224 boards carry a Protected Power Feed (PPF) relays, one for each port. Therefore this will be a Protected Power Feed restoral test. The test procedure and its response is same as that of EPF. One of differences between EFP and PPF is that, if the port goes into a overcurrent state, PPF does not report this change of state because it is a transient state which will not last more than 50ms. If the over current persists the power will be shut off automatically and an EPF_off_overcurrent message is sent uplink.

S8300 / G700

MM711 Media Modules provide power to the terminals. Therefore this will be an EPF restore test. The test procedure and its response is same as that of EPF. If the over current persists the power will be shut off automatically and an EPF_off_overcurrent message is sent uplink.

Table 315: Test #11 Digital Line Electronic Power Feed Test 1 of 2

If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
	FAIL	<p>Internal system error</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	<p>Electronic Power Feed test passed. The message to turn on the power to the station was successfully sent to the port.</p> <ol style="list-style-type: none"> 1. Although, except for the previous Internal system error, this test never actually returns a FAIL result, it will log an error indicating the real results of the test. Check the Error Log for any entries with Error Types 767 or 769 after the test completes. 2. If Error Type 767 appears in the Error Log, this indicates that the test sensed no problems with the power to the station. To verify that the station is powered up correctly, run a self-test on the station and check that every feature button is operating. 3. If Error Type 769 appears in the Error Log, this indicates some problem with the power to the station. Check for a short in the wiring, a damaged jack, a defective voice terminal, or an incorrect type of terminal.
		2 of 2

Voice and Control Channel Local Loop Test (#13)

Note:

S8300 / G700: This test aborts with Error Code 1412.

These tests check the information and control channels between the media server and the Digital Line port circuit. The media server sends a message to loop around both the port's information and control channels.

1. First, the primary information (voice) channel's loop-back test is run.

The test is performed by sending a digital count from the Tone-Clock circuit on the primary information channel's time slot and receiving the same digital count with a General-Purpose Tone Detector.

2. While the primary information channel is still looped around, the Control Channel Loop-Around test is run.

This test consists of sending four different transparent patterns to the on-board microprocessor, receiving them back, and comparing them.

3. Then, the secondary information (data) channel's loop-around test is run.

This is the same test as the primary information channel's loop-around test and is performed only if a DTDM is administered.

4. Next, a Conference test is run for the primary information channel.

This is the same test as Conference test (#6).

This 4-test sequence only generates one value (Pass, Fail, or Abort). If any test fails or aborts, the sequence stops.

If the port is in use, wait until it is idle before testing. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. 2. If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1392	ABRT	<p>This port is currently a TTI port and the test will not execute on it.</p> <ol style="list-style-type: none"> 1. Verify that the port is a TTI port using either display port (the port is a TTI port) or list config (a "t" shows for the port). 2. If either list config or display port indicates that the port is <i>not</i> a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct, and no action is necessary.
	FAIL	<p>Internal system error</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2 of 3		

Table 317: Test #16 DIG-LINE Station Lamp Updates Test 3 of 3

Error Code	Test Result	Description / Recommendation
	PASS	<p>The message to light every station lamp was sent successfully to the port.</p> <ol style="list-style-type: none"> 1. Observe the station lamps being lit when running the test. If all lamps do not light, the other Digital Line test results may indicate related problems that do not allow the lamps to light. 2. Investigate by using other Digital Line port tests, and by examining the station, wiring, and connections.
		3 of 3

Digital Station Audits Test (#17)

This is a series of six tests that are classified as audits. The media server sends messages to the on-board microprocessor to perform the following tests. These audits run only if the station is in-service.

- Switchhook Inquiry test — This is an update of the media server's records according to the circuit pack's or media module's records. This inquiry is sent all the way to the voice terminal.
- Bad Scan Inquiry test — An up-link message is sent containing a count generated by certain events relating to the link's conditions. This can be an indication of communications problems between the media server and Digital Port circuit pack or media module.
- ID Request test — A request is made to the station for its status. The station sends its configuration information and health information back. This information is checked and a pass/fail result is provided.
- Ringer Update test — This updates the digital telephone ringer state according to the processor records.
- DTMF Administration Update test — This is a message to the digital station to refresh the default value that causes the station to send touch- tones only in the primary information channel. This value is set initially when the station is put in-service and every time the station's state changes from other states to in-service state.

S8700 | 8710 / S8500

- EPF/PTC Inquiry test — For a TN413 or a TN754 (vintage 13 or earlier), an up-link status message of the Electronic Power Feed (EPF) is sent. Possible conditions are: EPF-on-ok, EPF-off, and EPF-no-load.

For TN754 (vintage 14 or later), TN754B, TN2136, TN2181, or TN2224, an up-link status of the PTC is sent. Possible conditions are: PTC-on-ok, PTC-off, and PTC-no-load.

S8300 / G700

- For the MM712 Media Module, the status of the EPF is sent uplink. Possible conditions are EPF-on-ok, EPF-off, and EPF-no-load.

Table 318: Test #17 Station (Digital) Audits Test 1 of 2

Error Code	Test Result	Description / Recommendation
1	ABRT	Switchhook audit timed out.
2	ABRT	ID request fails, health bit returned from voice terminal is bad. 1. Make sure voice terminal is connected, and repeat the test. 2. If test fails, replace voice terminal and repeat test.
3	ABRT	S8700 8710 / S8500: The EPF/PTC has detected an overcurrent condition. 1. For a TN754 vintage 13 or earlier Digital Line circuit pack, use test location long . <ul style="list-style-type: none"> ● If Test #11 passes, then the EPF/PTC condition was cleared. Rerun the Short Test Sequence. ● If Test #11 does not pass, follow the repair procedures described for Test #11. S8700 8710 / S8500 / S8300: 2. Look for Error Type 769 logged against DIG-LINE and follow the procedures in the additional information. If any additional problems are found, rerun the test.
4	ABRT	Internal system error 1. Resolve any outstanding circuit pack or media module maintenance problems. 2. Retry the command at 1-minute intervals up to 5 times.
5	ABRT	Ringer update aborted due to station being in ready-for-service or out-of-service state.
		1 of 2

Table 318: Test #17 Station (Digital) Audits Test 2 of 2

Error Code	Test Result	Description / Recommendation
6	ABRT	<p>This port may have been busied out by system technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (port busied out) for this port. If this error is present, the release the port via release station extension. 2. Make sure that the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required for this test are not available.
1392	ABRT	<p>This port is currently a TTI port and the test will not execute on it.</p> <ol style="list-style-type: none"> 1. Verify that the port is a TTI port using either display port (the display shows that the port is a TTI port) or list config (the display shows a “t” for the port). 2. If either list config or display port indicate that the port is <i>not</i> a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct, and no action is necessary.
2000	ABRT	Response to the test was not received in the allowable time period.
	FAIL	<p>Internal system error</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	<p>Station Audits passed. This Digital Port circuit pack or media module is functioning properly.</p> <ol style="list-style-type: none"> 1. If complaints persist, investigate by using other port tests, and by examining the station, wiring, and connections.
2 of 2		

DIOD-BD (DIOD Trunk Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIOD-BD	MIN	<i>test port locations</i>	DIOD circuit pack

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

DIOD-DS1 (DS1 DIOD Trunk)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIOD-DS1	MAJ ¹	<code>test trunk grp#/mem# 1</code>	DS1 DIOD Trunk
DIOD-DS1	MIN	<code>test trunk grp#/mem# 1</code>	DS1 DIOD Trunk
DIOD-DS1	WRN	<code>test trunk grp#/mem#</code>	DS1 DIOD Trunk

1. A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by `set options` and that at least 75 percent of the trunks in this trunk group are alarmed.

Note:

Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end. Refer to *Administrator's Guide for Avaya Communication Manager, 555-233-506* for information on how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

A DS1 Direct Inward Outward Dialing (DIOD) trunk provides a link for digitized voice or data communications between the system and a central office switch. There are two types of DS1 interfaces:

- 24 DS0 channels on a 1.544-Mbps link
- 31 DS0 channels + 1 framing channel on a 2.048-Mbps link

Note:

32-channel mode is supported only on TN464C and higher suffix circuit packs and beginning with G3r V2 systems.

The DS1-DIOD MO monitors and maintains a DIOD trunk port on a TN464 UDS1 Interface circuit pack. See [UDS1-BD \(UDS1 Interface Circuit Pack\)](#) on page 2329 for more information about this circuit pack. The DS1 circuit pack supports low-level CO trunk signaling interfaces for both ground-start and loop-start trunks. This maintenance strategy covers the in-line errors log, initialization tests, periodic tests, scheduled tests, demand tests, and alarm resolution and escalation.

Communication Manager Maintenance-Object Repair Procedures

Three trunk service states are specified by DS1 DIOD trunk maintenance:

out-of-service	The trunk is in a deactivated state and cannot be used for either incoming or outgoing calls.
in-service	The trunk is in an activated state and can be used for both incoming and outgoing calls.
disconnect (ready-for-service)	The trunk is in an activated state but can only be used for an incoming call.

Error Log Entries and Test to Clear Values

2562 (m)	16665				
2817 (n)	52992				
3840 (o)		Port Audit and Update (#36)			
					2 of 2

1. This alarm is raised when the `Base Tone Generator` field is 4 (Italy) on the System-Parameter Country screen. This alarm is MINOR unless 75% or more trunks in this trunk group are out of service, then the alarm is upgraded to a MAJOR alarm.

2. Major alarms may be downgraded to Warning alarms based on the value used in `set options`.

Notes:

a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.

b. **Error Type 1**

Aux Data 57408: No tip ground is detected on an outgoing call.

Aux Data 57476: Rotary Dial before Wink.

Aux Data 57477: Rotary Dial pulse too early.

Aux Data 57485: Wink too short for a valid signal.

Aux Data 57487: PBX could not get "loop close" signal.

The DS1 Interface circuit pack detected a hardware fault. These errors will cause the Dial Tone test (#314) to run and are only considered a problem if the Dial Tone test fails (in which case Error Type 1025 will also show up). In this case, the trunk may be put in the ready-for-service state (shown as "disconnected" by the status command), which allows only incoming calls. Run the Dial Tone test (#314) and follow the procedures.

Communication Manager Maintenance-Object Repair Procedures

- c. **Error Type 15** is a software audit error that does not indicate any hardware malfunction. Run short test sequence, and investigate any errors.
- d. **Error Type 18**: System Technician has busied out the trunk to the out-of-service state. No calls can be made on this trunk except Facility Access Test Calls. For details, see [Facility test calls](#) in *Maintenance Procedures (03-300192)*.
- e. **Error Type 130** indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- f. **Error Type 257**: The DS1 Interface circuit pack detects a hardware fault. Aux Data 57392 indicates no external release on PBX disconnect.
- g. **Error Type 513**: The DS1 Interface circuit pack detects a hardware fault. Aux Data 57393 indicates belated external release on PBX disconnect.
- h. **Error Type 769**: The DS1 Interface circuit pack detects a hardware fault. Aux Data 57484 indicates fault is detected on tip/ring.
- i. **Error Type 1025**: The DS1 Interface circuit pack detects a hardware fault, and Aux Data contains 51200, port is unavailable. Run the Dial Tone test (#314).
- j. **Error Type 1793**: DS1 Interface circuit pack is out-of-service. Look for UDS1-BD errors in the Hardware Error Log if the port is on a TN464 UDS1 board. See [UDS1-BD \(UDS1 Interface Circuit Pack\)](#) on page 2329 for details.
- k. **Error Type 2049**:
 - Aux Data 57473 – Rotary dial rate below 8 pulses per second.
 - Aux Data 57474 – Rotary dial rate above 12 pulses per second.
 - Aux Data 57475 – Rotary Dial interdigit time is too short.

The DS1 interface circuit pack detects a hardware error on the DS1 DIOD trunk. The trunk cannot communicate with the far end because it is unable to interpret digits sent from the far-end switch. Check with the far-end switch or Operating Company for proper trunk connection.
- l. **Error Type 2305**: Recorder message, trunk could not be seized (Aux Data 50944). Run Test #314, and follow the outlined procedures.
- m. **Error Type 2562**: Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from Communication Manager and is generated when a second attempt (retry) to seize an outgoing trunk fails.
- n. **Error Type 2817**: Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a 2-way trunk from both the near and far ends. Attempt to place the call again. If the error persists, execute the Dial Tone Seizure test (#314), and follow those procedures.
- o. **Error Type 3840**: Port Audit and Update test (#36) failed due to an internal system error. Enter `status trunk` to verify the status of the trunk. If the trunk is out-of-service, then enter `release trunk` to put it back into in-service. Retry the test command.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order they are presented. By clearing error codes associated with the NPE Crosstalk test, for example, you may also clear errors generated from other tests in the sequence.

Table 320: System Technician-Demanded Tests: DS1-BD

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk test (#6)		X	ND
Conference Circuit test (#7)		X	ND
DS1 Dial Tone test (#314)	X	X	ND
Port Audit and Update test (#36)	X	X	ND

1. D = Destructive, ND = Nondestructive

NPE Crosstalk Test (#6)

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 321: Test #6 NPE Crosstalk Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be in use on a valid call. 1. Use status station or status trunk to determine when the port is available for testing. 2. Retry the command at 1-minute intervals up to 5 times.

1 of 3

Table 321: Test #6 NPE Crosstalk Test 2 of 3

Error Code	Test Result	Description / Recommendation
1001	ABRT	<p>System resources required for this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Use <code>status health</code> to determine if the system is experiencing heavy traffic.</p> <ol style="list-style-type: none"> 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABRT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service.</p> <ol style="list-style-type: none"> 1. Enter <code>list measurements tone-receiver</code> to see information about the system's tone receivers. 2. Resolve any TTR-LEV errors. 3. Resolve any TONE-PT errors. 4. If neither condition exists, retry the test at 1-minute intervals up to 5 times.
1004	ABRT	<p>The port has been seized by a user for a valid call. Use <code>status trunk</code> to determine when the port is available for testing.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1020	ABRT	<p>The test did not run due to a previously existing error on the specific port or a more general circuit pack error.</p> <ol style="list-style-type: none"> 1. Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the already existing error.
2000	ABRT	<p>Response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	<p>System resources required for this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2 of 3		

Table 321: Test #6 NPE Crosstalk Test 3 of 3

Error Code	Test Result	Description / Recommendation
2053	ABRT	<p>At least one of the following errors is found on the DS1 circuit pack:</p> <ul style="list-style-type: none"> ● 1281 – Loss of signal ● 1793 – Blue alarm ● 2049 – Red alarm ● 2305 – Yellow alarm ● 1537 – Hyperactivity <p>Look for the previous error types in the Hardware Error Log, and follow the procedures given in the DS1-BD (DS1 Interface Circuit Pack) on page 953 or UDS1-BD (UDS1 Interface Circuit Pack) on page 2329 maintenance documentation for the listed error types.</p>
	FAIL	<p>The NPE of the tested port was found to be transmitting in error. This will cause noisy and unreliable connections.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	<p>The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and examining station, trunk, or external wiring.</p>
3 of 3		

Conference Circuit Test (#7)

The Conference Circuit test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a tone detector port. If the level of the tone is within a certain range, the test passes.

Table 322: Test #7 Conference Circuit Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	<p>System resources required for this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1 of 3		

Table 322: Test #7 Conference Circuit Test 2 of 3

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required to run this test are not available. The port may be in use on a valid call. 1. Use status station or status trunk to determine when the port is available for testing.
1004	ABRT	The port has been seized by a user for a valid call. 1. Use status station or status trunk to determine when the port is available for testing. 2. Retry the command at 1-minute intervals up to 5 times.
1018	ABRT	Test disabled by administration. This only applies to analog stations. 1. To enable test, use change station extension and set the Test field to y . Run the test.
1020	ABRT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. 1. Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
2053	ABRT	At least one of the following errors is found on the DS1 circuit pack: <ul style="list-style-type: none"> ● 1281 – Loss of signal ● 1793 – Blue alarm ● 2049 – Red alarm ● 2305 – Yellow alarm ● 1537 – Hyperactivity Look for the previous error types in the Hardware Error Log, and follow the procedures given in the DS1-BD (DS1 Interface Circuit Pack) on page 953 or UDS1-BD (UDS1 Interface Circuit Pack) on page 2329 maintenance documentation for the listed error types.
		2 of 3

Table 322: Test #7 Conference Circuit Test 3 of 3

Error Code	Test Result	Description / Recommendation
	FAIL	The NPE of the tested port did not conference the tones correctly. This will cause noisy and unreliable connections. 1. Replace the circuit pack.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.
		3 of 3

Port Audit and Update Test (#36)

This test sends port-level translation data from switch processor to the DS1 Interface circuit pack to assure that a trunk's translations are correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of trunk kept in the DS1 Interface circuit pack and in switch software.

Table 323: Test #36 Port Audit and Update Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	Response to the test request was not received within the allowable time period.
2100	ABRT	Could not allocate the necessary system resources to run this test.
	FAIL	Test failed due to internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
		1 of 2

Table 323: Test #36 Port Audit and Update Test 2 of 2

Error Code	Test Result	Description / Recommendation
	PASS	Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack and switch software are consistent. If the trunk is busied out, the test will not run but will return PASS. To verify that the trunk is in-service: <ol style="list-style-type: none"> 1. Enter status trunk to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to step 2. 2. Enter release trunk to put the trunk back into in-service. 3. Retry the test command.
		2 of 2

DS1 CO Dial Tone Seizure Test (#314)

DS1 CO Dial Tone Seizure test checks the trunk’s signaling capability provided by the DS1 Interface circuit pack. The maintenance software initiates the test by sending a “seizure” message to the DS1 Interface circuit pack and expects an “active” reply from the DS1 interface circuit pack. If the “active” message is received, then the test passes. If no message is received and the timer expires, the test is aborted. If the DS1 Interface circuit pack sends a “reorder” message back to maintenance software, then the test fails.

This test cannot be run on a trunk in any of the following conditions:

- The trunk direction is administered as an incoming only trunk.
- The trunk has been seized by a normal trunk call.
- The trunk is administered with maintenance test disabled.

Table 324: Test #314 DS1 CO Dial Tone Seizure Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be in use on a valid call. Use status trunk to determine when the port is available for testing.
		1 of 3

Table 324: Test #314 DS1 CO Dial Tone Seizure Test 2 of 3

Error Code	Test Result	Description / Recommendation
1004	ABRT	The port has been seized by a user for a valid call. Use <code>status trunk</code> to determine when the port is available for testing. 1. Retry the command at 1-minute intervals up to 5 times.
1005	ABRT	Test failed due to incompatible configuration administered in trunk group screen. 1. Look at the Trunk Group administration screen and see if the trunk is incoming only, port 24 on a DS1 Interface with common control-channel signaling, or an automatic CO type such as FX. Under any of these conditions this is a normal abort.
1018	ABRT	Test has been disabled via administration. 1. Verify that the Maintenance Tests field on the Trunk Group screen is set to n . To enable the test, enter <code>change trunk-group x</code> where "x" equals the number of the trunk group to be tested, and change the Maintenance Tests field on the screen to y . 2. Repeat the test.
1020	ABRT	The DS1 Interface circuit pack is out-of-service. 1. Look for UDS1-BD errors in the Hardware Error Log. If present, see UDS1-BD (UDS1 Interface Circuit Pack) on page 2329. 2. Retry the command.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
		2 of 3

Table 324: Test #314 DS1 CO Dial Tone Seizure Test 3 of 3

Error Code	Test Result	Description / Recommendation
2053	ABRT	<p>At least one of the following errors is found on the DS1 circuit pack:</p> <ul style="list-style-type: none"> ● 1281 – Loss of signal ● 1793 – Blue alarm ● 2049 – Red alarm ● 2305 – Yellow alarm ● 1537 – Hyperactivity <p>Look for the previous error types in the Hardware Error Log, and follow the procedures given in the DS1-BD (DS1 Interface Circuit Pack) on page 953 or UDS1-BD (UDS1 Interface Circuit Pack) on page 2329 maintenance documentation for the listed error types.</p>
	FAIL	<p>The trunk cannot be seized for an outgoing call.</p> <ol style="list-style-type: none"> 1. Verify that the <code>Trunk Type</code> field on the trunk administration screen matches the trunk type administered on far-end switch. 2. Look for UDS1-BD errors in Hardware Error Log. If present, see UDS1-BD (UDS1 Interface Circuit Pack) on page 2329. 3. Retry the test at 1-minute intervals up to 5 times.
	PASS	The trunk can be seized for an outgoing call.
3 of 3		

DIOD-TRK (DIOD Trunk)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIOD-TRK	MAJ ¹	<code>test port location</code>	DIOD Trunk
DIOD-TRK	MIN	<code>test port location</code>	DIOD Trunk
DIOD-TRK	WRN	<code>test port location</code>	DIOD Trunk

1. A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by `set options` and that at least 75 percent of the trunks in this trunk group are alarmed.

Note:

Many trunk problems are caused by incorrect settings of parameters on the trunk group administration screen. Settings must be compatible with the local environment and with parameter settings on the far end. Refer to *Administrator's Guide for Avaya Communication Manager, 555-233-506*, for information about how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

Direct inward and outward dial (DIOD) trunks are 2-wire analog lines to the CO which support the following services:

- Both incoming and outgoing CO calls
- DID trunk
- DID trunk and 1-way outgoing DIOD

TN429 DIOD trunk circuit packs and MM711 Analog Media Modules provide eight ports for loop-start CO trunks and serve as an interface between the 2-wire analog CO line and the 4-wire TDM bus on the switch.

Note:

S8300 / G700 Although DIOD-TRK is provided for a G700 Media Gateway, DIOD-TRK only partially supports the MM711 Analog Media Module.

Loop Start Operation

Idle State: Tip = ground, Ring = CO Battery

Outgoing Call

1. PBX Off-Hook (Seize Message): Closes the Tip-Ring Loop CO Response: DC loop current + Dial tone
2. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current CO Response: CO goes to idle state (see Note)

Incoming Call

1. CO Applies Ringing Voltage PBX Response: Detect ringing current
2. PBX Off-Hook (Answer Message): Close loop CO Response: Trip ringing, provide loop current
3. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current CO Response: CO goes to idle state (see Note)

Direct Inward Dialing (DID) (Loop Start)

1. CO Applies Ringing Voltage
 PBX Response: Detect ringing current and close loop
 CO Response: Send DTMF digits
 PBX Response: Acknowledge of Number dialed and open loop
2. PBX Off-Hook (Answer Message): Close loop CO Response: Trip ringing, provide loop current
3. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current CO Response: CO goes to idle state (see Note)

Note:

CO does not normally provide an On-Hook (Disconnect) signal.

1. Major alarms on this MO may be downgraded to Warning alarms based on the value in `set options`. If the Minor alarm is not downgraded by `set options` values, the Minor alarm is upgraded to a Major alarm if 75 percent of the trunks in this trunk group are alarmed.

Additional Information:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.
- b. **Error Type 15** is a software audit error and does not indicate any hardware malfunction. Run the short test sequence, and investigate associated errors.
- c. **Error Type 769 Aux Data 57392** are in-line errors that have no specific test associated with them. The CO is not releasing after the call is dropped from the PBX end. After several occurrences, an off-board warning alarm is generated. Refer the problem to the CO.
- d. **Error Type 2561 Aux Data 57345:** Single polarity ringing current. This is an in-line error that has no specific test associated with it. This error results from abnormal ringing current, but does not prevent the incoming call from being accepted. This error code is logged for information purposes only and does not cause additional testing to occur. One cause could be that the reverse current detector associated with the port is failing. (Will not be detected by any tests.) The other cause could be that normal current is not detected. In this case, neither incoming nor outgoing calls can be completed, and the Dial Tone test (#0) also fails. Check for other errors.

Communication Manager Maintenance-Object Repair Procedures

- e. **Error Type 2817 Aux Data 57393** is an in-line error that has no specific test associated with it. CO released the trunk at least four minutes after the PBX dropped the call. This error code is log only and causes no other testing to occur. No alarm is generated. Check for other errors.
- f. **Error Type 3073 Aux Data 57376** is an in-line error that has no specific test associated with it. No loop current on incoming call. The incoming destination has already answered and no loop current has been detected. If this is a hard fault, the Dial Tone test (#0) and every outgoing call should also fail. Check for other errors.
- g. **Error Type 3585 Aux Data 57424** is an in-line error that has no specific test associated with it. No loop current on outgoing call. This error occurs on an attempt to seize a loop or ground-start trunk for an outgoing call. An error occurs if loop current is not detected or the caller hangs up before it is detected. Busyout the affected port, and run a Long test. If the Dial Tone test (#0) passes, ignore this error. Release the port.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order they are presented. By clearing error codes associated with NPE Crosstalk test, you may also clear errors generated from other tests in the sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk test (#6) S8300 / G700 This test aborts with Error Code 1412.		X	ND
Dial Tone test (#0) S8300 / G700 This test aborts with Error Code 1412.		X	ND
Looparound and Conference test (#33) S8300 / G700 This test aborts with Error Code 1412.		X	ND
Audit Update test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

Dial Tone Test (#0)

Note:

S8300 / G700: This test aborts with Error Code 1412.

This test attempts to seize a port and checks for the return of a dial tone.

Table 326: Test #0 Dial Tone Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use <code>display port location</code> to determine the trunk group/member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. Wait until the port is idle before retesting. 2. If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1001	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1004	ABRT	The port has been seized by a user for a valid call. Use <code>status trunk</code> to determine when the port is available for testing. 1. Retry the command at 1-minute intervals up to 5 times.
1018	ABRT	Test has been disabled via administration. 1. The Maintenance Tests field must be y on the Trunk Group form for this test to run. Use <code>change trunk-group grp#</code> to access the form. Then change the entry in the Maintenance Tests? field on the form to y .
<i>1 of 2</i>		

Table 326: Test #0 Dial Tone Test 2 of 2

Error Code	Test Result	Description / Recommendation
1005	ABRT	Trunk has been administered as incoming-only; or DID trunk group type; dial tone can only be obtained on outgoing trunks. This is a normal condition.
S8300 / G700 1412	ABRT	This test does not execute on a G700 Media Gateway.
2000	ABRT	Response to the test was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	Trunk was seized, but dial tone could not be detected. 1. Check for errors on TONE-BD or TONE-PT. Clear any errors and repeat test. 2. If error has still not cleared, refer problem to CO.
2002	FAIL	Seizure portion of test failed due to hardware problem. Fault is usually caused by a disconnected trunk. 1. Check trunk wiring to ensure good connection; repeat test if wiring correction made. 2. Locate another identical CO trunk and swap its wiring with one under test. Repeat test on both trunks and determine whether problem follows trunk or remains at original port. If problem follows trunk, refer problem to CO. If problem remains at port, replace the circuit pack and repeat test.
1009	PASS	Detected tone was not pure dial tone. No action required.
	PASS	Trunk was seized, and dial tone was detected. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.
2 of 2		

NPE Crosstalk Test (#6)

Note:

S8300 / G700: This test aborts with Error Code 1412.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is usually only part of a port's long test sequence and executes in about 20 to 30 seconds.

Table 327: Test #6 NPE Crosstalk Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Enter <code>display port location</code> to determine the trunk group/member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the port is in use, wait until it is idle before testing. 2. If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
1001	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABRT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the test at 1-minute intervals up to 5 times.
1 of 2		

Table 327: Test #6 NPE Crosstalk Test 2 of 2

Error Code	Test Result	Description / Recommendation
1004	ABRT	<p>The port was seized by a valid call during the test. The test has been aborted.</p> <ol style="list-style-type: none"> 1. Enter <code>display port location</code> to determine the trunk group/ member number of the port. Use <code>status trunk</code> to determine the service state of the port. If the port is in use, wait until it is idle before retesting.

2000	ABRT	<p>Response to the test was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
Any	FAIL	<p>The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	<p>The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.</p>
2 of 2		

Looparound and Conference Circuit Test (#33)

Note:

S8300 / G700: This test aborts with Error Code 1412.

This test checks the reflective loop and conference abilities of a CO port circuit. The test uses 404-, 1004-, and 2804-Hz tones. Each tone is transmitted separately through the loop and checked.

Table 328: Test #33 Looparound and Conference Circuit Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate system resources to run this test.
7	ABRT	Conference Circuit test aborted.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. <ol style="list-style-type: none"> 1. Enter display port location to determine the trunk group/ member number of the port. Use status trunk to determine the service state of the port. If the port is unavailable, wait until it is idle before testing. 2. If the port status is idle, retry the command at 1-minute intervals up to 5 times.
1004	ABRT	The port has been seized by a user for a valid call. Use status trunk to determine when the port is available for testing. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
S8300 G700 1412	ABRT	This test does not execute on a G700 Media Gateway.
2100	ABRT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1 of 2		

Table 328: Test #33 Looparound and Conference Circuit Test 2 of 2

Error Code	Test Result	Description / Recommendation
7	FAIL	<p>Fail</p> <ol style="list-style-type: none"> 1. Check for errors on TONE-BD or TONE-PT. 2. If the Reflective Looparound test fails for every port on a circuit pack, a -5V power problem is indicated. S8700 8710 / S8500: If a TN736 or TN752 power unit circuit pack is present, check the circuit pack for a red LED. If the red LED is on, then replace the power unit circuit pack. If neither the TN736 nor the TN752 Power Unit circuit pack is present, then the OLS631DB AC power unit may be defective. The system may contain a TN736 or TN752 power unit circuit pack or an OLS631DB AC power unit, but not both. See RMC-ENV (S8700 IP), or CARR-POW (S8700 MC). 3. Rerun the test. 4. If the test fails again, replace the circuit pack.
	PASS	<p>CO Trunk Looparound and Conference test is successful. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.</p>
2 of 2		

Port Audit Update Test (#36)

This test sends updates of the CO port translation for every translated port on the circuit pack or media module. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack or media module. No response message is expected from the circuit pack or media module once it receives translation updates. The port translation data includes: ground or loop start trunk, tone or rotary dialing trunk, rotary dialing inter-digit timing, network balance R/RC, and disconnect timing.

Table 329: Test #36 Port Audit Update Test

Error Code	Test Result	Description / Recommendation
	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run the test.
	FAIL	Internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	This test passed. Translation information was successfully updated on the circuit pack or media module. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring. If the trunk is busied out, the test does not run, but returns PASS. To verify that the trunk is in-service: <ol style="list-style-type: none"> 1. Enter status trunk to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to step 2. 2. Enter release trunk to put trunk back into in-service. 3. Retry the test command.

DLY-MTCE (MO-DAILY)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
DLY-MTCE	MINOR	NONE	DLY-MTCE
DLY-MTCE	MAJOR	NONE	DLY-MTCE

The DLY-MTCE MO monitors daily translation saves. If a translation save times out or fails to run, an error is logged against this MO.

If Save Fails	Then System Raises
Three times in a row	MINOR Alarm
Seven times in a row	MAJOR Alarm

Daily Maintenance Interference

[Table 330: Communication Manager SAT Command Actions](#) on page 950 lists Communication Manager SAT administration command actions that, when active, interfere with daily maintenance. Customer administrators frequently use these commands for routine administration of the system.

Table 330: Communication Manager SAT Command Actions

Likely to Disrupt	Less Likely to Disrupt	
add	backup	ping
change	busyout	recycle
duplicate	clear	release
remove	display	reset
set	enable	restore
	format	resume
	get	save
	list	status
	mark	test
	monitor	upgrade
	netstat	

Other command actions can also interfere with daily maintenance when certain qualifiers are used in the commands, or under certain circumstances. For example, certain **test** commands, when used with the modifier *continuously*, could interfere with daily maintenance. However, such command actions are not typically used by customer administrators doing routine administration, and are less likely to disrupt daily maintenance routines than are the **add**, **change**, **duplicate**, **remove**, and **set** command actions.

Incomplete Command Time-Out

A time-out feature exists on the Maintenance-Related System Parameters screen. Use **change system parameters maintenance** to access the screen. The time-out feature improves the operation of daily maintenance by allowing maintenance routines to run that might otherwise not run. It also helps to prevent the loss of translations that were not saved with a **save translation**, and were also not saved because daily maintenance was prevented from running prior to the system reset. Highlights of the feature include:

- Options for blank, 1, 2, 3, 4, 5, or 6 hours (the default is 2 hours)
- The blank option indicates that the feature is not active
- Only commands that block the running of daily maintenance (add, change, duplicate, remove, and set) are affected
- All logins will time-out if any of these commands are active for the prescribed time (except for the “blank” option)
- The feature applies to all logins, regardless of type (init, dadmin, craft, inads) or permissions granted to the specific login ID of an administration or maintenance user
- The corresponding “time-out” entry is appended to the list history log

The **Command Time-out** field can be viewed by customer administrators. A craft, init, dadmin, or inads login is required to change the option for the field. [Figure 47: Maintenance-Related System Parameters \(change system-parameters maintenance\)](#) on page 952 shows the Maintenance-related System Parameters screen for Communication Manager. [Figure 48: Command Time-out Entry on list history](#) on page 952 shows an example of the LIST HISTORY screen with the “time-out” entry. The final line indicates that **change system-parameters maintenance** was being executed when the time-out period of 2 hours expired.

DS1-BD (DS1 Interface Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DS1-BD	MAJ	<code>test board location sh</code>	DS1 Interface circuit pack
DS1-BD	MIN	<code>test board location l</code>	DS1 Interface circuit pack
DS1-BD	WRN	<code>test board location sh</code>	DS1 Interface circuit pack

The DS1 Interface circuit pack provides an interface to an external DS1 facility and supports 24 DS0 channels carried on a 1.544-Mbps DS1 link. These DS0 channels can be administered as either trunks to other switches or lines to off-premises stations. The TN464C (or later-suffixed) Universal DS1 Interface also supports a 32-channel interface on a 2.048-Mbps link. The functions and maintenance strategy for the TN464 circuit packs are covered under a separate MO, [UDS1-BD \(UDS1 Interface Circuit Pack\)](#) on page 2329.

DS1-BD maintenance logs in-line errors reported by the DS1 Interface circuit pack, runs tests for error diagnosis and recovery, and raises and clears alarms. The following table shows the capabilities of each DS1 circuit pack. The TN722 and TN722B are not supported on G3r V1 or later systems.

Circuit Pack Code	24-Channel	32-Channel	Tie Trunk Signaling	CO Trunk Signaling	DID Trunk Signaling	OPS Line Signaling
TN722/B	X		X			
TN767/B/C/D/E	X		X	X	X	X
TN464C/D/E/F/GP	X	X	X	X	X	X (24-chl only)
TN2313	X	X	X	X	X	X

ISDN-PRI Trunk signaling (for example, Q.921, Q.931) requires a TN464D or higher suffix, TN2464, or TN2242 (tie trunk signaling only) and is handled by system software. The TN464, TN2464, and TN2242 are covered in [UDS1-BD \(UDS1 Interface Circuit Pack\)](#) on page 2329.

Each trunk and line have their own maintenance strategies. However, they all depend on the health of the DS1 Interface circuit pack. See the following sections for details: [TIE-DS1 \(DS1 Tie Trunk\)](#) on page 2225, [CO-DS1 \(DS1 CO Trunk\)](#) on page 791, [DID-DS1 \(Direct Inward Dial Trunk\)](#) on page 861, [OPS-LINE \(DS1 Off-Premises Station Line\)](#) on page 1694, [ISDN-TRK \(DS1 ISDN Trunk\)](#) on page 1415, and [ISDN-PLK \(ISDN-PRI Signaling Link Port\)](#) on page 1392. Signaling over the DS1 link must be synchronized between the transmitting and receiving ends to ensure error-free communication. See [SYNC \(Port-Network Synchronization\)](#) on page 2100 for details.

Communication Manager Maintenance-Object Repair Procedures

Combined with a TN767E circuit pack, Avaya's 120A1 Integrated CSU module becomes an enhanced CSU. The 120A1 CSU, combined with new switch software and the functionality provided by a TN767E's hardware and firmware, provides functionality equivalent to an external stand-alone Avaya ESF T1 CSU. The 120A1 CSU connects to the TN767E circuit pack on the I/O connector panel on the back of the port carrier, and thus becomes an integrated part of the system. Throughout this document, the term 120A1 means a 120A1 (or later-suffixed) CSU.

The 120A1 CSU and the TN767E are for use in the United States of America with 1.544-Mbps DS1 service. For more information about the 120A1 CSU module see *DEFINITY® Communications System Generic 1, Generic 2 and Generic 3 V1 and 2 – Integrated Channel Service Unit (CSU) Module Installation and Operation, 555-230-193*.

A TN767E and a 120A1 integrated CSU support on-demand loop-back tests assisting fault detection between the:

- TN767E circuit pack and the integrated CSU
- Integrated CSU and an optional customer-premises loop-back jack
- Integrated CSU and a remote CSU.

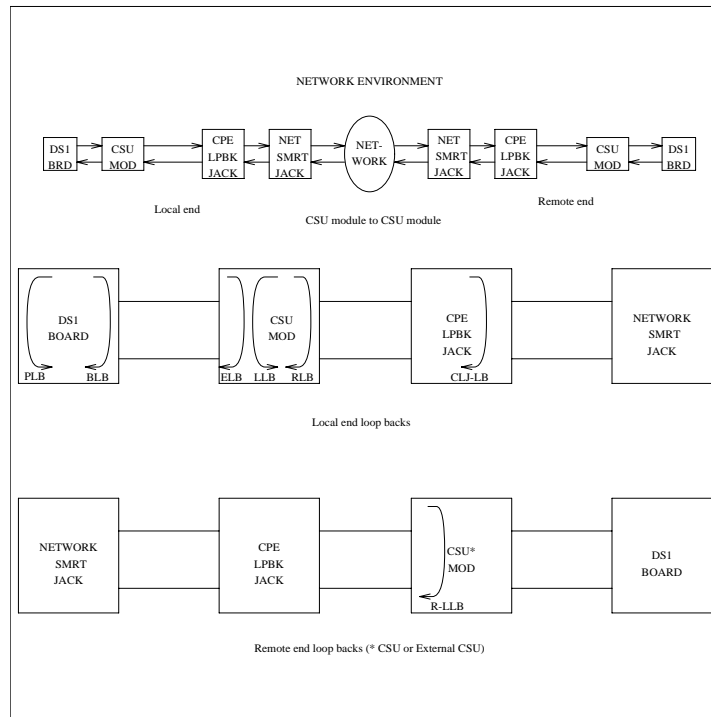

These loop-back tests are explained in detail later in this DS1-BD section, but [Figure 49: High-Level Overview Of Loop-Back Points](#) on page 955 gives a high-level overview of the loop-back points.

The following list of acronym definitions are for [Figure 49: High-Level Overview Of Loop-Back Points](#) on page 955:

- PLB = Payload Loopback
- BLB = Board Loopback
- ELB = Equipment Loopback
- LLB = Line Loopback
- RLB = Repeater Loopback
- CLJ = Loop-Back Jack Loopback
- R-LLB = Remote Line Loopback
- SMRT = Smart Jack
- LPBK = Loopback

For more information about DS1 interfaces, refer to the *DEFINITY® Communications System Generic 2.2 and Generic 3 V2 DS1/CEPT1/ISDN-PRI Reference, 555-025-107*.

3999 (y)	Any	None			
					4 of 4

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to the test’s description and follow the recommended procedures.
- b. **Error Type 1:** the circuit pack stopped functioning or is not completely administered. The alarm is logged approximately 15 minutes after the circuit pack has been removed or 11 minutes after the SAKI test (#53) fails.

To be completely administered, a DS1 circuit pack must:

- Have an entry in the circuit plan field in **change circuit-packs**
- Be administered using **add ds1 location**
- Be physically inserted in the correct slot

If the circuit pack has an entry in the circuit plan and either of the other two conditions are *not* met, a MINOR alarm is logged. To resolve the error, either:

- Make sure all conditions for administration are met and that a functioning DS1 circuit pack is inserted in the correct slot, or
- Completely remove the DS1-BD from the system:
 1. Remove any administered DS1 trunks or access endpoints associated with the circuit pack from their trunk groups.
 2. Execute `remove ds1 location` and `change circuit-packs UU`.

If all the administration conditions are met for this circuit pack and the red LED is still on, follow the instructions in [LED alarms without Alarm Log entry or with Error Type 1](#) on page 250.

- c. **Error Type 18:** the DS1 Interface circuit pack has been busied out by `busyout board location`.
- d. **Error Type 23:** the DS1-BD circuit pack is not completely administered. Ensure that the DS1-BD circuit pack has an entry in the circuit plan via `change circuit-packs`, is administered via `add ds1 location`, and is inserted into the correct port slot.
- e. **Error Type 125:** the circuit pack in the slot does not match the type administered to that position. Either replace the circuit pack with one of the type administered, or use `change circuit-packs` to re-administer the slot. This error may also indicate that the 24/32-channel selection on the DS1 administration screen does not match the configuration of the circuit pack.
- f. **Error Type 257** is associated with the Common Port circuit pack maintenance test. See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for details.
- g. **Error Type 513:** The DS1 Interface circuit pack has detected a transient hardware problem (for example, external RAM failure, internal RAM failure, internal ROM failure, or instruction set failure). This error disappears when no faults are detected for 30 minutes. The value in the `Aux Data` field indicates the type of hardware problem. However, when this error is reported with **Aux Data** of **4352** to **4358**, the circuit pack has reported a hardware failure. Escalate the problem.
- h. **Error Type 769:** The DS1 Interface circuit pack detected a transient hardware logic error (for example, program logic inconsistency). This error disappears when no faults are detected for 100 minutes. The value in `Aux Data` field indicates the type of hardware problem.
- i. **Error Type 1025:** CSU module or T1 sync splitter missing. The `Near-End CSU Type` field on the `add ds1` screen has been administered as `integrated`, but the 120A1 CSU or T1 sync splitter is not physically connected (or is improperly connected) to the TN767E board on the back of the port carrier.

If using the 120A1 CSU or T1 sync splitter, plug (or replug) the CSU or T1 sync splitter into the TN767E circuit pack's connector on the I/O connector panel on back of the carrier.

Communication Manager Maintenance-Object Repair Procedures

Otherwise, change the `Near-End CSU Type` field using the `change ds1` screen to `other`.

If this error remains after plugging the 120A1 CSU or T1 sync splitter into the board's connector, there could be a problem with the I/O connector panel.

- j. **Error Type 1301:** CSU module/T1 sync splitter not expected. The 120A1 CSU or T1 sync splitter is physically connected to the TN767E board on the back of the port carrier, but the `Near-End CSU Type` field on the `add ds1` screen has not been administered as `integrated`.

If the 120A1 CSU or T1 sync splitter is to be used, use `change ds1` to change the `Near-End CSU Type` field to `integrated`. Otherwise, physically remove the 120A1 CSU or T1 sync splitter from the back of the port carrier.

- k. **Error Type 1302:** DS1 configuration error. Attempting to use a 120A1 CSU with a TN767E circuit pack that is configured for 32-channel (2.048-Mbps) operation. This CSU only works with a DS1 board configured for 24-channel (1.544-Mbps) operation in the United States of America.

- l. **Error Type 1303:** DS1 circuit pack suffix incorrect for CSU or T1 sync splitter. The `Near-End CSU Type` field on the `add ds1` screen has been administered as `integrated` but the DS1 circuit pack is not a TN767E (or higher-suffixed) DS1 board.

If the 120A1 CSU or T1 sync splitter is to be used, remove the circuit pack and replace it with a TN767E (or higher-suffixed) board. Otherwise, use `change ds1` to change the `Near-End CSU Type` field to `other`.

- m. **Error Type 1310:** BLB failure. This error occurs when the DS1 Board Loopback (BLB) demand test fails. Repeat the test using `busyout board location, test ds1-loop location ds1/csu-loop-back jack-tests, release board location`. If the BLB test continues to fail, then the TN767E circuit pack needs to be replaced.
- n. **Error Type 1311:** ELB failure. This error occurs when the Integrated CSU (I-CSU) Module Equipment Loopback (ELB) test fails. This test is executed during I-CSU/T1 sync splitter power-up/reset (i.e., the TN767E board is physically inserted and the CSU module/T1 sync splitter is already installed) or when the CSU module/T1 sync splitter is plugged on to an already initialized DS1 board. The ELB test is also executed as part of `test ds1-loop location ds1/csu-loopback-tests`.

Attempt to clear the alarm with `busyout board location, test ds1-loop location ds1/csu-loopback-tests`, and `release board location`. If the ELB test continues to fail, then either the TN767E board, the CSU module, the T1 sync splitter, or the I/O cable between the backplane and the CSU module/T1 sync splitter (or any combination thereof) has failed. Escalate this problem.

- o. **Error Type 1312:** RLB failure. This error occurs when the Integrated CSU (I-CSU) Module Repeater Loopback (RLB) test fails. This test is executed during I-CSU/T1 sync splitter power-up/reset (i.e., the TN767E board is physically inserted and the CSU module/T1 sync splitter is already installed) or when the CSU module/T1 sync splitter is plugged on to an already initialized DS1 board. The RLB test is also executed as part of the command `test ds1-loop location ds1/csu-loopback-tests`.

Attempt to clear the alarm with **busyout board location, test ds1-loop location ds1/csu-loopback-tests**, and **release board location**. If the RLB test continues to fail, then the CSU module/T1 sync splitter needs to be replaced.

- p. **Error Type 1313:** CPE loop-back jack deactivation error. This error occurs when the TN767E circuit pack could not deactivate a CPE loop-back jack loop-back.

Attempt to clear the alarm with **busyout board location, test ds1-loop location end-loopback/span-test**, and **release board location**. If the attempt to deactivate the CPE loop-back jack loop back continues to fail, other steps must be taken to deactivate the loop back.

- q. **Error Type 1314:** Far CSU Loopback deactivation error. This error occurs when the TN767E circuit pack could not deactivate a far-end CSU loop back on power-up/reset or upon software request.

Attempt to clear the alarm with **busyout board location, test ds1-loop location end-loop back/span-test**, **release board location**. If the attempt to deactivate the Far CSU loop back continues to fail, then escalate the problem.

- r. **Error Type 1538:** The hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:

- The common circuit pack-level tests, such as Test #51 and Test #220, are aborting with error code 2000.
- The tests run on the ports of this circuit pack are returning NO BOARD.
- A **busyout/release** of the circuit pack has no affect on test results.
- **List configuration** shows that the circuit pack and ports are properly installed.

The circuit pack is isolated from the system and all trunks of this circuit pack are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 Interface circuit pack is restored to normal operation. All trunks of the DS1 Interface circuit pack are then returned to the in-service state. If the error recurs after 15 minutes, then escalate this problem.

- s. **Error Type 3160:** For later releases of G3V4 and beyond, only error 3073 shows that this board is receiving Slips, and the AUX data shows the last Slip count that was reported.
- t. **Error Type 3329 - 3345:** For later releases of G3V4 and beyond, only error 3329 shows that this board is receiving misframes and the AUX data shows the last misframe count that was reported.
- u. **Error Type 3840:** ignore, is not service-affecting.
- v. **Error Type 3900:** used to give status information about a CPE Loopback Jack test. The value in the **Aux Data** field indicates the status of the loop-back test:
- Aux Data 1:** Test is currently running.
 - Aux Data 2:** Test failed because loop back could not be activated.
 - Aux Data 3:** Test failed because test pattern could not be detected.
 - Aux Data 4:** Test has been deactivated.

- w. **Error Type 3901:** gives status information about a Far CSU Loopback test. The value in the `Aux Data` field indicates the status of the loop-back test.
 - Aux Data 1:** Test is currently running.
 - Aux Data 2:** Test failed because loop back could not be activated.
 - Aux Data 3:** Test failed because test pattern could not be detected.
 - Aux Data 4:** Test has been deactivated.
- x. **Error 3902:** gives status information about a One-Way Span test. The value in the `Aux Data` field indicates the status of the span test:
 - Aux Data 1:** Test is currently running.
 - Aux Data 2:** Test failed because loop back could not be activated.
 - Aux Data 3:** Test pattern was not received from the far end.
 - Aux Data 4:** Test has been deactivated.
- y. **Error Type 3999:** the circuit pack sent a large number of control-channel messages to the switch within a short period of time. If Error Type #1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If Error Type #1538 is absent, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order they are presented. By clearing error codes associated with the `NPE Connection Audit` test, for example, you may clear errors generated from other tests in the sequence.

Table 332: System Technician-Demanded Tests: DS1-BD 1 of 2

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	test ds1-loop Command	D/ND ¹

NPE Connection Audit Test (#50):

The system sends a message to the on-board microprocessor to update the network connectivity translation for all the Network Processing Elements (NPEs) on the circuit pack.

Table 333: Test #50 NPE Connection Audit Test

Error Code	Test Result	Description / Recommendation
None, 2100	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
1019	ABRT	Test already in progress.
	FAIL	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	The circuit pack's NPEs have been updated with their translation.
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Use <code>add ds1 location</code> to administer the DS1 interface if it is not already administered. 2. If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. 3. Enter <code>busyout board</code> 4. Enter <code>reset board</code> 5. Enter <code>release board</code> 6. Enter <code>test board long</code> <p>This should re-establish the linkage between the internal ID and the port.</p>

Control Channel Loop-around Test (#52)

This test queries the circuit pack for its circuit pack code and vintage and verifies its records.

Table 334: Test #52 Control Channel Loop-around Test 1 of 2

Error Code	Test Result	Description / Recommendation
None 2100	ABRT	System resources required for this test are not available. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	<p>The test failed because the circuit pack did not return the circuit pack code or vintage.</p> <p>Note: Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited.</p> <ul style="list-style-type: none"> • The DS1-BD tests (such as Tests 138 and 139) are aborting with error code 2000. • The tests run on the ports of this circuit pack are returning a no board result. • A busyout or a release command has no affect on the test result. • A list config command shows that the circuit pack and the ports are properly installed. <p>When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.</p> <ol style="list-style-type: none"> 1. Retry the command up to 5 times. 2. If the problem continues, check for hyperactivity. Resolve the problem, as appropriate. 3. If there is no longer hyperactivity, retry the command up to 5 times. 4. If the test continues to fail, escalate this problem.
	PASS	Communication with this circuit pack is successful.
1 of 2

Enter <code>test board long</code> <p>This should re-establish the linkage between the internal ID and the port.</p>
		2 of 2

SAKI Sanity Test (#53)

This test is destructive. This test resets the circuit pack.

Table 335: Test #53 SAKI Sanity Test 1 of 2

Error Code	Test Result	Description / Recommendation
None	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
1005	ABRT	Wrong circuit pack configuration to run this test. This error applies only to DS1 Interface circuit packs. It means the DS1 Interface circuit pack is providing timing for the system and, therefore, it cannot be reset without major system disruptions. 1. If the circuit pack needs to be reset, then set synchronization to another DS1 Interface circuit pack or to the Tone-Clock circuit and try again. Refer to "SYNC (Synchronization)".
1015	ABRT	Port is not out-of-service. 1. Busyout the circuit pack. 2. Execute the command again.
2100	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
1	FAIL	The circuit pack failed to reset.
2	FAIL	The circuit pack failed to restart. 1. Execute the command again. 2. If the problem persists, escalate this problem.
	PASS	The circuit pack initializes correctly. 1. Run the short test sequence.
1 of 2

Enter <code>test board long</code> <p>This should re-establish the linkage between the internal ID and the port.</p>
		2 of 2

Internal Loop-Around Test (#135)

This test is destructive.

The Internal Looparound test is run by looping the transmitted DS1 bit stream back into the DS1's board receiver. The loop occurs just before the DS1 facility interface. The test is highly destructive and can only be initiated by a technician-demanded `reset board location`.

All trunks on the DS1 Interface circuit pack must be busied out via the system technician `busyout board` command before running the Internal Looparound test. When the Internal Looparound test is initiated, maintenance software sends messages to the DS1 Interface circuit pack to start the test. The test uses the Tone Generator and Tone Detector to exercise a bit pattern consistency test for all ports. If the transmitted and received bit patterns on a trunk are different, the test fails.

When the test is complete, the maintenance software sends a stop loop around message to the DS1 Interface circuit pack to put the circuit pack back into the normal operation mode. All trunks of the DS1 Interface circuit pack are restored to the in-service state after `release board` is entered.

Table 336: Test #135 Internal Loop-Around Test 1 of 3

Error Code	Test Result	Description / Recommendation
2012	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals up to 5 times.
1003	ABRT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out of service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the test at 1-minute intervals up to 5 times.
1004	ABRT	Received an incoming call on a port of the DS1 circuit pack during the test. 1. Enter busyout board location to put every trunk on the DS1 circuit pack into the out-of-service state. 2. Retry the command at 1-minute intervals up to 5 times.
1015	ABRT	Ports on DS1 Interface circuit pack have not been busied out. 1. Enter busyout board location to put every trunk on the DS1 circuit pack into the out-of-service state. 2. Retry the command.
1039	ABRT	The DS1 Interface circuit pack is providing timing for the system. Therefore, it cannot be reset without major system disruption. 1. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit using the following command sequence: a. Enter disable synchronization-switch b. Enter set synchronization location c. Enter enable synchronization-switch
1 of 3		

Table 336: Test #135 Internal Loop-Around Test 2 of 3

Error Code	Test Result	Description / Recommendation
2000	ABRT	<p>The test was aborted. Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited.</p> <ul style="list-style-type: none"> ● The DS1-BD tests (such as Tests 139 and 140) are aborting with error code 2000. ● The tests run on the ports of this circuit pack are returning a no board result. ● A busyout or a release command has no affect on the test results. ● A list config command shows that the circuit pack and the ports are properly installed. <p>When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error recurs after 15 minutes, escalate this problem.</p>
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	<p>DS1 Interface circuit pack failed the Internal Looparound test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times. 2. If the DS1 Interface circuit pack is a TN767, enter list measurement ds1-log location to read the error seconds measurement. Otherwise, skip this step. 3. Verify that both of the DS1 link's endpoints are assigned with the same signaling mode, framing mode, and line coding. 4. Check the physical connectivity of DS1 Interface circuit packs and cable. 5. Contact T1 Network Service to diagnose remote DS1 endpoint. 6. If 2 to 5 are OK and the problem recurs, escalate the problem.
2 of 3		

Table 336: Test #135 Internal Loop-Around Test 3 of 3

Error Code	Test Result	Description / Recommendation
	PASS	Every administered trunk of DS1 Interface circuit pack passed the Internal Looparound test. The bit pattern consistency test executed successfully over the path that covers a DS1 port, cable, and the external NCTE device.
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Use <code>add ds1 location</code> to administer the DS1 interface if it is not already administered. 2. If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. 3. If the board was found to be correctly inserted in step 1, enter <code>busyout board</code> 4. Enter <code>reset board</code> 5. Enter <code>release board</code> 6. Enter <code>test board long</code> <p>This should re-establish the linkage between the internal ID and the port.</p>
3 of 3		

Loss of Signal Alarm Inquiry Test (#138)

This test verifies the synchronization status and continuity of the DS1 link. The Loss of Signal alarm indicates that the DS1 Interface circuit pack is unable to derive the synchronization clock from the DS1 facility. When the DS1 Interface circuit pack detects a Loss of Signal alarm, it stops providing the synchronization clock for the system if it is administered as a timing source and transmits a Yellow alarm to the remote DS1 endpoint.

When the Loss of Signal alarm is confirmed, the maintenance software places all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. The inquiry test will run every 10 minutes until the loss of signal has been restored. The DS1 Interface circuit pack raises a Loss of Signal alarm after the signal has been lost for about 1second. It will not retire the alarm until the signal has returned for about 10 seconds.

S8700 MC

This test is also used to maintain the 120A CSU module and the 401A T1 sync splitter. The CSU module, when combined with the functionality provided by the TN767E circuit pack, provides functionality equivalent to an external standalone ESF T1 CSU. The 401A T1 sync splitter, when combined with the functionality provided by the TN767E circuit pack, allows an ATM switch to derive its timing off a T1 facility connected to the S8700 Multi-Connect's DS1 circuit pack.

If a TN767E circuit pack detects certain I-CSU/T1 sync splitter hardware errors, it will notify the maintenance subsystem. When the subsystem receives notification of the error, it executes this Loss of Signal Inquiry test. The test, in addition to querying for a Loss of Signal alarm condition, will also query the TN767E board to confirm the error. A Minor or Warning alarm will be raised depending on the severity of the error. The trunks on the board may be taken out of service if the error is deemed serious.

If a Loss of Signal alarm and an I-CSU/T1 sync splitter error co-exist, the Loss of Signal alarm condition takes priority, and the board and all of its trunks are put in the out-of-service state. However both errors will be logged.

When the maintenance subsystem receives notification that the ICSU/T1 sync splitter hardware error condition no longer exists, maintenance will restore the board and all trunks to their previous service state if the alarm can be cleared (no other errors or Loss of Signal alarm exist).

Table 337: Test #138 Loss of Signal Alarm Inquiry Test 1 of 7

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1 of 7		

Table 337: Test #138 Loss of Signal Alarm Inquiry Test 2 of 7

Error Code	Test Result	Description / Recommendation
2000	ABRT	<p>Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited.</p> <ul style="list-style-type: none"> ● The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. ● The tests run on the ports of this circuit pack are returning a no board result. ● A busyout or a release command has no affect on the test results. ● A list config command shows that the circuit pack and the ports are properly installed. <p>When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.</p>
	FAIL	<p>DS1 Interface circuit pack detects a Loss of Signal alarm. The physical link is broken or the remote DS1 endpoint is down. All trunks or ports of this DS1 interface circuit pack are out-of-service. If the DS1 Interface circuit pack is designated as the supplier of the system synchronization source, then the system synchronization maintenance will adopt a source elsewhere. Refer to "SYNC (Synchronization)" section for details.</p> <ol style="list-style-type: none"> 1. If the DS1 Interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the DS1 Interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. 2. Check the physical connection of the DS1 Interface circuit pack and the cable. If a 120A1 CSU module/T1 sync splitter is physically connected to a TN767E board on the back of the port carrier, check the physical connection of the CSU module/T1 sync splitter, and make sure the Network Interface cable is plugged into the CSU module's/T1 sync splitter's NETWORK jack.

7 of 7		

Blue Alarm Inquiry Test (#139)

A remote DS1 endpoint sends a blue-alarm signal across the DS1 link when it is out-of-service. When a local DS1 Interface circuit pack detects a blue alarm from the remote DS1 endpoint, the circuit pack sends both:

- Periodic yellow alarms to the remote DS1 endpoint
- A BLUE ALARM message to the maintenance software

The Blue Alarm Inquiry test checks the remote DS1 endpoint's blue-alarm status. After the blue alarm is confirmed, maintenance software

- Takes every DS1 trunk on the circuit pack out of service
- Runs this test every 10 minutes until the blue alarm is cleared

For blue alarms, a DS1 Interface circuit pack takes much longer to recognize and report its resolution (~ 16 seconds) than its occurrence (~ 2 seconds). So, when a blue alarm is cleared, the local DS1 Interface circuit pack avoids false blue alarms by quickly:

- Restoring the DS1 trunks to service
- Discontinuing yellow alarms to the remote endpoint

before the remote endpoint can recognize and report another blue alarm.

Line Loopback Alarm

The Line Loopback (LLB) is used by the remote DS1 endpoint to put the ICSU or DS1 into a loop-back mode. When the ICSU or DS1 Board is in the LLB mode, the arriving bit pattern is regenerated and sent back. Line Loopback (LLB) Alarm is activated when the in-band activate LLB bit pattern has been arriving continuously for 5 seconds on the DS1 line. LLB is deactivated when the in-band deactivate LLB bit pattern has been arriving continuously for 5 seconds on the DS1 line.

Since LLB is a maintenance condition rendering all DS0 channels unavailable for signaling or bearer traffic, maintenance software treats this the same as a Blue Alarm.

Payload Loopback Alarm

The Payload Loopback (PLB) is used by the remote DS1 endpoint to put the switch DS1 into a loop-back mode. PLB Alarm is activated when a network protocol activate bit pattern arrives over the 4-kbps ESF data link on the DS1 line. PLB is deactivated when a network protocol deactivate bit pattern arrives over the 4-kbps ESF data link on the DS1 line.

Since PLB is a maintenance condition rendering all DS0 channels unavailable for signaling or bearer traffic, maintenance software treats this the same as a Blue Alarm.

3 of 3		

Red Alarm Inquiry Test (#140)

DS1 Interface circuit pack raises a Red alarm when the framing pattern of the incoming DS1 bit stream has been lost. The Red Alarm Inquiry test checks the framing status of a DS1 Interface circuit pack. DS1 Interface circuit pack takes 3 seconds to recognize and report a Red alarm and 10 seconds to recognize and report the resolution of a Red alarm.

When the DS1 Interface circuit pack detects a Red alarm, the circuit pack will transmit a Yellow alarm to the remote DS1 endpoint and send a RED ALARM message to the maintenance software. After the Red alarm is confirmed, the maintenance software places all trunks of the circuit pack into the out-of-service state. The inquiry test will be run every 10 minutes until the Red alarm is cleared.

Communication Manager Maintenance-Object Repair Procedures

When the Red alarm is cleared, the DS1 Interface circuit pack will stop transmitting the Yellow alarm to the remote DS1 endpoint. The maintenance software restores all trunks of the DS1 Interface circuit pack to the service state before the Red alarm occurs.

Loss of Multiframe Alarm: If the DS1 Interface circuit pack is administered using DMI-BOS signaling, the DS1 Interface circuit pack raises a Loss of Multiframe Alarm (LMA) when it cannot interpret the incoming signaling bits to synchronize to the multiframe pattern received in the 24th channel. Once DS1 Interface circuit pack detects an LMA, the circuit pack will transmit a Remote Multiframe Alarm (RMA) to the remote DS1 endpoint. Maintenance software handles both Red alarm and LMA alarm(s) using the same mechanism.

		3 of 3

Yellow Alarm Inquiry Test (#141)

Receiving a Yellow alarm from remote DS1 endpoint indicates that the remote DS1 endpoint has an out-of-frame condition. The Yellow Alarm Inquiry test is used to determine whether the remote DS1 endpoint is transmitting a Yellow alarm. The DS1 Interface circuit pack takes ½ second to recognize and report either a:

- Yellow alarm condition
- Cleared Yellow alarm condition

When the DS1 Interface circuit pack detects a Yellow alarm from the remote DS1 endpoint, it will send a YELLOW-ALARM uplink message to the maintenance software. After the maintenance software receives the YELLOW-ALARM message, the Yellow Alarm Inquiry test is run to confirm the Yellow alarm. Once the Yellow alarm is confirmed, the maintenance software places all trunks on the circuit pack into the out-of-service state. The Inquiry test will be run every 10 minutes until the Yellow alarm is cleared.

When the Yellow alarm is cleared, the maintenance software restores all trunks on the DS1 Interface circuit pack back to their previous service state before the Yellow alarm is raised.

This Yellow Alarm corresponds to the yellow F2 state documented in CCITT recommendation I.431.

Remote Multiframe Alarm: Remote Multiframe Alarm (RMA) indicates that the remote DS1 endpoint is in a Loss of Multiframe Alarm condition while the DS1 Interface circuit pack is administered using the DMI-BOS common-channel signaling. The RMA is handled as a Yellow alarm.

Yellow F5 State Alarm: For 32-channel E1 operation with CRC4 on, the F5 fault state is defined as a fault in the user-network interface, specifically in the direction from the user (PBX) to the network. Refer to CCITT recommendation I.431

Major Alarm Inquiry Test (#142)

The Major alarm raised by a DS1 Interface circuit pack indicates that the average bit error rate on the DS1 facility is greater than 1/1000. The Major Alarm Inquiry test is used to determine that the received DS1 bit error rate is greater than 1/1000. When D4 framing mode is selected, the DS1 Interface circuit pack takes 16 seconds to recognize and report a Major alarm and 16 seconds to recognize and report that a Major alarm condition is cleared. If ESF framing mode is selected, the DS1 Interface circuit pack takes 10 seconds to recognize and report a Major alarm and 10 seconds to recognize and report that a Major alarm condition is cleared.

When the DS1 Interface circuit pack detects a Major alarm, it will send a MAJOR-ALARM message to the maintenance software. After the maintenance software receives a MAJOR-ALARM message, the Major Alarm Inquiry test is initiated to confirm the Major alarm on the DS1 Interface circuit pack. The Inquiry test will be run every 10 minutes until the Major alarm is cleared. The maintenance software places all trunks on the circuit pack in the out-of-service state if the Major alarm persists for more than 20 minutes.

Communication Manager Maintenance-Object Repair Procedures

When the Major alarm is cleared, the maintenance software restores all trunks on the circuit pack to their previous service state before a Major alarm occurs.

Table 341: Test #142 Major Alarm Inquiry Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	<p>Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited.</p> <ul style="list-style-type: none"> ● The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. ● The tests run on the ports of this circuit pack are returning a no board result. ● A busyout or a release has no affect on the test results. ● A list config shows that the circuit pack and the ports are properly installed. <p>When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.</p>

Verify that the board's translations are correct. Use <code>add ds1 location</code> to administer the DS1 interface if it is not already administered. 2. If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. 3. If the board was found to be correctly inserted in step 1, enter <code>busyout board</code> 4. Enter <code>reset board</code> 5. Enter <code>release board</code> 6. Enter <code>test board long</code> <p>This should re-establish the link between the internal ID and the port.</p>
		2 of 2

Minor Alarm Inquiry Test (#143)

The Minor alarm raised by a DS1 Interface circuit pack indicates that the average bit error rate on the DS1 facility is greater than 1/1,000,000, but less than 1/1000. The Minor Alarm Inquiry test is used to determine that the received DS1 bit error rate is greater than 1/1,000,000 and less than 1/1000. When D4 framing mode is selected, the DS1 Interface circuit pack takes 41 minutes to recognize and report a Minor alarm and 41 minutes to recognize and report that a Minor alarm condition is cleared. If ESF framing mode is selected, the DS1 Interface circuit pack takes 10 minutes to recognize and report a Minor alarm and 10 minutes to recognize and report that a Minor alarm condition is cleared.

When the DS1 Interface circuit pack detects a Minor alarm condition, it will send a MINOR-ALARM message to the maintenance software. After the maintenance software receives a MINOR-ALARM message, the Minor Alarm Inquiry test is initiated to confirm the Minor alarm. All trunks on the circuit pack are kept in the in-service state after the Minor alarm is confirmed. The Minor Alarm Inquiry test is run every 10 minutes until the Minor alarm is cleared.

		3 of 3

Slip Alarm Inquiry Test (144)

Slips occur when transmitter and receiver are not running at precisely the same clock rate. The DS1 Interface circuit pack can detect both positive and negative slips on the DS1 facility. The Slip Alarm Inquiry test is used to acquire the total number of slips occurred on a DS1 link.

When the DS1 Interface circuit pack detects a slip condition, the circuit pack will increase the on-board slip counter by 1. A SLIP-COUNT message is spontaneously sent to the system software after the counter reaches a threshold (for example, 88). When the maintenance software receives the SLIP-COUNT message, the Slip Alarm Inquiry test is initiated to query the slip counters on DS1 Interface circuit pack and total the slip counts in the maintenance software.

If the count of slips is over the threshold, a Minor alarm is raised against the DS1 Interface circuit pack. All trunks of the DS1 Interface circuit pack are still in the in-service state. If the DS1 Interface circuit pack is used to supply the system synchronization source, the MINOR alarm will initiate a synchronization source switch. See [TDM-BUS \(TDM Bus\)](#) on page 2193 and [SYNC \(Port-Network Synchronization\)](#) on page 2100 for details.

		3 of 3

Misframe Alarm Inquiry Test (#145)

Misframe Alarm indicates that framing bits observed on a DS1 Interface circuit pack are in error. Misframe Alarm Inquiry test queries the total number of misframes that occurred on a DS1 Interface circuit pack since the last inquiry.

When the DS1 Interface circuit pack detects a misframe error, it will increase its misframe counter by 1. If the counter reaches the threshold, a MISFRAME-COUNT message is automatically sent to the switch maintenance software. After the maintenance software receives the MISFRAME-COUNT message, the Misframe Alarm Inquiry test is initiated to collect the misframe counts from the DS1 Interface circuit pack.

When the threshold of misframes is reached, if the DS1 Interface circuit pack is supplying the system synchronization source, then a switching synchronization source message is sent to the TDM Bus Clock. See TDM-BUS (TDM Bus) Maintenance documentation for details. A Minor alarm against the DS1 Interface circuit pack is raised, but all trunks of the DS1 Interface circuit pack are still in the in-service state.

		3 of 3

Translation Update Test (#146)

The Translation Update test sends the circuit pack-level information specified by System Administration to the DS1 Interface circuit pack. Translation includes the following data administered for a DS1 Interface circuit pack (see output of `display ds1 location`): DS1 Link Length between two DS1 endpoints, Synchronization Source Control, All Zero Suppression, Framing Mode, Signaling Mode, time-slot number of 697-Hz tone, time-slot number of 700-Hz tone, etc.

If a TN767E or later DS1 circuit pack is combined with a 120A CSU module or a T1 sync splitter to screen an integrated CSU module, this test will also send the administration for this Integrated CSU to the circuit pack to assure the board's translations are correct. The administration of the CSU module is done using the DS1 circuit pack administration screen. Translation for the CSU module includes the following data: Transmit LBO, Receive ALBO, Supply CPE loop-back jack Power, and so forth.

Table 345: Test #146 Translation Update Test

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	Internal system software error. 1. Enter <code>display ds1 location</code> to verify the DS1 Interface circuit pack translation.
	PASS	Translation data has been downloaded to the DS1 Interface circuit pack successfully.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Verify that the board's translations are correct. Use <code>add ds1 location</code> to administer the DS1 interface if it is not already administered. 2. If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. 3. If the board was found to be correctly inserted in step 1, enter <code>busyout board</code> 4. Enter <code>reset board</code> 5. Enter <code>release board</code> 6. Enter <code>test board long</code> This should re-establish the link between the internal ID and the port.

DS1 Board Loop-Back Test (#1209)

This test is **destructive**.

The DS1 BLB (Board Loopback) test causes a loop back at the TN767E DS1 board edge, and tests DS1 board internal circuitry.

The test is destructive and is initiated by a technician-demanded `test ds1-loop location ds1/csu-loopback-test`.

All trunks or ports on the DS1 Interface circuit pack must be busied out using `busyout board` before running the BLB test.

Communication Manager Maintenance-Object Repair Procedures

When the BLB test is initiated, maintenance software sends a message to the TN767E DS1 Interface circuit pack to start the test. The board sets up the BLB loop back, transmits a test pattern, and verifies that the pattern is received unaltered through the loop back. If the transmitted and received pattern is different, the test fails.

When the test is complete, enter **release board** to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 346: Test #1209 DS1 Board Loop-Back Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry test ds1-loop location ds1/csu-loopback-tests at 1-minute intervals up to 5 times.
1005	ABRT	DS1 Board Loopback test cannot be executed in the current configuration. To run this test, the TN767E (or higher-suffixed) DS1 must be administered for 24-channel operation. The Bit Rate field on the DS1 circuit pack administration screen must be set to "1.544" for 24-channel operation.
1015	ABRT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter busyout board location to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
1039	ABRT	The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence: 1. Enter disable synchronization-switch 2. Enter set synchronization location 3. Enter enable synchronization-switch
1950	ABRT	Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). The hardware error log will indicate whether a Customer loop-back jack test, Far CSU Loopback test, or the One-Way Span test is executing or if the board is in line loop-back or payload loop-back mode. Only one long-duration loop-back/span test can be active at a given time. Thus, if a loop-back/span test is already active, that test must be deactivated via test ds1-loop location end-loopback/span-test in order to execute this test.
1 of 3

		3 of 3

CSU Equipment Loop-Back Test (#1210)

This test is **destructive**.

The CSU ELB (Equipment Loopback) test causes a loop back at the near-edge of the local 120A CSU module or T1 sync splitter, and tests the connection from the TN767E DS1 board to the CSU module/T1 sync splitter (DS1 board edge interconnecting cable, and CSU module/T1 sync splitter edge). This test will only be performed if the 120A CSU module/T1 sync splitter is present, administered, and connected to a 1.544-Mbps TN767E DS1 circuit pack on the back of the port carrier.

The test is destructive and can only be initiated by a technician-demanded `test ds1-loop location ds1/csu-loopback-tests`.

Use `busyout board` to busy out all trunks or ports on the DS1 Interface circuit pack before running the ELB test.

When the ELB test is initiated, maintenance software sends a message to the TN767E DS1 Interface circuit pack to start the test. The board sets up the ELB loop back, transmits a test pattern, and verifies that the pattern is received unaltered through the loop back. If the transmitted and received pattern is different, the test fails.

The DS1 circuit pack hardware applies a DC current while the test is running in order to detect any broken wires that may not be detected by the loop-back pattern.

When the test is complete, use `release board` to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 347: Test #1210 CSU Equipment Loop-Back Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry <code>test ds1-loop location ds1/csu-loopback-tests</code> at 1-minute intervals up to 5 times.
1005	ABRT	CSU Equipment Loopback test cannot be executed in the current configuration. To run this test, the <i>Near-End CSU Type</i> field on the DS1 circuit pack administration screen must be set to <i>integrated</i> and the <i>Bit Rate</i> field must be set to "1.544" (for 24-channel operation). 1. Use <code>change ds1 location</code> and set the <i>Near-End CSU Type</i> field on the DS1 circuit pack administration screen to integrated , and/or set the <i>Bit Rate</i> field to 1.544 if the board is to be used in a 24-channel configuration. 2. Retry <code>test ds1-loop location ds1/csu-loopback-tests</code> .
1015	ABRT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter <code>busyout board location</code> to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
1039	ABRT	The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence: 1. Table 347: Test #1210 CSU Equipment Loop-Back Test 2 of 3

Error Code	Test Result	Description / Recommendation
1950	ABRT	Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). The hardware error log will indicate whether a Customer loop-back jack test, Far CSU Loopback test, or the One-Way Span test is executing or if the board is in line loop-back or payload loop-back mode. Only one long-duration loop-back/span test can be active at a given time. Thus, if a loop-back/span test is already active, that test must be deactivated via <code>test ds1-loop location end-loopback/span-test</code> in order to execute this test.
1951	ABRT	The CSU Equipment Loopback test could not be executed because the 120A CSU module/T1 sync splitter was not physically installed. Physically connect the 120A CSU module/T1 sync splitter to the TN767E board on the back of the port carrier.
	ABRT	Internal system error
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	<p>Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited.</p> <ul style="list-style-type: none"> ● The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. ● The tests run on the ports of this circuit pack are returning a no board result. ● A busyout or a release command has no affect on the test results. ● A list config command shows that the circuit pack and the ports are properly installed. <p>When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.</p>
		2 of 3

Table 347: Test #1210 CSU Equipment Loop-Back Test 3 of 3

Error Code	Test Result	Description / Recommendation
	FAIL	<p>DS1 Interface circuit pack failed the CSU Equipment Loopback test.</p> <ol style="list-style-type: none"> 1. Retry <code>test ds1-loop location ds1/csu-loopback-tests</code>. 2. If the ELB test continues to fail, then either the TN767E board, the CSU module/T1 sync splitter, or the I/O cable between the backplane and the 120A1 CSU module or the 401A T1 sync splitter (or any combination thereof) has failed. Attempt to isolate the problem to one of these areas. Replace the CSU module/T1 sync splitter, and run <code>test ds1-loop location ds1/csu-loopback-tests</code> again. 3. If the ELB test continues to fail, then replace the TN767E board and run <code>test ds1-loop location ds1/csu-loopback-tests</code> again. 4. If the ELB test continues to fail, the problem could be in the I/O cable between the backplane and the 120A1 CSU module or the 401A T1 sync splitter.
	PASS	<p>The ELB test executed successfully. The test pattern was transmitted and received successfully over the connection from the TN767E DS1 board to the near-edge of the 120A1 CSU module/T1 sync splitter.</p>
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Use <code>add ds1 location</code> to administer the DS1 interface if it is not already administered. 2. If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. 3. If the board was found to be correctly inserted in step 1, enter <code>busyout board</code> 4. Enter <code>reset board</code> 5. Enter <code>release board</code> 6. Enter <code>test board long</code> <p>This should re-establish the link between the internal ID and the port.</p>

3 of 3

CSU Repeater Loop-Back Test (#1211)

This test is **destructive**.

The CSU RLB (Repeater Loopback) test causes a loop back at the far-edge of the local 120A CSU module or T1 sync splitter, and tests the connection from the TN767E DS1 board to and including the CSU module/T1 sync splitter circuitry. The test runs only if the 120A CSU module/ T1 sync splitter is present, administered, and connected to a 1.544-Mbps TN767E DS1 circuit pack on the back of the port carrier.

The test is destructive and can only be initiated by `test ds1-loop location ds1/csu-loopback-test`.

Use `busyout board` to busy out all trunks or ports on the DS1 Interface circuit pack before running the RLB test.

When the RLB test is initiated, maintenance software sends a message to the TN767E DS1 Interface circuit pack to start the test. The board sets up the RLB loop back, transmits a test pattern, and verifies that the pattern is received unaltered through the loop back. If the transmitted and received pattern is different, the test fails.

The DS1 circuit pack hardware applies a DC current while the test is running in order to detect any broken wires that may not be detected by the loop-back pattern.

When the test is complete, use `release board` to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

CPE Loopback Jack Test (#1212)

This test is **destructive**.

The CPE Loopback Jack (CLJ-LB) test causes a loop back at the CPE loop-back jack and tests the building wiring connection between the TN767E DS1 board and the CPE loop-back jack.

The test is highly destructive and can only be initiated by a technician-demanded `test ds1-loop location cpe-loopback-jack-test-begin [number-of-bits bit-pattern]`. The system technician can either enter a loop-back activation code on the command line or use the default code (0x47F).

Use `busyout board` to busy out all trunks or ports on the DS1 Interface circuit pack before running the CPE Loopback Jack test.

The CPE Loopback Jack test has the TN767E DS1 Interface circuit pack transmit a loop-back activation code to the CPE loop-back jack, waits up to 10 seconds for return of the code to verify the loop back has been established, transmits a framed 3-in-24 test pattern, begins counting bit errors in the received test pattern, and returns a PASS result to indicate that the pattern was successfully sent. If the loop back is not established within the 10 seconds, the test returns FAIL.

Communication Manager Maintenance-Object Repair Procedures

The status of the CPE Loopback Jack test appears in the hardware error log via Error Type #3900. Several distinct aux values give information on the status of the test.

Use `list measurements ds1 summary` to show the length of time the test has been running (Test Duration field) and number of bit errors detected (Loopback/Span Test Bit-Error Count field). If the test pattern is passed through the loop back cleanly, the number of bit errors should be very low. The command also shows the type of loop-back/span test executing (Test field), the type of pattern generated for the loop-back/span test (Pattern field), and whether the pattern (3-in-24 Pattern) is synchronized (Synchronized field).

Use `test ds1-loop location end-loopback/span-test` to end the test.

Table 349: Test #1212 CPE Loopback Jack Test 1 of 4

Error Code	Test Result	Description / Recommendation

		4 of 4

Far CSU Loop-Back Test (#1213)

This test is **destructive**.

The Far CSU Loopback (R-LLB) test causes a loop back at the far-end CSU, and tests all circuitry and facilities from the local TN767E DS1 board to the far-end CSU.

The test is destructive and can only be initiated by a technician-demanded `test ds1-loop location far-csu-loopback-test-begin`.

Use `busyout board` to busy out all trunks or ports on the DS1 Interface circuit pack before running the Far CSU Loopback test.

If the far-end CSU is not a 120A CSU module or a 401A T1 sync splitter, and the DS1 is administered for ami-zcs line coding, disable density protection on the CSU during the test, due to the large number of zero's in the 3-in-24 test pattern.

The Far CSU Loopback test has the TN767E DS1 Interface circuit pack transmit a loop-back activation code to the remote CSU, waits up to 15 seconds for return of the code to verify the loop back has been established, transmits a framed 3-in-24 test pattern, begins counting bit errors in the received test pattern, and returns a PASS result. If the loop back is not established within the 15 seconds, the test fails.

Communication Manager Maintenance-Object Repair Procedures

The status of the Far CSU Loopback test appears in the hardware error log via Error Type #3901. Several aux values give information on the status of the test.

Use **list measurements ds1 summary** to show the length of time the test has been running (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). If the test pattern is passed through the loop back cleanly, the number of bit errors should be very low. The command also shows the type of loop-back/span test executing (`Test` field), the type of pattern generated for the loop-back/span test (`Pattern` field), and whether the pattern (*i.e.*, *3-in-24 Pattern*) is synchronized (`Synchronized` field).

Use **test ds1-loop location end-loopback/span-test** or **release board** to end the test. Use **release board** to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Enter <code>test board long</code> <p>This should re-establish the link between the internal ID and the port.</p>
3 of 3		

One-Way Span Test (#1214)

This test is **destructive**.

The One-Way Span test allows 1-way span testing to and from remote test equipment or another Communication Manager solution. This tests all circuitry and facilities from the local TN767E DS1 board to the remote test equipment or other Communication Manager solution.

The test is destructive and can only be initiated by a technician-demanded `test ds1-loop location one-way-span-test-begin`.

Use `busyout board` to busy out all trunks or ports on the DS1 Interface circuit pack before running the One-Way Span test.

The One-Way Span test has the TN767E DS1 Interface circuit pack transmit a framed 3-in-24 test pattern and attempts to receive and verify the pattern. If the TN767E board receives a framed 3-in-24 test pattern sent from another Communication Manager system or test equipment at the far end of the DS1, it begins counting bit errors within the received pattern.

Note:

G700: When a TN464 and an MM710 are connected, the One-Way Span test does not frame-align to the 3-in-24 repetitive pattern, and the test fails.

The status of the One-Way Span test appears in the hardware error log via Error Type #3902. Several aux values give information on the status of the test.

Use `list measurements ds1 summary` to see the length of time the test has been running (Test Duration field) and number of bit errors detected (Loopback/Span Test Bit-Error Count field). If the test pattern is sent cleanly over the span from the far end, the number of bit errors should be very low. The Test Duration field is **0** until the test pattern is received from the far end. Upon receiving the test pattern, the board begins calculating the test duration and number of bit errors. The command also shows the type of loop-back/span test executing (Test field), the type of pattern generated for the loop-back/span test (Pattern field), and whether the pattern (*i.e.*, 3-in-24 Pattern) is synchronized (Synchronized field).

Use `test ds1-loop location end-loopback/span-test` or `release board` to end the test. Use `release board` to restore all trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 351: Test #1214 One-Way Span Test 1 of 4

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry <code>test ds1-loop location one-way-span-test-begin</code> at 1-minute intervals up to 5 times.
		1 of 4

Table 351: Test #1214 One-Way Span Test 2 of 4

Error Code	Test Result	Description / Recommendation
1005	ABRT	One-Way Span test cannot be executed in the current configuration. To run this, the TN767E (or higher-suffixed) DS1 must be administered for 24-channel operation. The <code>Bit Rate</code> field on the DS1 circuit pack administration screen must be set to "1.544" for 24-channel operation.
1015	ABRT	<p>Ports on the DS1 Interface circuit pack have not been busied out to out-of-service.</p> <ol style="list-style-type: none"> 1. Enter <code>busyout board location</code> to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
1039	ABRT	<p>The DS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption.</p> <p>If the DS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit via the following command sequence:</p> <ol style="list-style-type: none"> 1. Enter <code>disable synchronization-switch</code> 2. Enter <code>enable synchronization-switch set synchronization location</code> 3. Enter <code>enable synchronization-switch</code>
1950	ABRT	<p>Another loop-back/span test is already executing on the DS1 board or the board is in a network requested loop-back mode (Line loop back or Payload loop back). The hardware error log will indicate whether a Customer Loop-Back Jack test, Far CSU Loopback test, or the One-Way Span test is executing or if the board is in line loop-back or payload loop-back mode. Only one long-duration loop-back/span test can be active at a given time. Thus, if a loop-back/span test is already active, that test must be deactivated via <code>test ds1-loop location end-loopback/span-test</code> in order to execute this test.</p>
	ABRT	Internal system error
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.

Verify that the board's translations are correct. Use <code>add ds1 location</code> to administer the DS1 interface if it is not already administered. 2. If board was already administered correctly, check the error log to determine whether the board is hyperactive. If so, the board was shut down. Reseating the board will re-initialize it. 3. If the board was found to be correctly inserted in step 1, enter <code>busyout board</code> 4. Enter <code>reset board</code> 5. Enter <code>release board</code> 6. Enter <code>test board long</code> <p>This should re-establish the link between the internal ID and the port.</p>
		4 of 4

Inject Single Bit Error Test (#1215)

This test is **destructive**.

The Inject Single Bit Error test causes a single bit error to be sent within an active framed 3-in-24 test pattern.

The test is highly destructive and can only be initiated by a technician-demanded `test ds1-loop location inject-single-bit-error`. An attempt to use this command is rejected if none of the three long-duration DS1 loop-back/span tests (CPE Loopback Jack test, Far CSU Loopback test, One-Way Span test) are active on a TN767E circuit pack.

Use `busyout board` to busy out all trunks or ports on the DS1 Interface circuit pack before running the Inject Single Bit Error test.

Use `list measurements ds1 summary` to show the number of bit errors detected (Loopback/Span Test Bit-Error Count field). Injecting this single bit error should increment the bit error count of the loop-back/span test by one.

Use `release board` to restore the trunks or ports on the TN767E DS1 Interface circuit pack to the inservice state.

Table 352: Test #1215 Inject Single Bit Error Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry <code>test ds1-loop location inject-single-bit-error</code> at 1-minute intervals up to 5 times.
1015	ABRT	Ports on the DS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter <code>busyout board location</code> to put all trunks or ports of the DS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
	ABRT	Internal system error
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. <ul style="list-style-type: none"> ● The DS1-BD tests (such as test 138 and test 139) are aborting with error code 2000. ● The tests run on the ports of this circuit pack are returning a no board result. ● A <code>busyout</code> or a <code>release</code> command has no affect on the test results. ● A <code>list config</code> command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of its trunks are placed into the out-of-service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the DS1 interface circuit pack is restored to normal operation. Every DS1 interface trunk is then returned to the in-service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, escalate this problem.
		<i>1 of 2</i>

Table 352: Test #1215 Inject Single Bit Error Test 2 of 2

Error Code	Test Result	Description / Recommendation
	PASS	A single bit error has been successfully injected into an active framed 3-in-24 test pattern.
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Verify that the board's translations are correct. Use <code>add ds1 location</code> to administer the DS1 interface if it is not already administered. 2. If the board was found to be correctly inserted in step 1, enter <code>busyout board</code> 4. Enter <code>reset board</code> 5. Enter <code>release board</code> 6. Enter <code>test board long</code> <p>This should re-establish the link between the internal ID and the port.</p>
2 of 2		

End Loopback/Span Test (#1216)

This test is **destructive**.

The End Loopback/Span test deactivates an active loop-back or span test on a TN767E DS1 circuit pack. Bit error counting against the received test pattern stream halts, and sending of the framed 3-in-24 test pattern ceases. If either the CPE loop-back jack or the far-end CSU is looped, the loop-back deactivate code is sent. If the loop back could not be deactivated, the test will FAIL and a MINOR alarm is noted in the alarm log until the loop back is cleared.

The test is highly destructive and can only be initiated by a technician-demanded `test ds1-loop location end-loopback/span-test`. Since only one of these three different long-duration loop-back/span tests can be active at a time, the TN767E circuit pack knows which loop-back/span test to halt.

Use `busyout board` to busy out all trunks or ports on the DS1 Interface circuit pack before running this End Loopback/Span test.

Use `list measurements ds1 summary` to show the length of time the test ran (Test Duration field) and number of bit errors detected (Loopback/Span Test Bit-Error Count field).

Use `release board` to restore the trunks or ports on the TN767E DS1 Interface circuit pack to the in-service state.

Table 353: Test #1216 End Loopback/Span Test 1 of 3

		3 of 3

ICSU Status LEDs Test (#1227)

The TN767E DS1 circuit pack has four status LEDs on the faceplate in addition to the three standard faceplate LEDs. These four status LEDs are associated with the 120A1 Channel Service Unit (CSU) Module that can be connected to the TN767E board via the I/O connector panel on the back of the port carrier.

This test is a visual test. It lights the four status LEDs red for 5 seconds, green for 5 seconds, and yellow for 5 seconds. It then turns the LEDs off and returns control of the status LEDs to the circuit pack.

This test runs only on TN767E (or higher-suffixed) DS1 circuit packs administered for 24-channel operation (1.544 Mbps).

If the 1201 CSU module/T1 sync splitter is not installed, the status LEDs are always off and this test aborts.

Table 354: Test #1227 ICSU Status LEDs Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1005	ABRT	The ICSU Status LEDs test cannot be executed for the current configuration. The test applies only to TN767E or later DS1 circuit packs administered for 24-channel (1.544-Mbps) operation. 2. If the circuit pack is a TN767E (or higher-suffixed) DS1 circuit pack, then retry the command.
1951	ABRT	The ICSU Status LEDs test cannot be executed because a 120A1 (or higher-suffixed) CSU module or a 401A (or higher-suffixed) T1 sync splitter is not physically installed. If using a 120A1 CSU module/T1 sync splitter, physically connect it to the TN767E board on the back of the port carrier. Otherwise, ignore this abort.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
2500	ABRT	Internal system error. 1. Retry the command.
	PASS	The ICSU Status LEDs test executed successfully. A PASS result, however, does not necessarily mean that the status LEDs behaved properly. It only means that the software successfully attempted to light the status LEDs. This is a visual test. The service technician must visually exam the behavior of the LEDs while the test is running. The LEDs are functioning properly if the four status LEDs are lit red for 5 seconds, then lit green for 5 seconds, then lit yellow for 5 seconds. If the LEDs behave differently, escalate this problem.
1 of 2

If the board was found to be correctly inserted in step 1, enter <code>busyout board</code>. 4. Enter <code>reset board</code> 5. Enter <code>release board</code> 6. Enter <code>test board long</code> <p>This should re-establish the linkage between the internal ID and the port.</p>
		2 of 2

DS1-FAC (DS1 Facility)

S8700 MC

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DS1-FAC	MAJ	<code>test board location sh r 1</code>	DS1 Facility
DS1-FAC	MIN	<code>test board location sh r 1</code>	DS1 Facility
DS1-FAC	WRN	<code>test board location sh r 1</code>	DS1 Facility

The DS1-FAC is a part of the DS1 Converter (DS1C-BD) complex. The DS1C-BD complex consists of two TN574 DS1C-BD circuit packs or two TN1654 DS1C-BD circuit packs connected by one to four DS1 facilities. The MO name for the DS1 converter circuit pack is DS1C-BD, and the MO name for the connected DS1 facilities is DS1-FAC.

The TN1654 DS1 Converter circuit pack is a redesign of the TN574 DS1 Converter board. The TN1654 provides functionality equivalent to the TN574, and adds a 32-channel E1 interface for international support as well as circuit-switched wideband connections (NxDS0).

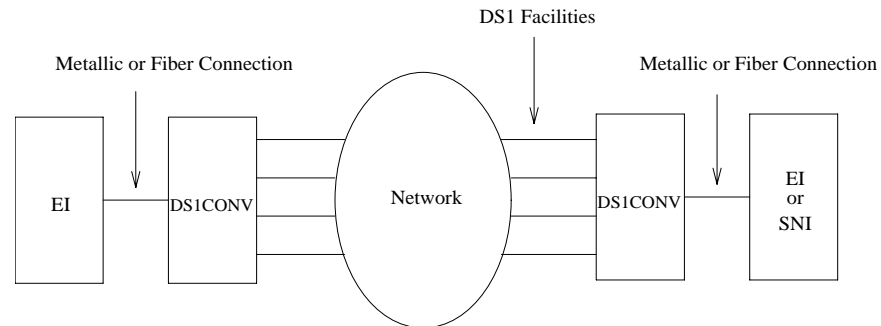

The TN1654 DS1 converter circuit pack is not compatible with the TN574 DS1 converter board or the Y-cable used to interface to the TN574 DS1 converter. A TN573B (or higher-suffixed) SNI board must be used when connecting to the TN1654 DS1 converter board. See DS1C-BD for information about both DS1 converter circuit packs.

The DS1 converter complex is a part of the port-network connectivity (PNC). The DS1 converter complex is used to extend the range of the 32-Mbps fiber links that connect PNs to the Center Stage Switch, allowing PNs to be located at remote sites.

The DS1 converter circuit pack contains on-board firmware that detects DS1 facility alarms and errors, communicates status to maintenance software, and runs either background or on-demand tests from maintenance software. The overall maintenance software strategy includes demand tests, recovery strategies, error and alarm logging, and periodic audits.

Every error condition reported by the firmware is associated with the background tests that the firmware runs autonomously. Demand tests that are executed by the maintenance software do not have any functionality that would effect any additional error manipulation by the firmware. However, the Failure Audit test (#949) affects auditing of the software error log by forcing the firmware to report the pending errors again.

DS1 converter circuit packs are connected to the Expansion Interface (EI) circuit packs (TN570) and the Switch Node Interface (SNI) circuit packs (TN573) as shown in [Figure 50: DS1 Converter Complex and the DS1 Facilities](#) on page 1029.

Figure 50: DS1 Converter Complex and the DS1 Facilities

The DS1 converter complex can replace fiber links between two EIs and fiber links between an PN's EI and an SNI. Fiber links between two SNIs and fiber links between the and the Center Stage Switch (CSS) cannot be replaced by a DS1 converter complex.

On the TN574 DS1 converter circuit pack, one of the four DS1 facilities is used as the primary facility (or packet facility), and it is the only facility that can carry packet traffic besides providing circuit connections. The primary facility has 22 channels available for circuit and packet connections. Other facilities each have 24 channels available for circuit connections. On the TN574 primary facility, channels 1 and 24 are not available for packet or for circuit connections. Channel 1 is used for excess packets traffic to prevent packet overflow that might result from zero code substitutions. Channel 24 is the DS1 control channel that carries control link data between the two DS1 converter circuit packs.

The primary facility on the TN1654 DS1 converter circuit pack is restricted to facility A or facility B. The TN1654 provides fixed packet bandwidth of 192 kbps while the TN574 provides packet bandwidth of up to 1408 kbps with a dynamic allocation mechanism that could change packet/circuit use of individual channels. The first three 64-kbps channels on the primary facility of the TN1654 are reserved as the packet channels. The DS1 control channel will be Channel 24 in T1 mode and Channel 31 in E1 mode. In T1 format the TN1654 provides 24 circuit channels for use on non-primary facilities and 20 circuit channels on the primary facility. E1 format provides 31 circuit channels for use on non-primary facilities and 27 circuit channels on the primary facility.

When there are alarms on the packet facility, DS1 converter circuit pack firmware changes the mapping of the DS1 channels to move the packet traffic to another facility. On TN574 DS1 converter boards, the packet traffic will be moved to another "Digital Data Compatible" facility (as indicated on the fiber link administration screen). On TN1654 DS1 converter boards, the packet traffic will be moved to either facility A or B if available. This mapping is done to keep the packet service operational at all times as the system control links are carried on these packet connections. When packet traffic is moved to another facility, circuit connections on the new facility are torn down and circuit connections on the old (faulty) facility are re-mapped to the new packet facility.

After firmware initialization, facility A, the first facility, is chosen as the default primary facility for both DS1 converter boards.

The TN574 DS1 converter has seven LEDs that provide an indication of the state of the DS1 converter circuit pack and the DS1 facilities. There is a yellow, a green, and a red LED under software and/or firmware control. There are four Green LEDs under hardware control that indicate, for each DS1 facility, whether a receive signal is present for the DS1 facility. From top to bottom these green LEDs correspond to DS1 facilities A, B, C, and D respectively. If one of the four green LED is on, it indicates a signal is present, but it does not imply that the signal is using the correct framing format (ESF or D4) or line coding (ZCS or B8ZS). See section DS1C-BD for the description of the red, the green, and the amber LEDs on the DS1 converter circuit pack.

The TN1654 DS1 converter board has eleven LEDs on its faceplate. The top three system standard LEDs (yellow, green and red) are used to provide an indication of the state of the DS1 converter board. The bottom four LEDs on the TN1654 board are labeled SPAN LEDs. These LEDs are under firmware control. If the facility is not administered, then the LED is not lit. The LED is lit amber if the facility is running alarm free. If the facility is detecting either a red alarm (loss-of-signal or loss-of-frame), a yellow alarm (remote frame alarm) or a blue alarm (AIS signal) then the LED is lit red. See section DS1C-BD for a complete description off all the LEDs.

The TN1654 DS1 converter circuit pack supports the Wideband Switching feature. The TN574 DS1 converter does not.

DS1 Facility Busyout

Busy out the MO to gracefully disconnect service. Busyout puts the object out-of-service until the repair procedures are completed.

Use `busyout ds1-facility` to busy out DS1 facilities. When an attempt is made to busyout the packet facility (or primary facility), the system prints a warning message indicating that the *override* option must be used to busyout the packet facility. Busying out the packet facility moves the packet traffic to another facility, and disconnects circuit connections on that new facility.

The system does not allow the last packet DS1 facility to be busied out. In this case, busy out the DS1 converter circuit pack instead.

When the `busyout ds1-facility` command is executed, software communicates with both DS1 converter circuit packs in the DS1 converter complex. If the board at which the facility is being busied out is not accessible, the abort code 2100 is returned. If the board at the other end of the DS1 converter complex is not accessible, the abort code 105 is returned.

DS1 Facility Administration

DS1 facility administration is a part of the fiber link administration. DS1 options are set on the Fiber Link Administration screen. For critical-reliability systems, the Fiber Link Administration screen contains the DS1 facility options for the B side of the PNC.

DS1 facility administration is explained in the following sections. These descriptions do not provide complete coverage of fiber link administration.

Replacing a DS1 Facility

Disconnecting a DS1 facility is service disrupting except on critical-reliability systems since they have PNC duplication.

For a standard-, duplex-, or high-reliability system (no PNC duplication):

This procedure is destructive.

1. Use **busyout ds1-facility** to busy out the DS1 facility.
2. Replace the DS1 facility.
3. Use **release ds1-facility** to release the DS1 facility.

For a critical-reliability system (PNC duplication):

This procedure is nondestructive.

1. If the DS1 facility to be replaced is on the active PNC (its amber LED is on solid), use **reset pnc interchange** to do a PNC demand interchange. Use **status pnc** to determine the active PNC.
2. When the DS1 facility to be replaced is on the standby PNC (if the DS1 facility was originally on the standby PNC or after the PNC interchange has finished), use **busyout ds1-facility** to busyout the DS1 facility.
3. Replace the DS1 facility.
4. Use **release ds1-facility** to release the DS1 facility.

Installing a DS1 Facility

To install a DS1 facility:

1. Connect the facility.
2. Use **list fiber-link** to check the fiber link number.
3. Use **change fiber-link** to administer the DS1 facility via the command. Set the `Facility Installed` field to **y** for the facility that is being installed.
4. Use **busyout board** to busyout the DS1 converter circuit pack.
5. Use **test board location long** to run the DS1 Facilities Connectivity test (#790), to ensure that the facilities are connected correctly.
6. Use **release board** to release the DS1 converter circuit pack.

Removing a DS1 Facility

Removing a DS1 facility is service disrupting in any system configuration, because the DS1 facility administration is similar on both sides of the PNC on critical-reliability systems.

This procedure is destructive.

1. Use `busyout ds1-facility` to busyout the DS1 facility.
2. Use `list fiber-link` to check the fiber link number.
3. Use `change fiber-link` to administer the DS1 facility. Set the `Facility Installed` field to `n` for the facility that is being removed.
4. Disconnect the DS1 facility (or facilities in a critical-reliability system configuration).

DS1 Interface Options

Use fiber link administration to set the following DS1 Interface options. Use `list fiber-link` to check the number of the fiber link. Execute `change fiber-link` and set the following fields:

Table 355: DS1 Interface Options administration 1 of 3

Field	Description
Facility Installed	<code>y</code> when the facility is installed. For TN574 DS1 converter boards, facility A must be installed first. Install Facilities B, C and D in any order on any of the four facilities. For TN1654 DS1 converter boards, facility A must be installed first, then B, then C or D. This is required because the primary facility can only reside on facilities A or B.
Passes Far-End Clock	<code>y</code> when the DS1 facility is used as a clock reference for the receive fiber signal. Appears on the Fiber-Link screen for TN574 DS1 converter circuit packs. On the TN1654 DS1 converter board, none of the facilities can be used as a clock reference for the receive fiber signal, and administration of this field is not applicable. DS1 facilities cannot be used as system synchronization sources.
Digital Data Compatible	<code>y</code> when the DS1 facility is digital data compatible and suitable for carrying packet traffic. Appears on the Fiber-link screen for TN574 DS1 converter circuit packs. The TN574 circuit pack allows any of the four facilities to be used as the primary facility that carries the packet traffic. The TN1654 DS1 converter board allows packet traffic only on facilities A and B, and administration of this field is not applicable.
1 of 3	

Table 355: DS1 Interface Options administration 2 of 3

Field	Description
Bit Rate	<p>Select domestic T1 operation or international E1 operation for all facilities in the TN1654 DS1 converter complex:</p> <ul style="list-style-type: none"> ● 1.544 Mbps for T1 operation ● 2.048 Mbps for E1 operation <p>Appears on the fiber-link screen only for TN1654 DS1 converter circuit packs.</p> <p>The TN1654 DS1 converter circuit pack is also field configurable for T1 or E1 operation. All four DS1 facilities are configured to either T1 or E1 as a group via an option switch located on the component side of the circuit pack. An error is logged and an alarm is raised if there is a T1/E1 inconsistency between the administered bit rate and the board option switch setting.</p>
Idle Code	<p>Set the idle code for all facilities on the TN1654 DS1 converter board. This field can accept any combination of ones (1) and zeros (0) with the exception that the second left-most digit must be set to one (1) at all times.</p> <p>Appears on the fiber-link screen for TN1654 DS1 converter circuit packs</p>
CRC	<p>This field determines if CRC is enabled for every facility on a TN1654 circuit pack. The field is γ if a cyclic redundancy check (CRC) is to be performed on transmissions that the board receives.</p> <p>CRC only applies to E1 operation and appears on the Fiber-link screen only for TN1654 DS1 converter circuit packs with a bit rate of 2.048 Mbps.</p>
DS1 Converter-1 and DS1 Converter-2 Line Compensation	<p>The DS1 facility line signal is pre-equalized at the transmitter on the DS1 converter circuit pack so that DS1 line pulses have correct amplitude and shape when they reach the Network Interface (see Figure 51: DS1 Facility Connections on page 1043). The amount of equalization necessary is determined by the distance to the Network Interface, and also by the type of wiring used to connect to the Network Interface. If the equalization is not set to the correct value, potentially high error rates (errored seconds) will be observed on the DS1 facility. Table 356: DS1 Facility Line Signal Equalization Values on page 1035 explains how equalization values are determined.</p> <p>Line compensation is applicable only to T1 operation, thus these fields will not appear on the fiber-link screen if the TN1654 DS1 converter is administered for a bit rate of 2.048 Mbps.</p>

2 of 3

Table 355: DS1 Interface Options administration 3 of 3

Field	Description
Line Coding	<p>Administer the line coding for the DS1 facility. For the TN574 board and the TN1654 board in T1 mode, the field may be set to <i>ami-zcs</i> or <i>b8zs</i>. If the TN1654 board is set for E1 operation, the line coding may be set to either <i>ami-basic</i> or <i>hdb3</i>. The line coding must be the same at each end of the DS1 converter complex.</p>
Framing Mode	<p><i>esf</i> or <i>d4</i> for the DS1 facility. The same framing mode must be used at each end of the DS1 converter complex.</p> <p>For TN574 DS1 converter boards, this is administrable.</p> <p>For TN1654 DS1 converter boards, this field is display only. The TN1654 has option switches located on the component side of the circuit pack. If T1 operation is selected via the first switch, four additional switches are used to select the framing mode for each facility. Each facility can be set to either D4 or ESF framing. The Framing Mode field will display what the switch is set to for the DS1 facility.</p> <p>Framing Mode is applicable only to T1 operation. This field does not appear on the fiber-link screen if the TN1654 DS1 converter is administered for a bit rate of 2.048 Mbps.</p>
Line Termination	<p>Display only, shows the line termination for the DS1 facility on the TN1654 DS1 Converter circuit pack.</p> <p>The TN1654 has option switches located on the component side of the circuit pack. If E1 operation is selected via the first switch, four additional switches are used to select the line termination for each facility. Each facility can be set to either CEPT 75 ohm coaxial or 120 ohm CEPT twisted pair. This line termination field will display what the switch is set to for the DS1 facility.</p> <p>Line Termination is applicable only to E1 operation. This field does not appear on the fiber-link screen if the TN1654 DS1 converter is administered for a bit rate of 1.544 Mbps</p>
Facility Circuit ID	<p>Specify a unique alpha-numeric name for each DS1 facility. This field appears for each facility when Facility Installed is <i>y</i>.</p>
<p>3 of 3</p>	

Table 356: DS1 Facility Line Signal Equalization Values

DS1 Converter-1 and DS1 Converter-2 Line Compensation (continued)	Equalizer Setting	Distance to Network Interface (feet)	
		Cable type 22 AWG ABAM & 24 AWG PDS	Cable type 26 AWG PDS
	1	1 to 133	0 to 90
	2	133 to 266	90 to 180
	3	266 to 399	180 to 270
	4	399 to 533	270 to 360
	5	533 to 655	360 to 450

DS1 Converter Performance Measurements Report

The DS1 Converter Performance Measurements provide link performance measurements for the DS1 facilities.

When no facility alarms exist on the DS1 facility, events that indicate a degradation in the performance of the DS1 facility are monitored and recorded. These events will generate alarms when performance of the DS1 facility has degraded below acceptable levels. These measurements include errored seconds, bursty seconds, severely errored seconds, and failed seconds.

There are two DS1 Converter Performance Measurements Sub-reports:

- The DS1 Converter Performance Measurements Summary Report provides information about the worst 15-minute interval of data, the total for 24 hours of data and the current 15-minute counter for each of the previously mentioned counters.
- The DS1 Converter Performance Measurements Detailed Report displays a detailed log for the last 96 15-minute intervals for each of the previously mentioned counters.

Access the DS1 Converter Performance Measurements Summary Report with `list measurements ds1-facility summary location [print | schedule]`. Access a more detailed version of the report with `list measurements ds1-facility log location f [print | schedule]`.

You can reset every hardware- and software-measurement counter for a given facility with `clear measurements ds1-facility location f`. The *Counted Since* time is also reset and the *Number of Valid Intervals* count is set to zero.

The reports are printed on the screen or, by using the `print` option, on a printer attached to the terminal.

Clearing Firmware Errors

DS1 converter error reports are generated by firmware autonomously. DS1 converter error reports are not associated with technician-demanded tests. The `test board clear` command does not affect the error status known by the DS1 converter firmware. To clear every on-board firmware-detected error unconditionally, use `clear firmware-counters`.

Error Log Entries and Test to Clear Values

Table 357: DS1 Facility Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	SAT Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test dsl-facility location sh r 1</code>
1 (b)		Failure Audit #949	MAJ	ON	<code>test board location sh r 1</code>
18 (c)	0	<code>busyout dsl-facility location</code>	WRN	OFF	<code>release dsl-facility location</code>
257 (d)		Failure Audit #949	MIN	ON	<code>test board location sh r 1</code>
513 (e)	1	Failure Audit #949	MIN	OFF	<code>test board location sh r 1</code>
513 (e)	2	Failure Audit #949	MIN	OFF	<code>test board location sh r 1</code>
856 (f)		DS1 Facility Query for Slips/Misframes #972	MIN	OFF	none
1025 (g)		Failure Audit #949	MAJ ¹	OFF	<code>test board location sh r 1</code>
1281 (h)	None	Failure Audit #949	MAJ ¹	OFF	<code>test board location sh r 1</code>
1281 (h)	1	Failure Audit #949	MAJ ¹	OFF	<code>test board location sh r 1</code>
1281 (h)	2	Failure Audit #949	MAJ ¹	OFF	<code>test board location sh r 1</code>
1537 (i)		Failure Audit #949	MAJ ¹	OFF	<code>test board location sh r 1</code>
1793 (j)		Failure Audit #949	MAJ ¹	OFF	<code>test board location sh r 1</code>
2065 (k)		DS1 Facility Query for Slips/Misframes #972	MIN	OFF	none
2305 (l)		Failure Audit #949	MAJ	OFF	<code>test board location sh r 1</code>
2561 (m)		Failure Audit #949	MIN ¹	OFF	<code>test board location sh r 1</code>

1. These failures are logged as a WRN alarm when the error is first reported. The alarm severity is raised to a MAJOR in 15 minutes if the problem persists.

Notes:

When problems persist, use **reset board** to reset the DS1 converter circuit pack. This may temporarily resolve the error condition and restore service until further assistance is provided.

- a. **Error Type 0**: Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.
- b. **Error Type 1**: A major failure occurred on the DS1 interface hardware on the DS1 converter circuit pack associated with this DS1 facility. Replace the DS1 converter circuit pack.
- c. **Error Type 18** indicates that the DS1 facility has been busied out via the **busyout ds1-facility** command. To resolve this error, release the DS1 facility via **release ds1-facility**.
- d. **Error Type 257**: A minor failure occurred on the DS1 interface hardware on the DS1 converter circuit pack associated with this DS1 facility. Replace the DS1 converter circuit pack.
- e. **Error Type 513**: DS1 converter circuit packs in this DS1 converter complex do not match in their framing formats or line coding formats.

Aux Data 1 indicates that the framing formats (ESF or D4) do not match. For TN574 DS1 converter boards, the framing mode is administered on the fiber-link screen. The TN1654 DS1 converter has option switches located on the component side of the circuit pack. If T1 operation is selected via the first switch, four additional switches are used to select the framing mode for each facility. The `Framing Mode` field on the fiber-link screen is display-only for the TN1654 boards. It displays what the switch is set to for the DS1 facility. It cannot be administered.

Aux Data 2 indicates that the line coding formats do not match. Line Coding is an administrable value on the fiber-link screen. The line coding options are *ami-zcs* or *b8zs* for TN574 boards and TN1654 boards in T1 mode. For TN1654 boards in E1 mode, the line coding options are *ami-basic* or *hdb3*.

This error should clear in 15 minutes.

1. Verify that DS1 facility and the network is using the same line coding (*ami-zcs*, *b8zs*, *ami-basic*, *hdb3*) and framing mode (ESF, D4). Use **list fiber-link** and **display fiber-link** to check the values for this DS1 facility. Contact T1 Network Service to check the modes used by the network.

If the framing mode format differs on boards in a TN1654 DS1 converter complex, the DS1 converter board that has its option switch set incorrectly will have to be physically removed from the system in order to set the facility framing mode switch properly.

2. If the problem persists, reset both DS1 converter circuit packs via the **reset board**.
3. If the problem still persists, replace this DS1 converter circuit pack.
4. If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

Communication Manager Maintenance-Object Repair Procedures

- f. **Error Type 856:** More than 88 negative and/or positive slip errors occurred. This error clears when there are no slips for 1 hour.
1. Enter `display errors` and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
 2. Verify that the DS1 facility and the network are using the same Line Coding. For TN574 boards and TN1654 boards in T1 mode, also verify that the Framing Mode used is the same. Use `list fiber-link` and `display fiber-link` to check the values for this DS1 facility. Contact T1 Network Service to check the modes used by the network. See the previous sections, “Line Coding” and “Framing Mode” for details on how these options apply to the TN574 and TN1654 DS1 converter boards.
 3. For TN574 boards and TN1654 boards in T1 mode, check line equalization settings as described in the previous section, “DS1 converter-1 and DS1 converter-2 Line Compensation.”
 4. Enter `display errors` and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints. Enter `display errors` and follow the associated repair procedures for any FIBER-LK errors for this fiber link.
 5. If the problem still persists, replace this DS1 converter circuit pack.
 6. If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.
- g. **Error Type 1025:** Loss of Frame Alignment (LFA) Alarm, the RED alarm. This alarm indicates that the DS1 interface associated with the DS1 facility cannot frame up on the received data.

For the following repair procedure, see to [Figure 51: DS1 Facility Connections](#) on page 1043 and the diagrams in the related test descriptions.

1. If the network is used instead of private T1 lines, check that the DS1 facility and the network are using the same line coding. For TN574 boards and TN1654 boards in T1 mode, also verify that the Framing Mode used is the same. For TN1654 boards, verify that the two boards in the DS1 converter complex are using the same bit rate. Use `list fiber-link` and `display fiber-link` to check the values for this DS1 facility. Contact T1 Network Service to verify the modes set for the network. See the previous sections, [Line Coding](#) on page 1034, [Framing Mode](#) on page 1034, and [Bit Rate](#) on page 1033 for details on how these options apply to the TN574 and TN1654 DS1 converter boards.
2. Run the Near-End External Loopback test (#799) via `test ds1-facility location external-loopback` by setting up a loop back at CPE side of CSU towards DS1 converter circuit pack shown as loop back point **LB 1** in the test description diagram. If the test fails, replace connectors and the cables between CSU and the DS1 converter circuit pack.
3. If the test passes, run the Near-End External Loopback test (#799) via `test ds1-facility location external-loopback` by setting up a loop back at DS1 facility side of CSU towards the DS1 converter circuit pack shown as loop-back point **LB 2** in the test description diagram. If the test fails, replace the CSU.

4. If Test #799 passes, run the Far-End Internal Loopback test (#797) via `test ds1-facility location long`. If Test #797 passes, go to step 6. If the test fails, then run the Near-End External Loopback test (#799) via `test ds1-facility location external-loopback` at the other end of the DS1 converter complex, and repeat steps 2 and 3 for the other endpoint.

If this is not a critical-reliability system and if there is only one DS1 facility, then Test #799 can only be executed at the end that is closer to the media server relative to the DS1 converter circuit pack at the end of the DS1 converter complex. If the test cannot be executed for this reason, then replace the cables, connectors and the CSU at the other end of the DS1 converter complex.

5. If the problem could not be isolated by the near-end external loop-back tests, then the fault should be between CSU A and CSU B. Contact T1 Network Service to resolve the problem(*).
6. If the problem still persists, check for excessive slips and synchronization problems. Enter `display errors` and follow the associated repair procedures for any SYNC, TDM-CLK, or SNC-BD errors. For TN574 boards and TN1654 boards in T1 mode, check line equalization settings as described in the previous section, [DS1 Converter-1 and DS1 Converter-2 Line Compensation](#) on page 1033.
7. Enter `display errors` and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints. Enter `display errors` and follow the associated repair procedures for any FIBER-LK errors for this fiber link.
8. If the problem still persists, replace this DS1 converter circuit pack.
9. If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.

If D4 framing mode is used, an in-band alarm signal (RFA) will be transmitted that will corrupt the transmit data on this facility.

h. Error Type 1281:

Aux Data None: This entry in the DS1 Facility Error Log occurs only prior to Release V5. The DS1 converter circuit pack's neighbor (the DS1 converter circuit pack at the other end of the DS1 converter complex) is unable to frame up on the signal being sent to it by this DS1 converter circuit pack on this DS1 facility. The far-end facility will be in LFA state. To isolate faults for this case, follow the repair procedure for Error Type #1025 for the other end of the DS1 facility. Note that references to the near and far ends are reversed, for example, the neighbor is now the near end. If D4 framing is used, received data will be corrupted as well as transmitted data.

Aux Data 1: indicates that the facility is detecting a Remote Frame Alarm (RFA), also known as the YELLOW alarm, being sent by the remote DS1 endpoint. This Yellow alarm corresponds to the yellow F2 state documented in CCITT Recommendation I.431. If D4 framing is used, received data will be corrupted in addition to transmitted data.

Communication Manager Maintenance-Object Repair Procedures

Aux Data 2: indicates that the facility is detecting a yellow F5 state alarm. This error only applies to TN1654 DS1 converter boards in 32-channel E1 operation with CRC enabled via the fiber-link screen. The F5 fault state is defined as a fault in the user-network interface, specifically in the direction from the user (PBX) to the network. Refer to CCITT recommendation I.431.

The far-end facility will be in LFA state. To isolate faults for this case, follow the same repair procedure as in Error Type #1025 (loss of frame alignment) for the other end of the DS1 facility.

- i. **Error Type 1537:** Alarm Indication Signal (AIS), the BLUE alarm. This alarm indicates that the far end of the facility is out of service. This means that the other end of the DS1 facility is undergoing maintenance testing or has a LOS condition and the CSU is providing a Keep Alive signal. If the Keep Alive signal is not supplied by the CSU, a LOS condition will exist on the facility instead of the AIS. If a LOS condition exists on the facility, the green LED on the TN574 DS1 converter circuit pack that is associated with the facility will be off; if an AIS condition exists on the facility, the green LED that is associated with the facility that has the AIS will be on. For TN1654 DS1 converter boards, the LED associated with the facility will be lit red if either the LOS or AIS conditions exist.

To isolate faults for this case, follow the same repair procedure as in Error Type #1793 (loss of signal) for the other end of this DS1 facility.

An RFA alarm indication (YELLOW alarm) is transmitted in response to this BLUE alarm. If D4 framing is used, transmitted data is corrupted.

- j. **Error Type 1793:** Loss of Signal (LOS) alarm. This alarm indicates that no signal is present at the DS1 interface associated with the facility. On TN574 DS1 converter boards, the green LED that is associated with the facility will be off. For TN1654 DS1 converter boards, the LED that is associated with the facility will be lit red. If the LED behavior differs, replace the DS1 converter circuit pack.

Fault isolation for this problem may be different depending on the capabilities of the CSU device that is being used. Typically, CSUs provides an LED that is useful for fault isolation (see [Figure 52: Typical CSU Maintenance Capabilities](#) on page 1043). This is the “16 Zeros” LED. This LED is momentarily lit when a string of 16 consecutive zeros is detected in the DS1 signal from the DS1 converter. Zeros on a DS1 link are represented by an absence of a pulse. Thus, an active 16 Zeros LED indicates a LOS alarm from the DS1 converter.

For the following repair procedure, see [Figure 51: DS1 Facility Connections](#) on page 1043 and the diagrams in the related test descriptions.

1. If the DS1 facility side LOS indication on CSU A is off (inactive), check for a problem between the DS1 converter A circuit pack and the CPE side of CSU A. Connectors, cables, and the CSU may need to be replaced.
2. If the DS1 facility side LOS indication on CSU A is on (active), check for a problem between the CSU A and the CSU B. Contact T1 Network Service to resolve the problem. DS1 facility may be a private line or it may be connected to the Network. Network Interface (NI) point is where the customer’s maintenance responsibility ends and the DS1 facility vendor’s maintenance responsibility begins. This point ideally is the T, R, T1, and R1 terminals on the rear of the CSU to which the wires of the DS1 facility vendor’s DS1

facility is attached. If the NI does not occur at this point, then any cabling between the CSU terminals and the NI is also considered to be part of the CPE. This cable typically runs between the DS1 facility terminals of the CSU and a cross-connect field where the DS1 facility vendor has terminated the DS1 facility. Maintenance responsibility for this portion of the DS1 facility resides with the customer unless other arrangements are made.

3. If the CPE side LOS indication on CSU B is on (active), check for a problem between the CPE side of CSU B and the DS1 converter B circuit pack. Connectors, cables, and the CSU B may need to be replaced.
4. If the CSU A and the CSU B do not provide visual CPE side and DS1 facility side LOS indications, follow the repair procedure that is given for Error Type 1025 (loss of frame alignment). Apply the procedure first to the DS1 converter B side instead of the DS1 converter A where the error is reported (external loop-back test is not expected to pass if we execute it at this end as long as we have the LOS indication).

Repair procedure for Error Type #1025 (loss of frame alignment) includes execution of the Near-End External Loopback test (#799). If this is not a critical-reliability system and if there is only one DS1 facility, then Test #799 can only be executed at the end that is closer to the media server relative to the DS1 converter circuit pack at the end of the DS1 converter complex. If the test cannot be executed for that reason, then still make the external loop back as if the test was going to be executed, but instead of executing the test, check the green LED at the face plate of the DS1 converter B that is associated with this DS1 facility. If the green LED is off, then replace the connectors, cables, and the CSU B.

5. If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.
6. If the problem still persists, replace this DS1 converter circuit pack.

If D4 framing is used, an in-band alarm signal (RFA) is transmitted that corrupts transmit data in response to this alarm.

- k. **Error Type 2065:** More than 17 misframe errors occurred. This error will clear when there are no misframes for 1 hour.
 1. Enter `display errors` and follow the associated repair procedures for any SYNC, TDM-CLK, or SNC-BD errors.
 2. Verify that the DS1 facility and the network are using the same Line Coding. For TN574 boards and TN1654 boards in T1 mode, also verify that the Framing Mode used is the same. Use `list fiber-link` and `display fiber-link` to check the values for this DS1 facility. Contact T1 Network Service to check the modes used by the network. See the previous sections, "[Line Coding](#)" on page 1034 and "[Framing Mode](#)" on page 1034 for details on how these options apply to the TN574 and TN1654 DS1 converter boards.
 3. For TN574 boards and TN1654 boards in T1 mode, check line equalization settings as described in the previous section "[DS1 Converter-1 and DS1 Converter-2 Line Compensation](#)" on page 1033.

Communication Manager Maintenance-Object Repair Procedures

4. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints. Enter **display errors** and follow the associated repair procedures for any FIBER-LK errors for this fiber link.
 5. If the problem still persists, replace this DS1 converter circuit pack.
 6. If the problem still persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.
- l. Error Type 2305:** Facility Packet Channel Loopback Error. This error indicates that the DS1 converter primary facility that carries the packet time slots and DS1 control channel is looped to itself. This error applies only to facilities A and B on TN1654 DS1 converter boards. If both facilities A and B are being used and firmware detects a loop-back condition an attempt will be made to switch the primary facility to the other facility. If the other facility is looped, down or not being used, the PN will be down until this loop back is removed.
1. Check the loop-back LEDs on both CSU A and CSU B as shown in [Figure 51: DS1 Facility Connections](#) on page 1043 to see if a CSU is in a loop-back mode. Also check to see if the CSUs have been manually hard-wired into a loop-back mode. Remove detected loop backs.
 2. If the CSUs are not in loop-back mode, reset both DS1 converter boards via **reset board**.
- m. Error Type 2561:** Facility Jitter Alarm. This alarm indicates excessive receive jitter on the DS1 facility. This error only applies to TN1654 DS1 converter boards. The problem is external to the DS1 converter board. It could be caused by bad wiring, a bad device (CSU or repeater) or a bad signal coming in at the Network Interface.

Figure 51: DS1 Facility Connections

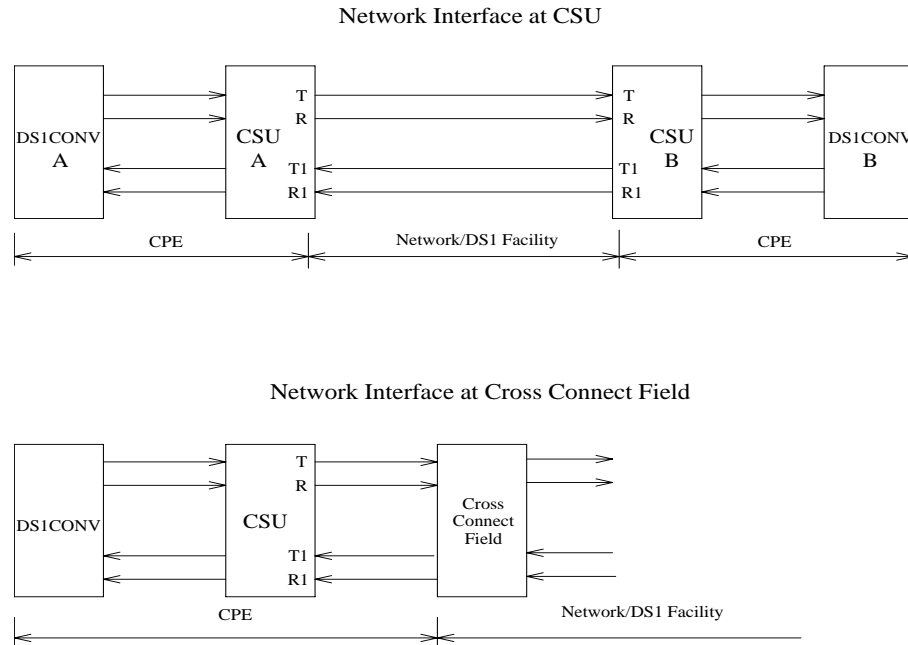

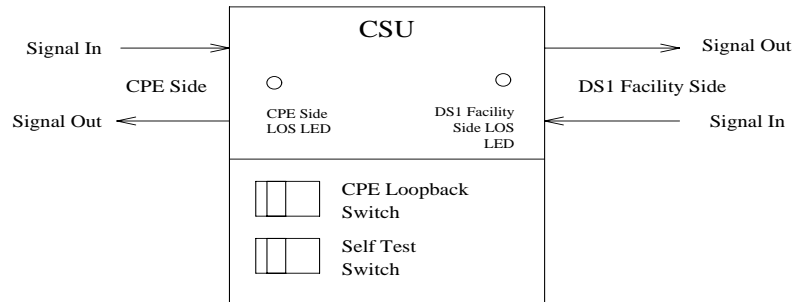

Figure 52: Typical CSU Maintenance Capabilities

System Technician-Demanded Tests: Descriptions And Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Failure Audit, you may clear errors generated from other tests in the sequence. Use `test board` to run Failure Audit.

Order of Investigation	Short Test Sequence	Long Test Sequence	External Loopback	Reset Sequence	D/ND ¹
Failure Audit (#949)					ND
DS1 Interface Options Audit (#798)	X	X			ND
Far-End Internal Loopback (#797)		X			D
Near-End External Loopback test (#799)			X		D

1. D = Destructive; ND = Nondestructive

Far-End Internal Loop-Back Test (#797)

This test is **destructive**.

This test starts at the DS1 converter circuit pack whose equipment location was entered and traverses over the specified facility and loops at the internal facility interface on the other DS1 converter circuit pack in the DS1 converter complex. See the following diagram.

Every part of this test is executed under firmware control and the result is sent back to the maintenance software. The test is executed by sending digital data through every DS1 channel on this facility. For TN574 DS1 Converter facilities, test patterns are sent through every DS1 channel. For TN1654 DS1 Converter facilities, test patterns are sent through one DS1 channel.

If there is only one DS1 facility available, the system will not allow that last facility to be busied out. In that case, the DS1 converter circuit pack must be busied out before executing this test.

For a standard-, duplex-, or high-reliability system (no PNC duplication), if there is only one DS1 facility available, then this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack because of its impacts on the system control links. For TN574 DS1 converter boards, the completion of the test will be delayed in this configuration to wait for the recovery of the system control links. For a critical-reliability system (PNC duplication) or for a system with multiple DS1 facilities, the test can be executed at any DS1 converter circuit pack.

If the test passes on a TN1654 DS1 facility, the *round trip delay time* appears in milliseconds in the `Error Code` field. The round trip delay time is the length of time in milliseconds it takes for the firmware to receive the test pattern after it has been sent.

Figure 53: Far-End Internal Loop-Back Test (#797)

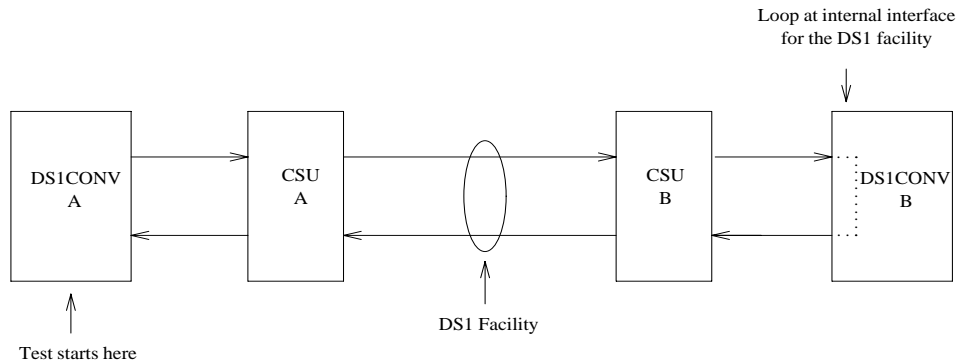

Table 358: Test #797 Far-End Internal Loop-Back Test 1 of 2

Error Code	Test Result	Description / Recommendation
2000	ABRT	Timed out while waiting for a response from the circuit pack. 1. Retry the command at 1-minute intervals up to 3 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2300	ABRT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals up to 3 times.
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. ● Use add fiber-link to administer the DS1 converter.
2321	ABRT	DS1 facility is not busied out. ● Use busyout ds1-facility to busyout the DS1 facility. ● If there is only one DS1 facility, use busyout board to busyout the DS1 converter circuit pack.
2332	ABRT	For this system configuration, test is not allowed to execute at the far end when there is only one DS1 facility available. 1. Execute the test at the other end of the DS1 converter complex.
		1 of 2

Table 358: Test #797 Far-End Internal Loop-Back Test 2 of 2

Error Code	Test Result	Description / Recommendation
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
	FAIL	Far-End Internal loop back failed. A problem exists between DS1 converter A and DS1 converter B's internal interface for the DS1 facility (see previous diagram). 1. If the test is executed as a part of an error analysis, then return back to the related section. 2. Enter display errors and follow the associated repair procedures for any on-board DS1C-BD errors on this DS1 converter circuit pack and the DS1 converter circuit pack at the other end of the DS1 converter complex. 3. If the network is used instead of private T1 lines, verify that the DS1 facility and the network are using the same Line Coding. For TN574 boards and TN1654 boards in T1 mode, also verify that the Framing Mode used is the same. Use list fiber-link and display fiber-link to check the values for this DS1 facility. Contact T1 Network Service to check the modes used by the network. See the previous sections, "Line Coding" and "Framing Mode" for details on how these options apply to the TN574 and TN1654 DS1 converter boards. 4. Isolate the problem by running the Near-End External Loopback test (#799) via test ds1-facility location external-loopback , first at this end and then at the other end of the DS1 converter complex. Setup loop backs at different points as shown in the description diagram for Test #799, and follow repair procedures described for Test #799. 5. If the problem could not be found by near-end external loop-back tests, then the fault should be between the CSU A and the CSU B. Contact T1 Network Service to resolve the problem, also see the repair procedures for Error Type #1025 (loss of frame alignment).
Any	PASS	Transmission through the path of the loop back is successful. TN1654 DS1 facilities will display the round trip delay time in milliseconds in the Error Code field. The round trip delay time is defined as the length of time in milliseconds it takes for the firmware to receive the test pattern after it has been sent.
2 of 2		

DS1 Interface Options Audit Test (#798)

This test is nondestructive.

This test sends the administered DS1 Interface options to the DS1 converter circuit pack. Options are sent to both DS1 converter circuit packs at the same time to prevent any transitional mismatch of options.

The following DS1 facility options are sent to the TN574 DS1 converter circuit pack: Framing Mode, Line Coding and DS1 converter-1 and DS1 converter-2 Line Compensation.

The following DS1 facility options are sent to the TN1654 DS1 converter circuit pack: Line Coding and DS1 converter-1 and DS1 converter-2 Line Compensation (T1 only). These option fields appear on the Fiber-link Administration screen.

Table 359: Test #798 DS1 Interface Options Audit

Error Code	Test Result	Description / Recommendation
105	ABRT	The neighbor DS1 converter circuit pack at the other end of the DS1 converter complex is not accessible. 1. Retry the command at 1-minute intervals up to 3 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2000	ABRT	Timed out while waiting for a response from the circuit pack. 1. Retry the command at 1-minute intervals up to 3 times.
2300	ABRT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals up to 3 times.
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. Use add fiber-link to administer the DS1 converter fiber link.
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
	PASS	The DS1 Interface options are sent to the circuit pack.

Near-End External Loop-Back Test (#799)

This test is **destructive**.

This test starts at the DS1 converter circuit pack whose equipment location was entered and traverses over the specified facility and loops back at the manually hard-wired external loop-back device. Depending on the type of physical connectivity of the DS1 facility, special tools, cables or connectors may be required to make the hard-wired loop backs.

To isolate a problem, set the loop back first at the loop-back point LB 1, and then at the loop-back point LB 2, see [Figure 54: Loopback Points for Test #799](#) on page 1049 and [Figure 51: DS1 Facility Connections](#) on page 1043. Place the loop backs at as many points as your CSU capabilities will allow. Hard-wired loop backs at the far end are not desirable, because the equalization-level adjustments may cause problems.

Every part of this test is executed under firmware control and the result is sent back to the maintenance software. The test is executed by sending digital data through every DS1 channel on this DS1 facility.

This test is executed via `test ds1-facility location external-loopback`. It is not part of the long test sequence because it requires modifications to the physical connectivity of the DS1 facility.

If there is only one DS1 facility available, system will not allow the last facility to be busied out. In that case, the DS1 converter circuit pack must be busied out before executing this test.

For a standard-, duplex-, or high-reliability system (no PNC duplication), if there is only one DS1 facility available, then this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack because of its impacts on the system control links. For a critical-reliability system (PNC duplication) or for a system with multiple DS1 facilities, the test can be executed at any DS1 converter circuit pack.

If the test passes on a TN1654 DS1 facility, the *round trip delay time* will be displayed in milliseconds in the `ERROR CODE` field. The round trip delay time is defined as the length of time in milliseconds it takes for the firmware to receive the test pattern after it has been sent. This measurement is taken on the last DS1 channel tested.

Figure 54: Loopback Points for Test #799

Table 360: Test #799 Near-End External Loop-Back Test 1 of 2

Error Code	Test Result	Description / Recommendation
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2000	ABRT	Timed out while waiting for a response from the circuit pack. 1. Retry the command at 1-minute intervals up to 3 times.
2300	ABRT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals up to 3 times.
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. ● Use <code>add fiber-link</code> to administer the DS1 converter fiber link.
2321	ABRT	DS1 facility is not busyout. ● Busyout the DS1 facility via <code>busyout ds1-facility</code> . ● If there is only one DS1 facility, busyout the DS1 converter circuit pack via <code>busyout board</code> .
2332	ABRT	With this system configuration, test is not allowed to execute at the far end when there is only one DS1 facility available. Check the green LED at the face plate of the DS1 converter circuit pack. The green LED should be on if the loop is complete.
		1 of 2

Table 360: Test #799 Near-End External Loop-Back Test 2 of 2

Error Code	Test Result	Description / Recommendation
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
	FAIL	Near-end external loop back failed. A problem exists in the path of the loop back. 1. If the test is executed as a part of an error analysis, then return back to the related section. 2. Enter display errors and follow the associated repair procedures for any on-board DS1C-BD errors. 3. If the loop-back point is LB 1 , replace connectors and cables between the DS1 converter A and the CSU A. If the loop-back point is LB 2 , replace CSU A. Also see the repair procedure for Error Type #1025 (loss of frame alignment). 4. If the test still fails, replace DS1 converter A circuit pack.
Any	PASS	Transmission through the path of the loop back is successful. TN1654 DS1 facilities will display the round trip delay time in milliseconds in the Error Code field. The round trip delay time is defined as the length of time in milliseconds it takes for the firmware to receive the test pattern after it has been sent. This measurement is taken on the last DS1 channel tested.
2 of 2		

Failure Audit (#949)

This test is nondestructive.

This test queries the DS1 converter circuit pack for any existing circuit pack or facility failures and any unacknowledged cleared failure messages. Upon receiving the query request, DS1 converter firmware sends failure reports to the maintenance software for every error in its failure database.

This test operates on both MOs DS1C-BD and DS1-FAC. Error counts of both MOs (DS1C-BD and DS1-FAC) that are displayed in the error log will be incremented when this test is executed. This test is executed via **test board**. The test is also executed internally by the maintenance software when an alarm is resolved

Table 361: Test #949 Failure Audit

Error Code	Test Result	Description / Recommendation
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2000	ABRT	Timed out while waiting for a response from the circuit pack. 1. Retry the command at 1-minute intervals up to 3 times.
2300	ABRT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals up to 3 times.
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. ● Use add fiber-link to administer the DS1 converter fiber link.
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
	FAIL	The DS1 converter circuit pack reported failures or retransmitted a cleared failure message. 1. Enter display errors and follow the associated repair procedures for any DS1C-BD and DS1-FAC errors.
	PASS	The DS1 converter circuit pack has no failures.

DS1C-BD

S8700 MC only

Also called DS1 Converter

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DS1C-BD	MAJ	<code>test board location sh r 1</code>	DS1 converter circuit pack
DS1C-BD	MIN	<code>test board location sh r 1</code>	DS1 converter circuit pack
DS1C-BD	WRN	<code>test board location sh r 1</code>	DS1 converter circuit pack

The DS1 converter complex is part of the port-network connectivity (PNC) consisting of two TN574 DS1 Converter or two TN1654 DS1 Converter circuit packs connected by one to four DS1 facilities. It is used to extend the range of the 32-Mbps fiber links that connect PNs to the Center Stage Switch, allowing PNs to be located at remote sites.

The TN1654 DS1 Converter Circuit pack is a redesign of the TN574 DS1 Converter board. The TN1654 provides functionality equivalent to the TN574 but also adds a 32-channel E1 interface for international support as well as circuit-switched wideband connections (NxDS0). The TN1654 is supported beginning with DEFINITY Release 5r.

Every error condition reported by the firmware is associated with background tests that the firmware runs autonomously. Demand tests that are executed by the maintenance software do not cause any new error generation by the firmware. However, Failure Audit test (#949) affects auditing of the software error log by forcing the firmware to report the pending errors again.

Maintenance of the DS1 facilities themselves is covered under the “DS1-FAC” MO.

The DS1 converter complex can extend a fiber link between two EIs or between a PN EI and an SNI. Fiber links between two SNIs or between a PN and the Center Stage Switch (CSS) cannot be extended.

The TN1654 board is not compatible with the TN574 board. A DS1 converter complex may consist of two TN574 boards or two TN1654 boards, but a TN574 cannot be combined with a TN1654 in the same complex. A system with multiple DS1 converter-remoted PNs may contain DS1 converter complexes of both types, TN1654 board-pairs and TN574 board-pairs. Critical-reliability configurations with a pair of DS1 converter complexes serving an PN require identical board pairs and facilities. For example, a TN574 complex and a TN1654 complex may not be used together to serve the same PN in a critical-reliability configuration.

DS1 converter circuit packs connect to TN570 Expansion Interface (EI) circuit packs and TN573 Switch Node Interface (SNI) circuit packs via metallic cables as shown in [Figure 55: DS1 converter connection to EIs and SNIs](#) on page 1053. A fiber link cable can be used instead of the metallic cable if it is necessary to locate the DS1 converter far from the connected EI or SNI circuit pack, for example, in an adjacent cabinet.

The DS1 converter circuit pack can be placed in any regular slot in a PN carrier. However, the DS1 converter circuit pack can only be placed in slots 1 and 21 in a Switch Node (SN) carrier. The DS1 converter circuit pack is not connected to the TDM bus or the SN backplane. Communication to the circuit pack is done through the connected EI or the SNI circuit packs. Therefore, there is considerable interaction between the DS1 converters and the connected EIs and the SNIs. A special “Y” cable connects the DS1 converter circuit pack to the Fiber Endpoint and to the facilities.

Note:

The two DS1 converter boards, TN1654 and TN574, use unique “Y” cables that are incompatible with each other.

The TN573 SNI circuit pack is incompatible with the TN1654 board. A TN573B (or higher-suffixed) SNI board must be used when connecting to a TN1654 board. The TN573B SNI board is fully backward compatible with the TN573 board and can be connected to either TN1654 or TN574 boards.

Note:

A TN573B (or higher-suffixed) board must be used when connecting a SNI board to a TN1654 board. Error 125 will be logged and an on-board minor alarm will be generated against the SNI board if it is incompatible with the TN1654 circuit pack.

[Figure 56: DS1 converter Complex in Direct Connect PNC](#) on page 1054 and [Figure 57: DS1 Converter Complex in Duplicated PNC with 1 SN](#) on page 1055 show DS1 converter connections in a direct-connect PNC configuration and between the CSS and an PN in a critical-reliability system configuration (duplicated PNC).

Figure 55: DS1 converter connection to EIs and SNIs

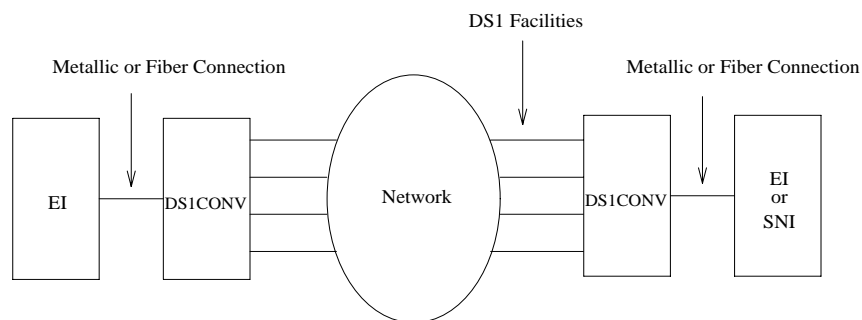

Figure 56: DS1 converter Complex in Direct Connect PNC

Figure 57: DS1 Converter Complex in Duplicated PNC with 1 SN

DS1 Converter Administration and Board Insertion

Board insertion is the detection of a circuit pack by the system. The DS1 converter circuit pack will not be inserted unless the circuit pack type, TN574 or TN1654, is entered into the associated field in circuit pack administration screen. The Fiber Endpoint (the EI or the SNI) must also be inserted and be operational for the DS1 converter circuit pack to function.

Fiber link administration must be completed before the DS1 converter maintenance can be operational. Fiber links are administered via `add fiber-link`. Fiber Endpoints, DS1 converter circuit pack locations and DS1 facility options are entered as a part of the fiber link administration.

Communication Manager Maintenance-Object Repair Procedures

To administer a standard-, duplex-, or high-reliability system (no PNC duplication):

1. Administer carriers via `add/change cabinet`.
2. Administer circuit packs via `change circuit-pack`.
3. Administer connectivity and the facility options of the DS1 converter complex via `add/change fiber-link`.

To administer a critical-reliability system (PNC duplication):

1. Enable PNC duplication feature using the `change system-parameter customer-option`.
2. Administer carriers via `add/change cabinet`.
3. Administer circuit packs via `change circuit-pack`.
4. Administer connectivity and the DS1 facility options of each DS1 converter complex via `add/change fiber-link`.
5. Turn on PNC duplication via `change system-parameter duplication`.

TN1654 Board Configuration Switch Settings

The TN1654 DS1 converter circuit pack is field configurable for T1 or E1 operation so that a single board serves worldwide application. All four DS1 facilities are configured to either T1 or E1 as a group via an option switch located on the component side of the circuit pack. If T1 operation is selected, four additional switches are used to select the framing mode for each facility. Each facility can be set to either D4 or ESF framing. If E1 operation is selected, the same four switches are used to select the E1 facility line termination impedance. The E1 line termination impedance for each facility can be set to either 120Ω for twisted-pair or 75Ω for coaxial wiring.

T1 or E1 operation must also be administered for the TN1654 DS1 converter board on the fiber-link screen via the `Bit Rate` field. An error will be logged and an alarm will be raised if there is a T1/E1 inconsistency between the administered bit rate and the board option switch setting.

The T1 facility framing mode and the E1 facility line termination impedance are defined by the option switch settings only. Administration of these values is not allowed. The fiber-link screen will display the selected option switch settings for each facility.

DS1 Converter LEDs

The TN574 board has seven LEDs on its faceplate. The TN1654 board has eleven LEDs on its faceplate. The top three system standard LEDs are used to provide an indication of the state of the DS1 converter board. These LEDs are under firmware control until the board has established a link to the media server via the EI or SNI. Once the link is established, software controls the three LEDs. If the link breaks, the LEDs are again under firmware control.

The red and green LEDs have the traditional use where red means an alarm condition and green indicates that maintenance testing is in progress. The red and green LED is also turned on during circuit pack initialization by firmware. When the control link to the circuit pack is lost, firmware controls the red LED to indicate an alarm condition.

The amber LED under firmware control is used to indicate the state of the:

- Physical fiber interface
- Fiber channel (link to EI or SNI)
- DS1 control channel (link to opposite DS1 converter board)
- Server communications link

in the following manner and descending order of priority. (The amber LED stays lit longer as the DS1 converter complex approaches full operation.)

1. If the fiber is out of frame or is in a loss-of-signal condition, the amber LED will flicker at a 5-Hz rate (on for 0.1 second, off for 0.1 second).
2. If the fiber channel is down (DS1 Converter circuit pack/fiber endpoint communications), the amber LED will flash at a 1-Hz rate (on for ½ second, off for ½ second).
3. If the DS1 control channel is down between the two DS1 converters in the DS1 converter complex, the amber LED will pulse at a 1/2-Hz rate (on for 1 second, off for 1 second).
4. If the media server communications link is down, the amber LED will wink off every 2 seconds for 200 msec (2 seconds on, 0.2 second off).
5. If all is well with the Fiber Interface and every communications channel, the amber LED will remain on continuously in a standard-, duplex-, or high-reliability system. In a critical-reliability system (duplicated PNC):
 - An active DS1 converter circuit pack's amber LED remains on continuously.
 - A standby DS1 converter circuit pack's amber LED remains off.

The LED will then be under software control.

The bottom four green LEDs on the TN574 DS1 converter board are under hardware control. The four green LEDs indicate, for each DS1 converter facility, whether a receive signal is present for the DS1 facility.

The next four LEDs on the TN1654 DS1 converter board are labeled STATUS LEDs and are for future use. These LEDs will not be lit.

The bottom four LEDs on the TN1654 board are labeled SPAN LEDs. These LEDs are under firmware control. If the facility is not administered, then the LED is not lit. The LED is lit amber if the facility is running alarm free. If the facility is detecting either a red alarm (loss-of-signal or loss-of-frame), a yellow alarm (remote frame alarm) or a blue alarm (AIS signal) then the LED is lit red. The SPAN SELECT Switch on the TN1654 faceplate is for future use. Pushing the switch will have no affect on the board.

Clear Firmware-Counters Command

DS1 converter firmware generates error reports autonomously. This takes place independently of technician-demanded tests. The `test board location clear` command will not affect the error status reported by firmware. The `clear firmware-counters` command clears every on-board firmware-detected error unconditionally.

The `clear firmware-counters location` command sends a downlink message to the DS1 converter circuit packs, causing them to clear out their firmware error counters and failure databases. Once the firmware failure database is cleared, the failure audit test (#949) will pass. If problems still exist, the firmware will increment its error counters and the failure audit test will begin failing again.

This command should not be used as a replacement for the repair procedures associated with the hardware error log entries. This command may be useful if a problem has been fixed and off-board alarms associated with the problem are still active.

Downtime Required when Upgrading to TN1654 DS1 Converter Circuit Packs

 **WARNING:**

Upgrading from TN574 DS1 converter circuit packs to TN1654 DS1 converter circuit packs will require down time for the affected PN.

The TN1654 DS1 Converter circuit pack is not compatible with the TN573 SNI circuit pack, the TN574 DS1 converter board, the Y-cable used to connect to the TN574 DS1 converter board or pre-G3V5 software. All DS1 converter boards and Y-cables must be upgraded. If the PN is remoted via a Center-Stage Switch, the connected SNI must also be upgraded. A TN573B (or higher-suffixed) SNI board must be used when connecting to a TN1654 DS1 converter board.

Use `remove fiber-link` to remove the fiber-link administration for the TN574 DS1 converter complex. Use `change circuit-pack` show that TN1654 boards are now being used. Then use `add fiber-link` to administer the TN1654 DS1 converter complex.

Replacing a DS1 Converter Circuit Pack with the Same Type DS1 Converter Circuit Pack — Unduplicated PNC

WARNING:

Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:

Replacing a Switch Node Interface, Switch Node Clock, Expansion Interface or DS1 Converter circuit pack on an unduplicated system disrupts service. The service effect can range from outage of a single PN to outage of the entire system.

WARNING:

A DS1 Converter complex must consist of two TN574 boards or two TN1654 boards. A TN574 cannot be combined with a TN1654 in the same DS1 converter complex.

Steps	Comments
Enter busyout board location .	location represents the cabinet-carrier-slot address of the circuit pack to be replaced.
Replace the circuit pack with the same DS1 converter board type.	
Wait for the circuit pack to reset.	Red and green LEDs will light and then go out.
Enter release board location	<i>CAUTION: Do not busyout any Expansion Interface circuit packs after this point.</i>
Enter test alarms long clear for category exp-intf .	
Wait 5 minutes for SNI-BD, FIBER-LK, and DS1C-BD alarms to clear, or enter clear firmware-counters a-pnc .	

Replacing a DS1 Converter Circuit Pack with the Same Type DS1 Converter Circuit Pack—Duplicated PNC

⚠ WARNING:

On a system with duplicated PNC, synchronization may be provided over a combination of active and standby components. This condition is indicated by an OFF-BOARD WRN alarm against TDM-CLK with Error Type #2305. Repairs to standby PNC in this state may disrupt service. Otherwise, if the active PNC is functional, replacement of a standby component will not disrupt service.

Steps	Comments
Enter <code>status pnc</code> .	Verify that the component to be replaced is on the standby PNC.
Enter <code>busyout pnc</code> .	
Enter <code>busyout board location</code> .	location represents the cabinet-carrier-slot address of the circuit pack to be replaced.
Replace the circuit pack with the same DS1 converter board type.	
Enter <code>release board location</code> .	<i>CAUTION: Do not busyout any Expansion Interface circuit pack after this point.</i>
Enter <code>test alarms long clear</code> for category <code>exp-intf</code> .	
Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK, and DS1C-BD alarms to clear, or enter <code>clear firmware-counters <a-pnc or b-pnc></code> .	Use the letter designation of the pnc that holds the replaced component (the standby pnc).
Enter <code>status pnc</code> .	If either PNC's state of health is not "functional", consult the PNC-DUP section of the Maintenance Manual.
Enter <code>release pnc</code> .	

⚠ WARNING:

Do not power down a Switch Node carrier to replace a circuit pack.

⚠ WARNING:
Replacing a Switch Node Interface, Switch Node Clock, Expansion Interface or DS1 Converter circuit pack on an unduplicated system disrupts service. The service effect can range from outage of a single PN to outage of the entire system.

⚠ WARNING:
A DS1 Converter complex must consist of two TN574 boards or two TN1654 boards. A TN574 cannot be combined with a TN1654 in the same DS1 converter complex.

⚠ WARNING:
The two DS1 converter boards, TN1654 and TN574, use unique “Y” cables that are incompatible with each other.

⚠ WARNING:
A TN573B (or higher-suffixed) board must be used when connecting a SNI board to a TN1654 DS1 Converter board.

Steps	Comments
Enter <code>list fiber-link</code>	Determine the fiber-link number associated with the two TN574 circuit packs to be upgraded.
Enter <code>busyout fiber-link fiber#</code>	Fiber# represents the fiber-link number associated with the TN574 DS1 converter complex that is being upgraded to a TN1654 DS1 converter complex.
Enter <code>remove fiber-link fiber#</code>	
Remove the TN574 DS1 converter circuit packs from the system.	
Replace the TN574 Y-cables with TN1654 Y-cables.	
Replace the removed TN574 DS1 converter circuit packs with TN1654 DS1 converter circuit packs. Prior to installing the TN1654 boards, review the prior section, <i>TN1654 Board Configuration Switch Settings</i> .	
If a TN1654 DS1 converter board is connected to an SNI board, upgrade the SNI to a TN573B or greater.	
Wait for the circuit packs to reset	Red and green LEDs will light and then go out.
1 of 2	

Steps	Comments
Enter <code>change circuit-packs cabinet #</code> . Update the screen to show that TN1654 boards are now being used instead of TN574 boards. Also update the connected SNI, if applicable, to suffix B.	Cabinet # represents the cabinet associated with a DS1 converter board. The <i>change circuit-packs</i> screen needs to be updated for both DS1 converter boards. Also, if needed, re-add translations for connected EI boards.
Enter <code>add fiber-link fiber#</code> to re-add the fiber-link using TN1654 DS1 converter circuit packs.	Fiber# represents the fiber-link number associated with the TN574 DS1 converter complex that is being upgraded to a TN1654 DS1 converter complex
Enter <code>test alarms long clear</code> for category <code>exp-intf</code> .	
Wait 5 minutes for SNI-BD, FIBER-LK AND DS1C-BD alarms to clear, or enter <code>clear firmware-counters a-pnc</code>	
2 of 2	

Upgrading TN574 DS1 Converter Circuit Packs in a Fiber-Link to TN1654s — Duplicated PNC

-  **WARNING:**
Do not power down a Switch Node carrier to replace a circuit pack.
-  **WARNING:**
In duplicated PNC configurations, one DS1 converter complex in the fiber-link serves as the active and the second DS1 converter complex serves as the standby. Each DS1 Converter complex consists of two TN574 boards or two TN1654 boards. A TN574 cannot be combined with a TN1654 in the same DS1 converter complex. It is also required that all four DS1 converter boards and interconnecting facilities that serve an PN be of the same type. Note, however, that TN574 and TN1654 boards can coexist within the same system, they just cannot be in the same fiber-link.
-  **WARNING:**
The two DS1 converter boards, TN1654 and TN574, use unique “Y” cables that are incompatible with each other.
-  **WARNING:**
A TN573B (or higher-suffixed) board must be used when connecting a SNI board to a TN1654 DS1 Converter board.

Table 362: Upgrading TN574 DS1 Converter Circuit Packs in a fiber-link to TN1654s — Duplicated PNC 1 of 2

Steps	Comments
Enter <code>status pnc</code> .	Verify that the A-PNC is active. If the B-PNC is active, enter the <code>reset pnc</code> interchange command to cause the A-PNC to go active.
Enter <code>busyout pnc-standby</code> .	Fiber link cannot be removed if PNC duplication is operational. Must busyout the standby PNC first.
Enter <code>change system-parameters duplication</code> . Change the <code>Enable Operation of PNC Duplication</code> field to <code>n</code> .	Disable PNC duplication.
Enter <code>list fiber-link</code> .	Determine the fiber-link number that the four TN574 circuit packs to be upgraded are associated with.
Enter <code>busyout fiber-link fiber#</code> .	<i>fiber#</i> represents the fiber-link number associated with the TN574 DS1 converter complexes that are being upgraded to TN1654 DS1 converter complexes.
Enter <code>remove fiber-link fiber#</code> .	
Remove the four TN574 DS1 converter circuit packs from the system.	
Replace the TN574 Y-cables with TN1654 Y-cables.	
Replace the removed TN574 DS1 converter circuit packs with TN1654 DS1 converter circuit packs. Prior to installing the TN1654 boards, review the prior section, <i>TN1654 Board Configuration Switch Settings</i> .	
If a TN1654 DS1 converter board is connected to an SNI board, upgrade the SNI to a TN573B or greater.	
Wait for the circuit packs to reset.	Red and green LEDs will light and then go out.
Enter <code>change circuit-packs cabinet#</code> . Update the screen to show that TN1654 boards are now being used instead of TN574 boards. Also update the connected SNI, if applicable, to suffix B.	<i>cabinet#</i> represents the cabinet associated with a DS1 converter board. The <i>change circuit-packs</i> screen needs to be updated for all four DS1 converter boards. Also, if needed, re-add translations for connected EI boards.
1 of 2	

Table 362: Upgrading TN574 DS1 Converter Circuit Packs in a fiber-link to TN1654s — Duplicated PNC 2 of 2

Steps	Comments
Enter <code>change system-parameters duplication</code> . Enter <code>y</code> in Enable Operation of PNC Duplication field.	Enable PNC duplication.
Enter <code>add fiber-link fiber#</code> to re-add the fiber-link using TN1654 DS1 converter circuit packs.	<i>fiber#</i> represents the fiber-link number associated with the TN574 DS1 converter complexes that are being upgraded to TN1654 DS1 converter complexes.
Enter <code>test alarms long clear</code> for category <code>exp-intf</code> .	
Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK and DS1C-BD alarms to clear, or enter <code>clear firmware-counters a-pnc b-pnc</code> .	
Enter <code>status pnc</code> .	If either PNC's state of health is not "functional", consult the PNC-DUP section of the Maintenance Manual.
2 of 2	

Converting DS1-CONV Complex to Direct-Connect Fiber (duplicated PNC)

Note:

The following procedure is generic in its scope. Check the customer's switch configuration for EI/SNI structures.

WARNING:

Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:

In duplicated PNC configurations, one DS1-CONV complex in the fiber-link serves as the active and the second DS1-CONV complex serves as the standby. Each DS1 Converter complex consists of two TN574 or TN1654 circuit packs.

Table 363: Convert from DS1-CONV to direct-connect fiber in a duplicated PNC 1 of 2

Step	Command/Step	Description
1.	<code>status pnc</code>	Verify that the A-side is active. <ul style="list-style-type: none"> • If the B-PNC is active, enter <code>reset pnc-interchange</code> and press Enter. • Then verify that the A-side is active (<code>status pnc</code>).
2.	<code>busyout pnc-standby</code>	Busyout the duplicated switch side.
3.	<code>change system-parameters duplication</code>	Disable PNC duplication by changing the Enable Operation of PNC Duplication field to n .
4.	<code>list fiber-link</code>	Lists administered fiber connections by number. Select the link number associated with the DS1-CONV complex that you are removing.
5.	<code>busyout fiber link n</code>	Busyout the fiber link of interest. The fiber link number (step 6) is n for this command.
6.	<code>remove fiber link n</code>	Remove the link administration for this link.
7.	<code>change circuit-pack cabinet</code>	Remove the DS1-CONV administration for the four designated circuit packs (<code>cabinet</code> is the cabinet number where these DS1-CONV complexes reside). Press Enter .
1 of 2		

Table 363: Convert from DS1-CONV to direct-connect fiber in a duplicated PNC 2 of 2

Step	Command/Step	Description
8.	Remove the DS1- CONV hardware.	Remove the 4 TN574 or TN1654 DS1-CONV circuit packs and Y-cables. The TN1654 and TN574 DS1-CONV boards use unique “Y” cables that are incompatible with each other. Reuse these cables only with the proper circuit pack.
9.	Install fiber-optic cable.	Add the lightwave transceivers (multimode 9823A or single-mode 300A) to match the lightguide fiber. Add these to the EIs and SNIs formerly connected to the DS1 converter circuit packs. Connect the lightwave transceivers with lightguide fiber.
10.	Check fiber-optic cable connections.	Ensure that the fiber-optic cables are securely connected to the lightwave transceivers that are attached to the designated circuit packs through the connections on the back of the cabinet.
11.	<code>add fiber-link n</code>	Administer the new EI/SNI fiber connection.
12.	<code>change system-parameters duplication</code>	Enable PNC duplication by changing the Enable Operation of PNC Duplication field to <code>y</code> .
13.	Enter <code>test alarms long clear</code> for category <code>exp-intf</code> .	
14.	Wait 5 minutes.	SNI-BD, SNI-PEER, FIBER-LK and EXP-INTF MOs need time to clear (or enter <code>clear firmware-counters a-pnc</code> or <code>b-pnc</code>)
15.	Enter <code>status pnc</code> .	If either PNC’s state of health is not functional, consult the PNC-DUP MO.
2 of 2		

Removing Fiber Connectivity to an PN

This procedure covers removing the connectivity to an PN or between SNs. Removing an PN and its associated carrier and circuit packs can be handled on a board-type basis.

If this system is duplicated, start with step 1; otherwise, start with step 6.

Note:

The following procedure is generic in its scope. Check the customer's switch configuration for EI/SNI structures.

WARNING:

Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:

In duplicated PNC configurations, one DS1-CONV complex in the fiber-link serves as the active and the second DS1-CONV complex serves as the standby. Each DS1Converter complex consists of two TN574 or TN1654 circuit packs.

Table 364: Removing Fiber Connectivity from a PN 1 of 2

Step	Command/Step	Description
1.	<code>status pnc</code>	Verify that the A-side is active. 1. If the B-PNC is active, enter <code>reset pnc-interchange</code> and press Enter . 2. Verify that the A-side is active (<code>status pnc</code>).
3.	<code>busyout pnc standby</code>	Busyout the duplicated switch side.
4.	<code>change system-parameters duplication</code>	Disable PNC duplication by setting the Enable Operation of PNC Duplication field to n .
5.	<code>list fiber-link</code>	List administered fiber connections by number. Record the endpoints (EIs, SNIs, and DS1Cs), and fiber link numbers that you are removing.
6.	<code>busyout fiber-link n</code>	Busyout the fiber link of interest. The fiber link number (step 4) is n for this command.
7.	<code>remove fiber-link n</code>	Remove the link administration for this link.
1 of 2		

Table 364: Removing Fiber Connectivity from a PN 2 of 2

Step	Command/Step	Description
8.	<code>change system-parameters duplication</code>	Enable PNC duplication by changing the Enable Operation of PNC Duplication field to y .
9.	Physically remove the a-pnc and b-pnc fiber endpoint circuit packs	Physically remove EI, SNI, and DS1C circuit packs associated with the b-pnc.
10.	<code>change circuit-pack</code>	Un-administer the PNC circuit packs.
11.	<code>clear firmware</code>	Clear any alarms or errors against those circuit packs.
12.	<code>status pnc</code>	Use <code>status pnc</code> to ensure that the PNC is in good health.
2 of 2		

Downgrading from Critical to High Reliability

The strategy this downgrade follows is to change from critical to high reliability. High reliability is actually duplication of the media server, control network, and IPSIs without duplicate paths from IPSIs to CSS.

Table 365: Downgrading from Critical to High Reliability 1 of 2

Step #	Command/Step	Description
1.	<code>status pnc</code>	Check to see if A-side is active. If not: 1. Resolve any alarms against a-pnc. 2. <code>reset pnc-interchange</code> to activate a-pnc.
3.	<code>busyout pnc-standby</code>	Busyout the standby PNC.
4.	<code>change system-parameters duplication</code>	Disable PNC duplication by setting the Enable Operation of PNC Duplication field to n .
5.	<code>list fiber-link</code>	Lists administered fiber connections by number.
1 of 2		

Table 365: Downgrading from Critical to High Reliability 2 of 2

Step #	Command/Step	Description
6.	<code>change fiber-link n</code>	<code>Change fiber</code> removes the b-pnc endpoints (EI, DS1Cs, if equipped). <i>n</i> is the number of the fiber from step 4. Repeat this step for every fiber from step 4.
7.	Physically remove the b-pnc endpoint circuit packs	Start with the switch carrier most distant from the media server. Physically remove EI, SNI, and SNC circuit packs associated with the b-pnc. Remove fiber cable not used for b-pnc carriers. See the following CAUTION.
8.	<code>change circuit-packs</code>	Update the translations for the removed circuit packs using <code>change circuit-packs</code> for the: <ul style="list-style-type: none"> ● Cabinet with b-pnc SN carrier <ul style="list-style-type: none"> - SNIs - SNCs - EIs and DS1Cs, if any ● Cabinet with b-pnc SN carrier <ul style="list-style-type: none"> - DS1Cs from port carrier ● Cabinet with b-pnc EIs in every PN (also DS1Cs, if equipped)
9.	<code>change cabinet UU</code>	Remove the b-pnc SN carrier.
10.	Disable duplication.	Obtain a license file to disable PNC duplication.
2 of 2		

**CAUTION:**

The removal of hardware and fiber cable will interrupt service.

Note:

At this point in the downgrade procedure, the system is in unduplicated mode and is operational. The physical removal of the SN carriers may be done at a time that is convenient for the customer. The next step in the downgrade is to follow the normal upgrade procedures from standard to high reliability.

Error Log Entries and Test to Clear Values

Table 366: DS1 Converter Board Error Log Entries 1 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	SAT Test to Clear Value

					2 of 2

Notes:

When problems persist, resetting the DS1 converter circuit pack via **reset board** may temporarily resolve the error condition and restore service until further assistance is provided.

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.
- b. **Error Type 1:** If the alarm is on board, then a major hardware error has occurred in a common part of the circuit pack, not circuit or packet specific. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a major hardware error has occurred in a common part of the circuit pack, or a good clock signal cannot be recovered from the synchronization source. The synchronization source can be the fiber link or any one of the DS1 facilities.

1. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
 2. Enter **display errors** and follow the associated repair procedures for any FIBER-LK and DS1-FAC errors.
 3. If the problem persists, replace the DS1 converter circuit pack.
- c. **Error Type 18:** indicates that the DS1 converter circuit pack has been busied out via **busyout board**. To resolve this error, release the DS1 converter circuit pack via the **release board**.

Communication Manager Maintenance-Object Repair Procedures

- d. **Error Type 25:** The 24/32-channel option switch setting on the TN1654 circuit pack does not match the administered Bit Rate on the fiber-link screen. If the on-board switch setting is wrong, the circuit pack must be physically removed to change the setting of the board option switch. If the administered bit rate is wrong, use **change fiber-link** to correct it.
- e. **Error Type 218:** The DS1 converter board is physically installed in a slot different than its administered slot. Remove the DS1 converter board and install it in its administered slot or execute **remove fiber-link** followed by **add fiber-link** to re-add the fiber-link setting the DS1 converter board's administered location to the physically installed slot.
- f. **Error Type 257:** A minor hardware error has occurred in a common part of the circuit pack, not circuit or packet specific. Replace the DS1 converter circuit pack.
- g. **Error Type 513, Aux Data 1:** A major hardware problem has occurred that affects only circuit data being received from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.
- h. **Error Type 513, Aux Data 2:** A major hardware problem has occurred that affects only circuit data being transmitted from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.
- i. **Error Type 513, Aux Data 3:** A major hardware problem has occurred that affects only packet data being received from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.
- j. **Error Type 513, Aux Data 4:** A major hardware problem has occurred that affects only packet data being transmitted from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.
- k. **Error Type 513, Aux Data 5:** A major lightwave transceiver transmit error occurred that affects data transmitted from the fiber link to the DS1 facility. Replace the DS1 converter circuit pack.
- l. **Error Type 769, Aux Data 1:** This error only applies to TN574 DS1 converter circuit packs.

If the alarm is on board, then a minor hardware problem has occurred that affects only circuit data being received from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a minor hardware problem has occurred that affects only circuit data being received into the DS1 converter circuit pack or a good clock signal cannot be recovered from one of the DS1 facilities.

1. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
2. Enter **display errors** and follow the associated repair procedures for any DS1-FAC errors.
3. If the problem persists, replace the DS1 converter circuit pack.

m. **Error Type 769, Aux Data 2:** This error only applies to TN574 DS1 converter circuit packs.

If the alarm is on board, then a minor hardware problem has occurred that affects only circuit data being transmitted from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a minor hardware problem has occurred that affects only circuit data being transmitted from the DS1 converter circuit pack or a good clock signal cannot be recovered from the fiber channel.

1. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
2. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, SNI-BD, and FIBER-LK errors.
3. If the problem persists, replace the DS1 converter circuit pack.

n. **Error Type 769, Aux Data 3:** *This error only applies to TN574 DS1 converter circuit packs.*

If the alarm is on board, then a minor hardware problem has occurred that affects only packet data being received from the DS1 converter circuit pack. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a minor hardware problem has occurred that affects only packet data being received from the DS1 converter circuit pack or corrupted packets are being received from the packet facility.

1. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, SNI-BD, and DS1-FAC errors.
2. If the problem persists enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
3. If the problem still persists, replace the DS1 converter circuit pack.

o. **Error Type 769, Aux Data 5:** If the alarm is on board, then a minor FOI transmit error occurred that affects data transmitted from the fiber link to the DS1 facility. Replace the DS1 converter circuit pack.

If the alarm is off board, then either a minor FOI transmit error occurred that affects data transmitted from the fiber link to the DS1 facility. or corrupted packets are being received from the packet facility.

1. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, SNI-BD, and DS1-FAC errors.
2. If the problem persists enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
3. If the problem still persists, replace the DS1 converter circuit pack.

p. **Error Type 769, Aux Data 6:** A minor FOI receive error occurred that affects data received from the DS1 facility and transmitted to the fiber link. Replace the DS1 converter circuit pack.

Communication Manager Maintenance-Object Repair Procedures

- q. **Error Type 769, Aux Data 7:** A minor on-board hardware failure exists on the processor/control hardware on the DS1 converter circuit pack. Replace the DS1 converter circuit pack.
- r. **Error Type 1281:** For TN574 DS1 converter boards, this error indicates that the facility masks or the clock reference masks do not match between the two DS1 converter circuit packs in the DS1 converter complex.

For TN1654 DS1 converter boards, this error indicates that the facility masks do not match between the two DS1 converter circuit packs in the DS1 converter complex.

Alarm should clear in 15 minutes.

1. If the problem persists, reset both DS1 converter circuit packs in the DS1 converter complex via **reset board**.
 2. If the problem persists, replace this DS1 converter circuit pack.
 3. If the problem persists, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.
- s. **Error Type 1537:** The two TN574 DS1 converter circuit packs in the DS1 converter complex do not have the same firmware vintage. The TN574 DS1 converter with the older vintage should be replaced. This error does not apply to TN1654 boards.
 - t. **Error Type 1793:** Fiber Loss of Frame Alignment (LFA) alarm occurred at the other end of the DS1 converter complex. The DS1 converter circuit pack at the other end of the DS1 converter complex cannot frame up on the signal coming into the circuit pack from the fiber. (The neighbor DS1 converter circuit pack detected the LFA and relayed this information to this DS1 converter circuit pack via the DS1 control channel.) The amber LED will flicker at a 5-Hz rate (on for 0.1 second, off for 0.1 second).
 1. Execute **list fiber-link** to determine the Fiber Endpoint that is connected to the DS1 converter circuit pack. Enter **display errors** and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints. Enter **display errors** and follow the associated repair procedures for any FIBER-LK errors for this fiber link.
 2. If the problem still persists, check for excessive slips and synchronization problems. Enter **display errors** and follow the associated repair procedures for any SYNC, TDM-CLK, and SNC-BD errors.
 3. If the problem still persists, run the Far-End DS1 converter Circuit Pack Loopback test (#788) on this DS1 converter circuit pack via **test board location long**. This test indicates if the neighbor DS1 converter circuit pack hardware is functioning. If the test fails, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.
 4. If the problem still persists, run the Far-End Fiber Optic Terminator (lightwave transceiver) Loopback test (#789) on this DS1 converter circuit pack via **test board location long**. If this test fails, replace the lightwave transceiver that is connected to the neighbor DS1 converter circuit pack at the other end of the DS1 converter complex. If the neighbor board is connected to the Fiber Endpoint via metallic cable, this test aborts.

5. If the problem still persists, replace connectors and the cable between the neighbor DS1 converter circuit pack and the Fiber Endpoint at the other end of the DS1 converter complex. The cable may be a fiber or a metallic cable.
- u. **Error Type 2049:** Fiber Loss of Signal (LOS) alarm occurred at the other end of the DS1 converter complex. The DS1 converter circuit pack at the other end of the DS1 converter complex does not detect a signal coming into the circuit pack from the fiber. (The neighbor DS1 converter circuit pack detected the LOS and relayed this information to this DS1 converter circuit pack via the DS1 channel.) The amber LED will flicker at a 5-Hz rate (on for 0.1 second, off for 0.1 second).
1. Execute `list fiber-link` to determine the Fiber Endpoints that are connected to both ends of this DS1 converter complex. Enter `display errors` and follow the associated repair procedures for any EXP-INTF, and SNI-BD errors for the Fiber Endpoints that are administered on this fiber link, and Enter `display errors` and follow the associated repair procedures for any FIBER-LK errors for this fiber link.
 2. If the problem still persists, run the Far-End DS1 converter circuit pack loop-back test (#788) on this DS1 converter circuit pack via `test board location long`. This test shows if the neighbor DS1 converter circuit pack hardware is functioning. If this test fails, replace the DS1 converter circuit pack at the other end of the DS1 converter complex.
 3. If the problem still persists, run the Far-End Fiber Optic Terminator (lightwave transceiver) Loopback test (#789) on this DS1 converter circuit pack via `test board location long`. If this test fails, replace the lightwave transceiver that is connected to the neighbor DS1 converter circuit pack. If the neighbor board is connected to the Fiber Endpoint via metallic cable, then this test will abort.
 4. If the problem persists, replace connectors and the cable between the neighbor DS1 converter circuit pack and the Fiber Endpoint at the other end of the DS1 converter complex. The cable may be fiber or metallic.
- v. **Error Type 3329:** This error indicates that excessive slips have occurred on the fiber link between the DS1 converter board and the Fiber Endpoint. See MO SYNC for diagnosing slip problems.

System Technician-Demanded Tests: Descriptions And Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Failure Audit, you may also clear errors generated from other tests in the sequence. Tests 788 and 789 are executed by the TN574 DS1 Converter circuit pack only.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
Failure Audit (#949)	X	X		ND
DS1 Facilities Connectivity test (#790)		X		D
Far-End DS1 converter circuit pack loop back (#788) (Executed by TN574 only)		X		D
Far-End Lightwave Transceiver Loopback test (#789) (Executed by TN574 only)		X		D
Board Options Audit (#795)	X	X		ND
Reset test (#787)			X	D

1. D = Destructive; ND = Nondestructive

Note:

Test #984 is not an actual demand maintenance test. This test number is used to report results of **clear firmware-counters**. Refer to the table for Test #949 to interpret ABORT codes for Test #984.

Reset Test (#787)

This test is **destructive**.

DS1 converter circuit pack is reset via **reset board**. When the circuit pack is reset, firmware executes a series of diagnostic tests on the circuit pack. The results of these tests are queried from the board when the board is inserted after completion of the reset sequence. If any of the diagnostic tests fail, the error log will have an entry of Error Type #1 for this circuit pack's location, and the alarm log will have an entry of ON-BOARD MAJOR alarm.

The reset sequence will take about one minute to complete.

Table 367: Test #787 Reset Board

Error Code	Test Result	Description / Recommendation
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2300	ABRT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals up to 3 times.
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. ● Use add fiber-link to administer the DS1 converter fiber link.
2321	ABRT	DS1 converter circuit pack is not busied out. ● Use busyout board to busyout the DS1 converter circuit pack.
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
	PASS	Reset sequence was executed successfully. (However, this test result does not indicate whether the firmware diagnostic tests passed.) 1. Enter display errors to check the error log for any failed diagnostic firmware tests. (This is indicated by an entry of Error Type #1 for this circuit pack's location.) 2. Enter display alarms to check the alarm log for any ON-BOARD MAJOR alarms.
0	NO BOARD	The system software found no board. 1. Reset the board. 2. Remotely retry the command.

Far-End DS1 Converter Circuit Pack Loopback Test (#788)

This test is **destructive**.

This test is executed by the TN574 DS1 Converter circuit pack only. See Test #790 for testing for the TN1654 DS1 Converter.

This test starts at the DS1 converter circuit pack whose equipment location was entered, and loops all fiber time slots at the far edge Fiber Optic Interface of the DS1 converter circuit pack at the other end of the DS1 converter complex. See [Figure 58: Far-End DS1 Converter Loop-Back Test \(#788\)](#) on page 1078.

This test is executed under firmware control, and the result is sent back to the maintenance software. The test is executed by sending digital data through every administered DS1 facility channel. Two different test patterns are used: hexadecimal values 55 and AA.

For a standard-, duplex-, or high-reliability system (no PNC duplication), this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack, because of its impacts on the system control links. The completion of the test is delayed in this configuration to wait for the recovery of the system control links. For a critical-reliability system (PNC duplication), test can be executed at any DS1 converter circuit pack.

Figure 58: Far-End DS1 Converter Loop-Back Test (#788)

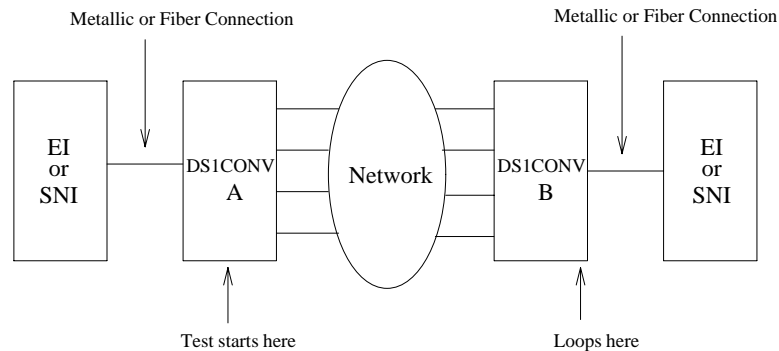

Table 368: Test #788 Far-End DS1 Converter Board Loop-Back Test 1 of 3

Error Code	Test Result	Description / Recommendation
2000	ABRT	Timed out while waiting for a response from the circuit pack. 1. Retry the command at 1-minute intervals up to 3 times.
		1 of 3

Table 368: Test #788 Far-End DS1 Converter Board Loop-Back Test 2 of 3

Error Code	Test Result	Description / Recommendation
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2300	ABRT	The downlink message necessary to run this test could not be sent to the selected DS1C board. 1. Retry the command at 1-minute intervals up to 3 times.
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. Administer the DS1 converter fiber link via add fiber-link .
2321	ABRT	DS1 converter circuit pack is not busied out. 1. Busyout the DS1 converter circuit pack via busyout board .
2332	ABRT	With this system configuration (unduplicated PNC), the test was aborted because it cannot be run at the far end when there is only one DS1-FAC available. (The link would be lost, and no test results would be seen at the media server). Run the test at the other end of the DS1C complex.
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
		2 of 3

Table 368: Test #788 Far-End DS1 Converter Board Loop-Back Test 3 of 3

Error Code	Test Result	Description / Recommendation
	FAIL	<p>Far-end DS1 converter loop back failed. A problem exists between the DS1 converter A and the DS1 converter B (see previous diagram).</p> <ol style="list-style-type: none"> 1. If there are facilities that are not digital-data compatible, busyout the facilities via busyout ds1-facility. 2. If the test is executed as a part of an error analysis, then return back to the related section. 3. Enter display errors and follow the associated repair procedures for any on-board DS1C-BD errors on this DS1 converter circuit pack and the DS1 converter circuit pack at the other end of the DS1 converter complex. Enter display errors and follow the associated repair procedures for any DS1-FAC errors on the DS1 facilities. 4. Check the DS1 Converter Measurements Report to see if there are facilities with excessive errors. Use list measurements ds1-facility summary. If there are facilities with excessive errors, execute the Far-End Internal Loopback test (#797) on those facilities, and follow repair procedures described for the test. 5. If the test still fails, replace the DS1 converter circuit pack at the other end of the DS1 converter complex. 6. If the test still fails, replace this DS1 converter circuit pack.
	PASS	Transmission through the path of the loop back is successful.
0	NO BOARD	<p>The system software found no board.</p> <ol style="list-style-type: none"> 1. Reset the board. 2. Remotely retry the command.
3 of 3		

Far-End Lightwave Transceiver Loopback Test (#789)

This test is **destructive**.

This test is executed by the TN574 DS1 Converter circuit pack only. Test #790 covers this testing for the TN1654 DS1 Converter.

This test starts at the DS1 converter circuit pack whose equipment location was entered and loops at the Fiber Optic Terminator (lightwave transceiver) that is connected to the DS1 converter circuit pack at the other end of the DS1 converter complex. See the following diagram.

Every part of this test is executed under firmware control and the result is sent back to the maintenance software. The test is executed by sending digital data through every DS1 facility channel. Two different test patterns are used, these are hexadecimal values 55 and AA.

For a standard-, duplex-, or high-reliability system (no PNC duplication), this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack because of its impacts on the system control links, also the completion of the test will be delayed in this configuration to wait for the recovery of the system control links. For a critical-reliability system (PNC duplication), the test can be executed at any DS1 converter circuit pack.

Figure 59: Far-End Lightwave Transceiver Loop-Back Test

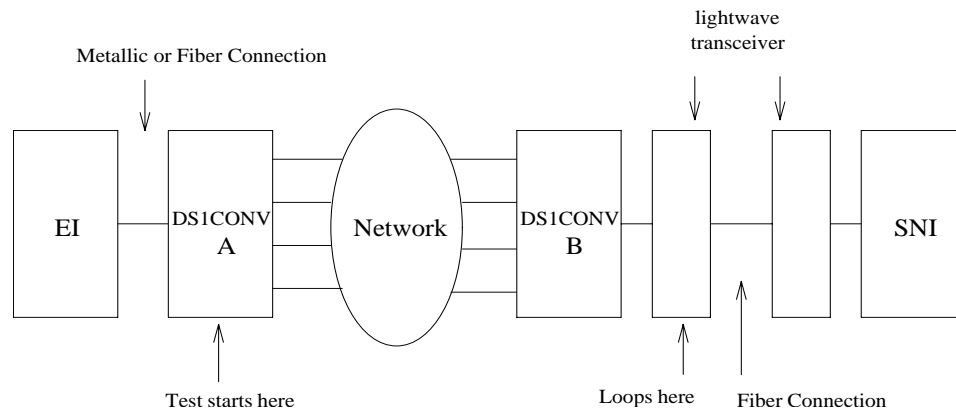

Table 369: Test #789 Far-End FOT (Lightwave Transceiver) Loop-Back Test 1 of 3

Error Code	Test Result	Description / Recommendation
1410	ABRT	The test aborted because no lightwave transceiver is present. The neighbor DS1 converter circuit pack and the fiber endpoint are connected via metallic cable. This abort may be ignored.
2000	ABRT	Timed out while waiting for a response from the circuit pack. 1. Retry the command at 1-minute intervals up to 3 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.

Table 369: Test #789 Far-End FOT (Lightwave Transceiver) Loop-Back Test 2 of 3

Error Code	Test Result	Description / Recommendation
2300	ABRT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals up to 3 times.
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. Administer the DS1 converter fiber link via add fiber-link .
2321	ABRT	DS1 converter circuit pack is not busied out. Busyout the DS1 converter circuit pack via busyout board .
2332	ABRT	With this system configuration (unduplicated PNC), the test was aborted because it cannot be run at the far end when there is only one DS1-FAC available. (The link would be lost, and no test results would be seen at the media server). Run the test at the other end of the DS1C complex.
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
2 of 3		

Table 369: Test #789 Far-End FOT (Lightwave Transceiver) Loop-Back Test 3 of 3

Error Code	Test Result	Description / Recommendation
	FAIL	<p>Far-end lightwave transceiver loop back failed. A problem exists between the DS1 converter A and the lightwave transceiver connected to the DS1 converter B (see previous diagram).</p> <ol style="list-style-type: none"> 1. If there are facilities that are not digital-data compatible, busyout the facilities via busyout ds1-facility. 2. If the test is executed as a part of an error analysis, then return back to the related section. 3. Enter display errors and follow the associated repair procedures for any on-board DS1C-BD errors on this DS1 converter circuit pack and the DS1 converter circuit pack at the other end of the DS1 converter complex. Enter display errors and follow the associated repair procedures for any DS1-FAC errors on the DS1 facilities. 4. Check the DS1 Converter Measurements Report to see if there are facilities with excessive errors. Use list measurements ds1-facility summary. If there are facilities with excessive errors, execute the Far-End Internal Loopback test (#797) on those facilities, and follow repair procedures described for the test. 5. If the test still fails, replace the lightwave transceiver device that is connected to the DS1 converter circuit pack at the other end of the DS1 converter complex. 6. If the test still fails, replace the DS1 converter circuit pack at the other end of the DS1 converter complex. 7. If the test still fails, replace this DS1 converter circuit pack.
	PASS	Transmission through the path of the loop back is successful.
0	NO BOARD	<p>The system software found no board.</p> <ol style="list-style-type: none"> 1. Reset the board. 2. Remotely retry the command.
3 of 3		

DS1 Facilities Connectivity Test (#790)

This test is **destructive**.

The DS1 facilities connectivity test will check the correct connectivity of the DS1 facilities at opposite ends of the DS1 converter complex. Every part of this test is executed under firmware control and the result is sent back to the maintenance software.

For TN574 DS1 Converter circuit packs, this test is executed by sending digital data through each time slot of every DS1 facility channel. Two different test patterns are used, these are hexadecimal values 55 and AA.

For TN1654 DS1 Converter circuit packs, this test has been enhanced to provide error codes that point to the exact fault. Rather than simply reporting a failure of the connectivity test, the TN1654 test specifically identifies the two DS1 facilities that are cross-connected at the near and far ends of the DS1 converter complex. In addition, a fault code will indicate the condition of not being able to loop-up the far end, as required to run the test, due to the packet DS1 facility being down.

The TN1654 connectivity test sends digital data through only one time slot. Instead of looping back the facility to itself, the TN1654 version of the test loops-up the other three facilities. If the test pattern comes back, the firmware fails the test due to an incorrect connection between DS1 facilities. It should be noted that this test will pass and give no indication of problems if the non-packet facilities are down.

For a standard-, duplex-, or high-reliability system (no PNC duplication), this test can only be executed at the endpoint that is closer to the media server relative to the neighbor DS1 converter circuit pack because of its impacts on the system control links. In addition, for TN574 DS1 converter boards, the completion of the test will be delayed in this configuration to wait for the recovery of the system control links. For a critical-reliability system (PNC duplication), test can be executed at any DS1 converter circuit pack.

Table 370: Test #790 DS1 Facilities Connectivity Loop-Back Test 1 of 3

Error Code	Test Result	Description / Recommendation
2000	ABRT	Timed out while waiting for a response from the circuit pack. 1. Retry the command at 1-minute intervals up to 3 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2300	ABRT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals up to 3 times.
		1 of 3

Table 370: Test #790 DS1 Facilities Connectivity Loop-Back Test 2 of 3

Error Code	Test Result	Description / Recommendation
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. Use <code>add fiber-link</code> to administer the DS1 converter fiber link.
2321	ABRT	DS1 converter circuit pack is not busied out. ● Use <code>busyout board</code> to busyout the DS1 converter circuit pack.
2332	ABRT	With this system configuration (unduplicated PNC), the test was aborted because it cannot be run at the far end when there is only one DS1-FAC available. (The link would be lost, and no test results would be seen at the media server.) Run the test at the other end of the DS1C complex.
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
	FAIL	TN574 DS1 facilities connectivity loop-back test failed.
1	FAIL	TN1654 near-end DS1 facility A is connected to far-end DS1 facility B.
2	FAIL	TN1654 near-end DS1 facility A is connected to far-end DS1 facility C.
3	FAIL	TN1654 near-end DS1 facility A is connected to far-end DS1 facility D.
10	FAIL	TN1654 near-end DS1 facility B is connected to far-end DS1 facility A.
12	FAIL	TN1654 near-end DS1 facility B is connected to far-end DS1 facility C.
13	FAIL	TN1654 near-end DS1 facility B is connected to far-end DS1 facility D.
20	FAIL	TN1654 near-end DS1 facility C is connected to far-end DS1 facility A.

23	FAIL	TN1654 near-end DS1 facility C is connected to far-end DS1 facility D.
30	FAIL	TN1654 near-end DS1 facility D is connected to far-end DS1 facility A.
31	FAIL	TN1654 near-end DS1 facility D is connected to far-end DS1 facility B.
32	FAIL	TN1654 near-end DS1 facility D is connected to far-end DS1 facility C.
		2 of 3

Table 370: Test #790 DS1 Facilities Connectivity Loop-Back Test 3 of 3

Error Code	Test Result	Description / Recommendation
55	FAIL	<p>TN1654 DS1 converter packet facility is down and can't send loop-up message to the far end.</p> <ol style="list-style-type: none"> 1. Enter display errors and follow the associated repair procedures for any DS1-FAC errors on the DS1 facilities at both ends of the DS1 converter complex. If an alarm exists on a DS1 facility, then this test will fail. 2. Check the DS1 connections, both circuit packs should have their DS1 facilities connected identically. 3. Check the DS1 Converter Measurements Report to see if there are facilities with excessive errors. Use list measurements ds1-facility summary. If there are facilities with excessive errors, execute the Far-End Internal Loopback test (#797) via test ds1-facility location long on those facilities, and follow repair procedures described for the test. 4. Both circuit packs may not have the same translation information. Run the Board Options Audit test (#795) via test board location short for both circuit packs in the DS1 converter complex to send the options. Check the results of this audit test. This test does not pass until the audit test problems are resolved.
	PASS	DS1 facility connections are correct.
0	NO BOARD	<p>The system software found no board.</p> <ol style="list-style-type: none"> 1. Reset the board. 2. Remotely retry the command.
3 of 3		

Board Options Audit (#795)

This test is nondestructive.

This test sends the administered circuit pack options to the DS1 converter circuit pack. Options are sent to both DS1 converter circuit packs at the same time to prevent any transitional mismatch of options.

The following data is sent to the TN574 DS1 converter circuit pack:

- system-reliability configuration
- master and slave endpoints for framing (determined by the relative position of the circuit pack to the media server)
- facility mask (whether each facility is installed)
- clock reference mask (whether:
 - each facility can be used as a clock-reference source
 - the board is being used as a network-timing source)
- packet compatible mask (whether each facility is packet compatible)
- facility information for line coding, framing mode, and line compensation

The following data is sent to the TN1654 DS1 converter circuit pack:

- system-reliability configuration
- master and slave endpoints for framing (determined by the relative position of the circuit pack to the media server)
- facility mask (whether each facility is installed)
- idle code
- CRC-enabled/-disabled flag (sent in E1 mode only)
- facility information for line coding and line compensation (sent in T1 mode only).

Failure Audit (#949)

This test is nondestructive.

This test queries the DS1 converter circuit pack for any existing circuit pack or facility failures and any unacknowledged cleared failure messages for auditing purposes. Upon receiving the query request, DS1 converter firmware sends failure reports to the maintenance software for every error in its failure database.

Communication Manager Maintenance-Object Repair Procedures

This test operates on both MOs DS1C-BD and DS1-FAC. Error counts of both MOs (DS1C-BD and DS1-FAC) that are displayed in the error log will be incremented when this test is executed. This test is also executed internally by the maintenance software when an alarm is resolved

Table 371: Test #949 Failure Audit

Error Code	Test Result	Description / Recommendation
2000	ABRT	Timed out while waiting for a response from the circuit pack. 1. Retry the command at 1-minute intervals up to 3 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2300	ABRT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals up to 3 times.
2301	ABRT	The timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals up to 3 times.
2316	ABRT	Fiber link is not administered. Administer the DS1 converter fiber link via add fiber-link .
2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 3 times.
	FAIL	The DS1 converter circuit pack reported failures or retransmitted a cleared failure message. 1. Enter display errors and follow the associated repair procedures for any DS1C-BD and DS1-FAC errors.
	PASS	The DS1 converter circuit pack has no failures.
0	NO BOARD	The system software found no board. 1. Reset the board. 2. Remotely retry the command.

DT-LN-BD (Data Line Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DT-LN-BD	MIN	<code>test board location sh</code>	Data Line circuit pack
DT-LN-BD	WRN	<code>test board location sh</code>	Data Line circuit pack

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for circuit pack-level errors. See also [DAT-LINE \(Data Line Port\)](#) on page 845 for related line information.

DTMR-PT (Dual-Tone Multifrequency Receiver Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DTMR-PT	MAJ	<code>test port location sh</code>	Dual-Tone Multifrequency Receiver port (TTR)
DTMR-PT	MIN	<code>test port location sh</code>	Dual-Tone Multifrequency Receiver port (TTR)
DTMR-PT	WRN	<code>release port location</code>	Dual-Tone Multifrequency Receiver port (TTR)

Dual-Tone Multifrequency Receiver ports (DTMR), also known as Touch-Tone Receivers (TTRs), reside on the following circuit packs:

- TN748
- TN420
- TN756
- TN744B and TN744C
- TN2182
- TN2312AP
- TN2312BP

There are four Dual-Tone Multifrequency Receiver (DTMR-PT) ports and two General Purpose Tone Detector (GPTD-PT) ports on the TN748, TN420 and TN756 Tone Detector packs. There are eight GPTD-PT ports on each TN744, TN2182 and TN2312AP circuit packs. The GPTD ports can be used for TTR, call progress tone detection, call prompting, MF signaling, dial tone detection, CO answer detection and OCM call classification. The DTMR port is used to detect touch-tone digits that are placed on the Time Division Multiplex (TDM) bus. Examples of touch-tone digits are digits 0 through 9, digit #, and digit *. The ability of the DTMR port to detect touch-tone digits is essential for maintenance of other circuit packs (for example, IPSI circuit pack) and in placing a station-to-station call. Calls originating from a hybrid station *do not* require a DTMR port.

The DTMR-PT MO implements a set of tests to ensure that detection of touch-tone digits by the DTMR port is functioning properly. For any Tone Detector circuit-level error (DETR-BD), see [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494.

Error Log Entries and Test to Clear Values

Table 372: Dual-Tone Multifrequency Receiver Port (TTR) Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location sh r 1</code>
1 (d)	17664	Tone Detector Audit/ Update test (#43)	MAJ MIN (b)	ON	<code>test port location r 2</code>
18	0	<code>busyout port location</code>	WRN	ON	<code>release port location</code>
130 (e)		None	WRN	ON	<code>test port location sh r 2</code>
257 (c)	17666	Tone Detector Audit/ Update test (#43)	MAJ MIN (b)	ON	<code>test port location r 3</code>
513 (d)	Any	Tone Detection Verification test (#42)	MAJ MIN (b)	ON	<code>test port location r 3</code>

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each test's description, and follow its recommended procedures.
- b. There are two possible alarm levels for this error: Major alarm and Minor alarm. A Major alarm is raised if the total number of DTMR ports currently in service is less than or equal to 1/2 of the administered threshold number. Otherwise, a Minor alarm is raised. In either case, run the short test sequence against the DTMR port and follow the error code procedures for the individual tests.

The threshold number of DTMR ports for service is administered using **change system-parameters maintenance**.
- c. **Error Type 257** The DTMR port lost its translation. Testing the DTMR port is sufficient to reload its translation. If testing the DTMR port does not clear the error, then the IPSI or Tone Detector circuit pack containing the defective DTMR port should be replaced.
- d. **Error Type 513:** This error indicates the DTMR port is having problems detecting touch-tone digits. If this error is being constantly logged, then the IPSI or Tone Detector circuit pack containing the defective DTMR port should be replaced.
- e. **Error Type 130:** This error type indicates that the circuit pack has been removed or has been insane for at least 11 minutes. To clear the error, reinsert or replace the circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Tone Detection Verification test (#42)	X	X	ND
Tone Detector Audit/Update test (#43)	X	X	ND

1. D = Destructive; ND = Nondestructive

Tone Detection Verification Test (#42)

This test checks the touch-tone digits detection capability of the DTMR port.

Table 373: Test #42 Tone Detection Verification Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	The system could not allocate enough resources for this test, or there was an Internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
1	ABRT	The system could not allocate enough resources to test the DTMR port. 1. Retry the command at 1-minute intervals up to 5 times.
1001	ABRT	The system was unable to put the DTMR port in the mode to test it. 1. Retry the command at 1-minute intervals up to 5 times.
1002	ABRT	The system could not allocate time slots for the test connection. This could happen when the system is heavily loaded. If the system is not heavily loaded, then test the TDM Bus via the <code>test tdm [a b]</code> . 1. Retry the command at 1-minute intervals up to 5 times.
1 of 2		

Table 373: Test #42 Tone Detection Verification Test 2 of 2

Error Code	Test Result	Description / Recommendation
1003	ABRT	<p>The system could not allocate a Tone Generator for the test connection. This may be caused by a heavy load on the system or by a faulted Tone-Clock.</p> <ol style="list-style-type: none"> 1. Check to see if there are any alarms against the Tone-Clock in the PN where the test aborted. If so, see the recommended procedures for TONE-BD (Tone-Clock Circuit) on page 2282 or TONE-PT (Tone Generator) on page 2308. 2. If a new Tone-Clock has been inserted, allow about 1 minute for maintenance to run on the newly inserted circuit pack. 3. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	<p>Response to the test was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2006	ABRT	<p>DTMF detection failed. Make sure that the companding mode administered for the system matches that of the Tone Detector: mu-law for TN748, A-law for TN420.</p>
1-3	FAIL	<p>DTMF digits were not correctly detected.</p> <ol style="list-style-type: none"> 1. Run the short test sequence: <code>test port location sh r 1</code>. 2. If the problem persists, the system is still operating properly but system capacity will be reduced. In order to restore the system performance to normal, replace the Tone Detector or IPSI circuit pack containing the defective DTMR port.
	PASS	The DTMR port is able to detect every touch-tone digit.
2 of 2		

Tone Detector Audit/Update Test (#43)

The DTMR port is refreshed with all time-slot information, and sanity audit is performed on the DTMR port.

Table 374: Test #43 Tone Detector Audit/Update Test

Error Code	Test Result	Description / Recommendation
None	ABRT	The system was not able to allocate all the resources needed for this test. 1. Wait 1 minute and try again.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
	FAIL	Hardware audit failed. 1. Run the short test sequence: <code>test port location sh r 1</code> . 2. If the problem persists, the system is still operating properly but system capacity will be reduced. In order to restore the system performance to normal, replace the Tone Detector or IPSI circuit pack containing the defective DTMR port.
	PASS	The DTMR port has been successfully refreshed with its translation.

E-DIG-BD (Multi Application Platform Board)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
DIG800-BD	MIN	<code>test board location sh</code>	MO800DIG-BD
DIG800-BD	WRN	<code>test board location sh</code>	MO800DIG-BD

The maintenance strategy for DIG800-BD is the same as the one described for MO-XXX-BD [[XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494]. Maintenance testing of the common circuit pack is handled by on-board firmware and server-controlled tests. Maintenance software queries the firmware for error and alarm information, status, and test results. The firmware automatically reports error conditions that will result in server-controlled testing.

Board Insertion

The switch makes an additional board query if any of the following circuit packs are inserted:

Circuit Pack	Vintage
TN754	49
TN556	49 80 or greater
TN800	any

For any of the previous initial board up-links, the switch sends queries requesting additional data from the board for administration purposes, while also telling the board the switch software release and the system type.

For the native mode, the response to the board query downlink messages consists of several CCMS uplink messages that identify the true board code, vintage, suffix, emulation type, and the number of reserved slots it needs.

Hyperactivity

The common circuit pack is considered “hyperactive” if the service dispatcher receives 200 up-link messages from the circuit pack in a 10-second period. Since MAPD has 32 ports, the hyperactivity limit is increased to 500 up-link messages per 10 seconds. An alarm is issued, and the board is taken out of service when the limit reaches 400 or when it hits 500 up-link messages in 10 seconds.

LED Use

The LED Control message 038x requests the Angel to drive the red, yellow, and green LEDs on the face plate of typical port board on or off. On the MAPD, only the red LED is controlled by this message. Yellow and green change requests received from the switch by the MAPD drive LCD behavior rather than LED behavior. The switch continues to send the same LED control messages to the MAPD that it currently sends to every other port board. The MAPD handles proper interpretation of these messages. The PC on the MAPD, as well as the switch itself, can control the LEDs and the LCD on the MAPD.

Port Administration

In administration without hardware, the switch allows administration of up to 32 MAPD ports of any port type. If the port type later reported by the board does not match the existing type, the switch assumes the board is a MAPD board with a different configuration and rejects the board. MAPD_DCP_STA and MAPD_ASAT_STA are the only two types of terminals are allowed on a MAPD board. Therefore, while administering ports on MAPD with `add station`, it will allow only the previously mentioned terminals.

Note:

See [XXX-BD \(Common Port Circuit Pack/Media Module\)](#) on page 2494 for circuit pack-level errors. See [DIG-LINE \(Digital Line\)](#) on page 899 for related line information.

E-DIG-RES (TN800 reserve slot)

S8700 | 8710 / S8500

See [ASAI-RES/E-DIG-RES \(TN800 reserve slot\)](#) on page 488.

E-DIG-STA (Emulated Digital Line)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
E-DIG-STA	MIN	<code>test port location 1</code>	Emulated Digital Station
E-DIG-STA	WRN	<code>test port location sh</code>	Emulated Digital Station

There are 4 tests in the Emulated Digital Line station maintenance test sequence and only one test path in the test sequence. Once the test sequence begins, every test in the test sequence is executed.

E-DIG-ST maintenance monitors and tests ports on the TN800 MAPD circuit pack and the hardware connected to those ports for lines administered as a digital station. These include stations with an emulated digital voice terminal and stations with an emulated digital voice terminal and a linked data module. Stand-alone data modules and data adaptors in stand-alone mode are not supported by the TN800 circuit pack. Circuit pack maintenance is covered by E-DIG-BD.

Hardware Error Log Entries and Test to Clear Values

					1 of 2

Table 375: Digital Line Error Log Entries – E-DIG-STA 2 of 2

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
2049 (g)		NPE Crosstalk test (#9)	MIN WRN ¹	ON	test port location 1 r 3
2305 (h)	32770	None			
3840 (i)	40965	None			
3841 (j)	41029	None			
2304 (k)		None			
					2 of 2

1. Major alarms may be downgraded to Warning alarms based on the value used in `set options`.

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 18:** Maintenance personnel have busied out the port in question. Make sure that the port is released from busyout by using `release port location`.
- c. **Error Type 130:** The circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the circuit pack.
- d. **Error Type 257:** Problems transmitting to the voice terminal. This problem can be caused by defective wiring that can cause varying degrees of problems on different types of sets. Sets such as the 7410 appear to be more susceptible to wiring problems than others.
- e. **Error Type 1537:** An in-link maintenance error has generated an off-board warning due to some problem with the link to the voice terminal. This can be ignored if no user complaints are received. Otherwise, make sure the voice terminal is connected, check for defective wiring, check for a defective voice terminal, and move voice terminal to a jack that is closer to the switch (number of feet of wiring between the jack and the switch). If the problem still exists, replace the circuit pack. Once the problem has been resolved, the alarm is retired after a predetermined amount of time.
- f. **Error Type 1793:** The local loop test failed. Each failure increments the counter by 1 when the local loop test fails. The counter is decremented when the loop test passes. When the counter reaches a threshold of 3, an on-board MINOR alarm is raised.
- g. **Error Type 2049:** The NPE Crosstalk test failed. The counter increments by 1 when the NPE Crosstalk test fails. The counter is decremented by 1 when the NPE Crosstalk test passes. When the counter reaches a threshold of 3, an on-board MINOR alarm is raised and the board is taken out of service.

Communication Manager Maintenance-Object Repair Procedures

- h. **Error Type 2305:** The station went off-hook while it was in the ready-for-service state. Use **status station** to determine the state of the station. The off-hook should have moved the station to ready-for-service. No technician action is necessary.
- i. **Error Type 3840:** No terminal is connected to the Digital Line board. No maintenance action is required.
- j. **Error Type 3841:** The circuit pack's message buffer is full. This may be caused by having many display phones with heavy traffic connected to the circuit pack. No action is necessary.
- k. **Error Type 2304:** Internal system error; no action is necessary. The error counters 1, 2, 3, 4, 5, 6, 10, 11, 12, 13, 14, 15, and 16 do not have any significance for this MO.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *Voice and Control Channel Local Loop Around* test (#13), you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Voice and Control Channel Local Loop Around test (#13)		X	D
NPE Crosstalk test (#9)		X	ND
Station Lamp Updates test (#16)		X	ND

1. D = Destructive; ND = Nondestructive

Digital Line NPE Crosstalk Test (#9)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM-bus interface. The NPE controls port connectivity and gain and provides conferencing functions on a per-port basis. The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, 1-way and noisy connections may be observed. This test is part of a port's long test sequence and takes about 20 to 30 seconds to complete. Crosstalk testing occurs on both the primary information channel (voice) and the secondary information channel (data) associated with each digital station port. If this test fails on either channel, the station and the DTDM are taken out of service.

Table 376: Test #9 Digital Line NPE Crosstalk Test 1 of 2

Error Code	Test Result	Description / Recommendation
1	ABRT	<p>During testing of the primary information channel, system resources may not have been available or the port was busy during the test.</p> <ol style="list-style-type: none"> 1. Check the port status. 2. Use <code>display port location</code> to determine the station extension of the port. Use <code>status station</code> to determine the service state of the port. If the port is in use, wait until it is idle before retesting. 3. If the port status is idle, then retry the command at 1-minute intervals up to 5 times.
2	ABRT	<p>During testing of DTDM, system resources may not have been available or he port was busy during the test.</p> <ol style="list-style-type: none"> 1. Check if port is being used. If possible, disconnect by toggling the disconnect button on DTDM. Retry the command after 1 minute. <p> CAUTION: This action drops the call in progress.</p>
1000	ABRT	<p>System resources required to run this test are not available. The port may be busy with a valid call.</p> <ol style="list-style-type: none"> 1. Error code 2 = Crosstalk test failed on the secondary channel.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	<p>The port is correctly using its allocated time slots.</p> <ol style="list-style-type: none"> 1. To ensure that this is not an intermittent problem, repeat this test up to 10 times. 2. If complaints persist, examine the station, connections, and wiring.
2 of 2		

Voice and Control Channel Local Loop Test (#13)

These tests check the information and control channels between the media server and the Digital Line port circuit. The media server sends a message to loop around both the information and control channels for the port. First, the primary information (voice) channel loop-back test sends a digital count from the Tone-Clock circuit pack on the primary information channel time slot and receives the same digital count with a General-Purpose Tone Detector.

While the primary information channel is still looped around, the Control Channel Loop-around test sends four different transparent patterns to the on-board microprocessor, receives them back, and compares them.

The Loop Around test for the secondary information (data) channel is the same as the primary information channel loop around test and is performed only if a DTDM is administered.

A Conference test checks the primary information channel. This is the same test as Conference test (#6).

The four tests generate only one result: Pass, Fail, or Abort. If any test fails or aborts, the test sequence stops.

Table 377: Test #13 Voice and Control Channel Local Loop Test 1 of 3

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use display port location to determine the station extension or attendant number of the port. Use status station or status attendant to determine the service state of the port. If the port is in use, wait until it is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. 2. If the port status is idle, then retry the command at 1-minute intervals up to 5 times.

2 of 3		

Table 377: Test #13 Voice and Control Channel Local Loop Test 3 of 3

Error Code	Test Result	Description / Recommendation
7	FAIL	Conference test failed on primary channel. In some cases, users may not notice disruption in service. In extreme cases, conferencing feature may not work at all.
14	FAIL	The primary voice channel is not transmitting properly. User impact may range from noticing nothing to not being able to use this port.
15	FAIL	The control channel between the Processor and Digital circuit pack is not transmitting properly. User impact may range from noticing nothing to not being able to use the port. This could disrupt other users.
16	FAIL	<p>The secondary voice channel is not transmitting properly. User impact may range from noticing nothing to not being able to use this port.</p> <ol style="list-style-type: none"> 1. Run circuit pack tests to check the Tone Generator circuit pack and the Tone Detector circuit pack using test board location. 2. Resolve any problems that are detected on the Tone Generator circuit pack or Tone Detector circuit pack. 3. If the test still fails, replace the Digital Line circuit pack.
	PASS	<p>The test passed, and every channel is transmitting properly.</p> <ol style="list-style-type: none"> 1. To ensure that this is not an intermittent problem, repeat this test up to 10 times. 2. If noisy connections for voice or corrupted data for data transfer persist, examine the station, connections, and wiring.
3 of 3		

Station Lamp Updates Test (#16)

This test lights every lamp on the terminal as specified. The lamp updates will run only if the station is in service. The status of the station is checked and the lamp updates are blocked from taking place if the station is not in the in-service state. This test does not affect the status of the Message Waiting lamp.

Table 378: Test #16 DIG-LINE Station Lamp Updates Test 1 of 2

Error Code	Test Result	Description / Recommendation
	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
1	ABRT	System technician may have busied out the port. 1. Look for Error Type 18 (port busied out) for this port. If this error type is present, then release the port (release station extension) and run the test again. 2. Make sure that the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times.
3	ABRT	Station may be in ready-for-service or out-of-service state. 1. Use status station to verify state of station. 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals up to 5 times.
1000	ABRT	System resources required to run this test are not available. The port is busy with a valid call. 1. Use display port location to determine the station extension or attendant number of the port. 2. Use status station or status attendant to determine the service state of the port. If the port is in use, wait until it is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out. 3. Retry the command at 1-minute intervals up to 5 times.
1 of 2		

Table 378: Test #16 DIG-LINE Station Lamp Updates Test 2 of 2

Error Code	Test Result	Description / Recommendation
1392	ABRT	<p>This is currently a TTI port, and the test cannot execute on it.</p> <ol style="list-style-type: none"> 1. Verify that the port is a TTI port using either <code>display port</code> (the display shows that the port is a TTI port) or <code>list config</code> (the display shows a <code>t</code> for the port). 2. If either <code>list config</code> or <code>display port</code> indicates that the port is <i>not</i> a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct, and no action is necessary.
	FAIL	<p>Internal system error.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
	PASS	<p>The message to light every station lamp was successfully sent to the port.</p> <ol style="list-style-type: none"> 1. Observe the station lamps being lit when running the test. If every lamps does not light, the other Digital Line test results may indicate related problems that are causing the unlit lamps. 2. Investigate by using other Digital Line port tests and by examining the station, wiring, and connections.
		2 of 2

EMG-XFER (Emergency Transfer)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run ¹	Full Name of MO
EMG-XFER	MAJ	test environment UU	Emergency Transfer
EMG-XFER	WRN	test environment UU	Emergency Transfer

1. UU is the universal cabinet number listed in the PORT field of the Alarm or Error Log.

S8700 | 8710 / S8500

Emergency Transfer (SCC Cabinets)

The system provides the ability to cut designated analog phones through to CO trunks if the switch cannot provide even minimal phone service. This ability is known as Emergency Transfer. The EMG-XFER MO tracks the control of Emergency Transfer. There is one EMG-XFER MO for the port network. Emergency Transfer can be controlled by the system or can be manually controlled via the Emergency Transfer switch located on the Maintenance (TN775) circuit pack. A manual ON position (up) generates a Major alarm. A manual OFF position (down) generates a Warning alarm. Unless a technician is currently working on the system, the switch should be left in the auto position.

Error Log Entries and Test to Clear Values

Table 379: Emergency Transfer Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any	Any	test environment sh r 1
1 (a)	0	Emergency Transfer Query (#124)	MAJ	ON	test environment r 3
257 (b)	0	Emergency Transfer Query (#124)	WRN	ON	test environment r 3

Notes:

- a. **Error Type 1** indicates that the Emergency Transfer switch located on the Processor circuit pack is set to the manual ON position (up). When the Emergency Transfer switch is in this position it generates a Major alarm.
- b. **Error Type 257** indicates that the Emergency Transfer switch located on the Processor circuit pack is set to the manual OFF position (down). When the Emergency Transfer switch is in this position it generates a Warning alarm.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented. By clearing error codes associated with the Cabinet Query Test, you may also clear errors generated from other tests in the testing sequence.

Single Carrier System

Table 380: Emergency Transfer System Technician-Demanded Tests

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Cabinet Query Test (#122) (a)	X	X	ND
Emergency Transfer Query Test (#124)	X	X	ND
External Alarm Lead Query Test (#120) (b)	X	X	ND
Analog Ring Generator Initialization Test (#117) (c)	X	X	ND
Analog Ring Generator Query Test (#118) (c)	X	X	ND

1. D = Destructive; ND = Nondestructive

Notes:

- a. See [CABINET \(Cabinet Sensors\)](#) on page 732 for a description of this test.
- b. See [EXT-DEV ADMIN? Y \(External Device Alarm\)](#) on page 1213 for a description of this test.
- c. See [RING-GEN \(Analog Ring Generator\)](#) on page 1900 for a description of this test.

Emergency Transfer Query Test (#124)

This test queries the hardware for the state of the Emergency Transfer switch and reports the result. If the switch is in a position where the system software can control Emergency Transfer, then the test passes. If the switch is in a position where the system software cannot control Emergency Transfer, then the test fails. The Processor controls Emergency Transfer. The system software does not have control of Emergency Transfer within a cabinet if the switch is in the manual ON or manual OFF state.

Table 381: TEST #124 Emergency Transfer Query Test

Error Code	Test Result	Description/Recommendation
1000	ABRT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to ABRT with error code 2000, check for system powering problems with the A carrier. Resolve all CABINET alarms. Then, repeat the test.
2029	ABRT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
1	FAIL	Emergency Transfer is manually turned OFF via the Emergency Transfer switch. 1. Place the switch in the AUTO position.
2	FAIL	Emergency Transfer is manually turned ON via the Emergency Transfer switch. 1. Place the switch in the AUTO position.
	PASS	The system software has control of Emergency Transfer. If Emergency Transfer is invoked, then there can be a Major alarm in the system that is invoking Emergency Transfer. Table 382: Test #124 Error Log Entries That Cause Emergency Transfer on page 1111 lists the error types and MOs that may cause Emergency Transfer. If any or all of these errors appear in the log, then refer to the appropriate Maintenance documentation and resolve those problems first. If none of these errors appear in the log, then check the Emergency Transfer hardware.

Table 382: Test #124 Error Log Entries That Cause Emergency Transfer

MO Name	Error Type	Aux Data
SW-CTL	1	
SW-CTL	2	
TONE-BD	1	0
TONE-BD	2305	0

S8700 | 8710 / S8500

The Emergency Transfer MO monitors the position of the Emergency Transfer switch(es) on the EPNs' Maintenance circuit packs. It does not monitor whether the system is actually in Emergency Transfer.

Emergency Transfer (ET) provides the ability to connect designated analog phones to CO trunks when the switch cannot provide minimal phone service. Each EPN's cabinet has its own ET capability, and there is one EMG-XFER MO for each cabinet or stack of single-carrier cabinets.

ET is controlled either automatically by the system, or manually, depending on the setting of the ET switches as described in the following section.

Emergency Transfer Status

The `status cabinet uu` command shows the location of the ET switches and the current status of ET in the designated cabinet as follows:

- auto+ ET is invoked and under system control.
- auto- ET is not in effect and is under system control (normal operating state).
- unavailable The switch setting(s) is not available.

Error Log Entries and Test to Clear Values

Table 383: EMG-XFER Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test environment UU
1	0	Emergency Transfer query (#124)	MAJ	ON	test environment UU r 3
257	0	Emergency Transfer query (#124)	WRN	ON	test environment UU r 3

1. Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes (Multicarrier)

Always investigate tests in the order presented in the following table. By clearing error codes associated with one test, you may clear errors generated from other tests in the sequence.

Table 384: System Technician-Demanded Tests: EMG-XFER (Multicarrier Cabinets) 1 of 2

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery & Battery Charger Query test (#5) (a)	X	X	ND
AC Power Query test (#78) (b)	X	X	ND
OLS Query test (Carrier E) (#127) (c)	X	X	ND

OLS Query test (Carrier A) (#127) (c)	X	X	ND
OLS Query test (Carrier B) (#127) (c)	X	X	ND
OLS Query test (Carrier C) (#127) (c)	X	X	ND
Emergency Transfer Query test (#124)	X	X	ND
Cabinet Sensors Query test (#122) (d)	X	X	ND
			1 of 2

Table 384: System Technician-Demanded Tests: EMG-XFER (Multicarrier Cabinets) 2 of 2

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
External Alarm Lead Query test (#120) (e)	X	X	ND
Analog Ring Generator Initialization test			
Analog Ring Generator Initialization test (#117) (f)	X	X	ND
Analog Ring Generator Query test (#118) (f)	X	X	ND
			2 of 2

1. D = Destructive, ND = Nondestructive

Notes:

- a. See [POWER](#) on page 1827 for a description of this test.
- b. See [AC-POWER](#) on page 323 for a description of this test.
- c. See [CARR-POW \(Carrier Power Supply\)](#) on page 744 for a description of this test.
- d. See [CABINET \(Cabinet Sensors\)](#) on page 732 for a description of this test.
- e. See [EXT-DEV ADMIN? Y \(External Device Alarm\)](#) on page 1213 section for a description of this test.
- f. See [RING-GEN \(Analog Ring Generator\)](#) on page 1900 section for a description of this test. These tests show up in the test sequence only if there is a TN768 or TN780 Tone-Clock circuit pack in the EPN being tested.

System Technician-Demanded Tests: Descriptions and Error Codes (Single-Carrier)

Investigate tests in the order presented. By clearing error codes associated with the *Power Query* test (#79), you may also clear errors generated from other tests in the sequence.

Single-Carrier System			
Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Power Query test (#79) (a)	X	X	ND
Emergency Transfer Query test (#124)	X	X	ND
External Alarm Lead Query test (#120) (b)	X	X	ND
Analog Ring Generator Initialization test (#117) (c)	X	X	ND
Analog Ring Generator Query test (#118) (c)	X	X	ND

1. D = Destructive; ND = Nondestructive

Notes:

- a. See [DC-POWER \(Single-Carrier Cabinet Environment\)](#) on page 855 for a description of this test.
- b. See [EXT-DEV ADMIN? Y \(External Device Alarm\)](#) on page 1213 for a description of this test.
- c. See [RING-GEN \(Analog Ring Generator\)](#) on page 1900 for a description of this test.

Note:

These tests only show up in the test sequence if there is a TN768 Tone-Clock Board in the EPN being tested.

Emergency Transfer Query Test (#124)

The Emergency Transfer Query test queries the hardware for the state of the Emergency Transfer switch and reports the result. If the position of the switch in a PN cabinet is such that the system software can control Emergency Transfer (auto), then the test passes. If the position of the switch or switches is such that the system software cannot control Emergency Transfer (manual "on" or manual "off"), then the test fails. Maintenance Tone-Clock controls Emergency Transfer.

Table 385: Test #124 Emergency Transfer Query Test 1 of 2

Error Code	Test Result	Description / Recommendation
1000	ABRT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	Response to the test was not received within the allowable time period. 1. Retry the command at 1-minute intervals up to 5 times. 2. If the test continues to ABORT with Error Code 2000, check for system powering problems with the PN's A carrier. Resolve every AC-POWER and CARR-POW alarm in a multicarrier cabinet system or DC-POWER alarm in a single-carrier cabinet system. Then, repeat the test. 3. If the test continues to ABORT with a 2000 Error Code, resolve every or MAINT (Maintenance circuit pack) error in a PN. Then, repeat the test.
2029 2319 2320 2500	ABRT	Internal system error 1. Retry the command at 1-minute intervals up to 5 times.
17 18 20 33 65 289	FAIL	Emergency Transfer is manually turned OFF (Emergency Transfer switch off). 1. Place the switch in the AUTO position.

Table 385: Test #124 Emergency Transfer Query Test 2 of 2

Error Code	Test Result	Description / Recommendation
34, 290	FAIL	<p>Emergency Transfer is manually turned ON (Emergency Transfer switch on).</p> <ol style="list-style-type: none"> Place the switch in the AUTO position.
	PASS	<p>System software has control of Emergency Transfer within this cabinet. If Emergency Transfer is currently invoked (the emergency transfer LED is on), the cause could be a major alarm.</p> <ol style="list-style-type: none"> The following list shows the error types that can cause Emergency Transfer. If any of these errors appear in the log, then see TONE-BD (Tone-Clock Circuit) on page 2282, and resolve these error types first: <ul style="list-style-type: none"> Error Type 3585, Aux Data 121 Error Type 2305, Aux Data 40800 If none of the previous errors appear in the log, then check the Emergency Transfer hardware. On an EPN, if Emergency Transfer is invoked while call processing is permitted, verify that the current limiter card (982LS) is in the correct slot on the backplane. If the current limiter card is not in the correct slot, move it to the correct location, and rerun Test #124.

EPN-SNTY (PN Sanity Audit)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
EPN-SNTY	None	None	EPN Sanity Audit

The EPN Sanity Audit feature enhances the system's ability to recover from failure conditions that disable an entire PN. In such situations, not only is the affected PN unable to provide service to the system, but the system itself has not detected the condition. The EPN Sanity Audit feature recognizes a PN as unable to provide service when the software cannot receive control messages from PN circuit packs. When such a failure is detected by the EPN Sanity Audit, a sequence of recovery actions is triggered to restore the PN to service.

For a standard-reliability system (unduplicated server), the recovery sequence is:

1. TDM bus switch
2. EPN WARM reset
3. EPN COLD reset

The recovery sequence is:

1. TDM bus switch
2. Tone-Clock switch within the PN
3. PNC interchange
4. PN WARM reset
5. PN COLD reset

The EPN Sanity Audit feature activates only when every existing maintenance operation has failed to detect the PN problem. The EPN Sanity Audit serves as a safety net for the PN.

Note:

It is not clear why certain types of PN problems activate this feature. Thus, error log entries related to these problems do not specify which hardware to replace. The error log entries only indicate that some drastic recovery action occurred due to an unknown problem. However, clues as to the root cause of the PN outage may be present in the Error Logs and the Alarm Logs of the following MOs: [TDM-BUS \(TDM Bus\)](#) on page 2193, [EXP-INTF \(Expansion Interface Circuit Pack\)](#) on page 1143, and [TDM-CLK \(TDM Bus Clock\)](#) on page 2208, [EXP-PN \(Expansion Port Network\)](#) on page 1202, and [PNC-DUP \(PNC Duplication\)](#) on page 1809. You should refer to these maintenance sections during troubleshooting operations.

Error Log Entries and Test to Clear Values

Table 386: EPN-SNTY Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any			None
8801 (b)	Any	None			
8803 (c)	Any	None			
9901 (d)	Any	None			
9902 (e)	Any	None			
9903 (f)	Any	None			
9904 (g)	Any	None			
9905 (h)	Any	None			

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error 8801:** the PN is unable to send up-link control messages, and the control channel of the PN's TDM bus is swapped as part of the recovery procedure.
- c. **Error 8803:** the PN is unable to send up-link control messages and the PN's Tone-Clock is swapped as part of the recovery procedure.
- d. **Error 9901:** the PN is unable to send up-link control messages, but recovers after the control channels of the PN's TDM bus are swapped.
- e. **Error 9902:** the PN is unable to send up-link control messages, but recovers after the PN's active Tone-Clock is swapped.
- f. **Error 9903:** the PN is unable to send up-link control messages, but recovers after a PNC interchange has taken place.
- g. **Error 9904:** the PN is unable to send up-link control messages, but recovers after a PN WARM reset.
- h. **Error 9905:** the PN is unable to send up-link control messages, but recovers after a PN COLD reset.

ERR-LOG (Error Log)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial Command to Run	Full Name of MO
ERR-LOG	none	none	Error Log

The ERR-LOG MO is responsible for the sanity of the Alarm Log, the Hardware Error Log, and the Software Error Log. If an inconsistency is detected in any one of these logs, every log will be re-initialized and a hardware error will be logged against ERR-LOG indicating the time of inconsistency. There are no tests and no alarms for the Error Log MO. This MO exists solely for the purpose of allowing errors to be logged against it.

Hardware Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
510 (a)	See Note	none	none	none	none

Notes:

- a. **Error Type 510:** An inconsistency was detected in either the Alarm Log, the Hardware Error Log, or the Software Error Log. The system attempts to recover the logs but, depending on the extent of the corruption, some or all entries in the logs may be lost. Any alarms that were active at the time of this error have been cleared. There is no associated test for this error.

The Aux Data value indicates when the inconsistency was found:

0	During a periodic audit of the Error Log
1	After an extended reboot
2	After a reboot
3	After a Reset System 3 (Cold_1)
4	After a Level-3 System Reset (Cold_1)

ETH-PT (Control LAN Ethernet)

S8700 | 8710 / S8500 / S8300

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
ETH-PT	MAJ	<code>test port location long</code>	MO_ETH_PT
ETH-PT	MIN	<code>test port location long</code>	MO_ETH_PT
ETH-PT	WRN	<code>test port location short</code>	MO_ETH_PT

The TN799DP Control LAN (C-LAN) packet port circuit pack provides TCP/IP connection to adjuncts applications such as CMS, INTUITY, and DCS Networking. The C-LAN circuit pack has one 10baseT Ethernet connection and up to 16 DS0 physical interfaces for PPP connections. Multiple C-LAN circuit packs in a system provide additional TCP/IP capacity.

Note:

S8300 / G700: Although the ETH-PT MO is provided for a G700 media gateway, this MO only partially supports the G700's MG-ANN virtual media module.

An RSCL (remote socket control link) links the C-LAN and the media server to pass call-control and other management information. Since one link serves every port on the circuit pack, maintenance of the RSCL is part of the C-LAN circuit pack's maintenance.

Note:

The TN799DP C-LAN circuit pack replaces the PGATE and PI circuit packs in the G3r and G3si/G3vs systems, respectively. The PGATE or PI can be used with the C-LAN to create an X.25-to-TCP/IP bridge for adjunct and DCS connections.

Control LAN Congestion Controls

The switch activates congestion controls on C-LAN when it detects buffers exceeding the threshold. The switch releases the congestion controls when the C-LAN reports that its buffers have returned to normal levels.

If congestion:	Then the switch:
Persists for a 14-minute interval	Raises a MINOR alarm.
Exhausts buffers	Raises a MINOR alarm.
Ceases for 12 minutes	Retires a MINOR alarm.

Error Log Entries and Test to Clear Value

Table 387: ETH-PT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)	0	Any	Any	Any	<code>test port location s</code>
1 (b)	0	Ethernet Local Looparound test (#1278)	MIN	ON	<code>test port location l r 3</code>
513 (c)	0	Link Integrity Inquiry (#1282)	MIN	OFF	<code>test port location r 2</code>
769 (d)	0		WRN	OFF	
1281 (e)	0				
1537, 1538 (f)		Session Status test (#1286)	MIN	OFF	
1793–1920 (g)					
2305–2560 (h)					
2561–2816 (h)					
3329 (i)		TCP/IP Ping test (#1281)	WRN	OFF	

Notes:

- a. **Error Type 0:** Run the short test sequence first. If every test passes, run the long test sequence. Refer to each appropriate test's description, and follow its recommended procedures.
- b. **Error Type 1:** Ethernet Local Looparound test (#1278) failed.
 1. Test the port (`test port location long`).
 2. Refer to repair procedures for Test #1278.
- c. **Error Type 513:** Link Integrity Inquiry test (#1282) failed, or C-LAN port detected loss of Ethernet link integrity.

Possible causes:

 - Cables
 - Ethernet transceiver
 1. Test the port (`test port location long`).
 2. If the Link Integrity Inquiry test (#1282) fails, refer to its repair procedure.

Communication Manager Maintenance-Object Repair Procedures

d. **Error Type 769:** Port received invalid frame.

Invalid Ethernet frame errors occur when the frame:

- Contains a bad cyclic redundancy check (CRC)
- Is misaligned

1. Isolate the problem with the Ethernet Local Looparound test (#1278).
2. Test the port (`test port location long`).
3. Verify the repair with the Ethernet Local Looparound test (#1278).
4. Clear the alarm (`test port location long clear`).

e. **Error Type 1281:** System software received an indication that the far end has requested a disconnect of a session on this link. This is a log-only error.

f. **Error Type 1537–1538:** Some or all sessions on a port are down

If:	Then the switch raises:
Some sessions are down	WARNING alarm on circuit pack
Every session is down	MINOR alarm on circuit pack

1. Test the port (`test port location short`).
2. Refer to Session Status test (#1286) repair procedure to verify repair.

g. **Error Type 1793–1920:** System software received an indication that a socket was closed due to an error.

The error type indicates the application associated with this socket. (Whereas, the Aux Data indicates the internal application number.)

Error Type	Application
1793	Unused
1794	DCS
1795	AUDIX
1796	CMS
1797	ISDN Gateway
1798–1920	Reserved for future

- h. **Error Type 2305–2816:** System software detected a session is down. Aux Data indicates the session number. These are log-only errors. Error types 2305–2560 are for session numbers 1–256. Error types 2561–2816 are for session numbers 257–512.
- i. **Error Type 3329:** TCP/IP Ping test failed.
1. Test port (`test port location short`).
 2. Refer to TCP/IP Ping test (#1281) repair procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors in the order they appear in the following table.

Table 388: System Technician-Demanded Tests: ETH-PT

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Ethernet Local Loop-Around test (#1278)		X	D
TCP/IP Ping test (#1281)	X	X	ND
Session Status test (#1286)	X	X	ND
Link Integrity Inquiry test (#1282)	X	X	ND
Verify NIC options (#1511)	X	X	ND

1. D = Destructive, ND = Nondestructive

Ethernet Local Loop-around Test (#1278)

This test is destructive.

Use this test to check circuitry in the data path for an Ethernet call (from the on-board processor to the Ethernet Transceiver). This test fails if the data it receives does not match the data it transmits.

Table 389: Test #1278 Ethernet Local Loop-Around Test

Error Code	Test Result	Description / Recommendation
1000	ABRT	<p>The port is in use.</p> <ol style="list-style-type: none"> 1. Determine status of port (<code>status clan-port location</code>). 2. Retry the command when the port is idle. You can force the port to the idle state by executing <code>busyout port location</code>. <p> CAUTION: The <code>busyout port</code> command is destructive, causing every call and link associated with the port to be torn down.</p>
2000	ABRT	<p>Did not receive circuit pack test response within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the problem persists, reset the circuit pack (<code>busyout board location, reset board location, and release board location</code>). 2. If the problem persists, replace the circuit pack.
2012	ABRT	<p>Internal system error.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 3 times. 2. If the problem persists, escalate the problem.
2100	ABRT	<p>Could not allocate the necessary resources to run test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 5 times. 2. If the problem persists, escalate the problem.
1	FAIL	<p>Circuit pack detected failure in the Ethernet Local Looparound test (#1278).</p> <ol style="list-style-type: none"> 1. If the problem persists, reset the circuit pack (<code>busyout board location, reset board location, and release board location</code>). 2. If the problem persists, replace the circuit pack.
	PASS	<p>The circuitry tests properly.</p>

TCP/IP Ping Test (#1281)

This nondestructive test fails if every endpoint fails to respond. Use this test to check the circuitry in the data path for a peer-to-peer IP layer connection.

Table 390: Test #1281 TCP/IP Ping Test 1 of 3

Error Code	Test Result	Description / Recommendation
1 2 11	ABRT	Internal error <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 3 times. 2. If the problem persists, escalate the problem.
7	ABRT	Destination unreachable. <ol style="list-style-type: none"> 1. Verify that there is a destination to ping in the routing table (list ip-route and look for destinations reachable through this Ethernet port). 2. If there are no reachable destinations from this port (i.e., no routes administered on Ethernet), administer a route and retry. 3. Escalate if the problem persists.
1005	ABRT	Incorrect test configuration. <ol style="list-style-type: none"> 1. Verify Ethernet link is in service (<code>status port location</code> or <code>status link n</code>). 2. Verify that Ethernet link is enabled (<code>status port location</code>, <code>status link n</code>, or <code>display data-module</code>). 3. Verify routing table has reachable destinations. 4. Repeat the test. 5. If problem persists while the Ethernet link is in service and enabled, escalate the problem.
1124	ABRT	Ethernet link is not enabled. <ol style="list-style-type: none"> 1. Verify that the Ethernet link is enabled (<code>status port location</code>, <code>status link n</code>, or <code>display data-module</code>). 2. If the link is not enabled, enable the link (<code>change data-module</code>). 3. Repeat the test. 4. Escalate if the problem persists.
1 of 3		

Table 390: Test #1281 TCP/IP Ping Test 2 of 3

Error Code	Test Result	Description / Recommendation
1125	ABRT	<p>Ethernet link not in service.</p> <ol style="list-style-type: none"> 1. Verify Ethernet link is in service (status port location or status link n). 2. If the link is not in service, release the link using (release link n or release port location). 3. Repeat the test. 4. Escalate if the problem persists.
2000	ABRT	<p>Did not receive circuit pack test response within the allowable time period.</p> <ol style="list-style-type: none"> 1. Reset the circuit pack (busyout board location, reset board location, and release board location). 2. If the test fails again, replace the circuit pack.
2012	ABRT	<p>Internal system error.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 3 times. 2. Escalate if the problem persists.
2100	ABRT	<p>Could not locate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 5 times. 2. Escalate if the problem persists.
2500	ABRT	<p>Internal system error.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 3 times. 2. Escalate if the problem persists.
1003	FAIL	<p>Ping to the destination failed due to on-board problem.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 3 times. 2. If the problem persists, reset the circuit pack (busyout board location, reset board location, and release board location). 3. If the problem persists, re-administer the Ethernet connection through a different Ethernet port, if available. 4. If the problem still persists, or if there are no other available Ethernet ports, replace the circuit pack.
		2 of 3

Table 390: Test #1281 TCP/IP Ping Test 3 of 3

Error Code	Test Result	Description / Recommendation
1007	FAIL	<p>Ping to the destination failed due to the destination down.</p> <ol style="list-style-type: none"> 1. Verify that at least one destination reachable through this port is up. Ping this destination (<code>ping ip-address xxx.xxx.xxx.xxx</code>). 2. If the ping to any destination is successful through this port, the link is up, although some destinations are unreachable. Ignore the failure. 3. If ping to every destination fails, test this port (<code>test port location short</code>), and follow the repair procedures for Session Status test (#1286) failures.
	PASS	TCP/IP Ping test (#1281) is successful.
3 of 3		

Link Integrity Inquiry Test (#1282)

This nondestructive test queries the C-LAN Ethernet port's physical connections.

If . . .	Then the test . . .
C-LAN connection is present	Passes
C-LAN connection is absent	Fails
There is no response	Aborts

Table 391: Test #1282 Link Integrity Inquiry Test 1 of 2

Error Code	Test Result	Description / Recommendation
1124	ABRT	<p>Ethernet link is not enabled.</p> <ol style="list-style-type: none"> 1. Verify that the Ethernet link is enabled (<code>status port location, status link n, or display data-module</code>). 2. If the link is not enabled, enable the link (<code>change data-module</code>). 3. Repeat the test. 4. Escalate if the problem persists.
1 of 2		

Table 391: Test #1282 Link Integrity Inquiry Test 2 of 2

Error Code	Test Result	Description / Recommendation
1125	ABRT	Ethernet link not in service. 1. Verify whether Ethernet link is in service (status port location or status link n). 2. If the Ethernet link is not in service, release the link (release link n or release port location). 3. Repeat the test. 4. Escalate if the problem persists.
1959	ABRT	Downlink message error. 1. Retry the command at 1-minute intervals, up to 3 times. 2. Escalate if the problem persists.
2012	ABRT	Internal system error. 1. Retry the command at 1-minute intervals, up to 3 times. 2. Escalate if the problem persists.
2100	ABRT	Could not locate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals, up to 5 times. 2. Escalate if the problem persists.
2500	ABRT	Internal system error. 1. Retry the command at 1-minute intervals, up to 3 times. 2. Escalate if the problem persists.
	FAIL	Link integrity lost due to problem with attachment of Ethernet cable to the port. 1. Repeat the test. 2. If the test fails, verify that the cable properly is secured to Ethernet port and to the bus. 3. Verify the C-LAN circuit pack's link integrity LED is glowing. 4. Retry the test. 5. If problem persists, see Ethernet Local Loop-around test (#1278) repair procedures.
	PASS	The Ethernet Link Integrity test (#1282) detects good connections.
2 of 2		

Session Status Test (#1286)

This nondestructive test determines the status of every Ethernet port session. This test queries the system software on port session status.

If the system software indicates that. . .	Then the switch . . .
Every port session is up (ALL UP)	Raises no alarm, or retires alarm
Some port sessions are up (SOME UP)	Raises WARNING alarm
Every port session is down (ALL DOWN)	Raises MINOR alarm

Table 392: Test #1286 Session Status Test 1 of 2

Error Code	Test Result	Description / Recommendation
1124	ABRT	<p>Ethernet link is not enabled.</p> <ol style="list-style-type: none"> 1. Verify that the Ethernet link is enabled (<code>status port location</code>, <code>status link n</code>, or <code>display data-module</code>). 2. If the link is not enabled, enable the link (<code>change data-module</code>). 3. Repeat the test. 4. Escalate if the problem persists.
1125	ABRT	<p>Ethernet link not in service.</p> <ol style="list-style-type: none"> 1. Verify whether Ethernet link is in service (<code>status port location</code> or <code>status link n</code>). 2. If the Ethernet link is not in service, release the link (<code>release link n</code> or <code>release port location</code>). 3. Repeat the test. 4. Escalate if the problem persists.
2000	ABRT	<p>Did not receive circuit pack test response within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the problem persists, reset the circuit pack (<code>busyout board location</code>, <code>reset board location</code>, and <code>release board location</code>). 2. If the problem persists, replace the circuit pack.
		1 of 2

Table 392: Test #1286 Session Status Test 2 of 2

Error Code	Test Result	Description / Recommendation
2100	ABRT	Could not locate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 5 times. 2. Escalate if the problem persists.
2500	ABRT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 3 times. 2. Escalate if the problem persists.
1	FAIL	System software indicates at least one Ethernet link session is down (SOME UP). <ol style="list-style-type: none"> 1. Isolate downed sessions (status port location or status link n). 2. Follow actions based on session information.
2	FAIL	System software indicates every Ethernet session is down (ALL DOWN). <ol style="list-style-type: none"> 1. Test the port (test port location) to verify the Ethernet Local Looparound test (#1278) result. 2. If test passes, wait for system software to indicate ALL UP. If not, check the destination and other components in the path. 3. If the destination and other components in the path are in service, take action based on session information.
	PASS	Every session is up.
2 of 2		

Verify NIC Options Test (#1511)

This test is **non-destructive**.

This test verifies if the NIC interface parameters, speed, and duplex (full/half) match with administration.

The test passes if the NIC parameters match administration. The test fails if the NIC parameters do not match administration.

Table 393: Verify NIC Options Test (#1511) 1 of 3

Error Code	Test Result	Description / Recommendation
1014	ABRT	Board is not inserted. Insert and administer a TN2302 board.
1022	ABRT	Invalid board. The board is not capable of changing its ethernet options. The board suffix must be D or greater.
1115	ABRT	Unable to allocate system resources (in-use) to run this test. 1. Retry the test at one minute intervals a maximum of 3 times.
2000	ABRT	Response to the test was not received within the allowable time. Retry the command at 1 minute intervals a maximum of 3 times. 1. If this result occurs repeatedly, attempt to reset the circuit pack with busyout board location and reset board location . 2. If this result occurs again, after resetting the board, replace the circuit pack.
2012	ABRT	Internal system error. 1. Retry the command at 1-minute intervals up to 3 times.
2100	ABRT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals up to 5 times.
2801	ABRT	Could not find the IP address for this board. Use the change ip-interfaces location to administer an IP address for this board. Retest.
2807	ABRT	The board is administered but not enabled on the ip-interfaces form. Use the change ip-interfaces location to enable the board. Retest.
1 of 3		

Table 393: Verify NIC Options Test (#1511) 2 of 3

Error Code	Test Result	Description / Recommendation
3585	FAIL	<p>Aux Data = 1. The board is reporting that it is running half duplex with auto-negotiate (y). Communication Manager is trying to negotiate the settings on the circuit pack to match the administered settings and, under the above condition, it is logging a fault. It could be argued that this is a false alarm, especially if the link is operating correctly with no observable degradation of service. This capability (Test 1511) started with release R011i.03 1.531.0.</p> <p>Note:</p> <p>Do not immediately replace the board for this fault. There is a mismatch between what is programmed in the board and administration on Communication Manager. CAT-3 wiring does not support 100Mbps data rates. Wiring between the backplane and router must be CAT-5</p> <p>Follow these steps to attempt to resolve the problem.</p> <ol style="list-style-type: none"> 1. Change the ethernet options. Set the speed to 100Mbps with full duplex. Set Auto (negotiate) to n. This should match the settings of the connected router. If the router does not have the same capabilities, you may have to adjust accordingly. The important thing is to make the media processor (TN2302) and the connected router match. <p>Command steps to accomplish changes to Communication Manager administration.</p> <ol style="list-style-type: none"> a) Enter <code>get ethernet-options location</code> to determine current settings, both administered and actual. b) Enter <code>change ip-interface location (Enable Ethernet Port field to n)</code> to turn off the interface. Submit the command to disable the interface. c) Enter <code>change ip-interface location</code> change the Ethernet Options fields as required. Submit the form. d) Enter <code>change ip-interface location (Enable Ethernet Port field to y)</code> to turn on the interface. Submit the command. to enable the interface. e) Enter <code>get ethernet-options location</code> to verify that Ethernet options are the same in administration and on the board. 2. If service is normal and the alarm is causing concern, disable the test and escalate the problem.
		2 of 3

Table 393: Verify NIC Options Test (#1511) 3 of 3

Error Code	Test Result	Description / Recommendation
3585	FAIL	<p>Aux Data = 2. The board is reporting different options than what is administered. Software tried to correct the options but the board did not take the option update. It could be argued that this is a false alarm, especially if the link is operating correctly with no observable degradation of service. This capability (Test 1511) started with release R011i.03 1.531.0.</p> <p>Note:</p> <p>Do not immediately replace the board for this fault. There is a mismatch between what is programmed in the board and administration on Communication Manager.</p> <p>Follow these steps to attempt to resolve the problem.</p> <ol style="list-style-type: none"> 1. Use the command steps listed below to administer the ethernet options to their desired values. <ol style="list-style-type: none"> a) Enter <code>get ethernet-options location</code> to determine current settings, both administered and actual. b) Enter <code>change ip-interface location (Enable Ethernet Port field to n)</code> to turn off the interface. Submit the command to disable the interface. c) Enter <code>change ip-interface location</code> change the Ethernet Options fields as required. Submit the form. d) Enter <code>change ip-interface location (Enable Ethernet Port field to y)</code> to turn on the interface. Submit the command. to enable the interface. e) Enter <code>get ethernet-options location</code> to verify that Ethernet options are the same in administration and on the board. 2. If the board values and administration values still do not match repeat the actions from step 1 above one time. 3. Set the administration values to the actual values that the board is reporting. Test the board using the <code>test board location</code> command. If the test still fails replace the board. 4. If service is normal and the alarm is causing concern, disable the test and escalate the problem.
		3 of 3

ETR-PT (Enhanced Tone Receiver Port)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
ETR-PT	MAJ	<code>test port location sh</code>	Enhanced Tone Receiver Port
ETR-PT	MIN	<code>test port location sh</code>	Enhanced Tone Receiver Port
ETR-PT	WRN	<code>test port location sh</code>	Enhanced Tone Receiver Port

Note:

Replacing the Tone-Clock circuit pack requires a special procedure which is described in [TONE-BD \(Tone-Clock Circuit\)](#) on page 2282. That section also describes the LED display for this board.

The ETR-PT MO is supported by TN2182, TN2312AP and TN2312BP circuit packs.

TN2312AP IPSI Circuit Pack's Tone-Clock

For a PN with a TN2312 IPSI, the TONE-BD MO is a module located on the IPSI circuit pack. It provides tone generation, tone detection, call classification, and clock generation and synchronization. The TN2312 replaces the TN2182B Tone-Clock board and is inserted into each PN's Tone-Clock slot. For a non-IPSI PN, the TN2182B Tone-Clock circuit packs provide the previous functions.

The TN2312 IPSI circuit pack (for PNs equipped with IPSIs) or the Tone-Clock circuit packs (for non IPSI PNs) both house two independent components:

- Tone Generator that provides every tone needed by the system
- Clock that generates clocks for both the system's Time Division Multiplex (TDM) bus and the LAN bus. It also aids in monitoring and selecting internal synchronization references.

When resolving errors/alarms on an IPSI or Tone-Clock circuit pack, the following sections should also be consulted:

- For a non-IPSI PN, use `set tone-clock uc` to establish the tone and synchronization resources for the system.
- For an IPSI PN, use `set ipserver-interface uc` to establish the tone and synchronization resources for the system.
- TONE-PT (Tone Generator)
- TDM-CLK (TDM Bus Clock)
- SYNC (Synchronization)
- TONE-BD
- PKT-INT (IPSI only)

TN2182 Tone-Clock Circuit Pack (for Non-IPSI Connected PNs)

A TN2182 is a combined Tone Generator/Tone Detector board. It provides eight Enhanced Tone receiver (ETR) ports. Each of these ports provides the functions previously found individually on DTMR-PTs, GPTD-PTs and CLAS-PTs ports. Each port on the TN2182 may be used for any tone-detection function that was previously done by TN748, TN420, or TN744 Tone Detection boards.

The TN2182 provides Mu-law or A-law tone-detection capability.

Since the TN2182 also provides Tone-Clock function, only one TN2182 circuit pack may reside in a PN (or two if your system is duplicated). If more tone-detection resources are needed, the additional resources must be provided by TN748, TN420, or TN744 circuit packs.

Error Log Entries and Test to Clear Values

Table 394: ETR-PT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	any	Test #43 Tone Detector Audit/Update Test	MAJ MIN	ON	test port location r 2
18		busyout port	WRN	OFF	release port location
257 (a) (b)	17666	Test #43 Tone Detector Audit/Update Test	MAJ MIN	ON	test port location r 3
513 (a) (c)	any	Test #43 Tone Detector Audit/Update Test	MAJ MIN	ON	test port location r 3

Notes:

- a. **Error Type 1, 257, 513:** There are two possible alarm levels for this error type: major alarm and minor alarm. These alarm levels are dependent on the administered thresholds for TTR, CPTR, and CCTR. Each ETR port is capable of operating an any of these.

A major alarm is raised if the total number of ports capable of TTR, CPTR or CCTR detection currently in service is less than or equal to one-half of the administered TTR, CPTR, or CCTR threshold number. Otherwise, a minor alarm is raised. In either case, run the short test sequence against the port (ETR-PT) and follow the error code procedures for the individual tests.

The threshold number of ports for service is administered using **change system-parameters maintenance**.

If a major or minor alarm occurs, follow this repair procedure.

Communication Manager Maintenance-Object Repair Procedures

1. Use `list configuration carrier` to get the board type and location. If the board is TN744, then do steps 2–4; if it is TN2182 or TN2312, do steps 5–12.
 2. Execute three commands: `busyout board location`, `reset board location`, and `release board location`. Reset is required to reload RAM associated with the TN744's DSPs. This will take all eight tone detector ports out of service for a few seconds. Only four of the eight would be out of service due to the alarm. (There are four tone detectors on each of the two DSPs.) Other than the unlikely potential of running out of tone detector resources in the switch, there is no other effect when the board is reset.
 3. Test the board (`test board location long`).
 4. If the test passes, terminate the repair process. If the test fails, replace the board.
 5. Check to see if the board is duplicated (`list cabinet` and `status port-network` on the affected PN).
 6. If the board is not duplicated, use `test tone location long` to resolve the error. The long test resets the board and is required to reload on-board RAM associated with the DSPs. The effect is that tone detectors are taken out of service momentarily and tones are removed from the TDM bus for about 10 seconds. This means no dial pulses or touch tones during this interval, which probably will not affect calls in progress but could cause a call origination to abort or cause a user to not get dial tone when going off hook.
 7. If every test passes and the alarm does not resolve, retest (`test tone location long clear`).
 8. If the test passes, terminate the repair process. If it fails, replace the circuit pack at the customer's convenience.
 9. If the board is duplicated, switch to the standby side (`set tone/set ipserver-interface`).
 10. Test the alarmed board (`test tone location long`). This resets the board and is required to reload on-board RAM associated with the circuit pack's DSPs.
 11. If every test passes and the alarm does not resolve, retest with `test tone location long clear`.
 12. If the test passes, terminate the repair process. If it fails, replace the board.
- b. **Error Type 257:** The ETR-PT lost its translation. Testing the ETR-PT is sufficient to reload its translation. If testing the ETR port does not clear the error, then the circuit pack containing the defective ETR port should be replaced at a time when it is convenient to remove a clock board from the system. Follow the procedures described in [TONE-BD \(Tone-Clock Circuit\)](#) on page 2282 for replacing a Tone-Clock circuit pack.
- c. **Error Type 513:** This error indicates the (ETR-PT) Enhanced Tone Receiver is having problems detecting touch tones, call-progress tones, or MFC tones. If this error type is persistently logged, then the circuit pack containing the defective ETR-PT should be replaced at a time it is convenient to remove a clock board from the board from the system. Follow the procedures described in the [TONE-BD \(Tone-Clock Circuit\)](#) on page 2282 section for replacing a Tone-Clock circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order presented.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Tone Detection Verification test (#42)	X	X	ND
Tone Detection Audit/Update test (#43)	X	X	ND

1. D = Destructive; ND = Nondestructive

Tone Detection Verification Test (#42)

This test checks out a single ETR port's touch-tone receiver mode, MFC tone-detection/generation mode, and general-purpose tone-detection mode. During the test sequence, these modes are tested in the following order:

1. Touch-tone receivers
2. General-purpose, call-progress, and maintenance tones
3. MFC tones

Table 395: Test #42 Tone Detection Verification Test 1 of 3

Error Code	Test Result	Description / Recommendation
none	ABRT	The system was not able to allocate every resource needed for this test, or there was an internal system error. 1. Retry the command at 1-minute intervals up to 5 times.
1	ABRT	The system could not allocate every resource needed to test the tones. 1. Retry the command at 1-minute intervals up to 5 times.
1001	ABRT	The system was unable to put the ETR-PT in the appropriate mode to test it. 1. Retry the command at 1-minute intervals up to 5 times.
1 of 3		

Table 395: Test #42 Tone Detection Verification Test 2 of 3

Error Code	Test Result	Description / Recommendation
1002	ABRT	<p>The system could not allocate time slots for the test connection. This situation could occur when the system is heavily loaded. If the system is not heavily loaded, test the TDM-BUS with <code>test tdm</code>.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1003	ABRT	<p>The system could not allocate a Tone-Clock for the test connection. This may be caused by a heavy load on the system or by a faulted Tone-Clock.</p> <ol style="list-style-type: none"> 1. Check to see if there are any alarms against the TONE-BD or TONE-PT in the PN where the test aborted. 2. If a new Tone-Clock has been inserted, allow about 1 minute for maintenance to run on the newly inserted circuit pack. 3. Retry the command at 1-minute intervals up to 5 times.
2000	ABRT	<p>Circuit pack's response to the test request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
2006	ABRT	<p>This abort code indicates that the active Tone-Clock circuit pack or a Tone Detector circuit pack may not be functioning properly.</p> <ol style="list-style-type: none"> 1. Test the <i>active</i> Tone-Clock circuit pack in the PN with <code>test tone-clock UUC</code>. 2. Retry the command at 1-minute intervals up to 5 times.
2100	ABRT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals up to 5 times.
1-122	FAIL	<p>DTMF digits were not detected correctly.</p> <ol style="list-style-type: none"> 1. Run the short test sequence with <code>test port location sh r 1</code>. 2. If the problem persists, the system is still operating properly but capacity is reduced. To restore performance to normal, replace the circuit pack with the defective ETR-PT.
		2 of 3

Table 395: Test #42 Tone Detection Verification Test 3 of 3

Error Code	Test Result	Description / Recommendation
102	FAIL	<p>2225-Hz Modem Answer Tone was not detected correctly. This impacts call-classification operation.</p> <ol style="list-style-type: none"> 1. Run the short test sequence via <code>test port location sh r 1</code>. 2. If the problem persists, the system can still operate properly but capacity is reduced. In order to restore performance to normal, replace the circuit pack containing the defective port. Follow the procedures described in TONE-BD (Tone-Clock Circuit) on page 2282 for replacing a Tone-Clock circuit pack.
130	FAIL	<p>Forward or Backward MFC signals were not correctly generated or detected. This will impact MFC calls.</p> <ol style="list-style-type: none"> 1. Run the short test sequence via <code>test port location sh r 1</code>. 2. If the problem persists, the system can still operate properly but capacity will be reduced. In order to restore performance to normal, replace the TN2182/TN2312AP circuit pack containing the defective ETR-PT. Follow the procedures described in TONE-BD (Tone-Clock Circuit) on page 2282 for replacing a Tone-Clock circuit pack.
	PASS	<p>Tone detection verification is successful. The ETR port is able to detect/generate every necessary tone.</p>
3 of 3		

Tone Detector Audit/Update Test (#43)

A Digital Signal processor sanity audit is performed on the ETR-PT.

Table 396: Test #43 Tone Detector Audit/Update Test 1 of 3

Error Code	Test Result	Description / Recommendation
none	ABRT	The system could not allocate every resource needed for this test. 1. Rerun the test at 1-minute intervals up to 5 times.
2000	ABRT	Response to the test request was not received within the allowable time period. 1. Rerun the test at 1-minute intervals up to 5 times.
2100	ABRT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals up to 5 times.
1 of 3		

Table 396: Test #43 Tone Detector Audit/Update Test 2 of 3

Error Code	Test Result	Description / Recommendation
	FAIL	<p>Hardware audit failed.</p> <ol style="list-style-type: none"> 1. Use <code>list configuration carrier</code> to get the board type and location. If the board is TN744, then do steps 2–4; if it is TN2182/ TN2312AP, do steps 5–12. 2. Execute three commands: <code>busyout board location</code>, <code>reset board location</code>, and <code>release board location</code>. Reset is required to reload RAM associated with the TN744’s DSPs. This will take all eight tone detector ports out of service for a few seconds. Only four of the eight would be out of service due to the alarm. (There are four tone detectors on each of the two DSPs.) Other than the unlikely potential of running out of tone detector resources in the switch, there is no other effect when the board is reset. 3. Test the board (<code>test board location long</code>). 4. If the test passes, terminate the repair process. If the test fails, replace the board. Follow the procedures in TONE-BD. 5. Check to see if the board is duplicated (<code>list cabinet</code> and <code>status port-network</code> on the affected PN.) 6. If the board is not duplicated, use <code>test tone location long</code> to resolve the error. The long test resets the board and is required to reload on-board RAM associated with the TN2182’s/TN2312AP’s DSPs. The effect is that tone detectors are taken out of service momentarily and tones are removed from the TDM bus for about 10 seconds. This means no dial pulses or touch tones during this interval, which probably will not affect calls in progress, but could cause a call origination to abort or cause a user to not get dial tone when going off hook. 7. If every test passes and the alarm does not resolve, retest (<code>test tone location long clear</code>). 8. If the test passes, terminate the repair process. If it fails, replace the circuit pack at the customer’s convenience. Follow the procedures in TONE-BD. 9. If the board is duplicated, switch to the standby side (<code>set tone/set ipserver-interface</code>).
		2 of 3

Table 396: Test #43 Tone Detector Audit/Update Test 3 of 3

Error Code	Test Result	Description / Recommendation
	FAIL (CONT'D)	<p>10. Test the alarmed board (test tone location long). This resets the board and is required to reload on-board RAM associated with the TN2182's/TN2312AP's DSPs.</p> <p>11. If every test passes and the alarm does not resolve, retest with test tone location long clear.</p> <p>12. If the test passes, terminate the repair process. If it fails, replace the board. Follow the procedures in TONE-BD.</p>
	PASS	The ETR port has passed the sanity inquiry.
		3 of 3

EXP-INTF (Expansion Interface Circuit Pack)

S8700 | 8710 / S8500

MO Name in Alarm Log	Alarm Level	Initial SAT Command to Run	Full Name of MO
EXP-INTF	MAJ	<code>test board location s</code>	Expansion Interface circuit pack
EXP-INTF	MIN	<code>test board location s</code>	Expansion Interface circuit pack
EXP-INTF	WRN	<code>test board location s</code>	Expansion Interface circuit pack

WARNING:

If the Expansion Interface (EI) circuit pack you are troubleshooting is associated with a Survivable Remote EPN (SREPN), before the SREPN can be returned to normal service, every LAPD EI link problem must be cleared, and the SREPN slide switch on the TN2301 (located in the SREPN carrier) must be manually set to the normal position. See [Restoring Normal Service to the SREPN](#) on page 1150 in this section.

Refer also to *Avaya MultiVantage Solutions Installation and Maintenance for Survivable Remote EPN, 555-233-121*.

Following this introductory description of the Expansion Interface (EI) circuit pack are sections on the following topics:

- [EI In-Service Mechanism](#) on page 1148
- [Survivable Remote EPN](#) on page 1149
- [LEDs](#) on page 1150
- [EI and Tone-Clock Interactions](#) on page 1153
- [Replacing an EI Circuit Pack—Unduplicated PNC](#) on page 1156
- [Replacing an EI Circuit Pack— Duplicated PNC](#) on page 1157
- [Expansion Interface Manual Loop-Back Procedure](#) on page 1158

The TN570 or the TN776 Expansion Interface (EI) circuit pack provides a TDM- and packet bus-to-fiber interface for the communication of signaling information, circuit-switched connections, and packet-switched connections between endpoints residing in separate PNs. EI circuit packs are connected via optical fiber links. An EI can be connected to:

- Another EI, in a direct-connect configuration
- A DS1 converter in a DS1 converter complex, used to remote a PN
- A Switch Node Interface (SNI), in a center stage switch (CSS) configuration
- A survivable remote EPN (SREPN)

Communication Manager Maintenance-Object Repair Procedures

In a CSS configuration with duplicated Port Network Connectivity (PNC), EI circuit packs reside in the Switch Node Carrier (see [Figure 63: Center Stage Switch Configuration with Duplicated PNC](#) on page 1147). In this case, the EI and SNI circuit packs may be connected via a metallic cable instead of an optical fiber link. Metallic cable should be tested and replaced in the same manner as optical fiber.

A PN-to-PN connection can be extended through a DS1 converter complex. (See [Figure 64: Fiber Link with DS1 Converter Complex](#) on page 1148). When discussing problems that may be related to fiber links, the DS1 converter is considered part of the fiber link. If diagnosis of the problem points to fiber connectivity and a DS1 converter circuit pack is part of the connectivity, problems with the DS1 converter circuit pack should be investigated (see [DS1C-BD](#) on page 1052). The DS1 converter circuit pack enters into diagnostics for the EI circuit pack via such tests as the Neighbor Query test (#237), the Fiber Out-of-Frame test (#238), the Two-Way Transmission test (#241), and the Packet Transmission test (#589).

In a critical-reliability system, the fiber link's are duplicated as part of PNC duplication. In a high-reliability system with a CSS (Center Stage Switch) and unduplicated PNC, a single point of failure between the media server and the CSS is eliminated by duplicating each link, consisting of:

- SNI in the CSS to which the PN's EI connects
- Physical fiber paths between them

These dual connections normally share the call-processing load. Should one of these links fail, the entire load can be shifted to the operational link.

[Figure 60: Direct Connect Configuration with Unduplicated PNC](#) on page 1144 shows the location of the EI circuit packs in a typical unduplicated PNC, direct connect configuration.

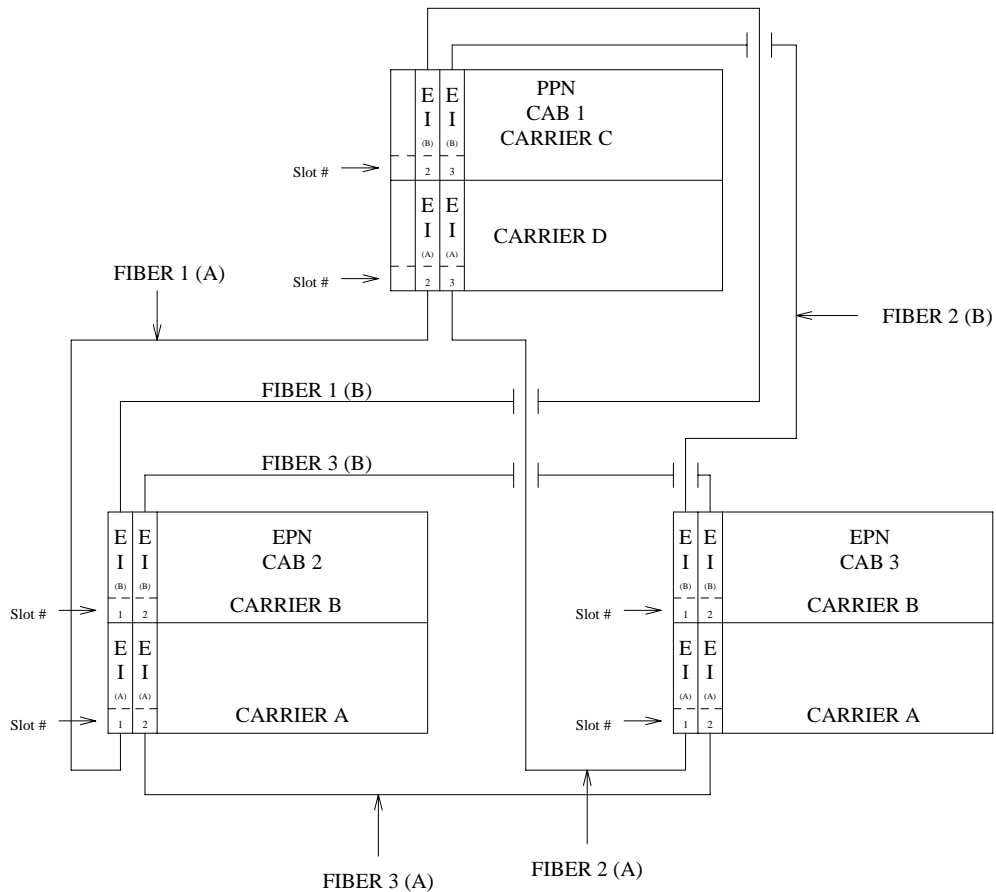

Figure 60: Direct Connect Configuration with Unduplicated PNC

Each PN in a direct-connect configuration must be connected to the other PNs through a fiber link. Each PN has one EI that functions as an Archangel. This EI must be connected with fiber to an EI. If an EI is functioning as an Archangel (bus master), its amber LED will be flashing at a rate of 2 seconds on and 200 ms off.

[Figure 61: Direct Connect Configuration with Duplicated PNC](#) on page 1145 shows the location of EI circuit packs in a typical duplicated PNC, direct-connect configuration.

Figure 61: Direct Connect Configuration with Duplicated PNC

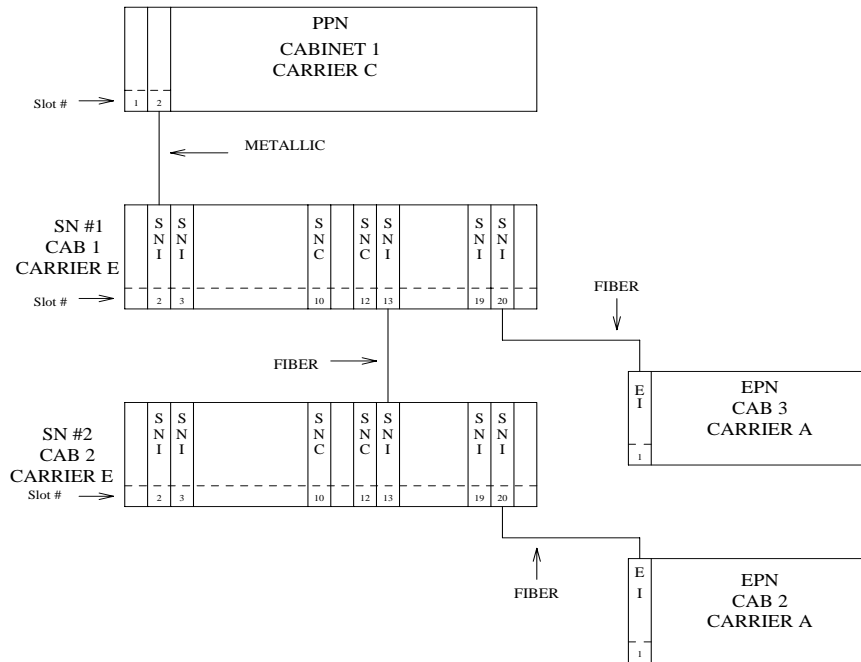

In a duplicated PNC there is an A-side and a B-side PNC. Every EI in this diagram is labeled with an A or a B designating to which PNC it belongs. Note that a PNC's designation (A or B) does not relate directly to the carrier where its EIS reside. Again, only one of a PN's EIs can function as the Archangel (TDM-bus master). A PN's EI that is:

- On the active PNC
- Logically connected to the media server

is the only one that can function in this mode. In normal operation, its amber LED should be blinking at a rate of 2 seconds on and 200 ms off.

[Figure 62: Center Stage Switch Configuration with Unduplicated PNC](#) on page 1146 shows the location of EIs in a typical center stage switch configuration with unduplicated PNC.

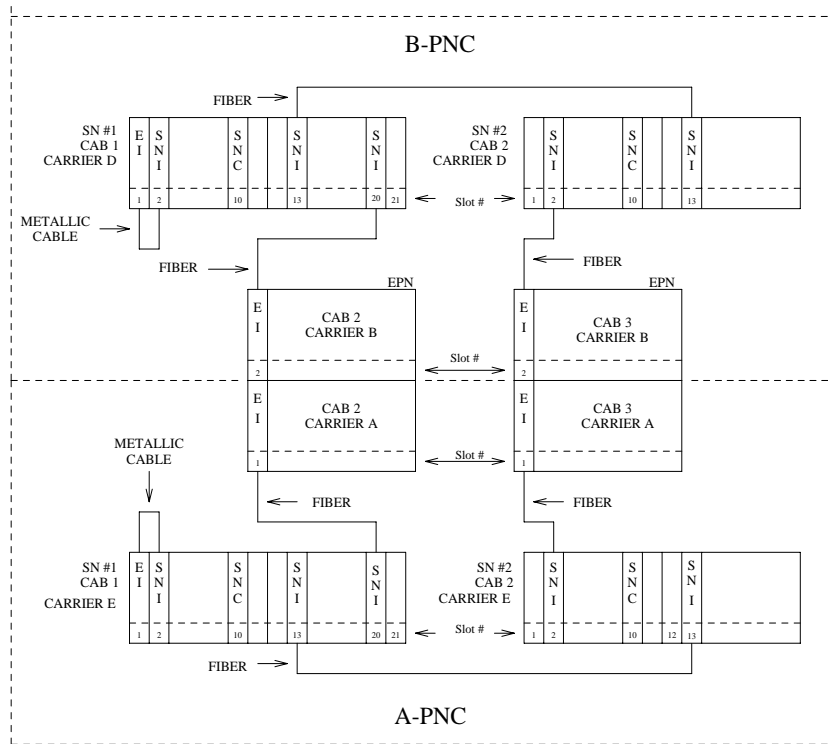

Figure 62: Center Stage Switch Configuration with Unduplicated PNC

For an unduplicated center stage switch configuration, only one EI is needed in each PN. Notice that there is no direct connection between the PNs, rather every inter-PN connection is made through the center stage switch. Each SNI in the switch node carriers can be connected to a PN through an EI circuit pack.

[Figure 63: Center Stage Switch Configuration with Duplicated PNC](#) on page 1147 shows the location of EIs in a typical two Switch Node Center Stage Switch configuration with duplicated PNC.

Figure 63: Center Stage Switch Configuration with Duplicated PNC

In a duplicated center stage switch configuration, two EIs are needed in each PN. One resides in the PNC's A side and one in the B side. Note that a PNC designation (A or B) does not directly designate the carrier where an EI resides. The active PNC's EI is the one acting as the PN's Archangel (TDM bus master). This EI's amber LED should be blinking at a rate of 2 seconds on and 200 ms off. Whereas, the amber LED on standby PNC's EI should be off.

A PN (and thus, the EIs contained within it) can be remoted via a DS1 Converter complex. This requires that a fiber link (providing connectivity to the remoted PN) be administered with an associated DS1 Converter complex. This complex consists of two TN574 DS1 Converter (DS1C-BD) circuit packs connected by from 1 to 4 DS1 facilities. [Figure 64: Fiber Link with DS1 Converter Complex](#) on page 1148 shows where the DS1 converter complex fits into an EI-to-SNI or EI-to-EI fiber link. For more information, see [DS1C-BD](#) on page 1052.

Figure 64: Fiber Link with DS1 Converter Complex

EI In-Service Mechanism

In order for calls to be routed through a given PN, the EI that is part of the connectivity to that PN must be put into service. In order for an EI to be put into service, the following criteria must be met:

1. The EI must be recognized by software (inserted). Use `list config carrier` to verify that the board is recognized by software.
2. The EI must have a fiber link administered to it. Use `list fiber-link` to verify that this EI circuit pack has a fiber administered to it.
3. The EI must have established a LAPD link to its neighbor (the circuit pack on the “other end” of the fiber link). This neighbor can be another EI or an SNI.

⚠ CAUTION:

If previous requirements 1 and 2 have been met, and the amber LEDs are flashing in a manner that appears to confirm that the EI circuit pack has established a LAPD link to its neighbor, the circuit pack still may not be “in service”. The requirement is that it must have the CORRECT neighbor on the other end of the fiber. Care must be taken when connecting the fibers to the back of the carriers so that fibers are connected to the correct circuit packs. In a Center Stage Switch configuration, run the “configuration audit” test against the SNI circuit pack that is the neighbor of the EI circuit pack in question (see [SNI-BD \(SNI Circuit Pack\)](#) on page 2003 for more details).

Once an EI has been put into service, if any of the previously listed in-service criteria become untrue, the EI is taken out of service, and service to that PN is not available.

In a system that is configured with PNC duplication active, taking an EI out of service that is on the active PNC will, if all other things on the active and standby PNC are equal (i.e., both PNCs are equally healthy, the standby PNC is not busied out, the PNC is not locked by software), result in a PNC interchange.

Survivable Remote EPN

The Survivable Remote EPN (SREPN) feature allows a S8700 Multi-Connect EPN (either MCC or SCC) to provide service to the customer when:

- Its fiber (or T1/E1 EI link to the S8700 Multi-Connect processor) fails or is severed
- The S8700 Multi-Connect processor or center stage fails.

Note:

This feature is viewed as a “disaster recovery operation” capability rather than as an additional reliability option.

The SREPN allows a remote EPN cabinet to provide processor capabilities to the EPN in the event of a failure. A logic switch circuit pack (TN2301) located in the SRPPN detects when the link to the S8700 Multi-Connect is down and switches to a link from the local SRPPN (TN790B-based processor). When the links to the S8700 Multi-Connect are restored and verified to be stable, the logic switch is manually reset, and the EPN is reconnected to the links from the S8700 Multi-Connect.

Note:

The SREPN feature is not available when an ATM-PNC/EI circuit pack is used to replace the TN570 EI circuit pack in a direct-connect configuration, or an ATM Switch is providing the Center Stage (PNC) connectivity.

Note:

If you suspect a problem with the TN790B-based R6si SRPPN use the R6si maintenance documentation supplied with the SREPN feature to resolve any alarms/errors associated with the SRPPN carrier.

SREPN Feature Active

 **WARNING:**

Every call within the SREPN is terminated when the SREPN feature is activated, and the R6si SRPPN takes control of the SREPN.

The SREPN feature is activated when the Maintenance circuit pack (TN775C or later and located in the SREPN) detects a problem with the SREPN's EI (TN570B) LAPD link to its counterpart in a S8700 Multi-Connect EPN. The TN775C Maintenance circuit pack notifies the co-located SRPPN of the problem, and the TN2301 SRSwitch circuit pack in the SRPPN carrier switches the EI LAPD link connection from the S8700 Multi-Connect Port Network to its counterpart in the S8300 Media Server with G700 Media Gateway SRPPN. The SREPN is now in the Survivable Remote mode and has the capabilities of an S8300 Media Server with G700 Media Gateway EPN that has been pre-translated with a *Disaster Recovery* configuration.

Note:

When SREPN feature is active, the EI circuit pack that is assigned to the SREPN and located in the S8700 Multi-Connect PN is put in loop-back mode.

Restoring Normal Service to the SREPN

WARNING:

Every call within the SREPN is terminated when the SREPN feature is returned to normal service.

To restore normal connections to the SREPN EI circuit pack in the S8700 Multi-Connect PN, you must:

1. Clear every error logged against the S8700 Multi-Connect SREPN EI circuit pack by using the suggested repair procedures outlined in this MO.
2. At the SRP flip the 3-position switch on the TN2301 to the RSTR (restore) or top position for at least 1 second and return the switch to the AUTO, or middle position.
3. After the SREPN slide switch has been restored to the normal position, test the connectivity to S8700 Multi-Connect EI LAPD link, by using the suggested procedures outlined in this MO.
4. After normal service is returned to the S8300 Media Server with G700 Media Gateway SREPN, the SRPPN will be in an *alarmed state*. This is *normal* for an SRPPN and indicates that the:
 - SRSwitch (TN2301) has disconnected it from its neighbor (EI in the SREPN)
 - SRPPN is no longer in control.

Connectivity has been reestablished between the EI in the SREPN and its counterpart EI circuit pack in the S8700 Multi-Connect PN. The system is now in a normal S8700 Multi-Connect EI configuration.

LEDs

SREPN Expansion Interface

The EI circuit pack has red, green, and amber LEDs. The red and green LEDs show the standard conditions:

- Red indicates an alarm condition.
- Green indicates maintenance testing in progress.

The amber LED is used to provide useful visual status information:

- Active EI circuit packs:
 - Have their amber LED on solid (for an inter-EPN EI in a direct connect system)
 - Blink a pattern of 2 seconds on and 200 ms off.
- The standby PNC EI circuit packs should have their amber LEDs off.

Another way to determine which PNC (and therefore, which EIs in an EPN) is active and which is standby, use `status port-network` and `status PNC`.

See [Table 397: Expansion Interface Circuit Pack Amber LED Flashing States](#) on page 1151 for the possible EI amber LED states.

Table 397: Expansion Interface Circuit Pack Amber LED Flashing States

Condition	LED On	LED Off
Fiber Out-of-Frame (a)	0.1 second	0.1 second
In Frame-No Neighbor (b)	0.5 second	0.5 second
Expansion Interface Active (c)	2 second	0.2 second
Expansion Interface Active (d)	solid on	never off
Expansion Interface Standby (e)	never on	solid off

Notes:

- a. This flashing state corresponds to error codes 769 and 770 from the Hardware Error Log and indicates a failure of Test #238. These error codes are usually accompanied by error code 1281 (no EI or SNI detected on opposite end of fiber). This condition may be caused by the absence of the neighbor EI or SNI circuit pack, a broken or missing fiber, or a missing lightwave transceiver on either endpoint (EI or SNI circuit packs).
- b. This corresponds to error code 1281 from the Hardware Error Log and indicates a failure of Test #237. This condition is usually due to the failure of this EI circuit pack or a failed EIEI or SNI circuit pack counterpart.
- c. This is the normal state for an active PN EI circuit pack that is also the bus master (Expansion Archangel) in the EPN.
- d. This is the normal state for an active EI circuit pack that is not the bus master (Expansion Archangel) for a PN. This applies only in the direct-connect configuration where the EI circuit pack in a PN is connected via a fiber link to an EI circuit pack in the other PN.
- e. This is the normal state for a standby EI circuit pack in a PN.

Note:

In a PN, its TN775C Maintenance (MAINT) circuit pack monitors the sanity of the EI circuit pack. If the EI circuit pack should cycle between sane and insane several times, the Maintenance circuit pack will hold the EI circuit pack reset. If a new EI circuit pack is installed in the PN, and the red LED remains lit, the PN's Maintenance circuit pack should be removed because it may be holding the new EI circuit pack reset. This condition could present itself if there is a link problem to the PN, and the PN experiences several PN restarts. The Maintenance circuit pack may be reinstalled after the EI circuit pack has been physically inserted and the EI circuit pack's red LED has gone off.

The link between two active EI circuit packs or between an active EI circuit pack and an active SNI circuit pack is involved in synchronization. The EI circuit pack reports slip errors if synchronization is not operating properly. When diagnosing synchronization problems, the EI circuit packs should be examined as a possible cause.

Expansion Interface LEDs

The EI circuit pack has the standard red, green, and amber LEDs. The red and green LEDs have the traditional uses: red means some alarm condition and green indicates maintenance testing in progress. The amber LED is used to provide useful visual status information. The state of the amber LED is very important when executing the Expansion Interface Manual Loop-Back Procedure. The possible amber LED states are shown in [Table 398: Expansion Interface Circuit Pack Amber LED Flashing States](#) on page 1152.

Upon power-up, the red and green LEDs turn on and off. The amber LED goes to its appropriate state.

To determine which PNC (and which EIs in a PN) is active and which is standby, use `status port-network` and `status pnc`. Alternately, visual inspection will show that the active EI circuit packs will have their amber LED on solid (for an inter-PN EI in a direct connect system) or blink a pattern of 2 seconds on and 200 ms off. The standby PNC EI circuit packs will have their amber LEDs off. See [Table 398: Expansion Interface Circuit Pack Amber LED Flashing States](#) on page 1152 for the possible EI amber LED states.

Table 398: Expansion Interface Circuit Pack Amber LED Flashing States

Condition	LED On	LED Off
Fiber Out-of-Frame (a)	0.1 second	0.1 second
In frame-No Neighbor (b)	0.5 second	0.5 second
Expansion Interface Active (c)	2 second	0.2 second
Expansion Interface Active (d)	solid on	never off
Expansion Interface Standby (e)	never on	solid off

Notes:

- a. Fiber Out-of-Frame - This flashing state corresponds to error codes 769 and 770 from the Hardware Error Log and indicates a failure of Test #238. These error codes will usually be accompanied by error code 1281 (no Expansion Interface or SNI detected on opposite end of fiber). This condition may be caused by the absence of the neighbor EI or SNI circuit pack, a broken or missing fiber, or a missing lightwave transceiver on either endpoint (EI or SNI circuit pack).
- b. In frame-No Neighbor - This flashing state corresponds to error code 1281 from the Hardware Error Log and indicates a failure of Test #237. This condition is usually due to the failure of this EI circuit pack or a failed EI or SNI circuit pack neighbor.

- c. This is the normal state for an active PN EI circuit pack that is also the bus master (Expansion Archangel) in the PN.
- d. This is the normal state for an active EI circuit pack that is not the bus master (Expansion Archangel) for a PN. This applies only in the Direct Connect configuration where the EI circuit pack in a PN is connected via a fiber link to an EI circuit pack in the other PN.
- e. This is the normal state for a standby EI circuit pack in a PN.

Note:

In a PN, its TN775C Maintenance (MAINT) circuit pack monitors the sanity of the EI circuit pack. If the EI circuit pack should cycle between sane and insane several times, the Maintenance circuit pack will hold the EI circuit pack reset. If a new EI circuit pack is installed in the PN, and the red LED remains lit, the PN's Maintenance circuit pack should be removed because it may be holding the new EI circuit pack reset. This condition could present itself if there is a link problem to the PN, and the PN experiences several PN restarts. The Maintenance circuit pack may be reinstalled after the EI circuit pack has been physically inserted and the EI circuit pack's red LED has gone off.

The link between two active EI circuit packs or between an active EI circuit pack and an active SNI circuit pack is involved in synchronization. The EI circuit pack will report slip errors if synchronization is not operating properly. When diagnosing synchronization problems, the EI circuit packs should be examined as a possible cause.

EI and Tone-Clock Interactions

The viability of the EI fiber link depends upon the system clock that is provided by the active Tone-Clock circuit pack on each network (see [TDM-CLK \(TDM Bus Clock\)](#) on page 2208 and [TONE-BD \(Tone-Clock Circuit\)](#) on page 2282). Each EI circuit pack transmits over the fiber at a rate derived from the system clock on its network. If the active Tone-Clock is defective in such a way that the frequency of system clock it produces is out of the specified range ("out of spec"), an EI fiber link might go down. This affects an Expansion Archangel Link (EAL), a Remote Neighbor Link (RNL), and/or a Local Neighbor Link (LNL), even though the EI circuit packs are healthy. When the PNC is duplicated, both fiber links could go down if there is a defective active Tone-Clock.

Whether or not a fiber link goes down, depends on certain characteristics of the EI circuit packs. An EI circuit pack should not be replaced if the fiber link on which it resides goes down because of a defective active Tone-Clock circuit pack. The defective Tone-Clock circuit pack should be replaced instead. The EI circuit packs are more sensitive to a defective system clock than the rest of the components of the system. Therefore, testing of the Tone-Clock circuit pack might not reveal a problem.

Communication Manager Maintenance-Object Repair Procedures

The symptoms of the problem in which an invalid system clock causes an Expansion Link to go down are as follows:

- If the Tone-Clock in the PN provides the current on-line synchronization reference (see **status synchronization**), is providing an invalid system clock:
 - Any EI or SNI circuit pack has a Fiber Out-of-Frame condition or a No Neighbor condition.
 - An EI circuit pack amber LED blinks quickly when a Fiber Out-of-Frame condition exists (0.1 seconds on, 0.1 seconds off) and Test #238 fails on the EI circuit pack that is out-of-frame.
 - An SNI circuit pack with a Fiber Out-of-Frame condition blinks its amber LED quickly (0.1 seconds on, 0.1 seconds off) and Test #989 fails on the SNI circuit pack that is out-of-frame.
 - An EI circuit pack amber LED blinks slowly when a No Neighbor condition exists (0.5 seconds on, 0.5 seconds off) and Test #237 fails on this EI circuit pack, but Test #238 passes.
 - An SNI circuit pack with a no neighbor condition blinks its amber LED slowly (0.5 seconds on, 0.5 seconds off) and Test #759 fails on this SNI circuit pack, but Test #989 passes.
- If a Tone-Clock in a PN that does not provide the current on-line synchronization reference (see **status synchronization**) is providing an invalid system clock:
 - In a direct connect configuration*, the PN EI circuit pack amber LED will blink quickly (Fiber Out-of-Frame condition – 0.1 seconds on, 0.1 seconds off).
 - Test #238 fails on this EI circuit pack.
 - In a CSS configuration*, the SNI connected to the PN EI circuit pack blinks its amber LED quickly (Fiber Out-of-Frame condition – 0.1 seconds on, 0.1 seconds off).
 - The PN EI circuit pack amber LED blinks slowly (In-frame, No Neighbor condition – 0.5 seconds on, 0.5 seconds off).
 - If the PN is in service, Test #237 fails on this EI circuit pack, but Test #238 passes.

These symptoms can also be the result of other problems (for example, one half of the fiber being unable to transmit data). If the system exhibits these symptoms, execute the following procedure:

1. Verify that the PN stays down for at least 1 minute.
 - If the EAL comes back in service after a short time, without switching the active Tone-Clock, the problem was probably that the on-line synchronization source became invalid (See SYNC Maintenance documentation for more information).
 - However, if the EAL(s) have not come back into service after a minute, the synchronization source is not the cause of the problem. Proceed to step 2.
2. Check for errors via **display errors** with the *Category* field set to **tone** and the Active Alarms field set to **n**. Some of the alarms on PN objects might have been resolved if the PN went down. Refer to the appropriate MO Maintenance documentation for descriptions of any of the errors occurring at about the same time as the EXP-PN errors, SYS-LINK errors against EAL s, RNLs, or LNLs, or FIBER-LK (769, 1025, or 1281) errors. Resolve any active alarms. Also, if Error Type 18 was logged against the SYNC MO when the PN went down,

the problem was probably that the synchronization on-line reference became invalid. Since reference switching was disabled, the Tone-Clock did not switch from the invalid reference. Therefore, the Tone-Clock circuit pack put out a system clock that was “out of spec.” Enter **enable synchronization-switch**. If the PN is down, reseal the Tone-Clock circuit packs on the PN. This action should restore the PN to service.

Execute Steps 3 and 4 in the order most convenient to you and least destructive to the customer.

3. Check to see if the fiber-optic cable is transmitting properly via the following procedure on one of the out-of-service links, or use the [Fiber link fault isolation](#) in *Maintenance Procedures (03-300192)*.
 - a. Carefully record the symptoms (amber LED pattern and test failing) that were occurring on the PN EI circuit pack and the PN EI circuit pack or the connected CI circuit pack in the case of a Center Stage system. Clearly indicate what symptoms are occurring on which EI/SNI circuit pack.

 **CAUTION:**

Before proceeding, note which is the current transmit fiber and which is the current receive fiber for proper reconnection.

- b. Disconnect the transmit and receive fiber pair from the lightwave transceiver on the back of one of the EI circuit pack slots that is exhibiting symptoms.
 - c. Connect what was formerly the transmit fiber to the receive jack.
 - d. Connect what was formerly the receive fiber to the transmit jack.
 - e. Perform steps b, c, and d on the opposite end of the fiber and the lightwave transceiver on the back of the connected EI or SNI circuit pack slot.
 - f. If the symptoms that were formerly occurring on the EI circuit pack that was exhibiting these symptoms are now occurring on the connected EI or SNI circuit pack and vice versa, the fiber is defective and should be replaced.
4. Determine whether the problem is due to a defective active Tone-Clock circuit pack. Refer to the preceding list of symptoms to decide which network contains the suspect active Tone-Clock.

 **CAUTION:**

If you remove the PN EI circuit pack that is active or that was active when the PN was last in service, the Tone-Clock lead will revert to the default value which will cause the Tone-Clock circuit pack located in the A carrier to become the active Tone-Clock. This characteristic can be deceiving. Replacing or reseating the active PN EI circuit pack might restore the link(s) temporarily. However, if the Tone-Clock circuit pack located in the B carrier was really the source of the problem and not the EI circuit pack, then the link(s) will go down again the next time a Tone-Clock switch to the Tone-Clock in the B carrier is attempted (probably when the scheduled Tone-Clock switch occurs).

 **CAUTION:**

If, after every link is restored, you suspect the problem might have been due to a defective Tone-Clock circuit pack, switch to this Tone-Clock at an appropriate time. If the Tone-Clock circuit pack was the cause of the problem and the same EI circuit packs are in place, the same link(s) will go down again.

- a. When the suspect Tone-Clock circuit pack resides in an in-service pot network (PN) with duplicated Tone-Clock circuit packs:

Switch to the standby Tone-Clock in this PN. If the suspect Tone-Clock is defective, the link(s) should be restored at this point. (Switching back to the defective Tone-Clock should take the same link(s) out of service.) This Tone-Clock is defective and should be replaced as soon as possible. If switching Tone-Clocks does not bring up the PN, then this Tone-Clock is not the source of the problem. Be sure to switch back to the original Tone-Clock.

 **CAUTION:**

If a defective Tone-Clock circuit pack is left as the standby Tone-Clock, then a scheduled Tone-Clock switch will cause the same link(s) go out of service again.

- b. When the suspect Tone-Clock resides in an out-of-service PN:

Replace the active Tone-Clock circuit pack in this PN. In a PN with duplicated Tone-Clock circuit packs, the active Tone-Clock's amber LED is flashing. If both amber LEDs are flashing, the active Tone-Clock's LED is blinking slower.

 **CAUTION:**

If a defective Tone-Clock circuit pack is left as the standby Tone-Clock, then a scheduled Tone-Clock switch will cause the same PN to go out of service again.

If replacing this circuit pack restores the link(s), then the circuit pack should be replaced as soon as possible. If not, then it was not the source of the problem.

Replacing an EI Circuit Pack—Unduplicated PNC

 **WARNING:**

Do not power down a Switch Node carrier to replace a circuit pack.

 **WARNING:**

Replacing a Switch Node Interface, Switch Node Clock, Expansion Interface, or DS1 Converter circuit pack in a standard-, duplex-, or high-reliability system disrupts service. This service effect can range from an outage of a single PN to an outage of the entire system.

Step	Action	Explanation / Caution
1.	Enter <code>busyout board location</code> .	location = cabinet-carrier-slot location of the circuit pack to be replaced.
2.	Replace the circuit pack.	
3.	Wait for the circuit pack to reset.	Red and green LEDs light and then go out. If the red LED remains lit, see the previous note under Expansion Interface LEDs on page 1152.
4.	Enter <code>release board location</code> .	CAUTION: Do not busyout any EI circuit packs after this point.
5.	Enter <code>test alarms long clear</code> for category <code>exp-intf</code> .	
6.	Wait 5 minutes for SNI-BD, FIBER-LK, and DS1C-BD alarms to clear, or enter <code>clear firmware-counters a-pnc</code> .	

Replacing an EI Circuit Pack— Duplicated PNC

On a system with duplicated PNC, synchronization may be provided over a combination of active and standby components. This condition is indicated by an OFF-BOARD WARNING alarm against TDM-CLK with Error Type 2305. Repairs to standby PNC in this state may disrupt service. Otherwise, if the active PNC is functional, replacement of a standby component will not disrupt service.

Step	Action	Explanation / Caution
1.	Enter <code>status pnc</code> .	Verify that the component to be replaced is on the standby PNC.
2.	Enter <code>busyout pnc</code> .	
3.	Enter <code>busyout board location</code> .	location represents the cabinet-carrier-slot location of the circuit pack to be replaced.
4.	Replace the circuit pack.	
5.	Enter <code>release board location</code> .	CAUTION: Do not busyout any EI circuit packs after this point.
6.	Enter <code>test alarms long clear</code> for category <code>exp-intf</code> .	
1 of 2		

Step	Action	Explanation / Caution
7.	Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK, and DS1C-BD alarms to clear, or enter <code>clear firmware-counters a-pnc</code> or <code>b-pnc</code> .	Use the letter designation of the PNC that holds the replaced component (the standby PNC).
8.	Enter <code>status pnc</code> .	If either PNC's state of health (SOH) is not "functional," consult PNC-DUP (PNC Duplication) on page 1809.
9.	Enter <code>release pnc</code> .	
2 of 2		

If the red LED remains lit, see the previous note under [Expansion Interface LEDs](#) on page 1152.

Expansion Interface Manual Loop-Back Procedure

This procedure is to be used when an EI circuit pack cannot be tested by software. This occurs when the EI circuit pack resides in an out-of-service PN. A short length of optical fiber is required for this procedure.

If this procedure is run on both endpoints of a fiber link (EI circuit packs or SNI circuit packs), and both check out fine, then the failure is most likely in the fiber itself, assuming neither endpoint circuit pack is busied out and the link remains inactive.

1. Busyout the circuit pack (EI or SNI) with the `busyout board location`.
2. Disconnect the transmit and receive fiber pair from the lightwave transceiver on the back of the circuit pack (EI or SNI) slot.

Note:

The fiber connected to the transmit side of the lightwave transceiver on one EI circuit pack should be connected to the receive side of the lightwave transceiver on the circuit pack on the opposite end of the fiber.

3. Using a fiber jumper cable, interconnect the transmit and receive jacks of the lightwave transceiver as shown in [Figure 65: Interconnection of Lightwave Transceiver Transmit/Receive Jacks](#) on page 1159.

Note:

Make sure that the total length of the fiber jumper cable does not exceed the maximum length recommended for the fiber link connections between cabinets. Using cable lengths not within connectivity guidelines can adversely affect test results.

4. Go to the front of the cabinet and inspect the amber LED.
 - If the amber LED flashes on at a rate of once per second, the (EI or SNI) circuit pack or transceiver should be replaced.
 - If the amber LED flashes on at a rate of five times per second, the circuit pack (EI or SNI) or the lightwave transceiver may need replacement. This condition may also be due to a faulty system clock on the network containing this EI circuit pack.
 - If the amber LED is not blinking, this circuit pack (EI or SNI) and the lightwave transceiver are functioning properly.
5. Replace faulty components and reconnect the original fiber. Be sure to reconnect the fibers properly as noted in step 3. If there is a problem with the PN after re-connecting the fiber, and the PN is connected to a Center Stage Switch, run the Configuration Audit via `test board` on the SNI circuit pack to which the intervening fiber is connected. See the SNI-BD section for instructions on interpreting results.
6. Release EI circuit pack or SNI circuit pack with `release board location`.
