

SIP Software for Avaya 1200 Series IP Deskphones-Administration

© 2015 Avaya Inc. All Rights Reserved.

Notice

While reasonable efforts have been made to ensure that the information in this document is complete and accurate at the time of printing, Avaya assumes no liability for any errors. Avaya reserves the right to make changes and corrections to the information in this document without the obligation to notify any person or organization of such changes.

Documentation disclaimer

"Documentation" means information published by Avaya in varying mediums which may include product information, operating instructions and performance specifications that Avaya may generally make available to users of its products and Hosted Services. Documentation does not include marketing materials. Avaya shall not be responsible for any modifications, additions, or deletions to the original published version of documentation unless such modifications, additions, or deletions were performed by Avaya. End User agrees to indemnify and hold harmless Avaya, Avaya's agents, servants and employees against all claims, lawsuits, demands and judgments arising out of, or in connection with, subsequent modifications, additions or deletions to this documentation, to the extent made by End User.

Link disclaimer

Avaya is not responsible for the contents or reliability of any linked websites referenced within this site or documentation provided by Avaya. Avaya is not responsible for the accuracy of any information, statement or content provided on these sites and does not necessarily endorse the products, services, or information described or offered within them. Avaya does not guarantee that these links will work all the time and has no control over the availability of the linked pages.

Warranty

Avaya provides a limited warranty on Avaya hardware and software. Refer to your sales agreement to establish the terms of the limited warranty. In addition, Avaya's standard warranty language, as well as information regarding support for this product while under warranty is available to Avaya customers and other parties through the Avaya Support website: http://support.avaya.com or such successor site as designated by Avaya. Please note that if You acquired the product(s) from an authorized Avaya Channel Partner outside of the United States and Canada, the warranty is provided to You by said Avaya Channel Partner and not by Avaya.

Licenses

THE SOFTWARE LICENSE TERMS AVAILABLE ON THE AVAYA WEBSITE, HTTP://SUPPORT.AVAYA.COM/LICENSEINFO OR SUCH SUCCESSOR SITE AS DESIGNATED BY AVAYA, ARE APPLICABLE TO ANYONE WHO DOWNLOADS, USES AND/OR INSTALLS AVAYA SOFTWARE, PURCHASED FROM AVAYA INC., ANY AVAYA AFFILIATE, OR AN AVAYA CHANNEL PARTNER (AS APPLICABLE) UNDER A COMMERCIAL AGREEMENT WITH AVAYA OR AN AVAYA CHANNEL PARTNER. UNLESS OTHERWISE AGREED TO BY AVAYA IN WRITING, AVAYA DOES NOT EXTEND THIS LICENSE IF THE SOFTWARE WAS OBTAINED FROM ANYONE OTHER THAN AVAYA, AN AVAYA AFFILIATE OR AN AVAYA CHANNEL PARTNER; AVAYA RESERVES THE RIGHT TO TAKE LEGAL ACTION AGAINST YOU AND ANYONE ELSE USING OR SELLING THE SOFTWARE WITHOUT A LICENSE. BY INSTALLING, DOWNLOADING OR USING THE SOFTWARE, OR AUTHORIZING OTHERS TO DO SO, YOU, ON BEHALF OF YOURSELF AND THE ENTITY FOR WHOM YOU ARE INSTALLING, DOWNLOADING OR USING THE SOFTWARE (HEREINAFTER REFERRED TO INTERCHANGEABLY AS "YOU" AND "END USER"), AGREE TO THESE TERMS AND CONDITIONS AND CREATE A BINDING CONTRACT BETWEEN YOU AND AVAYA INC. OR THE APPLICABLE AVAYA AFFILIATE ("AVAYA").

Heritage Nortel Software

"Heritage Nortel Software" means the software that was acquired by Avaya as part of its purchase of the Nortel Enterprise Solutions Business in December 2009. The Heritage Nortel Software currently available for license from Avaya is the software contained within the list of Heritage Nortel Products located at http://support.avaya.com/LicenseInfo under the link "Heritage Nortel Products" or such successor site as designated by Avaya. For Heritage Nortel Software, Avaya grants You a license to use Heritage Nortel Software provided hereunder solely to the extent of the authorized activation or authorized usage level, solely for the purpose specified in the Documentation, and solely as embedded in, for execution on, or for communication with Avaya equipment. Charges for Heritage Nortel Software may be based on extent of activation or use authorized as specified in an order or invoice.

Copyright

Except where expressly stated otherwise, no use should be made of materials on this site, the Documentation, Software, Hosted Service, or hardware provided by Avaya. All content on this site, the documentation, Hosted Service, and the product provided by Avaya including the selection, arrangement and design of the content is owned either by Avaya or its licensors and is protected by copyright and other intellectual property laws including the sui generis rights relating to the protection of databases. You may not modify, copy, reproduce, republish, upload, post, transmit or distribute in any way any content, in whole or in part, including any code and software unless expressly authorized by Avaya. Unauthorized reproduction, transmission, dissemination, storage, and or use without the express written consent of Avaya can be a criminal, as well as a civil offense under the applicable law.

Third Party Components

"Third Party Components" mean certain software programs or portions thereof included in the Software or Hosted Service may contain software (including open source software) distributed under third party agreements ("Third Party Components"), which contain terms regarding the rights to use certain portions of the Software ("Third Party Terms"). As required, information regarding distributed Linux OS source code (for those products that have distributed Linux OS source code) and identifying the copyright holders of the Third Party Components and the Third Party Terms that apply is available in the products, Documentation or on Avaya's website at: http://support.avaya.com/Copyright or such successor site as designated by Avaya. You agree to the Third Party Terms for any such Third Party Components.

Note to Service Provider

The product or Hosted Service may use Third Party Components subject to Third Party Terms that do not allow hosting and require a Service Provider to be independently licensed for such purpose. It is your responsibility to obtain such licensing.

Preventing Toll Fraud

"Toll Fraud" is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or is not working on your company's behalf). Be aware that there can be a risk of Toll Fraud associated with your system and that, if Toll Fraud occurs, it can result in substantial additional charges for your telecommunications

Avaya Toll Fraud intervention

If You suspect that You are being victimized by Toll Fraud and You need technical assistance or support, call Technical Service Center Toll Fraud Intervention Hotline at +1-800-643-2353 for the United States and Canada. For additional support telephone numbers, see the Avaya Support website: http://support.avaya.com or such successor site as designated by Avaya. Suspected security vulnerabilities with Avaya products should be reported to Avaya by sending mail to: securityalerts@avaya.com.

Trademarks

The trademarks, logos and service marks ("Marks") displayed in this site, the Documentation, Hosted Service(s), and product(s) provided by Avaya are the registered or unregistered Marks of Avaya, its affiliates, or other third parties. Users are not permitted to use such Marks without prior written consent from Avaya or such third party which may own the Mark. Nothing contained in this site, the Documentation, Hosted Service(s) and product(s) should be construed as granting, by implication, estoppel, or otherwise, any license or right in and to the Marks without the express written permission of Avaya or the applicable third party.

Avaya is a registered trademark of Avaya Inc.

All non-Avaya trademarks are the property of their respective owners. Linux $^{\! \otimes}$ is the registered trademark of Linus Torvalds in the U.S. and other countries.

Downloading Documentation

For the most current versions of Documentation, see the Avaya Support website: http://support.avaya.com, or such successor site as designated by Avaya.

Contact Avaya Support

See the Avaya Support website: http://support.avaya.com for product or Hosted Service notices and articles, or to report a problem with your Avaya product or Hosted Service. For a list of support telephone numbers and contact addresses, go to the Avaya Support website: http://support.avaya.com (or such successor site as designated by Avaya), scroll to the bottom of the page, and select Contact Avaya Support.

Chapter 1: New in this release	14
Avaya Aura [®] support for 1200 Series IP Deskphones	
Features	
Support for Auto Login parameters in server profiles	
No soft reset for IPv6 address change	
RTP/SRTP port changes	
Address Book size	
Case-insensitive Directory search	
Additional supported redirect scenarios	
IP Deskphone behavior when DHCPv4/DHCPv6 server is unreachable	
Handling fixed keys for multiple calls	18
Duplicate IPv6 addresses	19
IP Deskphone behavior during a non-consultative transfer	20
Debug port security	
HTTPS support in BootC mode	
Permanently disable Port Mirroring	
Improvements in <i>prtcfg</i> pdt command output	
Miscellaneous changes for IP Deskphones	
Avaya Aura [®] -specific features	23
Presence support for 1200 Series IP Deskphones	
Personal Profile Manager support	25
Embedded device certificates	26
SRTP support with Avaya Aura®	
Session Border Control support	27
Other changes	27
Revision history	28
Chapter 2: Customer Service	31
Navigation	31
Getting technical documentation	
Getting product training	31
Getting help from a distributor or reseller	31
Getting technical support from the Avaya Web site	32

Chapter 1: New in this release

SIP Software for Avaya 1200 Series IP Deskphones- Administration, NN43170-601 supports SIP Software Release 4.4. This document contains administration information for the Avaya 1220 IP Deskphone and Avaya 1230 IP Deskphone with SIP Software Release 4.4.

Supported platforms

SIP 4.4 supports the following platforms:

- Communication Server 1000 7.6
- B5800 Branch Gateway 6.2
- IP Office Release 8.1
- Avaya Aura® Communication Manager 6.2 FP2
- Avaya Aura® Messaging 6.2
- Avaya Aura[®] Presence Services 6.2
- Avaya Aura® Conferencing 7.0

Avaya Aura® support for 1200 Series IP Deskphones

The Avaya Aura[®] communications platform (solution comprised of Avaya Aura[™] Communication Manager, Avaya Aura[™] Session Manager, Avaya Modular Messaging) now supports the 1200 Series IP Deskphone with SIP 4.4 software. The 1200 Series IP Deskphones are directly registered to Session Manager and are supported by Communication Manager configured as an Evolution Server (CM-ES).

Supported platforms

The following Avaya Aura® platforms are supported:

- Avaya Aura® Communication Manager 6.2 FP2
- Avaya Aura® Session Manager 6.2 FP2
- Avaya Aura® Messaging 6.2
- Avaya Aura[®] Presence Services 6.1
- Avaya Aura® Conferencing 7.0

Telephony features

Some Communication Manager (CM) features can be invoked by dialing a Communication Manager Feature Name Extension (FNE). FNEs must be defined in Communication Manager for each of those features, subject to the existing dial plan.

Some CM features can be invoked by dialing a Communication Manager Feature Access Code (FAC). FACs must be defined in Communication Manager for each of those features, subject to the existing dial plan.

Most FNEs require first configuring the equivalent FAC.

Features

SIP Software Release 4.4 introduces support for the following:

Support for Auto Login parameters in server profiles

If the IP Deskphone configuration parameter AUTOLOGIN_ENABLE is configured as 2 or USE_AUTOLOGIN_ID, then the UserID, AuthID, and Passwd values are extracted from the AUTOLOGIN[_ID_KEY|_AUTHID_KEY|_PASSWD_KEY] configuration parameters.

Server profiles support all configurations of the AUTOLOGIN_ENABLE parameter.

If the AUTOLOGIN_ENABLE parameter in a profile is configured as 0 (or NO) or 1 (or YES), then the configuration file behaves as if there was no profile.

If the AUTOLOGIN_ENABLE parameter in the profile is configured as 2 (or USE_AUTOLOGIN_ID), the IP Deskphone performs a soft reset. After the soft reset, users specified by the AUTOLOGIN[ID_KEY|_AUTHID_KEY|_PASSWD_KEY] configuration parameters are logged in.

If the profile does not contain the AUTOLOGIN_ENABLE parameter, the parameter from the System Configuration file is used.

Note:

Auto login user names and passwords are not printed using the *prtcfg* command as they are not stored in the system configuration file and are secure parameters which should not be displayed.

For more information, see <u>Auto Login parameters in server profiles</u> on page 210.

No soft reset for IPv6 address change

With SIP 4.4, the IP Deskphone no longer performs a soft reset if the phone's IPv6 address(es) changes.

Note:

The IP Deskphone still performs a soft reset if the phone's IPv4 address changes.

If the IP Deskphone receives a new IPv6 address and this address is the best address for any active SIP connection, the following occurs:

- All users associated with this connection are logged out.
- The new address is added to the list of SipApp's addresses.
- The connection is re-established using the new best IPv6 address.
- Users associated with this connection are logged in automatically.

If the IP Deskphone's IPv6 address becomes deprecated, and that IP address is currently in use for any active SIP connections, the following occurs:

- All users associated with this connection are logged out.
- The deprecated address is removed from the list of SipApp's addresses.
- The connection is re-established using some other IPv6 address (if there is one).
- Users associated with this connection are logged in automatically.

In the preceding situations, if there is an active call at the time when the new best IPv6 address is added or the current IPv6 address becomes deprecated, the following message is displayed on the IP Deskphone screen:

Phone will reconnect

instead of SIP reset after call.

Connection is re-established after the active call is completed.

If the IP Deskphone's IPv6 address is removed and the IP address is currently used for any active SIP connection, the following occurs:

- All SIP sessions and active calls associated with this connection are terminated.
- The IP address is removed from the list of SipApp's addresses.
- The connection is re-established using another IPv6 address (if one is available).

RTP/SRTP port changes

There are changes in the allowed values of the RTP_MIN_PORT and RTP_MAX_PORT parameters. (The changes are highlighted in bold font).

 RTP_MIN_PORT — The minimum RTP port value is an integer between 2048 and 65535, exclusive of the restricted SIP ports between 5059 and 5080. The default value is 16384.

 RTP_MAX_PORT — The maximum RTP port value is an integer between 2048 and 65535, exclusive of the restricted SIP ports between 5059 and 5080. The default value is 32764.

Address Book size

In the device configuration file, the MAX_ADDR_BOOK_ENTRIES parameter specifies the maximum number of entries in the Address Book. The default value has been increased from 100 to 1000. The default value is 1000 (allowed values: 0–1000).

SIP 4.4 introduces the new parameter MAX_DOWNLOAD_ADDR_BOOK_ENTRIES. This parameter specifies the maximum number of Address Book entries that can be downloaded from the network in LOCAL Address Book mode. The default value is 1000 (allowed values: 0–1000).

In LOCAL Address Book mode, if MAX_DOWNLOAD_ADDR_BOOK_ENTRIES is greater than MAX_ADDR_BOOK_ENTRIES, then only MAX_ADDR_BOOK_ENTRIES are downloaded from the network.

IP Deskphone users can add manual entries to the Address Book unless the size of the Address Book will exceed the MAX_ADDR_BOOK_ENTRIES parameter. The number of entries that can be added manually is the difference between MAX_ADDR_BOOK_ENTRIES and MAX_DOWNLOAD_ADDR_BOOK_ENTRIES.

For more information, see Address Book on page 211.

Case-insensitive Directory search

SIP Software Release 4.4 introduces the case-insensitive Directory search.

When a Directory search is initiated, the displayed Address Book entries are sorted based on the entered characters, no matter what case was used. When Name search or First Character search methods are used, the first item which fits the entered search criterion is selected. Navigation keys are used to view other items which fit the entered criterion

This enhancement is available for English only.

For more information, see the IP Deskphone User Guide for the desired model.

Additional supported redirect scenarios

SIP 4.4 introduces support for the following redirect scenarios:

- Redirect from IPv4 to IPv6 SIP proxy through UDP, TCP and TLS
- · Redirect from IPv6 to IPv4 proxy through TCP and TLS
- Redirect from IPv6 to IPv6 SIP proxy with the IPv6 address belonging to a different IPv6 scope through UDP

IP Deskphone behavior when DHCPv4/DHCPv6 server is unreachable

If the DHCPv4/DHCPv6 server is unreachable due to the following scenarios:

- IP Deskphone starts and cannot get IPv4 address from DHCPv4 server (cached IP is disabled)
- IP Deskphone starts and cannot get IPv6 address from DHCPv6 server (cached IP is disabled)
- IPv4 address lease expires (cached IP is disabled)
- IPv6 address becomes deprecated and there are no active calls (cached IP is disabled)
- IPv6 address lease expires (cached IP is disabled)

then the following message is displayed on the IP Deskphone display screen:

DHCP server unreachable. Trying to contact...

Note:

If the IPv6 address becomes deprecated and there is an active call, the message is displayed on the IP Deskphone display screen after the active call is released.

When this message is displayed, the user can:

- wait until the IP Deskphone receives the required IP address from DHCP
- open the Device Settings menu (by double-pressing the Services key) and try to re-configure the IP Deskphone

The message window closes automatically when the IP Deskphone receives a new valid IPv4/IPv6 address.

For more information, see DHCP server unreachable on page 338.

Handling fixed keys for multiple calls

In SIP 4.4, the behaviour of the following fixed keys when there are multiple calls has been aligned:

- Line key
- Goodbye/Release button
- Mute
- Hold
- Handsfree
- Headset
- Hookswitch

If there is an active established call, the key action applies to this active call.

When there is no active call, the key action is applied to the call that is highlighted in the list of calls

Phone behavior after fixed key press

If there is one or more calls, the behavior of the IP Deskphone after pressing a fixed key is the following:

Goodbye/Release, Mute, Hold, Headset, Handsfree and Hookswitch:

If there is an active established call, the key action applies to this active call.

If there is no established call, the key action is applied to the call highlighted in the list of calls.

Note:

Some actions may be ignored in certain conditions, such as:

- · pressing the Mute key for a call on hold
- pressing the Goodbye/Release key for a call on local hold
- · pressing the Hold key for an incoming call

Line key:

If there is an incoming call, that call is answered.

If there is an active call, the key press is ignored.

If there are no incoming or active calls, the key action is applied to the call highlighted in the list of calls

Note:

If there is an active established call, and at the same time another call comes in, pressing the Line key puts the active call on hold and the incoming call is answered.

If there are several incoming calls at the same time, the newest call is answered. In order to answer a different call, the user must select the call and press the corresponding soft key.

Soft key:

Soft keys always perform actions on the highlighted call.

For more information, see the IP Deskphone User Guide for the desired model.

Duplicate IPv6 addresses

When the IP Deskphone receives an IP address from the DHCPv6 server and detects that this address is duplicated in the network,

Duplicated IPv6 Address

is displayed on the phone screen. There is an initial timeout of 10 seconds.

When the timeout expires,

Starting DHCPv6

is displayed on the phone screen and the IP Deskphone makes five attempts to contact the DHCP server.

If the DHCPv6 server sends a REPLY message in answer to the DECLINE message, the IP Deskphone removes the duplicate IP address from the list of IPv6 addresses, resources associated with the duplicate address are freed, and the DHCP process restarts.

If no reply is received, the duplicate address is removed, resources associated with the duplicate address are freed, and the DHCP process restarts.

For more information, see Duplicate IPv6 addresses from DHCPv6 server on page 337.

IP Deskphone behavior during a non-consultative transfer

When a user transfers a call, then the IP Deskphone prompts with the following question: "Consult with party?". Pressing the **No** soft key initiates a non-consultative transfer.

With SIP 4.4, a soft key with the caption "Exit" has been added to the transfer dialog for a non-consultative transfer. Pressing this soft key closes the "Transferring...." dialog . The IP Deskphone then displays any local calls, including the transferred call. The transferred call displays a state of "Transferring" until "Transfer successful" or "Transfer failed", is displayed, depending on the transfer results.

For more information, see the IP Deskphone User Guide for the appropriate model.

Debug port security

SIP 4.4 introduces a security change to prevent unauthorized access and intervention in IP Deskphone operation through the debug port (Accessory Expansion Module (AEM) port) when a dongle is used.

The debug port is now disabled by default; enabling the debug port requires access to the **Advanced Diag Tools** menu, which is always protected by the admin password.

The configuration option **Debug port** has been added to the **Advanced Diag Tools** menu. The default value is **disabled**.

For more information, see <u>Debug port security</u> on page 300.

HTTPS support in BootC mode

In SIP 4.4, the following functionality is introduced:

- When a firmware upgrade is performed and there is not enough memory for the upgrade, the IP Deskphone automatically reboots in BootC mode and upgrades in BootC. After the upgrade is completed, the IP Deskphone automatically reboots again and starts up in normal mode.
- Support of HTTPS protocol (for provisioning and firmware upgrades) is added to BootC mode.

Automatic firmware upgrade using BootC

When a firmware upgrade is performed and there is not enough memory to allocate a buffer for new firmware, the IP Deskphone automatically reboots and BootC is loaded.

BootC downloads the provisioning file (for example, 1220SIP.cfg). Only the [FW] section of this file is processed. BootC uses the same settings (for example, Provisioning Server URL, protocol) that are used in normal mode.

BootC performs the firmware upgrade, and the IP Deskphone automatically reboots again.

The IP Deskphone starts up with new firmware in Normal mode.

Note:

Regardless of whether the firmware upgrade was successful or not, the [FW] section does not offer to update during the IP Deskphone reboot.

Support of HTTPS protocol in BootC

HTTPS is supported for downloading provisioning files (for example, 1220SIP.cfg) and firmware images from the Provisioning Server. It uses the embedded and customer certificates that are installed on the IP Deskphone.

Important:

Customer certificates must be installed in Normal mode.

Both mutual authentication and server-only authentication methods are supported.

The TLS connection cipher is set according to the security policy configured on the IP Deskphone (the security policy must be configured in Normal mode). The default cipher is TLS RSA WITH AES 256 CBC SHA.

For more information, see HTTPS support in BootC mode on page 269.

Permanently disable Port Mirroring

SIP 4.4 introduces the ability to permanently disable Port Mirroring through provisioning. When Port Mirroring is permanently disabled, it cannot be enabled in the **Advanced Diag Tools** menu or by using the special key combination.

In SIP 4.4, when the existing PORT_MIRROR_ENABLE configuration parameter is set to NO, the Port Mirroring feature is permanently disabled. The Port Mirroring prompt in the **Advanced Diag Tools** menu is disabled and cannot be modified. This is the default.

If the PORT_MIRROR_ENABLE configuration parameter is set to YES, the Port Mirroring prompt in the **Advanced Diag Tools** menu is enabled and can be modified. If enabled, the Port Mirroring setting survives a soft reboot of the IP Deskhone, but not a power off. If the IP Deskphone is powered off, Port Mirroring becomes disabled.

Toggling Port Mirroring on and off by using the key sequence ([MUTE]-[UP]-[DOWN]-[UP]-[DOWN]-[UP]-[7]) is no longer supported; if Port Mirroring is enabled through provisioning, it can only be turned on and off through the Port Mirroring option in the **Advanced Diag Tools** menu.

For more information, see <u>Port Mirroring</u> on page 347 and <u>Feature configuration commands</u> on page 65.

Improvements in prtcfg pdt command output

SIP 4.4 enables faster debugging as the configuration of a customer's phone can be easily converted into a config file for duplicating problems.

The output can be directly copied to another phone's .cfg file. Displayed names match the device configuration file parameter names. The output now matches the device configuration file format. Previously missing parameters are now listed and detailed server profile information is shown.

SIP Software Release 4.4 provides the following enhancements to the output of the prtcfg pdt command:

- All printed parameters and their values correspond with parameters and values that can be provisioned on the IP Deskphones.
- DHCP information has been added to the system configuration section of the command output.
- The parameter device certificate version has been added to the command output.
- Domain-related information has been grouped together and is now separated by "# comments" for ease of use.
- Detailed configured server profiles information has been added to the command output.
- The displayed values of ADMIN_PASSWORD and other passwords have been replaced by "***" in the command output

Miscellaneous changes for IP Deskphones

Default input mode in Address Book

The default input mode for a telephone number has been changed to 123 when adding a new entry to the Address Book of an IP Deskphone.

User ID on IP Deskphone display

The User ID is still displayed near the Primary DN key of the IP Deskphone display, but is no longer displayed in the Context field.

Releasing a call on hold

An IP Deskphone user can no longer release a call on hold by pressing the Goodbye key. The IP Deskphone user is now required to retrieve the call from hold and then release it by pressing the Goodbye key or hanging up the handset.

Improved user interface during multiple calls

SIP 4.4 brings a more predictable user interface operation to the IP Deskphone. Fixed key presses (for example, line, hold, release, mute, headset, hookswitch) are now applied to the active call. If there is no active call, the action is applied to the highlighted call.

Instant Message display

The Instant Message Details window on the IP Deskphone now uses the full display area.

CALL_ORIGIN_BUSY parameter

This parameter determines if the user is presented with an incoming call when entering the address of an outbound call.

In SIP 4.4, it is no longer necessary for the DOD_ENABLE parameter to be set to YES to enable the CALL_ORIGIN_BUSY parameter.

Avaya Aura®-specific features

This section contains information on SIP 4.4 features and functionality specific to 1200 Series IP Deskphones with SIP 4.4 Software in an Avaya Aura® environment.

Presence support for 1200 Series IP Deskphones

SIP 4.4 introduces support for the Presence feature for 1200 Series IP Deskphone users on Avaya Aura[®] with Avaya Presence Server (PS).

The Presence feature is configured in SIP 4.4 with the following new configuration parameters:

- RPID_PRESENCE_ENABLE <YES/NO>
- PRES SERVER IP <IP address of Presence Server>

If the RPID_PRESENCE_ENABLE parameter is set to YES, RPID-based subscription and notification messages, required for Avaya Presence Services, are sent.

PRES_SERVER_IP parameter defines the IP address of the Avaya Presence Server.

Important:

If RPID PRESENCE ENABLE is configured as YES:

- The IP Deskphone must be configured to use TLS for connection to the SIP proxy.
- USE PUBLISH FOR PRESENCE must be set to YES.
- USE_DEFAULT_DEV_CERT must be set to YES to use the default device certificate for the TLS connection to Avaya Aura to work with the contact list stored on Avaya Aura Session Manager.
- ENABLE SERVICE PACKAGE must be set to PPM.
- In the phone's Communication Profile, check **Presence Profile** and select the appropriate Presence Server from the drop-down list.

Presence states

Presence dialog has been expanded to include the list of activities according to RFC4480.

The following activities are available when RPID PRESENCE ENABLE is set to YES:

Appointment	Permanent absence
Away	Playing
Breakfast	Presentation
Busy	Shopping
Dinner	Sleeping
Holiday	Spectator
In transit	Steering
Looking for work	Travel
Lunch	TV
Meal	Vacation
Meeting	Working
On the phone	Worship
Performance	Unknown

To set the desired presence state and activity, the IP Deskphone user must open the Presence dialog, select the presence state (Connected or Unavailable) and then select the desired activity. Any combination of presence state and activity can be selected.

Related Links

<u>Avaya Aura® support for 1200 Series IP Deskphones</u> on page 368 Presence status in Address Book on page 24

Presence status in Address Book

The status dialog of the Address Book displays the presence state of contacts designated as Friends. In SIP 4.4, the IP Deskphone Address Book displays the presence state of Friends if RPID_PRESENCE_ENABLE is set to YES.

Phone state

Phone state is determined automatically, based on notifications received from Avaya Presence Server. Phone state can be one of the following:

- On hook when the phone handset is on hook; there are no active calls
- On a call the user is on a call
- Do Not Disturb when the user activated Do Not Disturb mode
- Unknown

Note:

Phone state does not depend on the presence state and activity selected by the end user.

Note:

 The 1200 Series IP Deskphones support more presence states than the Aura Presence Server (PS); activity detail appears on the 1100 Series and 1200 Series IP Deskphones but not on Avaya 96xx Series phones. • Idle 1200 Series IP Deskphones appear as "offline" in the Avaya 96xx Series phones presence status; however, Busy, On the Phone and Away activities are displayed correctly.

Related Links

Presence support for 1200 Series IP Deskphones on page 23

Personal Profile Manager support

SIP 4.4 introduces support of the Personal Profile Manage (PPM) for Avaya Aura Communication Manager/Session Manager.

The PPM) is a web service that runs as part of the Avaya Aura® Session Manager and the System Manager. PPM processes SOAP messages over HTTP/HTTPS with digest authentication.

PPM is responsible for maintaining and managing an end user's personal information in the system. This information includes (but is not limited to) contact list information, profile information, session history, access control lists, and other permissions management. In addition to communicating with other server components for managing the data within the infrastructure servers, the PPM also interfaces directly with end clients.

SIP 4.4 supports the following functionality with PPM:

- · retrieving contact list from PPM
- · adding and deleting contacts
- updating contact
- · searching user
- retrieving E911 numbers
- PPM reboot mechanism

Configuration parameter

The ENABLE_SERVICE_PACKAGE configuration parameter is expanded to include the value PPM, which switches the mode to obtain PPM data.

Related Links

Avaya Aura® support for 1200 Series IP Deskphones on page 368

Configuration on page 373

Contact lists and PPM on page 373

Emergency numbers on page 373

Global search with PPM on page 374

PPM reboot mechanism on page 374

Global search with PPM

When PPM is enabled, and a global search is initiated from the IP Deskphone, PPM allows the IP Deskphone to search the Session Manager database for administered users. This search is based on search criteria sent in the request. IP Deskphone users can search using the following criteria:

- User Name (login name of the user; for example, 508@abc.com)
- First Name
- Last Name
- Phone Number

All users who correspond to the submitted criteria are retrieved from the database and displayed as list. It is possible to call any contact in the list, save any contact from the list to the Adress Book, and view the contact details

A maximum of 250 contacts can be loaded from PPM using global search.

Embedded device certificates

TLS connection with Avaya Aura[®] Session Manager requires mutual authentication by default. Mutual authentication requires proper Certificate Authority (CA) and device certificates to be installed on every IP Deskphone.

SIP 4.4 includes a default device certificate in the firmware, allowing easy connection to Avaya Aura through Session Manager using TLS . The IP Deskphones already have an embedded CA certificate which is trusted by Avaya Aura[®]; the embedded device certificate eliminates the need for customers to generate and install device certificates manually.

If used, embedded device certificate information is displayed in the IP Deskphone and in the output of appropriate PDT commands.

The default embedded device certificates are trusted by the Avaya Aura® system. If Aura is configured so that default certificates are replaced by customer certificates, then appropriate CA and device certificates must be installed on the IP Deskphones.

Important:

The default embedded device certificates are trusted by the Avaya Aura® system. If Aura® is configured so that the default certificates are replaced by customer certificates, then the appropriate CA and device certificates must be installed on the IP Deskphones as well.

Configuration

To support the embedded device certificate, SIP 4.4 introduces the following parameter: USE DEFAULT DEV CERT [YES/NO]

- YES Use the default device certificate if no customer device certificate is installed.
- NO Do not use the default device certificate (default).

This parameter controls the use of the default device certificate for HTTPS/TLS connections. The default value is NO. It is configured in the device configuration file.

SRTP support with Avaya Aura®

SIP 4.4 introduces support for SRTP with Avaya Aura®.

To use SRTP, you first have to be using TLS. That is, you cannot have secure media without using secure signalling.

The following SRTP modes are supported:

- Secure Only
- Best Effort Capability Negotiation

Configuration

SIP 4.4 introduces the following parameter to support SRTP on Avaya Aura®:

AVAYA_AURA_MODE_ENABLE [YES | NO]

The command specifies if Avaya Aura®-specific features are active on the IP Deskphone or not. The default value is NO. It can be configured through the device configuration file and through server profiles.

- YES Avaya Aura-specific features are active.
- NO Avaya Aura-specific features are not active.
- Important:

In the device configuration file, the parameter MKI must be set to NO.

Session Border Control support

Session Border Control (SBC) enables secure access for remote users.

SIP 4.4 supports the Avaya SBC for Enterprise 6.2 when the IP Deskphone is configured to use TLS.

Other changes

Migration information

The following IP Deskphone migration information has been added to this document:

 UNIStim IP Deskphone migration from CS 1000 to Avaya Aura[®]. See <u>UNIStim IP</u> <u>Deskphone migration from CS 1000 to Avaya Aura</u> on page 391. 2. Migrating IP Deskphones with UNIStim firmware from CS 1000 to IP Office. See Migrating IP Deskphones with UNIStim firmware from CS 1000 to IP Office on page 400.

User provisioning

Information on IP Deskphone user provisioning using System Manager 6.3 FP2 has been added to this document. See <u>User provisioning using System Manager 6.3 FP2</u> on page 406.

Adding the IP Deskphone to Avaya Aura

A Quickstart Guide — Add a 1200 Series IP Deskphone to Avaya Aura® has been added to this document. See Adding a new IP Deskphone to Avaya Aura® on page 411.

Configuring FACs and FNEs

Information on configuring FACs and FNEs on Avaya Aura® for the IP Deskphones has been added to this document. See <u>Configuring FACs and FNEs for the IP Deskphones</u> on page 414.

Creating speed dial lists

Information on creating a speed dial list on the IP Deskphone has been added to this document. See <u>Creating a speed dial list</u> on page 418.

Additional information

An appendix containing a listing of reference material and additional documentation has been added to this document. See Reference and additional documentation on page 421.

Revision history		
July 2015	Standard 06.05. This document is up-issued for the following changes:	
	 Remove information about support of Avaya one-X client software. 	
	Add limits for a Speed Dial List.	
March 2015	Standard 06.04. This document is up-issued for the following changes:	
	 Add SURV_SIP_SVR_ENABLE and TCP_SIP_PING_FAILBACK to the list of server and network configuration commands. 	
	 Add definitions for the SURV_SIP_SVR_ENABLE, BLIND_TRANSFER_EARLY_RELEASE, DST_START, DST_STOP, and TCP_SIP_PING_FAILBACK server and network configuration commands. 	
	 Add CALL_ORIGIN_BUSY, BLIND_TRANSFER_EARLY_RELEASE, DST_START, DST_STOP, LINE_KEY_SCROLLING, and USE_CONTACT_IN_REFERTO to the list of feature configuration commands. 	
	Add definitions for the LINE_KEY_SCROLLING, and USE_CONTACT_IN_REFERTO feature configuration commands. The state of	

Table continues...

	11 1 4 1 5 W
	 Update definitions for the DST_ENABLED and TIMEZONE_OFFSET feature configuration commands.
January 2015	Standard 06.03. This document is up-issued to add the following items:
	 Change the definition and default setting of the MAX_RING_TIME option.
July 2014	Standard 06.02. This document is up-issued to add updated information to the FAST_EARLY_MEDIA_ENABLE option.
November 2013	Standard 06.01. This document is up-issued to support SIP Software Release 4.4.
September 2013	Standard 05.02. This document is up-issued to reflect changes in technical content for the DEF_AUDIO_QUALITY parameter and a note has been added to Codecs preferences on the IP Deskphone on page 242.
June 2013	Standard 05.01. This document is up-issued to support SIP Software Release 4.3 Service Pack 2 (SP2).
April 2013	Standard 04.05. This document is up-issued to reflect changes in technical content in the section "IP Deskphone bug logging/recovery commands".
November 2012	Standard 04.04. This document is up-issued to remove references to Broadsoft content,
April 2012	Standard 04.03. This document is up-issued for changes to the Multiuser and Multiple Appearance Directory Number sections, the IP Deskphone to Server Options section and the IP Deskphone Security section.
February 2012	Standard 04.02. This document is up-issued to include revised content in the section IP Deskphone to Server options on page 103.
December 2011	Standard 04.01. This document is up-issued to support SIP 4.3.
September 2011	Standard 03.07. This document is up-issued to reflect changes in technical content for the inclusion of the FAIL_BACK_TO_PRIMARY configuration parameter.
August 2011	Standard 03.06. This document is up-issued to to reflect changes in technical content for Troubleshooting.
August 2011	Standard 03.05. This document is up-issued to reflect changes in technical content. References to the Software Web Manager have been removed.
May 2011	Standard 03.04. This document is up-issued to reflect changes in global power supply information and information on supported languages.
May 2011	Standard 03.03. This document is up-issued to reflect changes in technical content for:
	AUTOLOGIN_ID_KEY parameters
	reset codecs to default

	 modifying the SIP provisioning file
April 2011	Standard 03.02. This document is up-issued to reflect changes in technical content for Diagnostics and Troubleshooting information.
April 2011	Standard 03.01. This document is up-issued to support SIP Software Release 4.1.
August 2011	Standard 02.07. This document is up-issued to reflect changes in technical content. References to the Software Web Manager have been removed.
January 2011	Standard 02.03. This document is published to support SIP Software Release 4.0.
January 2011	Standard 02.02. This document is up-issued to support SIP Software Release 4.0.
October 2010	Standard 02.01. This document is up-issued to support SIP Software Release 4.0.
October 2010	Standard 01.03. This document is up-issued to reflect changes in the configuration of TLS for SIP.
September 2010	Standard 01.02. This document is up-issued with minor revisions to support SIP Software Release 3.2.
August 2010	Standard 01.01. This document is a new document and is issued to support SIP Software Release 3.2.

Chapter 2: Customer Service

Visit the Avaya Web site to access the complete range of services and support that Avaya provides. Go to http://www.avaya.com or go to one of the pages listed in the following sections.

Navigation

- Getting technical documentation on page 31
- Getting product training on page 31
- Getting help from a distributor or reseller on page 31
- Getting technical support from the Avaya Web site on page 32

Getting technical documentation

To download and print selected technical publications and release notes directly from the Internet, go to http://www.avaya.com/support.

Getting product training

Ongoing product training is available. For more information or to register, you can access the Web site at http://www.avaya.com/support. From this Web site, you can locate the Training contacts link on the left-hand navigation pane.

Getting help from a distributor or reseller

If you purchased a service contract for your Avaya product from a distributor or authorized reseller, contact the technical support staff for that distributor or reseller for assistance.

Getting technical support from the Avaya Web site

The easiest and most effective way to get technical support for Avaya products is from the Avaya Technical Support Web site at http://www.avaya.com/support.

Chapter 3: Introduction to this guide

Subject

This document describes how to install, configure, and provision the Avaya 1220 IP Deskphone and Avaya 1230 IP Deskphone for use on a SIP network. The Avaya 1220 IP Deskphone and Avaya 1230 IP Deskphone are collectively known as Avaya 1200 Series IP Deskphones. In this document, the Avaya 1220 IP Deskphone and Avaya 1230 IP Deskphone are referred to as IP Deskphones.

Part II

Part II of this document, <u>Avaya Aura® support for 1200 Series IP Deskphones</u> on page 368, provides information specific to the 1200 Series IP Deskphones with SIP Software on an Avaya Aura® system.

Part III

Part III of this document, provides information on how to migrate 1200 Series IP Deskphones in the following scenarios:

- UNIStim IP Deskphone migration from CS 1000 to Avaya Aura on page 391
- Migrating IP Deskphones with UNIStim firmware from CS 1000 to IP Office on page 400

Appendix information

The following appendices provide additional information:

- User provisioning using System Manager 6.3 FP2 on page 406
- Quickstart Add a 1200 Series IP Deskphone to Avaya Aura® on page 411
- Configuring FACs and FNEs for the IP Deskphones on Avaya Aura® on page 414
- Creating a speed dial list on page 418
- Reference and additional documentation on page 421

Intended audience

This administration guide is intended for system administrators of the Avaya 1220 IP Deskphone and Avaya 1230 IP Deskphone with a basic understanding of SIP. This guide is not intended for end users of the Avaya 1220 IP Deskphone and Avaya 1230 IP Deskphone. Many of the tasks outlined in the guide influence the function of the IP Phone on the network and require an understanding of telephony and Internet Protocol (IP) networking.

Acronyms

This guide uses the following acronyms:

Table 1: Acronyms used

AAA	Authentication, Authorization, and Accounting
ALG	Application Layer Gateway
BER	Bit Error Rate
CA	Certificate Authority
CN	Common Name
CRL	Certificate Revocation List
CTL	Certificate Trust List
DCP	Device Certificate Profile
DET	Distinguished Encoding Rules
DHCP	Dynamic Host Configuration Protocol
DN	Distinguished Name
DND	Do Not Disturb feature
DNS	Domain Name System
DRegex	Digit Regular Expression
DSCP	Differentiated Services Code Point
EAP	Extensible Authentication Protocol
ECR	Error Collection and Recovery
EJBCA	Enterprise Java Bean Certificate Authority
ERE	Extended Regular Expressions
FQDN	Fully Qualified Domain Name
FTP	File Transfer Protocol
GARP	Gratuitous Address Resolution Protocol
GUI	Graphical User Interface

Chapter 4: Overview

Introduction

This chapter describes the hardware and software features of the Avaya 1220 IP Deskphone and Avaya 1230 IP Deskphone with SIP Software Release 4.4. In this document, Avaya 1200 Series IP Deskphones are referred to as IP Deskphones.

SIP overview

Session Initiation Protocol (SIP) is a signaling protocol used for establishing multimedia sessions in an Internet Protocol (IP) network.

SIP is a text-based protocol similar to HTTP and SMTP. With the introduction of SIP to IP Deskphones, telephony integrates easily with other Internet services. SIP allows the convergence of voice and multimedia.

Avaya 1200 Series IP Deskphones with SIP Software

The Avaya 1200 Series IP Deskphones connect to an IP network using an Ethernet connection. All voice and signaling information is converted into IP packets and sent across the network.

IP Deskphones can be ordered with UNIStim software installed or with SIP software installed. UNIStim software and SIP software use the same hardware, but the order number of an IP Deskphone with UNIStim software is different from the order number of an IP Deskphone with SIP software.

If you have an IP Deskphone with UNIStim software, you can convert the software to SIP software. For information on how to convert the UNIStim software to SIP software and download the most recent version of SIP software, see Upgrade and convert the IP Deskphone software on page 122).

This chapter explains how to:

- configure the provisioning server and the DHCP server. Note: The provisioning server is where the software and the configuration files for the IP Deskphones.
- convert an IP Deskphone with UNIStim software to an IP Deskphone with SIP software
- provision the Device Settings parameters on the IP Deskphones with SIP software

Important:

Converting the software on an IP Deskphone from UNIStim software to SIP software overwrites the UNIStim software. The IP Deskphone cannot operate in both modes simultaneously. A switch from UNIStim to SIP software or SIP to UNIStim software requires a software reload.

The following figure shows the main components of the 1230 IP Deskphone with SIP software.

Figure 1: Avaya 1230 IP Deskphone with SIP Software

Related documentation

The Avaya 1200 Series IP Deskphones with SIP Softphone User Guide explains how to do the following:

- use the context-sensitive soft keys and Navigation key cluster
- · enter text
- · use the address book
- · access and use the call inbox and call outbox
- configure and use instant messaging
- receive, identify, answer, redirect, decline, or ignore an incoming call

- operate hold, three-way calling, call transfer, and call park
- use other features such as speed dial, call forward, do not disturb, and setting up conference calls
- use the Multi line appearance/Bridged line appearance feature

For more information about using the IP Deskphones, see Avaya 1220 IP Deskphone with SIP Software User Guide, NN43170-101, Avaya 1230 IP Deskphone with SIP Software User Guide, NN43170-102.

The Avaya 1200 Series IP Deskphones Getting Started Card included in the box with the IP Deskphone explains how to do the following:

- · connect the AC power adapter
- control the volume when answering a call
- make a call using the handset
- · make a call with the headset or using handsfree
- use hold and mute
- set the contrast
- · set the language

Installation overview

To install the IP Deskphone with SIP Software, three basic steps are required.

- Configure the provisioning server and, optionally, the DHCP server. The function of the
 provisioning server is to provide configuration options to every IP Deskphone throughout the
 network. The DHCP server can be configured to provide basic network-configuration data or
 a more comprehensive set of network-configuration data for the IP Deskphone with SIP
 Software.
- 2. Load SIP Software on the IP Deskphone.
- Configure the initial network-configuration parameters on the IP Deskphone with SIP Software.

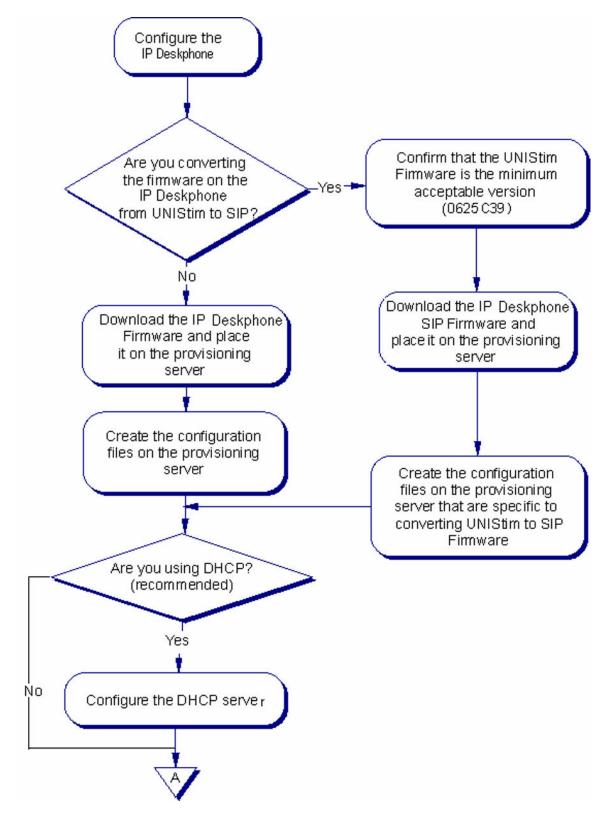

Figure 2: Installation of Avaya 1230 IP Deskphone with SIP Software, page 1 of 2

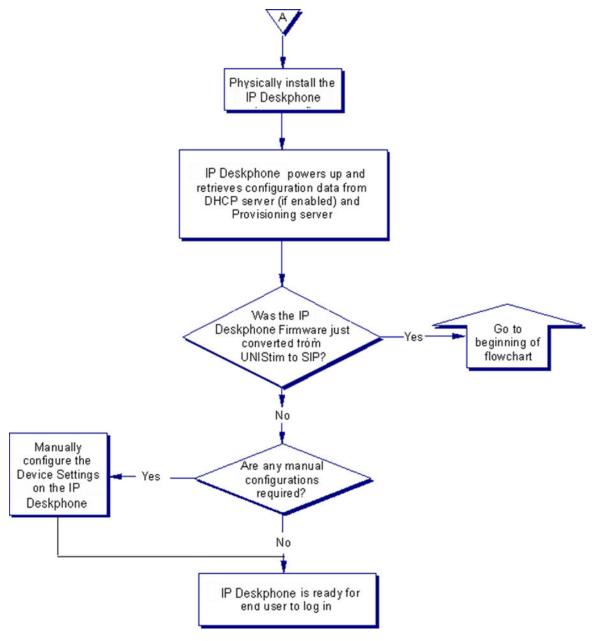

Figure 3: Installation of Avaya 1230 IP Deskphone with SIP Software, page 2 of 2

Chapter 5: Before installation

Introduction

This chapter features a checklist of tasks you must complete before you install SIP Software on the Avaya 1200 Series IP Deskphone.

Preinstallation

Complete the following checklist.

Preinstallation checklist

- 1. Read and become familiar with your IP Deskphone User Guide.
- 2. Ensure there is one IP Deskphone boxed package for each IP Deskphone being installed.
- 3. Ensure that the IP Deskphone box includes the following:

Table 2: IP Deskphone box contents

Item	Avaya 1220 IP Deskphone order number	Avaya 1230 IP Deskphone order number
IP Deskphone Graphite with icon keys without PS (SIP) (RoHS)		
IP Deskphone Graphite with English keys without PS (SIP) (RoHS)		
Handset, Charcoal	NTYS09AA70	
Handset cord, Charcoal	NTYS10AA70	
Footstand kit, Charcoal	NTYS11AA70	
Phone number label and lens kit	NTYS12AA	
2.3 m (7 ft) CAT5 Ethernet cable	NTYS13AA	

The IP Deskphone can be powered either by Power Over Ethernet (POE) or through an external AC power adapter. Order the external AC adapter global power supply separately.

Warning:

Do not use the AC adapter if you are connected to a Power over the Ethernet (PoE) connection. Only use the AC adapter global power supply when you do not have a PoE connection.

If the IP Deskphone has a Graphical Expansion Module connected, the type of power supply to the IP Deskphone controls what is functional on the Expansion Module. The Expansion Module backlight can only light when the AC adapter global power supply is present.

On the other hand, either the AC adapter global power supply or Power over Ethernet (PoE) to the IP Deskphone will power all of the Expansion Module's other functionality. To have the backlight on for the Expansion Module, the IP Deskphone should be powered by AC global power supply only.

Table 3: Avaya 1200 Series IP Deskphones parts list (order separately)

CPC code	PEC code	Product description
	NTYS17xxE6	IP Deskphone Global Power Supply (2000 series, 1100 series, 1200 series) (RoHS)
N0089603	NTYS14AAE6	Standard IEC Cable - North America (RoHS)
A0781922	NTTK15AA	Standard IEC Cable – Australia / NZ (Note: RoHS not required)
N0114986	NTTK16ABE6	Standard IEC Cable – Europe
N0109787	NTTK17ABE6	Standard IEC Cable – Switzerland
N0109881	NTTK18ABE6	Standard IEC Cable – UK
N010978	NTTK22ABE6	Standard IEC Cable – Denmark
A0814961	A0814961	Standard IEC Cable - Argentina (Note: RoHS not required)
N0118951	NTTK26AAE6	Standard IEC Cable - Japan

Caution:

The IP Deskphone must be plugged into a 10/100-BaseT Ethernet jack. Severe damage occurs if this IP Deskphone is plugged into an ISDN connection.

- 4. Ensure that the location meets the network requirements:
 - a DNS server and a DHCP server with DHCP relay agents installed, configured, and running. Using DHCP and DNS servers with a CS 2000 network is recommended but not mandatory.
 - An Ethernet connection to a network with an appropriate SIP proxy server.
 - One of the following file servers used as a Provisioning server:
 - TFTP server
 - FTP server
 - HTTP server

Only a TFTP server can be used for an initial UNIStim-to-SIP Software conversion. An IP Deskphone with SIP Software can operate with a TFTP, FTP, or HTTP file server.

Chapter 6: Creating the provisioning files

Important:

If you have UNIStim software on your IP Deskphone, the software must be converted from UNIStim to SIP before you proceed with the following instructions. See the chapter Upgrade and convert the IP Deskphone software on page 122 for instructions on how to convert the software on an IP Deskphone from UNIStim to SIP.

If the IP Deskphone is installed with SIP Software, further SIP Software upgrades can be done with a TFTP, an FTP, or an HTTP server.

How provisioning works

Provisioning is performed without interaction with the Call Server. The Avaya 1200 Series IP Deskphone with SIP Software connects directly with the provisioning server in order to retrieve software files and configuration files. In this case, the provisioning server is not to be confused with the IP Client Manager on the Call Server. The methods of provisioning are as follows:

- Automatic provisioning at power-up: After the IP Deskphone powers up or is reset, it checks the provisioning server for the latest files.
- Provisioning through user interaction: While logged in to the phone, the user can manually check for updates by pressing the Services context-sensitive soft key and selecting Check for Updates.

Caution:

You must not request a provisioning update while on an active call because the phone may reboot during processing of the received configuration data. While the phone checks for an update, it activates Do Not Disturb (DND). When the update is finished, DND is deactivated.

 Automatic provisioning at a preconfigured time: The IP Deskphone with SIP Software checks for updates every 24 hours, at a time specified by a parameter in the device configuration file.

The following is the sequence of events when provisioning updates occur.

The IP Deskphone with SIP Software:

- 1. connects to the provisioning server
- 2. retrieves the provisioning file (for example, 1230SIP.cfg) from the provisioning server

 reads and acts upon the content of the provisioning file and decides whether any other file is needed, based on a set of rules. If files need to be downloaded to the IP Deskphone, a new file transfer session starts for each file to be downloaded. The provisioning file (for example, 1230SIP.cfg) can contain commands that prompt for confirmation before a file is downloaded.

Download the SIP software

To download the SIP software, perform the following procedure.

Downloading SIP software for the IP Deskphone

- 1. Go to http://www.avaya.com/support.
- 2. Log on to the Avaya Web site with a valid Avaya User ID and Password.
 - The **Support** page appears.
- 3. Enter the IP Deskphone type in the **Knowledge and Solution Engine** box.
- 4. Select **Software** in the **All types** scroll-down menu.
- 5. Press the gray arrow at the end of the **Knowledge and Solution Engine** box to obtain the **Search Results**.
- 6. From **Search Results**, select and download the appropriate version of the SIP software for the IP Deskphone; for example, **SIP IP Deskphone 1230 Release SIP12x004.01.03.00.bin**.
- 7. Place the selected software on the provisioning server.

Create the SIP provisioning files

The provisioning file is downloaded from the provisioning server to the IP Deskphone every time the IP Deskphone checks for updates. The provisioning file is a clear text file that has the naming convention 12xxSIP.cfg. The provisioning file contains various sections.

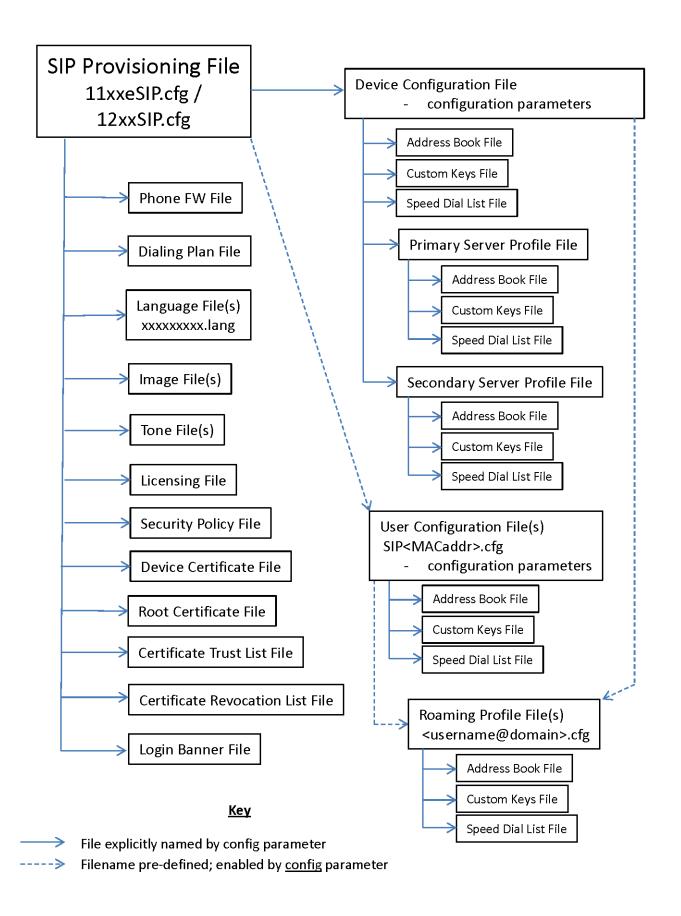

The following is a graphical representation of the sections that can be contained in a provisioning file. It illustrates the files which can be explicitly named as well as those that have pre-defined names.

One thing to note is the address book, custom keys and speed dial list files can be associated with different components. The phone downloads the these configuration files on bootup or user registration (depending on the file) and then uses the parameters from them as required. An address book, custom keys and speed dial list can be associated with:

- The overall device configuration file generally used for the phone model.
- The primary server profile used when the phone connects to the primary server.
- The secondary server profile used when the phone connects to the secondary server.
- Each User Configuration file used for a specific phone.

• Each Roaming Profile file – used for a specific user login.

The configuration can be as complex or as simple as you need. For instance, all phone models in a system can point to the same address book, custom keys and speed dial list files. Or you can individualize things to specify individual files for a user, a particular phone, when a phone is connected to a particular server or even when a user is logged into a particular phone. A common application of this is to configure specific lists of features or autodials for different phones, different users, or when a phone is connected to different systems.

The following is an example of an IP Deskphone provisioning file:

[DEVICE_CONFIG] DOWNLOAD_MODE AUTO VERSION 000001 FILENAME 12x0DeviceConfig.dat	Device configuration section
[FW] DOWNLOAD_MODE AUTO VERSION SIP112004.04.09.00 PROTOCOL TFTP FILENAME SIP12x004.04.09.00.bin	Firmware load section
[DIALING_PLAN] DOWNLOAD_MODE AUTO VERSION 000024	Dialing plan section
[LANGUAGE] DOWNLOAD_MODE AUTO DELETE_FILES YES VERSION 000024 FILENAME French.lng FILENAME Portugues.lng FILENAME Czech.lng FILENAME Russian.lng	Language files section
[TONES] DOWNLOAD_MODE AUTO DELETE_FILES YES VERSION 000003 FILENAME ring.wav	Tone files section
[LICENSING] DOWNLOAD_MODE AUTO VERSION 000001 FILENAME ipctoken*.cfg	Licensing section
[SEC_POLICY] DOWNLOAD_MODE AUTO VERSION 000001 PROTOCOL TFTP FILENAME SecPolicy.txt	Security Policy section
[DEV_CERT] DOWNLOAD_MODE AUTO VERSION 000001 PROFILE 1 PURPOSE -1 PROTOCOL TFTP FILENAME devcert*.p12	Device certificate section
[USER_KEYS] DOWNLOAD_MODE AUTO VERSION 000001 PROTOCOL TFTP FILENAME myRootCa.pem	Root certificate section
[CTL] DOWNLOAD_MODE AUTO VERSION 000001 PROTOCOL TFTP FILENAME ctl.txt	Certificate Trust List section
[CRL] DOWNLOAD MODE FORCED VERSION 000002 FILENAME CRL.pem PROMPT YES	Certificate Revocation List section Table continues

[LOGGIN_BANNER] DOWNLOAD_MODE AUTO VERSION 000002 FILENAME warning_banner.txt	Login banner section
[USER_CONFIG] DOWNLOAD_MODE FORCED VERSION 000001	IP Deskphone-specific configuration files

The following table lists the supported sections in a provisioning file.

Table 4: Provisioning file supported sections

[DEVICE_CONFIG]	Device configuration file
[FW]	Firmware image
[DIALING_PLAN]	Dialing plan
[LANGUAGE]	Downloadable language files (more than one can be specified in each section)
[TONES]	Downloadable tones (.wav files)
[LICENSING]	License files
[POLICY]	License policy files
[DEV_CERT]	Device certification files
[USER_KEYS]	User keys files
[LOGIN_BANNER]	Login banner
[USER_CONFIG]	IP Deskphone-specific configuration files

Provisioning file sections

Provisioning is performed using the commands in the 12x0SIP.cfg configuration file. The configuration file can have multiple sections.

Note:

The maximum length of a line item in the configuration file is 80 characters. If a line item with more than 80 characters is encountered when parsing the configuration file, the remaining portion of the file following that line item is ignored.

The '#' symbol is used to indicate a comment. Anything before a '#' symbol is a comment.

Each section in the configuration file defines rules for different file types. A section starts with a [SECTION NAME] to specify rules for each file type. For example: [FW].

A section is a mandatory field. Parsing of download rules for each file type starts with finding this key word. Currently, the following sections are supported by the IP Deskphone with SIP Software:

- [DEVICE_CONFIG] used to configure various parameters in the IP Deskphone.
- **[FW]** image files originate from Avaya only and are authenticated during software download. If the FW authentication fails, the IP Deskphone displays an error message and continues operation with the existing FW image.
- [DIALING_PLAN] used for configuring dialing patterns and the format of originated URIs in the SIP message.

• **[LANGUAGE]** — simple text files containing all text prompts used by the IP Deskphone. Language files are used for the localization of the IP Deskphone without software upgrade. Each language file has a header that contains a software load version with which this file is associated. Language files are signed by Avaya and are authenticated by the software for security reasons.

The following languages are supported. The language filename used in this section has the format <language>.ing where <language> is the language name from the following list.

- Czech
- Danish
- Dutch
- Finnish
- French
- German
- Hungarian
- Italian
- Japanese
- Latvian
- Norwegian
- Polish
- Portuguese
- Russian
- Slovenian
- Spanish
- Swedish
- Turkish
- **[TONES]** standard in the Telecommunications Standardization sector of the International Telecommunications Union (ITU-T). The IP Deskphone supports custom tone files. The tone files must be WAV files with the following specification: A-law or u-law (8.0 kHz, 8-bit, mono or 16.0 kHz, 16 bit mono). The WAV files can be created and downloaded to the IP Deskphone. These files are not authenticated by the IP Deskphone.
- [LICENSING] section for the licensing files
- [SEC_POLICY] section for downloading a file, which contains rules that define the security policy for the IP Deskphone. After the file downloads, the IP Deskphone verifies that the file is signed by a trusted entity before it accepts the values in the security policy file.
- [DEV_CERT] section to enable an IP Deskphone to import the PKCS# 12 file.
- [CTL] section to enable an IP Deskphone to download the Certificate Trust List.
- **[USER_KEYS]** section to enable an IP Deskphone to download a customer root certificate.
- [LOGIN_BANNER] section for the log in banner files

• [USER_CONFIG] — section for IP Deskphone-specific configuration file. This section header triggers the IP Deskphone to attempt to download an IP Deskphone-specific user configuration

IP Deskphone-specific configuration files support customizing the IP Deskphone on a per-IP Deskphone/user level. Parameters in the device configuration file can be overwritten with a IP Deskphone-specific configuration file. If the IP Deskphone encounters a IUSER CONFIGI section while parsing the 12x0SIP.cfg configuration file, the IP Deskphone downloads the IP Deskphone-specific configuration file SIP<mac id>.cfg.

Mandatory keywords in the provisioning file are:

• VERSION [xxxxxx] — where xxxxxx is a six- to ten-digit number representing the version of the file on the server. The version of the module is specified in this field. The command is used for version comparison in AUTO mode. VERSION is mandatory for all sections. In the FW section, the software version of the load located on the provisioning server must be entered in this field. For all other sections, VERSION is just a counter that can be incremented if it is necessary to download a new file version.

Note:

The version number of the firmware [FW] can be longer, up to 19 characters, and must follow this format:

Example: SIP12x004.04.09.00

Caution:

The version number is stored permanently on the IP Deskphone until a higher version number is downloaded. However, if the **Forced** option is in the 12x0SIP.cfg file, then the file is forced to download and the version number in the IP Deskphone is overwritten with the version number in the 12x0SIP.cfg file.

- DOWNLOAD_MODE [AUTO | FORCED] defines whether the version is checked. This command is optional. If this command is not present, AUTO mode is used as the default.
 - AUTO This mode compares the version of the module from the VERSION field and the version of the module version stored in the FLASH memory of the IP Deskphone. The file download is initiated only if the version specified is higher than the current version stored in the IP Deskphone. If the version is not applicable, as in the case of language files, the date of the file must be used for the decision.

Caution:

The version number stored in the FLASH is permanent until a higher number is downloaded from the provisioning file or you select Srvcs > Check for Updates on the IP Deskphone.

- FORCED - This mode forces the software download process. FORCED can be used for software downgrade procedures.

Note:

In FORCED or AUTO DOWNLOAD MODE, the version number is overwritten with each software download.

• **FILENAME [filename]** — specifies the file name to be downloaded for this section. For the language and tone section, the use of multiple filenames is allowed.

Optional keywords in the provisioning file are:

- **PROMPT [YES | NO]** used to indicate if the IP Deskphone should prompt the user for an update before the operation is performed. This command is optional with the default configured as NO.
 - YES enables the prompt
 - NO disables the prompt
- **PROTOCOL [TFTP | FTP | HTTP]** defines the protocol used to download the file. The IP Deskphone with SIP Software supports TFTP, FTP and HTTP protocols for file download. This command is optional. If it is not present, the default protocol TFTP is used.

! Important:

When using the TFTP protocol to transfer the software image, the average round trip time must be < 75 ms. The IP Deskphone times out and aborts the software download if the total download time is less than 10 minutes.

If the average round trip time is less than 75 ms, use the FTP or HTTP protocol to transfer the software image.

If using FTP or HTTP, then **SRV_USER_NAME** and **SRV_USER_PASS** are also key words. These commands specify the credentials used to log on to the file server for file download. If not present, the protocol default credentials are used (no credentials for TFTP and HTTP and anonymous with no password for FTP).

- SERVER_IP [address] allows the IP Deskphone to connect to the specified IP address or name of the server for which the file can be downloaded. If the address is not specified, the SERVER_IP that is used is the same SERVER_IP that is used to download the provisioning file.
- **DELETE_FILES [YES | NO]** if present, erases the language and tone files stored in the IP Deskphone before new files are downloaded. Otherwise, new files with different names are added without erasing existing files. This command is optional. Note that there is a hard limit of 5 language files and 5 tone files that can be stored in the IP Deskphone. When the limits are exceeded, no new file can be accepted for download.
 - YES erases the existing language and tone files
 - NO does not erase existing language and tone files
- **SRV_USER_NAME [username]** If the protocol is FTP or HTTP, this keyword specifies the user name to log on to the server.
- SRV_USER_PASS [password] If the protocol is FTP or HTTP, this keyword specifies the password to log on to the server.

The downloading of these files is initiated when an IP Deskphone is powered on, when an automatic check for updates is invoked, or when you select **Srvcs > Check for Updates**. Any of these actions causes the IP Deskphone to contact the provisioning server and attempt to read the provisioning file. A Soft Reset (**Srvcs > Reset Phone**) does not cause the IP Deskphone to retrieve the provisioning file.

Order of provisioning file sections

The SIP software processes the [DEVICE_CONFIG] and [USER_CONFIG] sections in the order that they appear in the 1xxxxSIP.cfg provisioning file. If a configuration parameter appears in both files, then the parameter value that is used depends on the order that the sections appear in the provisioning file.

For example:

1. If you have the order: [DEVICE CONFIG], then [USER CONFIG]:

Result:

The parameter value in the [USER_CONFIG] section overwrites the parameter value in the [DEVICE_CONFIG] section.

2. If you have the order: [USER CONFIG], then [DEVICE CONFIG]:

Result:

The parameter value in the [DEVICE_CONFIG] section overwrites the parameter value in the [USER_CONFIG] section.

Once the SIP phone downloads and processes configuration file parameters, it continues to use those parameter values until it either receives the parameter with a different value or the phone is reset to factory defaults.

A consequence of this is if a phone is configured to use an IP Deskphone-specific configuration file where user specific data has been configured and then is moved to a configuration without the IP Deskphone-specific file, the phone will continue to use the user specific data unless the device configuration file provides and thus overrides the configuration values already set on the phone.

An example is when the IP Deskphone-specific configuration file contains AUTOLOGIN_ENABLE USE_AUTOLOGIN_ID with auto-login credentials. If the provisioning setup is changed so the phone only receives the device configuration file, it will continue to attempt to login to the previously configured user login. To prevent this, include parameters in the device configuration file to force settings. In this example, including AUTOLOGIN_ENABLE YES or NO would avoid the potential problem.

In general, when things are not working as you would expect, look for configuration parameters that had been used in the phone's prior configuration files which are now not present. Any parameter that is not specified in a configuration file is set to the prior configured value or the factory default value (if never configured). The prtcfg tool is a good way to see what the phone is actually using for its configuration parameters. See PDT commands on page 352 for more information on using the prtcfg command.

Setting the default language on the IP Deskphone

To configure the default language on a new IP Deskphone, or an IP Deskphone that has not been logged into by an end user, include the following in the [DEVICE_CONFIG] and [LANGUAGE] sections of the 12xxSIP.cfg configuration file, as shown in the following example. The example

shows changing the default language to French; for other languages, use the same parameters but substitute the desired language filename and name.

```
[DEVICE_CONFIG]

DOWNLOAD_MODE AUTO

VERSION 000002

FILENAME DeviceConfig.dat

[LANGUAGE]

DOWNLOAD_MODE AUTO

VERSION 000000001

FILENAME <language>.lng
```

The DeviceConfig.cfg file should contain the following.

```
DEF LANG [language]
```

On a new IP Deskphone, the language switches to the specified language after downloading and processing the configuration files. The login menu displays in the specified language. On a subsequent bootup, the login menu and all boot messages are in the specified language.

For a new user login, the IP Deskphone creates a new user profile. All menus remain in the specified language. When a new user is created, the default language used is obtained from the DeviceConfig setting and stored as a user preference, after which the user preference for language is always used.

If a user has already logged in and either defaulted or chosen English as the user language preference, changing the configuration files does not affect the user's language display.

Create the device configuration file

After the IP Deskphone downloads the provisioning file from the provisioning server, the IP Deskphone reads the [DEVICE_CONFIG] section and is directed to download the device configuration file from the provisioning server.

The device configuration file is a clear text file and the naming convention is defined by the administrator. See the FILENAME keyword in the [DEVICE_CONFIG] section of the provisioning file.

The following is an example of a device configuration file.

```
# Server and Network configuration commands
DNS_DOMAIN corp.your_company.com
SIP_DOMAIN1 your_company.com
SERVER_IP1_1 10.1.2.3
SERVER_IP1_2 10.1.2.4
SERVER_PORT1_1 5060
SERVER_PORT1_2 5060
```

```
# VOICE FEATURE configuration commands
VMAIL 5555
VMAIL_DELAY 300

# Administrative feature commands
BANNER Avaya Aura
AUTOLOGIN_ENABLE YES

# Voice Application commands
DEF_LANG English
DEF_AUDIO_QUALITY High
ENABLE_BT_YES
ENABLE_3WAY_CALL NO
```

The following table provides a summary of the commands that can be used in the device configuration file. A description and the exact syntax of each command is given in Device configuration file command syntax on page 61.

Table 5: Device configuration commands

Configuration command type	Configuration commands	
Server and	SIP_DOMAIN1	SERVER_PORT3_2
network configuration	SIP_DOMAIN2	SERVER_PORT4_1
commands	SIP_DOMAIN3	SERVER_PORT4_2
	SIP_DOMAIN4	SERVER_PORT5_1
	SIP_DOMAIN5	SERVER_PORT5_2
	SERVER_IP1_1	DNS_DOMAIN
	SERVER_IP1_2	SIP_PING
	SERVER_IP2_1	FAIL_BACK_TO_PRIMARY
	SERVER_IP2_2	PCPORT_ENABLE
	SERVER_IP3_1	DHCP_NUMBER_OF_RETRIES
	SERVER_IP3_2	DHCP_INITIAL_TIMEOUT
	SERVER_IP4_1	LLDP_ENABLE
	SERVER_IP4_2	CACHED_IP_ENABLED
	SERVER_IP5_1	HTTP_RETRY_NUMBER
	SERVER_IP5_2	SERVER_PORT1_1
	SERVER_PORT1_2	SERVER_PORT2_1
	SERVER_PORT2_2	SERVER_PORT3_1
	SERVER_TCP_PORT2_2	SERVER_TCP_PORT1_1
	SERVER_TCP_PORT3_2	SERVER_TCP_PORT1_2

Configuration command type	Configuration commands	
	SERVER_TCP_PORT4_2	SERVER_TCP_PORT2_1
	SERVER_TCP_PORT5_2	SERVER_TCP_PORT3_1
	SERVER_TLS_PORT1_2	SERVER_TCP_PORT4_1
	SERVER_TLS_PORT2_2	SERVER_TCP_PORT5_1
	SERVER_TLS_PORT3_2	SERVER_TLS_PORT1_1
	SERVER_TLS_PORT4_2	SERVER_TLS_PORT2_1
	SERVER_TLS_PORT5_2	SERVER_TLS_PORT3_1

Device configuration file command syntax

! Important:

The device configuration file uses the following syntax:

- [] mandatory field
- < > optional field

For example:

```
AUDIO CODEC [ ] [ ] < >
would be filled in as
```

AUDIO CODEC1 G729 G.729 codec

Caution:

The syntax of the commands in the device configuration file is case-sensitive. Verify that the commands follow the case defined in this document.

Important:

Parameters in the device configuration file with empty values are not allowed and cause write failure.

Server and network configuration commands

- SIP_DOMAIN[x] [domain_name] preconfigures the proxy domain name for all servers. The same configuration can be done through the domain configuration menu on the IP Deskphone.
 - x the number of the SIP domain number from 1 to 5.
 - **domain_name** the proxy domain name for all servers.
 - Note:

SIP DOMAIN[x] is provisioned after user logout.

- SERVER_IP[x]_[y]_[ip_address] configures the primary and secondary IP address for each domain, two proxies for each domain.
 - x the domain number from 1 to 5.
 - y y indicates whether it is the primary or secondary IP address. .

y=1 indicates the primary address and y=2 indicates the secondary address.

- ip_address the IP address of the SIP proxy server.
- SERVER_PORT[x] [y] [port_number] configures the signaling ports for each proxy.
 - x the domain number.
 - **y** y indicates whether it is the primary or secondary IP address.

y=1 indicates the primary address and y=2 indicates the secondary address.

- port_number the SIP proxy signaling port (default is 5060).
- SERVER_TCP_PORT[x]_[y] [port_number] This parameter configures the signaling TCP ports for each proxy.
 - x the domain number.
 - y —y indicates whether it is the primary or secondary IP address.
 - y=1 indicates the primary IP address and y=2 indicates the secondary IP address.
 - port_number the SIP proxy signaling TCP port (default is 5060).
- **SERVER_TLS_PORT[x]_[y] [port_number]** This parameter configures the signaling TLS ports for each proxy.
 - x the domain number.
 - y y indicates whether it is the primary or secondary IP address.
 - y=1 indicates the primary IP address and y=2 indicates the secondary IP address.
 - port_number the SIP proxy signaling TLS port (default is 5061).
- DNS_DOMAIN [domain] the DNS domain of the IP Deskphone.
- SIP_PING [YES | NO] The SIP_PING configuration value is used to maintain server heartbeat detection and to keep a firewall pinhole open.

When used for server heartbeat detection, the IP Deskphone periodically pings the SIP Proxy and awaits a response. When three attempts to ping the SIP Proxy fail, the IP Deskphone begins a failover process and attempts to connect to the next configured SIP Proxy IP in the same domain.

When a NAT TRAVERSAL method is selected, the SIP_PING configuration value also helps keep a firewall pinhole open.

Important:

Decide carefully whether SIP_PING usage is appropriate for your environment. Even when SIP_PING is not used for NAT TRAVERSAL, it is highly likely that you must keep SIP_PING enabled for server heartbeat detection.

If the IP Deskphone is behind a firewall, it is very likely that you must keep SIP_PING enabled, unless an alternate method of keeping the firewall pinhole open is used.

The default value is YES if not specified in the device configuration file. If SIP_PING is changed in the Device configuration file, the IP Deskphone must be rebooted for the change to take effect.

- YES enables pinging
- NO disables pinging

- TCP_SIP_PING_FAILBACK [YES | NO] This parameter is used to maintain server behavior. If TCP/TLS connection to S1 is established, the phone should send a SIP PING request to S1 to determine if S1 is able to serve SIP requests.
 - YES enables pinging. If S1 responds to the PING with 503 response code (or other code indicating server's inability of serving SIP requests), the phone PINGs again after a timeout. This parameter should be enabled for Avaya Aura.
 - NO disables pinging so a phone performs the failback even if server is unable to serve SIP requests (default).
- IPV6_ENABLE [YES] [NO] This parameter must be applied at boot time prior to the network being enabled. The default value is NO. When this parameter is enabled, IPv4/IPv6 are supported on the IP Deskphone. When this parameter is not enabled only IPv4 is supported on the IP Deskphone.
 - YES enables IPv6 functionality in a dual mode
 - NO disables IPv6 functionality (default)

When the protocol is changed, the IP Deskphone automatically restarts and updates the Device Settings on the IP Deskphone.

- FAIL_BACK_TO_PRIMARY [YES | NO] This parameter allows you to enable/disable the Fail Back to Primary feature.
 - YES enables the fail back.
 - NO disables the fail back (default).
 - Note:

Set the KEEPALIVE_RETRIES parameter to 1 to more quickly determine if the primary proxy server is unavailable and to re-register to the secondary proxy server.

- SURV_SIP_SVR_ENABLE [YES | NO] This enabled parameter lets a user know that they are in fail-over mode. The default is NO.
 - YES enables the Avaya Survivable SIP Server. In fail-over mode, "Server Fail Over Mode" is displayed on the phone; primary line key is flashing.
 - NO disable the Avaya Survivable SIP Server. In fail-over mode, "Server Fail Over Mode" is not displayed on the phone.
- CACHED_IP_ENABLED [YES | NO] This parameter configures the cached IP feature. The parameter defines whether the IP Deskphone uses the IP address information previously configured if the IP Deskphone is not able to reach DHCP server or if it should interrupt regular work and wait for a DHCP response. The default is NO.
 - YES the last IP address information is used if the DHCP server is not reached.
 - NO Must receive a response to assign the IP Deskphone an IP address (default).
- PCPORT_ENABLE [YES | NO] This parameter enables/disables the PC port. The default is YES.
 - YES PC port is active (default).

- NO PC port is disabled.
- LLDP_ENABLE [YES | NO]
 - YES 802.1ab (LLDP) is enabled.
 - NO 802.1ab (LLDP) is disabled (default).
- HTTP_RETRY_NUMBER [x] This parameter configures the number of times the IP
 Deskphone attempts to contact the server when an HTTP 503 (server is unavailable) response
 is received. The IP Deskphone stops trying to connect to the server after
 HTTP_RETRY_NUMBER unsuccessful attempts have been made, or if any other response
 except HTTP 503 is received from the server.

x = positive integer. The default is 5.

If HTTP_RETRY_NUMBER is not specified in the Device Configuration file, the default number of attempts is applied.

If HTTP_RETRY_NUMBER is set to 0 in the Device Configuration file, the IP Deskphone performs HTTP retries continuously until it receives a response other than HTTP 503. If the HTTP_RETRY_NUMBER is configured as a negative value, the default number of attempts is applied.

• **DHCP_NUMBER_OF_RETRIES** [x] — This parameter configures the number of times the IP Deskphone attempts to contact the DHCP server.

The default value is 4.

- minimum value is 1
- maximum value is 10

If the value defined in the System Configuration file is incorrect, the default value is used.

• **DHCP_INITIAL_TIMEOUT [x]** — This parameter configures the initial time interval between attempts by the IP Deskphone to contact the DHCP server.

The default value is 4 seconds.

If the DHCP server does not respond, the IP Deskphone sends several requests one after another in different timeout intervals, based on the formula

```
timeout[i]=2* timeout[i-1] +- 1second
```

where "i" is the number of retries and timeout[0]= DHCP_INITIAL_TIMEOUT. The maximum timeout between Discovery requests cannot be greater than 64 seconds. If the value of the next timeout becomes greater than 64 seconds, the DHCP client stops increasing the timeout interval and keeps the timeout value of 64 seconds.

- minimum value is 4 seconds
- maximum value 10 seconds

If the value defined in the System Configuration file is incorrect, the default value is used.

• DHCP_UNTAG_ENABLED [YES | NO] — When this parameter is enabled, the IP Deskphone attempts to obtain an IP address in a VLAN (DHCP discovery frames are tagged), and the DHCP server is unreachable, then after the pre-defined number of Discovery attempts the IP

Deskphone begins sending Discovery frames in non-VLAN mode. If the IP Deskphone still does not receive an Offer then, after a pre-defined number of Discovery attempts, the IP Deskphone reverts to VLAN tag mode again.

The default is NO.

- SRTP_ENABLED [YES | NO] This parameter configures SFTP configuration values. The
 default value is NO.
 - YES enables SRTP.
 - NO disables SRTP (default).
- HASH_ALGORITHM [SHA1 | MD5] This parameter provides the hash algorithm. The
 default value is SHA1.
 - SHA1 algorithm is Secure HASH Algorithm 1
 - MD5 algorithm is Message-Digest algorithm 5
- SSHPWD This parameter configures SSH and SFTP passwords. The maximum limit is 49 characters.
- **KEEPALIVE_RETRIES [x]** This parameter specifies the number of times that the IP Deskphone attempts to connect to the proxy server. When the IP Deskphone determines that the proxy server does not respond (keep-alive mechanism fails), it tries to re-establish the connection the specified number of times.

Each reconnection attempt consists of several messages:

- TCP SYN messages if the connection is TCP or TLS
- SIP PING messages if the connection is UDP

The IP Deskphone logs out or registers to the secondary server if the primary proxy server does not respond during the specified number of reconnection attempts.

The default value is 3.

- minimum value is 1
- maximum value is 10
- REGISTER_RETRY_MAXTIME [seconds] This parameter configures in seconds the
 maximum length of time that the IP Deskphone waits before it attempts to re-register with the
 proxy server. The default value is 1800 (seconds).
 - minimum value 600 (seconds)
 - maximum value 1800 (seconds) (default)

Feature configuration commands

- TOVM_SOFTKEY_ENABLE [YES | NO]
 - YES enables the toVM soft key on the IP Deskphone.
 - NO disables the toVM soft key on the IP Deskphone.

- TOVM_VOICEMAIL_ALIAS <string> customizes the user ID of the SIP URI of the voice mail system. The default is transfertovm.
- TOVM_VOICEMAIL_PARAM<string> customizes the parameter name of the SIP URI of the voice mail system. The default is mbid.
- SCA_APPEARANCES configures the maximum number of appearances used for outgoing calls by the Shared Call Appearance (SCA) group. The valid range for this parameter is 2 to 24. The default value is 12.
- SCA_HOLD_BEHAVIOR [PRIVATE | PUBLIC] configures the default behavior of the hold button when user-determined behavior does not exist. When a user creates a new profile, the default behavior is taken from this setting. After the creation of a new profile, this configuration setting is not used. The default option is PUBLIC.
- SCA_LINE_SEIZE_EXPIRES [timeout] This parameter allows the administrator to specify expiration time in seconds for line-seize subscriptions (Single Call Appearance).

Allowed values are from 10 to 30 seconds. The default value is 15 seconds.

— timeout - expiration time for line-seize subscriptions in seconds.

RTP_MIN_PORT

The minimum RTP port value is an integer between 2048 and 65535, exclusive of the restricted SIP ports between 5059 and 5080. The default value is 16384.

RTP_MAX_PORT

The maximum RTP port value is an integer between 2048 and 65535, exclusive of the restricted SIP ports between 5059 and 5080. The default value is 32764..

Note:

The RTP port configuration parameters must satisfy the constraints that (RTP_MAX_PORT - RTP_MIN_PORT) is greater than or equal to 10 and less than 1000.

Note:

If there is a provisioning error, RTP_MIN_PORT is reset to the default value of 16384 and RTP_MAX_PORT is reset to the default value of 32764. An error message is logged. The SystemConfig file stores 16384 and 32764, rather than the erroneous configuration values, to indicate that the configuration attempt has been rejected.

CALL WAITING [SPEAKER | STREAM]

- **SPEAKER** the call waiting tone is played on the IP Deskphone speaker. This is the default option.
- STREAM the call waiting tone is injected into the stream played on the transducer in use for the active call

DISTINCTIVE RINGING [YES | NO]

- **YES** turns on the distinctive ringing feature. This is the default option.
- **NO** turns off the distinctive ringing feature.

USE RPORT [YES | NO]

- **YES** allows the IP Deskphone to work from behind and/or in front of a symmetrical NAT with servers and/or clients that support RFC3581.
- NO disables implementation of support for RFC3581. This is the default option.

Note:

To provision USE_RPORT, the IP Deskphone must be rebooted after the device configuration file is updated.

EXP_MODULE_ENABLE [YES | NO]

- YES the IP Deskphone detects and enables an Expansion Module.
- **NO** the IP Deskphone does not detect an Expansion Module. This is the default option.
- MAX_RING_TIME [x] an integer between 30 and 600 that configures the number of seconds for incoming calls to ring before ignoring them. 0 is a special value which disables this feature. The default value is 0.

ENABLE_UPDATE [YES | NO]

- YES enables UPDATE message support and adds "UPDATE" to ALLOW header. This is the default option.
- NO disables UPDATE message support.

Note:

ENABLE_UPDATE is provisioned after user logoff.

PROMPT_ON_LOCATION_OTHER [YES | NO]

- YES prompt the user to select new location if location "other" was previously selected.
- NO do not prompt the user to select new location if location "other" was previously selected. This is the default option.
- VMAIL [vmail_number] is the voice mail address, which can be the URI or the DN number of the voice mail server. This command takes a string as a parameter. This is the default link for a new user profile only. Individual users can customize the link through Prefs > User Options > Voice Mail Settings. This command has no effect on the user profiles after it is created.
 - vmail_number the number or URI of the voicemail server.
- VMAIL_DELAY [x] is a delay, configured in milliseconds, between when the voice mail server answers the call and the start of dialing the voice mail user ID. The default value is 1000ms.
 - x the delay in milliseconds
- LLDP_WAITING_TIME [timeout_sec] This parameter allows the administrator to configure the timeout in seconds the IP Deskphone should wait for the LLDP response.

The allowed values of the parameter are from 30 to 300 seconds. The default value is 30 seconds.

- timeout_sec timeout value in seconds
- IP OFFICE ENABLE [YES | NO] This parameter is a command that specifies if IP Officespecific features are active on the IP Deskphone or not. The default value is NO.
 - YES IP Office-specific features are active.
 - NO IP Office-specific features are not active.
- IPOFFICE CONF CODE [opt_string] This parameter allows the administrator to configure the **Conf** soft key. If the parameter is configured, the IP Deskphone user is able to call the IP Office option "Conference".
 - opt string = code of the **Conference** option

Example:

```
IPOFFICE CONF CODE *3
```

Note:

The option is available if IP OFFICE ENABLE is YES.

The code of the option is specified in the IP Office Administration Guide.

- IPOFFICE_MSG_CODE [opt_string] This parameter allows the administrator to configure the Msgs soft key. If the parameter is configured, the IP Deskphone user is able to call the IP Office option "Send Message".
 - opt string = code of the Send Message option

Example:

```
IPOFFICE MSG CODE *5
```

Note:

The option is available if IP_OFFICE_ENABLE is YES.

The code of the option is specified in the IP Office Administration Guide.

- IPOFFICE REDIAL CODE [opt string] This parameter allows the administrator to configure the **Redial** soft key. If the parameter is configured, the IP Deskphone user is able to call the IP Office option "Redial".
 - opt string = code of the **Redial** option

Example:

```
IPOFFICE REDIAL CODE *6
```

Note:

The option is available if IP OFFICE ENABLE is YES.

The code of the option is specified in the IP Office Administration Guide.

- AUTOLOGIN_ENABLE [YES | NO | USE_AUTOLOGIN_ID] or [1 | 0 | 2] controls whether the IP Deskphone attempts to automatically log on to the proxy server.
 - YES (or 1) turns on the auto login feature.

- NO (or 0) turns off the auto login feature.
- USE_AUTOLOGIN_ID (or 2) enables the auto login id feature using the userid specified in AUTOLOGIN_ID_KEY01 and the password specified in AUTOLOGIN_PASSWD_KEY01 to register and authenticate. Both userid and password must be specified.

The AUTOLOGIN_ID_KEY01 and AUTOLOGIN_PASSWD_KEY01 parameters are defined in the IP Deskphone-specific configuration file.

Note:

When USE_AUTOLOGIN_ID is used, the user is prevented from logging off the IP Deskphone.

Note:

If AUTOLOGIN_ENABLE is configured as USE_AUTOLOGIN_ID (2) in the IP Deskphone-specific configuration file, it is recommended that AUTOLOGIN_ENABLE be configured as YES (1) or NO (0) in the device configuration file.

This makes it easier to reconfigure an IP Deskphone that used the IP Deskphone-specific configuration file to use only the device configuration file. Otherwise a phone may try to login with the old IP Deskphone-specific configuration file auto-login parameters.

 AUTOLOGIN_AUTHID_KEYxx — is used for auto login when the AUTOLOGIN_ENABLE method is configured to USE AUTOLOGIN ID (or 2).

If the config file does not contain AUTOLOGIN_AUTHID_KEYxx, the client uses the value from AUTOLOGIN ID KEYxx.

- **PROMPT_AUTHNAME_ENABLE** is used to determine if the authentication ID screen is presented to the user. The default value is NO.
 - YES after the user login name is entered, the authentication ID screen appears.
 - **NO** after the user login name is entered, the password screen appears.
- AUTO_UPDATE [YES | NO] is a command to enable or disable the automatic updating of
 the IP Deskphone with SIP Software configuration files from the provisioning server. Enabling
 this command causes the IP Deskphone with SIP Software to check for updates once every
 day. The default is disabled.
 - YES turns on the AUTO_UPDATE feature.
 - NO turns off the AUTO_UPDATE feature.

Note:

If the IP Deskphone encounters any Major or Critical error in memory during the Auto update process, the IP Deskphone reboots based on the recovery level configured.

• AUTO_UPDATE_TIME [x] — is the actual time in seconds, starting from midnight, before an automatic update occurs. Each IP Deskphone adds random numbers to the time specified by this command so that every IP Deskphone does not try to access the provisioning server at the

same time. By default, the automatic update feature is disabled (see AUTO UPDATE RANGE).

- x the time after midnight that the automatic update occurs.
- AUTO_UPDATE_TIME_RANGE [x] is the range in hours, from the AUTO_UPDATE_TIME where an IP Deskphone checks for updates from the server. The default range is 1 hour.
 - **x** the range in hours when the IP Deskphone checks for updates from the server. The range can be from 1 to 6 hours.
- TRANSFER_TYPE [MCS | STANDARD] is used to configure the IP Deskphone to activate
 Avaya conference server-assisted attended transfers, instead of the industry standard method
 of attended transfers. The default setting is Standard.
 - MCS the typical attended transfer used by Avaya proxies. MCS uses a conference server to do the attended transfer.
 - **STANDARD** the standard method of a transfer. This method does not involve a conference server.
- BLIND_TRANSFER_EARLY_RELEASE [YES | NO] This parameter determines whether phone allows releasing while it is in transfer state.
 - YES enables the possibility to switch to idlestate after "release" keypress during transfer state until transfer is finished or failed.
 - NO it is not possible to exit transferring state until transfer is finished or failed (default).
- REDIRECT_TYPE [MCS | RFC3261] is a command used to select different protocols for IP Deskphone redirection. The default setting is MCS.
 - **MCS** when the IP Deskphone receives either 301 (moved permanently) or 302 (moved temporarily) during registration, it is assumed the IP Deskphone is moved to a new system (proxy+registrar) and all subsequent messages are sent to the new address.
 - RFC3261 the IP Deskphone assumes that, if during registration, a 301 (moved permanently) is received, the message contains a new registrar address. The IP Deskphone tries to register to the registrar using the existing proxy.

ENABLE_PRACK [YES | NO]

PRACK is utilized to make some SIP messages reliable and requires that an ACK be sent with many SIP messages. ENABLE_PRACK is often utilized to verify that early media is being received. See RFC3262 for details.

Note:

ENABLE_PRACK must be configured as NO when connected to the MCS 5100 Release 3.5 system.

Note:

ENABLE PRACK is provisioned after user logoff.

- NO disables PRACK and is the default value.
- YES- enables PRACK.

ENABLE_INTERWORKING [YES | NO]

This command is used to enable the interworking feature to pre-authorize users or groups of users to access automatic call answer. The configuration values are YES and NO. The default value is NO.

- NO the interworking feature is disabled.
- **YES** the interworking feature is enabled.
- PROXY_CHECKING [YES | NO] enables and disables extra security checking when
 incoming requests are sent to the IP Deskphone. The IP Deskphone with SIP Software always
 sends requests through an outgoing proxy. However, it is possible, through this configuration,
 to be able to accept an incoming request directly or through an incoming proxy.
 - **YES** means that the request must come directly from the proxy server. YES is the default to enable proxy checking.
 - NO means the request can be sent directly to the IP Deskphone. (NO is only suitable in a few situations).
- AUDIO_CODEC[n] [codec id] <description> is a command that specifies the codecs that are available for the user to select. You can configure up to 15 codecs.
 - n means the codec number. The value is 1 to 15.
 - codec ID means the codec identifiers are as follows:
 - PCMA
 - PCMU
 - G729
 - G723
 - **text description** a text description of the codec. For more information about audio codec configuration, see Audio codecs on page 238
- DEF_AUDIO_QUALITY [Low | Medium | High] This parameter is used to configure the
 default audio quality by setting the preferred audio codec order. If this parameter is not present
 in the device configuration file, the IP Deskphone uses High quality as the default value. The
 possible parameters for this command are High, Medium, and Low. If any other parameter is
 entered or if these commands are misspelled, the IP Deskphone uses High as the default
 setting. This parameter is used only if the audio codecs are not configured in the device
 configuration file.

The following codecs are used for each selection:

- **High** G711 (PCMU), G711 (PCMA), G729.
- Medium G711 (PCMA), G711 (PCMU), G729
- **Low** G729, G711 (PCMA), G711 (PCMU)
- AUTH_METHOD [AUTH | AUTH_INT] is used to configure the SIP authentication method.
 - **AUTH** only authenticates (username/password)

- **AUTH_INT** authentication plus integrity checking (an MD5 hash of the entity is also computed and checked).
- BANNER [banner_text] preconfigures the banner on the IP Deskphone. Use a text string to configure the banner. For example, BANNER ABC Company configures the banner to ABC Company. The text string can have a maximum of 24 characters.
 - banner_text an ASCII string displayed on the screen of the IP Deskphone with SIP Software.
- FORCE_BANNER [YES | NO] is configured by the system administrator through the configuration file. If FORCE_BANNER is configured as YES, the banner from the configuration file is reloaded each time the IP Deskphone powers up, even if the user changes the banner manually.
 - **YES** causes the banner configured by the administrator to override any banner configured by the user.
 - NO allows the user to configure the banner.
- DST_ENABLED [YES | NO] enables and disables the Daylight Savings Time (DST) mechanism. The time received from the server is GMT and is converted to the proper timezone by the IP Deskphone. If the Daylight Saving Time feature is enabled, the IP Deskphone automatically calculates the DST at the appropriate date and converts the time to and from DST. If the DST_ENABLE parameter is set to YES, but the DST_START and DST_STOP parameters are not provided, the North American DST start/stop dates are applied: 2nd Sunday of March 02:00 Local and 1st Sunday of November 01:00 Local.
 - YES (default) enables Daylight Saving Time.
 - NO disables Daylight Saving Time.
- DST_START/DST_STOP [dst_settings_str] The DST_START and DST_STOP options
 use the parameters shown in the following table. Parameters should be configured when
 DST_ENABLED is set to YES.
 - DST START parameter configures the date/time after which the DST offset is applied.
 - DST STOP parameter configures the date/time after which the DST offset is not applied.

Table 6: DST start and stop parameters

Char #	Value
1	Ordinal week number in month [1-4/L]; L = last week
2–4	3–letter shortcut for the weekday name (Sun, Mon, Tue, Wed, Thu, Fri, Sat)
5–7	3–letter shortcut for month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec)
8/8–9	1- or 2-digit hour (0-9 or 00-23)
9/10	Local/UTC time marker (L or U)

Note:

Standard Time should be provided as a part of DST_STOP value in case if Local time option is chosen.

Examples:

- 2SunJul2L means 2nd Sunday of July 2:00 Local time.
- LSatNov23U means Last Saturday of November 23:00 UTC time
- TIMEZONE_OFFSET [x] is used to configure the current time zone offset from GMT in seconds. TIMEZONE_OFFSET takes a number as a parameter. For example, TIMEZONE_OFFSET -25200 configures the time zone offset to MST, which is GMT-7 (-7*3600 = -25200 seconds).

Table 7: Time zone offset

Location	Time zone offset (seconds)
(GMT-11:00) Samoa	-39600
(GMT-10:00) Hawaii	-36000
(GMT-09:00) Alaska Standard Time	-32400
(GMT-08:00) Pacific Standard Time	-28800
(GMT-07:00) Mountain Standard Time	-25200
(GMT-06:00) Central Standard Time	-21600
(GMT-05:00) Eastern Standard Time	-18000
(GMT-04:00) Atlantic Standard Time	-14400
(GMT-03:30) Newfoundland	-12600
(GMT-03:00) Buenos Aires	-10800
(GMT-02:30) Newfoundland DST	-9000
(GMT-01:00) Azores	-3600
(GMT+00:00) Greenwich, Dublin, Lisbon, London	0
(GMT+01:00) Central European Time	3600
(GMT+02:00) Athens	7200
(GMT+03:00) Moscow	10800
(GMT+03:30) Tehran	12600
(GMT+04:00) Abu Dhabi	14400
(GMT+04:30) Khabul	16200
(GMT+05:00) Islamabad	18000
(GMT+05:30) Indian Standard Time	19800
(GMT+06:00) Sri Lanka	21600
(GMT+06:30) Myanmar	23400

Table continues...

Location	Time zone offset (seconds)
(GMT+07:00) Bangkok	25200
(GMT+08:00) China Standard Time	28800
(GMT+09:00) Japan Standard Time	32400
(GMT+09:30) Australian Central Standard Time	34200
(GMT+10:00) Australian Eastern Standard Time	36000
(GMT+11:00) Micronesia	39600
(GMT+12:00) Fiji	43200
(GMT+13:00) New Zealand	46800

- FORCE_TIME_ZONE [YES | NO] allows you to force the timezone offset on each user's IP Deskphone. The default is NO.
 - **YES** forces the IP Deskphone to use the TIMEZONE_OFFSET specified in the device configuration file.
 - NO uses the value stored in the user preferences.
- IM_MODE [ENCRYPTED | TEXT | SIMPLE | DISABLED] is used to configure the mode of Instant Messaging (IM). The default setting is ENCRYPTED.
 - **ENCRYPTED** Instant Messages are sent encrypted.
 - **TEXT** Instant Messages are sent as text.
 - **SIMPLE** Instant Messages are sent using SIP for Instant Messaging and Presence Leveraging Extensions (SIMPLE) protocol.
 - DISABLED Instant Messaging is turned off and no Instant Messages can be sent or received.

Note:

According to Federal Requirements:

- If the parameter FIPS_MODE=NO and IM_MODE=TEXT, the IM_MODE is changed to ENCRYPTED by force.
- If the parameter FIPS_MODE=YES, the IM_MODE is changed to TEXT by force
- **DEF_DISPLAY_IM [YES | NO]** enables or disables the display of Instant Messages (IM). The default setting is NO.
 - YES enables display of IMs.
 - NO disables display of IMs.
- **SELECT_LAST_INCOMING** is used to determine which call is selected when there are multiple calls ringing (or active). The default value is 0.
 - **0** leaves the last selected call static as new calls come in or are dropped.
 - 1 the selected call in the call list jumps to the most recent ringing call after it is added to the list.

• **SERVICE_PACKAGE_PROTOCOL** [proto_string] — This parameter specifies which protocol is to be used for obtaining the service package.

The supported values are HTTP or HTTPS.

The default value is HTTP.

- MAX_LOGINS [x] is used to determine the maximum number of user accounts that can be logged in at the same time. Numbers higher than the number of line keys on the IP Deskphone are equivalent to no limit other than the line keys. A value of 1 allows a single user at a time. A value of 0 is treated the same as a value of 1 because you cannot restrict the IP Deskphone to 0 logins. The number of concurrent logins can never exceed 24, regardless of the value configured on MAX LOGINS. The default is unlimited.
 - x the maximum number of user accounts that can be logged in at the same time.
- MAX_INBOX_ENTRIES [x] used to restrict the maximum number of inbox entries and takes
 a number as a parameter. For example, MAX_INBOX_ENTRIES 100 limits the number of
 entries in the inbox to 100. The default limit is 100.
 - x the maximum number of in box entries.
- MAX_OUTBOX_ENTRIES [x] used to restrict the maximum number of outbox entries and takes a number as a parameter. For example, MAX_OUTBOX_ENTRIES 100 limits the number of entries in the outbox to 100. The default limit is 100.
 - x the maximum number of outbox entries.
- MAX_REJECTREASONS [x] used to restrict the maximum number of Call Decline Reasons (Prefs > Feature Options > Call Decline Reasons) and takes a number as a parameter. The default limit is 20.
 - x the maximum number of reject reasons.
- MAX_CALLSUBJECT [x] used to restrict the maximum number of call subjects (Prefs > Feature Options > Call Subject) and takes a number as a parameter. The default limit is 20.
 - **x** the maximum number of call subject reasons.
- MAX_PRESENCENOTE [x] used to restrict the maximum number of presence notes and takes a number as a parameter. The default limit is 20.
 - x the maximum number of presence notes that an IP Deskphone can receive.
- USE_PUBLISH_FOR_PRESENCE [YES|NO] This parameter specifies whether to send the PUBLISH request when changing the Presence state.
 - YES send the PUBLISH request
 - NO do not send the request
- **DEF_LANG [language]** a command used for configuring the default language file (without filename extension). Note that the corresponding language file must be downloaded and stored in the IP Deskphone through the [LANGUAGE] section in Provisioning. If the language file is not stored in the IP Deskphone, the default language English is used.
 - language name of language file used by default (without filename extension).

Note:

To update the default language of an IP Deskphone already configured as English to any other language, use the following steps:

- 1. Update the Device Configuration file with DEF_LANG configured as the Language file name.
- 2. In the 12xxSIP.cfg file, make the Download mode FORCED
- 3. Incrementally increase the version number of the 12xxSIP.cfg file.
- MAX_IM_ENTRIES [x] used to configure the maximum number of Instant Message (IM) entries and takes a number as a parameter. Once the maximum number is reached, the oldest IM is deleted without any user notification. The default limit is 999.
 - x the maximum number of instant messages.
- MAX_ADDR_BOOK_ENTRIES [x] used to configure the maximum number of entries in the Address Book. The values are from 0 to 1000. The default is 1000.
 - x the maximum number of address book entries.
- MAX_DOWNLOAD_ADDR_BOOK_ENTRIES [x] This parameter specifies the maximum number of Address Book entries which can be downloaded from the network in LOCAL Address Book mode.
 - x the maximum number of Address Book entries.
 - The values are from 0 to 1000. The default value is 1000 entries.
- ADDR_BOOK_MODE [NETWORK | LOCAL | BOTH] a command to choose the address book that is used to search for other users. The default setting is NETWORK.
 - **NETWORK** downloads the user's address book from the network. New address book entries are uploaded to the network.
 - LOCAL creates a user address book and stores it locally on the IP Deskphone.
 - BOTH attempts to download a network address book and keep a copy on the IP Deskphone. If a network address book is available, the IP Deskphone functions as if NETWORK mode has been selected.
- HOLD_TYPE [RFC2543 | RFC3261] used to select the protocol to hold a call. The default setting is RFC3261.
 - RFC2543 RFC2543 is a standard protocol of the Internet Engineering Task Force (IETF).
 - RFC3261 RFC3261 is a standard protocol of the IETF.
- **ENABLE_3WAY_CALL [YES | NO]** a flag to enable or disable local IP Deskphone-based three-way calling for three-party conferences.
 - YES enables local (IP Deskphone-based) three-way calling for three-party conferences.
 YES is the default.
 - NO disables local (IP Deskphone-based) three-way calling.

- DISABLE_PRIVACY_UI [YES | NO] a flag to disable the privacy setting in UI menus.
 Disabling the privacy setting in UI menus disables the user's ability to configure privacy options.
 - YES disables the privacy setting in the UI menus.
 - NO enables the privacy setting in the UI menus. NO is the default.
- **DISABLE_OCT_ENDDIAL [YES | NO]** a flag used to configure the pound (#) key. The default setting is YES.
 - **YES** the pound (#) key initiates dialing when pressed after a phone number is entered.
 - **NO** the pound (#) key functions as any other digit or character on the dial pad typically used in networks that use vertical service codes or access codes.
- FORCE_OCT_ENDDIAL [YES | NO] a flag used to override attempts to change the function of the pound (#) key on the Graphical User Interface (GUI). The default setting is NO.
 - YES overrides attempts to change the function of the pound (#) key on the GUI.
 - NO does not override a change of the function of the pound (#) key on the GUI.
- **SNTP_ENABLE [YES | NO]** allows the IP Deskphone to obtain the time and date from an NTP server. The default is NO.

The IP Deskphone updates the time once every 24 hours from the NTP server. If the IP Deskphone cannot contact the server, the IP Deskphone tries every 15 minutes up to a maximum of 6 attempts, and then hourly attempts are made. If SNTP_ENABLE is configured as NO, the IP Deskphone tries to retrieve the time and date from the SIP proxy server. However, not all SIP proxy servers support this method of retrieving the time and date.

- YES enables NTP.
- NO disables NTP.
- **SNTP_SERVER** [ip_address] the IP address or FQDN of the NTP server that provides the time and date to the IP Deskphone. If this is not specified, the IP Deskphone does not generate any NTP requests.
 - ip_address the IP address of the NTP server in either Fully Qualified Domain Name (FQDN) or non-FQDN format.
- MADN_TIMER [x] used to configure the MADN polling timer interval (the interval at which the IP Deskphone attempts to determine the MADN group of the logged-in user). The minimum value for the polling interval is 900 seconds (15 minutes). The default value is 1800.
 - x the time delay (in seconds) between queries to find the MADN group DN of a user. The minimum value 900.
- MADN_DIALOG [YES | NO] used to configure the SIP URI or the GROUP DN for the subscription to the dialog event. The default value is NO.
 - YES- su bscribes to the dialog event using the SIP URI of the user.
 - **NO** subscribes to the dialog event using the group of the user.
- **DEFAULT_CFWD_NOTIFY [YES | NO]** used to configure the "ring splash" which occurs when either local call forwarding or network-based call forwarding have been enabled. If this

configuration value is enabled, the IP Deskphone plays an abbreviated ring tone to remind the user that a call has been forwarded. This configuration value only effects users when their user profile is first created, unless the FORCE_CFWD_NOTIFY flag is also used. The default setting is NO

- YES a brief ring splash plays when a call is forwarded.
- NO the ring splash does not play.
- DISPLAY_CALL_SNDR_IM_KEY [YES|NO] This parameter allows the administrator to display or hide the Call soft key when viewing Instant Messages (IMs). The default setting is YES.
 - YES the Call soft key is displayed
 - NO the Call soft key is not displayed
- FORCE_CFWD_NOTIFY [YES | NO] allows the administrator to force the behavior of the DEFAULT_CFWD_NOTIFY value on all users who login to the IP Deskphone. The default setting is NO.
 - YES the DEFAULT_CFWD_NOTIFY configuration value is forced into effect for the user.
 - **NO** the configuration value is not forced into effect for the user.
- ALPHA_ORDER_LOC_LIST [YES | NO] This parameter allows the administrator to specify whether the Location list should be sorted or not. The default value is YES.
 - YES the list should be sorted
 - NO the list is displayed as is
- ENABLE_SERVICE_PACKAGE [YES | NO | PPM] toggles the subscription to the Call Server service package. When the IP Deskphone connects to a Call Server that does not recognize the service package, the subscription for the service package fails. If this happens, ad hoc conferencing is not available, even if the Call Server supports ad hoc conferencing. You can configure values for ad hoc conferencing when the service package is not retrieved. The IP Deskphone retrieves the service package based on a configurable Boolean value.
 - YES the IP Deskphone downloads the service package (only with AS 5300 and CS 2000).
 - **NO** the IP Deskphone does not download the service package.
 - **PPM** the IP Deskphone requests Personal Profile manager (PPM) data (only supported with Avaya Aura®)

MAX_ADHOC_PORTS1 [0–4] indicates the maximum number of users supported for ad hoc conferencing on the server. This value must be the same as the value configured on the server. When ENABLE_SERVICE_PACKAGE is enabled, the preceding parameters are ignored.

- CONFERENCE_URI[x] contains the conference Uniform Resource Identifier (URI); for example, CONFERENCE URI1 conference@bvw.com.
 - x the SIP domain number from 1 to 5.

- ADHOC_ENABLED [YES | NO] This parameter configures support for ad hoc conferencing for the Call Server. The default value is NO. If a service package is used then this is provided by the service package.
 - x the SIP domain number from 1 to 5
 - YES the Call Server supports ad hoc conferencing.
 - NO the Call Serverr does not support ad hoc conferencing.
- MAX_ADHOC_PORTS[x] [max_ports_number] This parameter configures the maximum number of adhoc conference participants that can join the conference on the IP Deskphone.
 - x the SIP domain number from 1 to 5
 - max_ports_number number of participants from 0 to 4. The default value is 0.
- INTERCOM_PAGING [YES | NO] allows the IP Deskphone to belong to a paging group. When a page group call is received, a one-way speech path is created to the IP Deskphone, and the IP Deskphone automatically goes to a hands-free intercom state.
 - YES intercom/paging functionality is enabled.
 - **NO** intercom/paging functionality is disabled.
- LOGOUT_WITHOUT_PASSWORD [YES | NO] allows the user to log off without entering their password if the administrator enables LOGOUT WITHOUT PASSWORD feature.
 - YES enables the user to logout without a password.
 - **NO** does not allow the user to logout without a password.
- REMOTE_CHECK_FOR_UPDATE [YES | NO] provides the functionality to start a check to remotely update the IP Deskphone with the latest software present on the Trivial File Transfer Protocol (TFTP) server. You can enable or disable this feature with the flag present in the Device Configuration file. By default, this flag is set to NO.
 - YES prompt the user about the scheduled event and the user can accept or reject the scheduled software update check by pressing the YES or NO soft key.
 - NO disables the remote check for update option.
- SECURE _INCALL_DIGITS [YES | NO] shows the typed digits as asterisks when the user
 makes a call into the voice mail. When this feature is enabled, the most recently-pressed key is
 displayed but is overwritten by an asterisk (*) when the next key is pressed. The user has the
 option to Hide or Unhide the digits typed.
 - YES provides the secure digits while in call functionality.
 - **NO** disables the secure digits while in call functionality.
- **E911_TERMINATE_ENABLE [YES | NO]** specifies whether a 911 call can be terminated by the calling party or not. The default value is NO.
 - YES the caller can terminate the emergency call.
 - **NO** the caller cannot terminate the emergency call once the call has been established.

- **E911_USERNAME** an emergency username used for making an emergency call that does not require login. The proxy must be configured with the same emergency username; otherwise, the emergency call fails.
- **E911_PROXY** a default emergency proxy. This variable must contain the value that matches the value defined by one of the following variables specified in the same config file:
 - SIP DOMAIN1
 - SIP DOMAIN2
 - SIP_DOMAIN3
 - SIP DOMAIN4
 - SIP_DOMAIN5

If E911_PROXY does not match the value defined by these five variables, or the variable E911_PROXY is not defined, then the value of SIP_DOMAIN1 is used as the emergency proxy.

- **E911_PASSWORD** the password for the emergency username that is used for making an emergency call that does not require login. The proxy must be configured with the same password; otherwise the emergency call fails.
- **E911_TXLOC** is the variable that describes location information that must be sent with the REGISTER SIP message, or with the INVITE SIP message.
- E911_HIDE_MESSAGE [Y | N] This parameter configures whether or not the message "Emergency Calls Only" is displayed when no user is logged in and the IP Deskphone is taken off-hook.

The default is NO, which means that the Emergency Calls Only message is not hidden; it is displayed on the IP Deskphone when no user is logged in and the IP Deskphone is taken offhook.

• **KEEP_ALIVE_TYPE [type_string]** — This parameter indicates if OS keep-alive on the connection is enabled.

The supported values are **OS** or **CRLF** (or any string). The default value is **OS**.

- type_string the keep-alive mode value
- **CONN_KEEP_ALIVE [conn_keep]** This parameter configures the time in seconds to use for the keep-alive.

The values are from 5 to 1800 seconds. The default value is 120 seconds.

- conn keep keep-alive time in seconds
- MENU_AUTO_BACKOUT a menu auto back-out time preference configuration used to configure the auto back-out time on newly created profiles (not for profiles that already exist). The values, in seconds, are 0, 15, 30, 60, 120, 300, 600. The default value is 30.

Example:

MENU_AUTO_BACKOUT 15

Note:

There are some application screens that do not time out. Some menus, such as the administration menus, require the user to press the Back or Quit key to exit the screen.

- AUTOCLEAR_NEWCALL_MSG [YES | NO] used to configure the missed calls notification mode. Y means that the notification is cleared as soon as the inbox is entered without needing to visit all missed entries. The values are Y and N. The default value is N.
 - YES configures missed calls notification mode
 - NO missed calls notification mode is not configured

This configuration value only affects users when a user profile is first created. It does not affect a user profile which already exists. A user can modify the feature parameter by using the **Preferences** menu on the IP Deskphone and then selecting the **Feature Options > Missed Call Notification** menu item.

- LOGIN_BANNER_ENABLE [Y | N] used to enable or disable the customizable login banner. If configured as enable, the flag causes the login of the primary user to display the provisioned banner text as part of the login process. The banner text file is a separate file downloaded by provisioning. The banner text file is specified much like the current dialing plan is specified (file name listed in 12xxSIP.cfg, under section [LOGIN_BANNER]), and is downloaded when enabled or disabled. To be accepted, the file must contain at least one byte and must be no bigger than 2048 bytes. The encoding of the file must be UTF-8, or compatible with UTF-8, to ensure that all the characters are displayed properly. The values are Y and N. The default value is N.
- SECURE_UI_ENABLE [YES | NO] used to disable access to the IP Deskphone Information details screen, and the context-sensitive soft key that invokes it. The values are YES and NO. The default value is NO.
 - **YES** disables access to the IP Deskphone Information details screen and the context-sensitive soft key that invokes it.
 - NO enables access to the IP Deskphone Information details screen and the contextsensitive soft key that invokes it.
- SPEEDLIST_KEY_INDEX <feature key index> used to specify the programmable key used for displaying the Speed Dial List. If the specified index does not exist on the IP Deskphone, or is invalid, the speed dial list is not displayed on the IP Deskphone.

The IP Deskphone retrieves the device configuration through provisioning. If the SPEEDLIST_KEY_INDEX flag is configured to a valid programmable key that can be used for the feature, for example, >1 and less than or equal to available number of programmable keys, then the IP Deskphone verifies if it has previously loaded a "Speed Dial List" file (a file containing the contents of the speed dial list). This file is similar to the dialing plan file. It needs to be properly configured and uploaded to the IP Deskphone through provisioning. The IP Deskphone parses the file, and configures the feature key specified by SPEEDLIST_KEY_INDEX to hold the Speed Dial List. If the key defined for use by the Speed Dial List is already in use, the key is overwritten and the key is assigned speed dial list functionality. The Speed Dial List feature key then uses the label that is provisioned in SPEEDLIST_LABEL which cannot be modified by the end user.

- **SPEEDLIST_LABEL <text>** a feature key label used by the speed dial list feature key. The default value is SDL.
- MAX_APPEARANCE [x] defines the maximum number of possible active calls on the IP Deskphone. The values are 1 to 12. . The default value is 10.
 - x the maximum number of possible active calls
- MAX_BLFCALLS [x] defines the maximum number of available Busy Lamp Field (BLF) calls on the IP Deskphone. The values are 1 to 10. The default value is 10.
 - x the maximum number of available Busy Lamp Field (BLF) calls
 - The MAX_BLFCALLS parameter value cannot be greater than the MAX_APPEARANCE parameter value. If the value of the MAX_BLFCALLS parameter is greater than the value of the MAX_APPEARANCE parameter, the value of the MAX_BLFCALLS parameter is reduced by force and takes the value of the MAX_APPEARANCE parameter (MAX_BLFCALLS = MAX_APPEARANCE).
- BLF_ENABLE [Y | N | SCS | SIPX] used to enable or disable the Busy Lamp Field (BLF) feature support. If configured as Y, the flag BLF_RESOURCE_LIST_URI is not ignored and the BLF feature is used. The values are Y, N, SCS, and SIPX. The default is N.
 - When BLF_ENABLE has the SCS or SIPX value, the BLF_RESOURCE_LIST_URI parameter is ignored and the IP Deskphone autogenerates an URI of the following format: ~~rl~C~<username>@<domain>
- BLF_RESOURCE_LIST_URI <bif uri> used to configure the Busy Lamp Field (BLF) resource list URI for the BLF feature. You must use the URI provided by the proxy when properly configuring the user for BLF.
 - The <blf uri> is the server provided URI to subscribe for BLF notifications, for example, blf-resource-list@as.avaya.com .
- **FM_PROFILES_ENABLE [YES | NO]** This parameter allows the user to perform actions on User Profiles using the file manager. The default value is YES.
 - YES allows the user to perform actions on User Profiles using the file manager (default). .
 - NO does not allow the user to delete or copy User Profiles on the IP Deskphone or USB drive using the file manager
- FM_LANGS_ENABLE This parameter allows the user to perform actions on Languages files using the file manager. The default value is YES.
 - YES allows the user to perform actions on Language files using the file manager (default).
 .
 - NO does not allow the user to delete or copy Language files on the IP Deskphone or USB drive using the file manager
- FM_SOUNDS_ENABLE [YES | NO] allows the user to act on WAV files using the file manager. If the value is configured as NO, the IP Deskphone cannot perform any actions on WAV files, such as delete or copy a wav file, through the file manager. If the user selects a WAV file on the IP Deskphone and presses the **Delete** or **Send** Context-sensitive softkey, an error message appears. If the value is configured as YES, the user can delete or copy WAV

files with the file manager interface (this applies to WAV files on the IP Deskphone). The values are YES and NO. The default value is YES.

- YES allows the user to delete or copy WAV files on the IP Deskphone through the file manager
- NO does not allow the user to delete of copy WAV files on the IP Deskphone through the file manager
- FM_IMAGES_ENABLE [Y | N] allows the user to act on JPG and PNG files using the file manager. The values are Y and N. The default value is Y.
- FM_CERTS_ENABLE [Y | N] allows the user to act on CER and PEM files using the file manager. The values are Y and N. The default value is N.
- **FM_CONFIG_ENABLE [Y | N]** allows the user to act on CFG files using the file manager. The values are Y and N. The default value is N.
- **FM_LOGS_ENABLE [Y | N]** allows the user to act on CFG files using the file manager. The values are Y and N. The default value is Y.
- **HOTLINE_ENABLE [Y | N]** indicates if Hotline Service is enabled or disabled. The values are Yes and No. The default value is No.
- HOTLINE_URL used as the To field of INVITE message by the SIP IP Deskphone to notify
 the Proxy Server that this is a call from a Hotline Deskphone. The HOTLINE_URL is not a real
 URL of the Hotline target. The IP Deskphone has no idea about the Hotline target. The Proxy
 server replaces the To field of INVITE request message with a real Hotline target when it
 receives an INVITE request from the Hotline Phone. The default value is Hotline.
- SESSION_TIMER_ENABLE [YES | NO] indicates if the session timer service is enabled or disabled. The values are Yes and No. The default value is Yes.
 - **YES** the Session Timer Service for the IP Deskphone is enabled, and the behavior of the IP Deskphone complies with RFC4028.
 - NO the Session Timer Service is disabled.
- SESSION_TIMER_DEFAULT_SE indicates the default session expiration in seconds. The Session-Expires header, in a request, informs the terminating endpoint and proxies of the Session-Expires interval value that the originating endpoint requires for the session timer duration, in units of delta seconds. The default value is 1800.
- **SESSION_TIMER_MIN_SE** indicates the minimum session expiration in seconds. The default value is 1800.
- **SET_REQ_REFRESHER** [0 | 1| 2] indicates what refresher value is configured in the initial session request. The values are 0, 1, and 2. The default value is 0.
 - 0 indicates that the refresher is omitted
 - 1 indicates that the refresher is configured to UAC
 - 2 indicates that the refresher is configured to UAS

- SET_RESP_REFRESHER [0 | 1 | 2] indicates what refresher value is configured in the 200 OK response. The values are 0, 1, and 2. The default value is 2.
 - **0** indicates that the refresher is omitted (only valid when SET_REQ_REFRESHER is not equal to 0)
 - 1 indicates that the refresher is configured to UAS
 - 2 indicates that the refresher is configured to UAC
- **ENABLE_INTERWORKING** used to enable the interworking feature to pre-authorize users or groups of users to access automatic call answer. The configuration values are YES and NO. The default value is NO.
 - **YES** the interworking feature is enabled.
 - **NO** the interworking feature is disabled.
- **PORT_MIRROR_ENABLE [YES | NO]** used to enable or disable the Port Mirroring feature. The values are YES and NO. The default value is NO.
 - YES The Port Mirroring prompt in the Advanced Diag Tools dialog is enabled and can be modified.

₩ Note:

If enabled, the Port Mirroring setting survives a reboot of the IP Deskhone, but not a power off. If the IP Deskphone is powered off, Port Mirroring becomes disabled.

- **NO** The Port Mirroring prompt in the Advanced Diag Tools dialog is permanently disabled (dimmed) and cannot be modified.
- MEMCHECK_PERIOD <nnnnn> used to determine the time period in seconds when the Memory monitor wakes up (after re-start or the last memory check attempt). The values are 1800 (0.5 hrs) to 86400 (24 hrs). The default value is 86400 (24 hrs).
- DOS_PACKET_RATE determines the maximum number of packets per second that is allowed.
- DOS_MAX_LIMIT specifies how many packets past the DOS_PACKET_RATE the IP
 Deskphone can receive before packets are dropped. If packets are received at a rate of
 DOS_PACKET_RATE +1, then packets are dropped after the time specified in
 DOS_MAX_LIMIT (in seconds).
- DOS_LOCK_TIME specifies the amount of time (in seconds) that the IP Deskphone stops
 processing packets after DOS_MAX_LIMIT is reached. If DOS_PACKET_RATE is < 1, other
 values are ignored and packets are not dropped.
- LOGSIP_ENABLE [YES | NO] used to enable or disable SIP-logging. The values are YES and NO. The default value is NO.
 - **YES** the SIP-logging Manager is active and starts to log SIP incoming and outgoing packages into the log file in FFS.
 - NO the SIP-logging Manager is not active and cannot log SIP incoming and outgoing packages into the log file in FFS.

- CUST_CERT_ACCEPT a Security Policy parameter that controls further signing of a customer root certificate (not the first one). The values are VAL_NO_MANUAL, VAL_MANUAL_A, and VAL_MANUAL_B. The default value is VAL_MANUAL_A.
- CERT_ADMIN_UI_ENABLE [YES | NO] allows you to access the Certificate Administration User Interface. The values are YES and NO. The default value is NO.
- **SEC_POLICY_ACCEPT** allows you to accept security policy. The default value is VAL_MANUAL_A. Following are the acceptable parameters:
 - VAL_MANUAL_A If the resource file is not signed and if there are no customer certificates, then Finger Print Display and Accept/Reject options appear.
 - VAL_MANUAL_B If the resource file is not signed and if there are no customer certificates, enter the Finger Print Value manually and then select Accept option.
- SECURITY_LOG_UI_ENABLE [YES | NO] allows you to access the Security and Error Logs User Interface. The values are YES and NO. The default value is No.
- **KEY_SIZE** the default key size that is used when generating keys on the IP Deskphone, and acts at the minimum allowed key size that is enforced when loading certificates from the IP Deskphone. The values are 1024, 1536, and 2048. The default value is 1024.
- KEY_ALGORITHM the preferred key generation algorithm. The accepted value is KEY_ALG_RSA.
- TLS_CIPHER the preferred TLS Cipher used for HTTPS to configure a stronger cipher preference when available. The values are RSA_WITH_AES_128_CBC_SHA, and RSA_WITH_AES_256_CBC_SHA. The default value is RSA_WITH_AES_256_CBC_SHA.
- SIGN_SIP_CONFIG_FILES [YES | NO] overrides the file signing of files (resource files such as the device configuration file and the dial plan) other than the Security Policy and Customer Certificates. The values are YES and NO. The default value is NO.
 - **YES** Signing is required.
 - **NO** No authentication check is performed.
- **FP_PRESENTED** allows you to accept or reject a Finger Print if the resource file is not signed and if there are no customer certificates.
- **FP_ENTERED** allows you to manually enter and accept a Finger Print value if the resource file is not signed and if there are no customer certificates.
- SUBJ_ALT_NAME_CHECK_ENABLE [YES | NO] allows you to verify the Subject
 Alternative Attribute in the presented certificate. Only the IPv4 IP address is supported for this
 attribute. The values are YES and NO. The default value is NO.
- **SECURITY_POLICY_PARAM_CHANGE** allows the IP Deskphone to enter changes that are made to the security policy file in the security log file.
- **CERT_EXPIRE** allows you to select Certificate Expiration Policy. The default value is LOG EXPIRE. Following are the acceptable parameter values:
 - **DELETE_CERT** A certificate is deleted when it expires and a security log entry is added.

- **LOG_EXPIRE** A certificate is not deleted when it expires and a security log entry is added. Even if the certificate is not deleted, it cannot be used to authenticate a file.
- **NO_EXPIRE_LOG** A certificate is not deleted when it expires and security log entry is not added. Even if the certificate is not deleted, it cannot be used to authenticate a file.
- DWNLD_CFG_ACCEPT defines how all TFTP configuration files are authenticated when there are no customer certificates on the phone. The parameter does not come to effect when a customer certificate installed. The default value of the parameter is VAL_ACCEPT Following are the acceptable parameter values:
 - VAL_ACCEPT Unsigned and signed files are always accepted if there are no valid customer certificates.
 - VAL_MANUAL_A If the resource file is not signed and if there are no customer certificates, then Finger Print Display and Accept/Reject options prompt appears.
 - VAL_MANUAL_B If the resource file is not signed and if there are no customer certificates, then enter Finger Print Value and select Accept option manually.
- **DWNLD_CFG_SIGNING [YES | NO]** defines if configuration files (12xxSIP.cfg) are forced to sign if a customer certificate installed. This parameter does not come into effect if the customer certificates are installed. The default parameter value is no. The following are the acceptable values for this parameter:
 - **NO** If there is a customer certificate installed, the downloaded file is automatically accepted without authentication.
 - YES If there is a customer certificate installed, the downloaded file must be signed and fully authenticated.
- **PRIMARY_SERVER_PROFILE** [FILENAME] This parameter is the set of Server Profile configuration parameters to be applied for the Primary (S1) SIP server.
 - filename the name of the Server Profile file to be applied for the Primary server; for example, profile01.dat
- SECONDARY_SERVER_PROFILE [FILENAME] This parameter is the set of Server Profile configuration parameters to be applied for the Secondary (S2) SIP server.
 - filename the name of the Server Profile file to be applied for the Secondary server; for example, profile02.dat
- **TECH_SUPPORT_LABEL [label_string]** This parameter configures the label used for the Support soft key on the licensing screen. The user can call the Technical Support service by pressing this soft key. The default value of the label is "Support".
 - label string label characters. Maximum length of the string is 6 alpha-numerics characters.
 - Note:

The label appears if the TECH_SUPPORT_ADDRESS parameter is defined.

• TECH_SUPPORT_ADDRESS [addr_string] — This parameter configures the URI of the Technical.Support service. If the IP Deskphone licensing verification fails, then special dialog

appears where the IP Deskphone user can press the **Support** soft key to call to the Technical Support service (see the preceding command TECH_SUPPORT_LABEL).

The default value is **notset@invalid.invalid**.

• FAST_EARLY_MEDIA_ENABLE [YES|NO] — This parameter allows the administrator to activate and deactivate the Fast Early Media option (according to RFC 3264).

The default value is NO.

- YES activate the Fast Early Media option. When set to YES, SRTP is not supported.
- NO deactivate the Fast Early Media option
- **ENABLE_ANSWER_MODE [YES | NO]** This parameter allows the administrator to specify if Answer-Mode is supported when registering with the proxy. The default value is NO.
 - YES the Answer-Mode is allowed. The IP Deskphone adds the "answermode" tag to the Support header in the REGISTER request.
 - NO the Answer-Mode is not supported (default).
- ANSWER_MODE_MAXALLOWADDR [max_addr] This parameter specifies the maximum number of addresses that can be white-listed for Answer-Mode support.

The allowed values are from 0 to 200. The default value is 100.

- max addr maximum number of addresses
- ANSWER_MODE_MICMUTE [YES | NO] This parameter specifies if the microphone is muted when a call is auto-answered by the Answer-Mode functionality.
 - YES mute the microphone
 - NO do not mute the microphone (default value)
- FIPS_MODE [YES | NO] FIPS mode is used in a Federal environment. This parameter verifies that the IP Deskphone is in Federal Information Processing Standards (FIPS) certified mode.

Note:

The FIPS_MODE parameter has an interaction with the IM_MODE parameter. Refer to the IM_MODE parameter description.

- PREFER_CUSTOMIZED_RBT [YES | NO] This parameter configures the opportunity to not stop the customized ringback tone when a 180 Ringing message is received.
 - YES after receiving a 180 Ringing message without SDP body, the media stream is not closed and the customized ringback tone continues to play.
 - NO after receiving a 180 Ringing message without SDP body, the media stream is closed and local ringback tone is generated (default).

- RPID_PRESENCE_ENABLE [YES | NO] This parameter configures RPID-based presence with Avaya Presence Services. RPID is required for Avaya Presence Services. The defailt is NO.
 - YES if Avaya Presence Services with Avaya Aura Session Manager/Communication Manager are used .
 - NO if Avaya Presence Services with Avaya Aura Session Manager/Communication Manager are not used (default).
- PRES_SERVER_IP <IP address of Presence Server> This parameter is the IP address of Avaya Presence Server. It is required if Avaya Presence Services are used.
 Default value is <empty>.
- USE_DEFAULT_DEV_CERT [YES | NO] This parameter controls the use of the default device certificate for HTTPS/TLS connections to Avaya Aura®. The default value is NO. It can be configured through the device configuration file.
 - YES Use the default device certificate if no customer device certificate is installed.
 - NO Do not use the default device certificate.
- AVAYA_AURA_MODE_ENABLE [YES | NO] This parameter is a command that specifies if Avaya Aura®-specific features are active on the IP Deskphone or not. It can be configured through the device configuration file and through server profiles. The default value is NO.
 - YES Avaya Aura®-specific features are active.
 - NO Avaya Aura®-specific features are not active.
- CALL_ORIGIN_BUSY [YES | NO] This parameter determines if the user is presented with an incoming call when entering the address of an outbound call. The default is NO.
- LINE_KEY_SCROLLING [YES | NO] This parameter defines whether scrolling for long line key labels is enabled. The default value is NO.
 - YES scroll long line key labels
 - NO do not scroll long line key labels
- USE_CONTACT_IN_REFERTO [YES | NO] This parameter defines which transfer target address should be used in Refer-To header of REFER SIP request on attended transfer. The default value is YES.
 - YES use Contact URI of the transfer target in Refer-To header of REFER SIP request
 - NO use To URI of the transfer target in Refer-To header of REFER SIP request

QoS and ToS commands

AVAYA_AUTOMATIC_QoS [YES | NO] — provides a better treatment for signaling and media
packets after you deploy the IP Deskphones with the Avaya switches. All the devices use

private Differentiated Services Code Point (DSCP) values to give better treatment to the traffic coming from peer Avaya devices.

- YES the IP Deskphone uses private DSCP values, unless overridden.
- NO the IP Deskphone uses either one of the configured DSCP values or the system default values.
- **DSCP_CONTROL** [x] a value entered in decimal format between -1 and 63. If the value is -1, the DSCP value is picked up by the Service Package. The default value is 40.
 - x a value from -1 to 63 indicating the DSCP value.
- 802.1P_CONTROL [x] a value entered in decimal format between -1 and 7 representing the 802.1P value in the SIP signaling packets. If the value is -1, the 802.1P value is retrieved from the Service Package. The default value is 6.
 - x the value from -1 to 7 indicating the 802.1P value.
- DSCP_MEDIA [x] a value entered in decimal format between -1 and 63 representing the DSCP value in the Real-time Transfer Protocol packets. If the value is -1, the DSCP value is retrieved from the Service Package. The default value is 44.
 - x a value from -1 to 63 indicating the DSCP value.
- 802.1P_MEDIA [x] a value entered in decimal format between -1 and 7 representing the 802.1P value in the IP Deskphone Media (RTP) packets. If the value is -1, then the 802.1P value is retrieved from the Service Package is the 802.1 setting for media Real-time Transport Protocol (RTP). The default value is -1.
 - x a value from -1 to 7 indicating the 802.1P value.
- DSCP_DATA [x] a value entered in decimal format between -1 and 63 representing the DSCP value in the provisioning packets. If the value is -1, the DSCP value is retrieved from the Service Package. The default value is 40.
 - x a value from -1 to 63 indicating the DSCP value.
- **802.1P_DATA [x]** a value entered in decimal format between -1 and 7 representing the 802.1P value in the provisioning packets. If the value is -1, the 802.1P value is retrieved from the Service Package. The default value is 6.
 - x a value from -1 to 7 indicating the 802.1P value.

Tone configuration commands

- DIAL_TONE [frequency1 | frequency2 | on_time | off_time] used to select the tone advising the caller that the exchange is ready to receive call information and invites the user to start sending call information. You can select the country-specific tone. The default tone is the North American tone.
 - frequency1 the frequency of tone 1.
 - frequency2 the frequency of tone 2.

- on time the duration of the tone when it is on. A -1 indicates a continuous tone.
- **off_time** the duration when no tone is played.

The following is an example of DIAL_TONE:

350,440;-1 (350 and 440 Hz continuous tone)

- RINGING_TONE [frequency1 | frequency2 | on_time | off_time] used to select the tone advising the caller that a connection is made and a calling signal is applied to a telephone number or service point. You can select the country-specific tone. The default tone is the North American tone.
 - **frequency1** the frequency of tone 1.
 - **frequency2** the frequency of tone 2.
 - on time the duration of the tone when it is on. A -1 indicates a continuous tone.
 - **off_time** the duration when no tone is played.

The following is an example of RINGING TONE:

440,480; 2000,4000 (440 and 480 Hz with 2 seconds on, 4 seconds off)

- BUSY_TONE [frequency1 | frequency2 | on_time | off_time] used to select the tone advising the caller that the telephone number is busy. You can select the country-specific tone. The default tone is the North American tone.
 - **frequency1** the frequency of tone 1.
 - frequency2 the frequency of tone 2.
 - on time the duration of the tone when it is on. A -1 indicates a continuous tone.
 - off time the duration when no tone is played.
- FASTBUSY_TONE [frequency1 | frequency2 | on_time | off_time] used to select the tone advising the caller that the telephone number is busy. It is fast in cadence or frequency. You can select the country-specific tone. The default tone is the North American tone.
 - frequency1 the frequency of tone 1.
 - **frequency2** the frequency of tone 2.
 - on_time the duration of the tone when it is on. A -1 indicates a continuous tone.
 - off time the duration when no tone is played.
- CONGESTION_TONE [frequency1 | frequency2 | on_time | off_time] used to select the tone advising the caller that the groups of lines or switching equipment necessary for setting up the required call, or for the use of a specific service, are temporarily engaged. You can select the country-specific tone. The default tone is the North American tone.
 - **frequency1** the frequency of tone 1.
 - **frequency2** the frequency of tone 2.
 - on_time the duration of the tone when it is on. A -1 indicates a continuous tone.

- off time - the duration when no tone is played.

The IP Deskphone supports using WAV files to replace the ringtone Frequency/Cadence pattern. For a system-wide setting, the country default values can be used.

NAT configuration commands

- NAT_SIGNALLING [NONE | SIP_PING | STUN] indicates the type of protocol used for NAT traversal in the signaling port. The IP Deskphone with SIP Software supports two methods of NAT traversal of the signaling path: SIP_PING and STUN.
 - **NONE** If the value is not configured as None, this parameter overrides the value of the parameter SIP_PING in the device configuration file.
 - **SIP_PING** an Avaya proprietary NAT traversal protocol. Note that SIP_PING only supports NAT traversal in the signaling port.
 - **STUN** the most common NAT traversal method.
- NAT_MEDIA [NONE | STUN] indicates the type of protocol used for NAT traversal in the media ports. The default is NONE.
 - **NONE** is the default and disables NAT_MEDIA.
 - **STUN** the most common NAT traversal protocol for the media (RTP and Real-time Control Protocol [RTCP]) port.
 - x is the binding lifetime in seconds.

! Important:

NAT_TTL [x] is used for future development. Currently, the default value is 2 minutes (120 seconds) and IP Deskphones do not process or use the value defined in NAT_TTL [x]. The IP Deskphone always pings the ports at regular intervals of 60 seconds regardless of the NAT_TTL value.

- STUN_SERVER_IP1[ip_address] NAT traversal using STUN protocol requires a STUN server in the public internet. Two STUN server IP addresses can be provisioned.
 - - ip_address is the IP address of STUN Server 1.
- STUN_SERVER_IP2[ip_address] NAT traversal using STUN protocol requires a STUN server in the public internet. Two STUN Server IP addresses can be provisioned.
 - — ip_address is the IP address of STUN Server 2.
- STUN_SERVER_PORT1[port_number] the port number used corresponding to STUN_SERVER_IP1. The default port number is 3478.
 - **port number** is the port number.
- STUN_SERVER_PORT2[port_number] the port number used corresponding to STUN_SERVER_IP2. The default port number is 3478.
 - **port_number** is the port number.

VQMon configuration commands

It is important to read <u>How VQMon works</u> on page 143 before configuring the VQMON parameters.

- VQMON_PUBLISH [YES | NO] the command that is used to enable or disable the publish
 message containing the voice quality monitoring metrics sent to the Proactive Voice Quality
 Monitoring (PVQMoN) collecting server.
 - YES enables VQMoN.
 - NO disables VQMoN. NO is the default.
- **VQMON_PUBLISH_IP [xxx.xxx.xxx.xxx]** used to configure the IP address of the PVQMoN server that collects voice quality monitoring metrics from the publish message.

This IP address is used only within the report.

- LISTENING_R_ENABLE [YES | NO] used to enable or disable the alerts based on the Listening R Minor and Major Thresholds. The default value is vocoder-dependent, using a scale from 1 (lowest quality) to 100 (highest quality). Currently, default values are used based on VOCODER on a per-call basis, as summarized below.
 - **YES** enables the sending of the alert report based on the Listening R Value.
 - **NO** disables the sending of the alert report based on the Listening R Value.

VOCODER_G711_ULAW	LISTENING_R_WARN = 80
VOCODER_G711_ULAWPLP	LISTENING_R_EXCE = 70
VOCODER_G723	LISTENING_R_WARN = 60
VOCODER_FLAG_G723_RATE_53	LISTENING_R_EXCE = 50
VOCODER_FLAG_G723_RATE_63	
VOCODER_G729	LISTENING_R_WARN = 70 (default if not
VOCODER_PCM8	configured and unknown type)
vqmonVocoderTypeUnknown	LISTENING_R_EXCE = 60

- LISTENING_R_WARN [xx] the threshold to send a report on Listening R less than [xx]. The default value is 70. Using a value of **0** resets it to the default value, based on the far-end VOCODER.
 - xx is an INTEGER value used as the threshold.
- LISTENING_R_EXCE [xx] the threshold to send a report on Listening R less than [xx]. The default value is 60. Using a value of **0** resets it to the default value, based on the far-end VOCODER.
 - xx is an INTEGER value used as the threshold.
- PACKET_LOSS_ENABLE [YES | NO] used to enable or disable the alerts based on the packet loss thresholds. Packet loss is the fraction of RTP data packets from the source lost

since the beginning of reception. The value is an integer scaled by 256. The range is 1 to 25600.

- YES enables the sending of an alert report based on the packet loss
- **NO** disables the sending of an alert report based on the packet loss
- PACKET_LOSS_WARN [xx] the threshold to send a report on Packet Loss greater than [xx]. The default is 256 (1%). Using a value of **0** resets the threshold to the default value.
 - **xx** is an INTEGER value scaled by 256 that is used as the threshold. The range is 1 to 25600.
- PACKET_LOSS_EXCE [xx] the threshold to send a report on Packet Loss greater than [xx]. The default is 1280 (5%). Using a value of **0** resets the threshold to the default value.
 - **xx** is an INTEGER value scaled by 256 that is used as the threshold. The range is 1 to 25600.
- JITTER_ENABLE [YES | NO] used to enable or disable alerts based on the inter-arrival
 Jitter on incoming RTP packets inter-arrival time. The value is represented in 1/65536 of a
 second.
 - YES enables the sending of an alert report based on jitter detection
 - NO disables the sending of an alert report based on jitter detection
- **JITTER_WARN [xx]** the threshold to send a report on Inter-arrival Jitter greater than [xx]. 1 second is broken up into 65535 (0xffff hex) parts. [xx] / 65535 is the threshold in seconds. The default is 3276 (50 ms). Using a value of **0** resets the threshold to the default value.
 - xx is an INTEGER value used as threshold
- **JITTER_EXCE [xx]** the threshold to send a report on Inter-arrival Jitter greater than [xx]. 1 second is broken up into 65535 (0xffff hex) parts. [xx] / 65535 is the threshold in seconds. The default is 32760 (500 ms). Using a value of **0** resets the threshold to the default value.
 - xx is an INTEGER value used as threshold
- DELAY_ENABLE [YES | NO] used to enable or disable the alerts based on excessive delay detection. This is the one-way delay (including system delay) for the call, measured in milliseconds.
 - YES enables excessive delay detection.
 - **NO** disables excessive delay detection.
- **DELAY_WARN** [xx] the threshold to give warning on excessive delay greater than [xx]. The default is 150 ms. Using a value of **0** resets the threshold to the default value.
 - xx is an INTEGER value used as a threshold measured in 1/1000 of a second.
- **DELAY_EXCE [xx]** the threshold to report unacceptable excessive delay greater than [xx]. The default is 175 ms. Using a value of **0** resets the threshold to the default value.
 - xx is an INTEGER value used as a threshold measured in 1/1000 of a second.
- **SESSION_RPT_EN [YES | NO]** used to enable or disable periodic VQMon session reports. The default is disabled.

Both session report enable (SESSION_RPT_EN) and session report interval (SESSION_RPT_INT) must be configured if the IP Deskphone software has been upgraded to SIP Release 3.0 or later. Otherwise, the SESSION_RPT_INT default of 60 seconds is used automatically.

- YES enables periodic VQMon session reports.
- NO disables periodic VQMon session reports. Default is NO.
- **SESSION_RPT_INT [xx]** used to specify the interval for the periodic VQMon session report in seconds. The minimum acceptable value is 60 seconds. The maximum acceptable value is 600 seconds. The default is 60 seconds.
 - xx is an INTEGER value in seconds.

System commands

- ADMIN_PASSWORD [password] used to change the default administrator password of the IP Deskphone that is used for unlocking network menus. The default is 26567*738.
 - password the administrator password.
- ADMIN_PASSWORD_EXPIRY [seconds] This parameter configures the date when the ADMIN_PWD is no longer valid and requires a new password to be downloaded from the provisioning server.

The value specifies the expiry date in seconds (Unix Timestamp format). A simple Unix Timestamp format converter is available at http://www.unixtimestamp.org/.

To reset the expiry date value, use the following format:

ADMIN_PASSWORD_EXPIRY 0

- HASHED_ADMIN_PASSWORD [YES | NO] This parameter indicates whether the Admin password is hashed or not. The default value is NO.
 - YES Admin password is hashed.
 - NO Admin password is not hashed.

IP Deskphone bug logging/recovery commands

- **RECOVERY_LEVEL** controls the IP Deskphone recovery if the IP Deskphone hits any Major or Critical error. The following values are used for configuring the recovery level on the IP Deskphone:
 - 0 IP Deskphone never recovers from any error
 - 1 IP Deskphone recovers from Critical error
 - 2 IP Deskphone recovers from Major and Critical errors

Default is 255, which is equivalent to the recovery level of 2.

- LOG_LEVEL [x] This parameter defines which IP Deskphone bugs are logged in the ECR file. The following values are used for configuring the logging level on the IP Deskphone.
 - x level of bugs from 0 to 255. The default value is 2.
 - 0 logging is blocked
 - 1 log only Critical bugs
 - 2 log Critical / Major bugs
 - 3 log Critical / Major / Minor bugs
 - if >= 4 log all information and bugs

Important:

LOG_LEVEL 4 is intended for debug purposes only. Do not set LOG_LEVEL to 4 or a higher value unless you are instructed to do so by Avaya support.

User login commands

- AUTOLOGIN_ID_KEY[nn] [* | xx] [userID@domain name] This parameter is located within the IP Deskphone-specific configuration file. This is the ID that the IP Deskphone uses to register and authenticate. The default User ID "user1" is used if an ID is not supplied and the IP Deskphone is not logged in.
 - * indicates that the IP Deskphone should use its MAC address (lower case) as the User ID
 - xx an ASCII string that corresponds to the User ID.
 - userID@domain name the user ID must be followed by the domain name; for example, ismith@company_name.com; 2247@company_name.com

Note:

To provision AUTOLOGIN_ID_KEY[nn] [userID@domain name], the IP Deskphone must be rebooted after the IP Deskphone configuration file is updated. To force a hard reboot after the IP Deskphone configuration file is updated, configure FORCE_REBOOT YES in the device configuration file.

AUTOLOGIN_PASSWD_KEY[nn] [xx] — This parameter is located within the IP Deskphone-specific configuration file. There is no default password. If this parameter is blank and AUTOLOGIN_ENABLE is configured to USE_AUTOLOGIN_ID (or 2) in the device configuration file, the IP Deskphone does not log on.

Note:

To provision **AUTOLOGIN_PASSWD_KEY[nn] [xx]**, the IP Deskphone must be rebooted after the IP Deskphone configuration file is updated. To force a hard reboot after the IP Deskphone configuration file is updated, configure FORCE_REBOOT YES in the device configuration file.

 PROMPT_AUTHNAME_ENABLE [YES | NO] — This parameter causes the user to be prompted to enter an authentication name when they log on to the IP Deskphone. For a CS 1000 system, it is necessary to configure an authentication name when configuring IP Deskphone features.

- YES prompt the user to enter an authentication name.
- NO authentication name is not configured.
- AUTOLOGIN_AUTHID_KEY[nn] [xx] This parameter specifies the authentication name to be used for a specific key.
 - [nn] = the key number (01 maximum number of keys supported on the IP Deskphone)
 - [xx] = the authorization ID for that key's login

Create the IP Deskphone-specific configuration file

If the IP Deskphone encounters a [USER_CONFIG] section while parsing the 12x0SIP.cfg configuration file, the IP Deskphone downloads the IP Deskphone-specific configuration file SIP<MAC ID>.cfg from the provisioning server.

IP Deskphone-specific configuration files support customizing the IP Deskphone on a IP Deskphone/user level. Parameters in the device configuration file can be overwritten with a IP Deskphone-specific configuration file.

Most of the parameters in the IP Deskphone configuration file are saved on the IP Deskphone. Removing a parameter from the IP Deskphone configuration file does not change the parameters saved on a configured IP Deskphone. If a parameter is configured only in the IP Deskphone-specific configuration file, removing the IP Deskphone-specific configuration file does not clear the setting.

Important:

If the 12x0SIP.cfg configuration file contains a [USER_CONFIG] section, Avaya recommends that DOWNLOAD_MODE be configured as FORCED. This is a global setting for all IP Deskphones used to determine if the MAC ID file should be read. Alternatively, if the user wants to use DOWNLOAD_MODE configured to AUTO, then when a change is made to any MAC ID file the version number should be incremented so that all IP Deskphones read the file.

Create the Dialing Plan file

If the IP Deskphone encounters a [DIALING_PLAN] section while parsing the 12x0SIP.cfg configuration file, the IP Deskphone downloads the specified dialing plan configuration file from the provisioning server.

A dialing plan essentially describes the number and pattern of digits that a user dials to reach a particular telephone number. Access codes, area codes, specialized codes, and combinations of the number of digits dialed are all part of a dialing plan.

The purpose of the dialing plan is so that the end user does not have to press the send or pound key (#) to have the IP Deskphone with SIP Software send the initial message to start the call.

Dialing a telephone number on an IP Deskphone that supports SIP can be different than dialing a number from a traditional telephone. SIP signaling is communicated through a SIP URI to get to the far end. For example, you can key in the SIP address, <code>jsmith@company_name.com</code> to reach John Smith. When the IP Deskphone with SIP Software receives this address, the dialing plan is bypassed and the IP Deskphone uses the SIP URI to send a SIP INVITE to <code>jsmith@company_name.com</code> (INVITE sip: <code>jsmith@company_name.com</code>).

Entering a SIP URI address, however, is inconvenient on an IP Deskphone with SIP Software. Also, the user must explicitly press the **Send** key (or use some method to indicate the end of the URI) to indicate the completion of the SIP address. This is not something that the user is accustomed to in a traditional PBX environment.

The alternative is to use a URI where numbers are used to reach the far end. Using different access codes, the IP Deskphone with SIP Software translates the digits entered into something that the server can understand and remaps the number entered into different URIs. Some of the numbers are mapped as intercom calls, some numbers are mapped as local Public Switched Telephone Network (PSTN) calls, and some numbers are mapped as public long-distance calls.

The issue is that until the IP Deskphone itself can determine the type of call, no SIP INVITE message is sent. This is where the dialing plan comes into effect. The call type is determined by the dialing plan. Based on the rules defined in the dialing plan, once a match has been identified, the IP Deskphone with SIP Software sends the invite without the need to press the send key. This behavior closely matches the traditional PBX operation.

The IP Deskphone with SIP Software design places no restriction in the format of the SIP URI. The dialing plan is a scheme to match the user experience with traditional PBX operation. It does not restrict the type of URI that the user can use.

The IP Deskphone with SIP Software uses a dialing plan to recognize a call as an call when it sends an INVITE. The dialing plan can have multiple emergency numbers. See the chapter Emergency Services on page 217 for information on the handling of Emergency calls by the IP Deskphone with SIP software.

The following is an example of a dialing plan.

```
/* ----- */
$n="mycompany.com"
$t=300
응응
/* DIGITMAP: Operator call */
(0) | (0) #
                  && sip:$$@$n;user=phone &&
/* DIGITMAP: Emergency call */
(911) | (911) #
                  && sip:$$@$n;user=phone
                                        && t=100|emergency
/* DIGITMAP: Avaya Aura Feature Access Code, *nn */
(*x{2})|(*x{2})# && sip:$$@$n;user=phone
                                           && t=100
/* DIGITMAP: Private internal call, 4 digit extensions starting with 4 */
(4x{3})|(4x{3})# && sip:$$@$n;user=phone &&
```

```
/* DIGITMAP: Private intra-location call, no access code */
([^4960]x{3})|([^4960]x{3})# && sip:$$@$n;user=phone
                                                                & &
/* DIGITMAP: Private intra-company call, access code 6 */
(6[^10]x{6})|(6[^10]x{6})# && sip:$$@$n;user=phone
                                                                & &
/* DIGITMAP: Public local call, access code 9 */
(9[^1]x{9})|(9[^1]x{9})# && sip:$$@$n;user=phone
                                                               ۶,۶
/* DIGITMAP: Public national call, access code 61 */
(61x\{10\}) | (61x\{10\}) #
                                 && sip:$$@$n;user=phone
                                                                  8 8
/* DIGITMAP: Public international call, access code 6011 */
(6011x{7,15})|(6011x{7,15})# && sip:$$@$n;user=phone
                                                          && t=8000
/* End of Dial Plan */
```

Tip:

When repeating a pattern to add a trailing #, cut and paste the first pattern to ensure the patterns are identical (minimizes typing errors).

Dialing function description

Dialing plan

As most IP Deskphone users are used to dialing digits to indicate the address of the destination, there is a need to specify the rule by which digits are transformed into a URI. The IP Deskphone with SIP Software dialing plan contains two sections delimited by two percent signs (%%).

+		+	-+
i	declarations section	user pre define variables and parameters	i
- 1	88	section separator	-
1	digit maps	list of digit maps	-
+			-+

Figure 4: Sample dialing plan declarations section

In the declaration section, the administrator can define the variables. The variables must start with a dollar (\$) sign, followed by a number or a character, such as \$1 or \$a. There are two variables that are reserved by system. They are as follows:

\$\$: used for the collected digits if they match the pattern

\$t: default timer

There must be a domain name defined and the domain name can be represented by any variable. In the dialing plan example given in <u>Create the Dialing Plan file</u> on page 96, the domain name is represented by \$n.

The variable definitions take the form:

Figure 5: Sample dialing plan variable definitions

For example:

\$1="avaya.com"

\$2="Avava"

\$3="."

\$4="com"

\$5="Avaya.com"

\$t=10000 (default timer is 10 seconds)

\$a=Avaya.com

The second section of dialing plan contains the digit map. The digit map section has three subsections that are divided by a separator of two ampersands (&&).

```
+-----+
| patterns && destination string && dialing action attributes |
+-----+
```

Figure 6: Sample dialing plan digit map section

The first part of a dialing plan contains a pattern defined with DRegex, which is used for matching the dialed number. The patterns are separated by the pipe (|) sign. The second part contains the result string used in the dial step. The third part defines the parameters used by UA in dialing action.

The following parameter is currently defined:

t=xxxx: After this timer expires, the number entered is automatically dialed. The timer starts after the first digit is entered and after it expires, the collected digits are automatically dialed out. xxxx is a decimal number in msec. The default timer is used when t is not specified in the digit map.

For example:

X{4} && sip:\$\$; phone-context=avaya.com;user=phone && t=7000

When the user presses any 4 digits, such as 4567, the following SIP URIs are generated because of the translation rule:

Sip:4567; phone-context=avaya.com;user=phone. The timeout of stopping the collection of digits is 7 seconds.

The pound sign (#) at the end of the digit map causes the IP Deskphone to dial the matched dialing plan immediately.

DRegex

The Digit Regular Expression (DRegex) syntax is a telephony-oriented mapping of Portable Operating System Interface (POSIX) Extended Regular Expressions (ERE). Users must take care not to confuse the DRegex syntax with POSI EREs, as they are not identical. In particular, there are many features of POSIX EREs that DRegex does not support. The dialing plan uses DRegex instead of ERE. The following rules demonstrate the use of DRegex.

Table 8: DRegex rules

Entity	Matches	
Character	Digits 0-9, *, #, and A-D (case insensitive, A-D only for military requirements)	
*	The * character	
#	The # character	
[character selector]	Any character in selector	
[^digit selector]	Any digit (0-9) not in selector	
[range1-range2]	Any character in range from range1 to range2, inclusive	
х	Any digit 0-9	
{m}	m repetitions of previous pattern	
{m,}	m or more repetitions of previous pattern	
{,n}	At most n (including zero) repetitions of previous pattern	
{m,n}	At least m and at most n repetitions of previous pattern	
()	Provide "captures" for back reference variable \$\$	
\$\$	Back reference "matches" text previously matched within parentheses or the "matches" if parentheses are not specified	
/* comments line */	Comments	

DRegex notation example

Example	Description
1	Matches the digit 1
[179]	Matches 1,7, or 9
[2-9]	Matches 2,3,4,5,6,7,8,9
[^15]	Matches 0,2,3,4,6,7,8,9
[02-46-9A-D]	Matches 0,2,3,4,6,7,8,9,A,B,C,D
х	Matches 0,1,2,3,4,5,6,7,8,9

Table continues...

Example	Description	
*6[179#]	Matches *61, *67, *69, or *6#	
x{10}	Matches ten digits	
011x{7,15}	Matches 011 followed by seven to fifteen digits	
91(x{10})	Matches 91 followed by ten digits	
	(x{10}) specifies the back reference variable, so \$\$ collects only ten digits (does not include the 91)	
	Example:	
	911234567890 is dialed	
	\$\$=1234567890	
(91x{10})	Matches 91 followed by ten digits	
	 (91x{10}) specifies the back reference variable, so \$\$ collects all twelve digits 	
	• Example:	
	911234567890 is dialed	
	\$\$=911234567890	

Downloadable WAV files

It is possible to customize the ring tones on the IP Deskphone. Up to five special ring tones can be downloaded from the provisioning server and stored on the IP Deskphone. The end user can select which ring tone they would like to implement.

In order to download these special files, the files must reside on the provisioning server and be specified in the SIP provisioning file. For more information, see <u>Download the SIP software</u> on page 46. The WAV files have a maximum size of 512 KB each for the IP Deskphone.

The file format is restricted to ITU-T A-law or u-law (8.0 kHz, 8-bit, mono or 16.0 kHz, 16 bit mono).

After the WAV files are downloaded to the IP Deskphone, the WAV file names appear in **Pref > Audio > Tones > Ring Pattern** (1 to 8 are standard ring tones, and 9 and above are WAV ring tones) and the WAV ring tones can then be selected to replace the standard ring tones.

For further information about downloadable WAV files, see the applicable IP Deskphone User Guide.

Chapter 7: Configure the DHCP Server

The Avaya IP Deskphones support two basic Dynamic Host Configuration Protocol (DHCP) mechanisms to provide configuration information to the IP Deskphones. These mechanisms are the following:

- Normal DHCP
- DHCP VLAN phase

Normal DHCP

The normal DHCP is used to configure standard IP parameters such as IP address, NetMask, default gateway, and DHCP lease parameters. The message sequence consists of Discover, Offer, Request, and Acknowledge. The IP Deskphones can also insert an optional phase. To include an optional phase, the first phase is used to discover and configure the voice VLAN using a Avaya proprietary method. The second phase then proceeds normally on the discovered VLAN. If the DHCP VLAN discovery is not used, then there is only a single phase.

DHCP VLAN Phase

The DHCP site and vendor specific options contain VLAN information to configure VLANs. The VLAN parameters are text string embedded in the standard DHCP Vendor and Site Specific options. You can acquire the VLAN parameters using 802.1ab and acquire IP address parameters using DHCP.

If the IP Deskphone does not contain VLAN configuration provisioned manually or through LLDP, the IP Deskphone attempts to determine the VLAN during DHCP VLAN Phase. If the IP Deskphone does find a VLAN configuration, it proceeds to the DHCP Configuration Phase. If the VLAN Phase (VLAN configured through DHCP) is successful, then the VLAN Phase finishes with a final DHCP. A release message appears after the completion of the Configuration Phase.

The following is the procedure to configure the Voice VLAN using DHCP, assuming VLAN is not configured using any other method:

- 1. The IP Deskphone sends a DHCP request using an untagged (no VLAN) packet during any of the following scenarios:
 - The customer network is configured to handle untagged packets; for example, retag them to a specific VLAN.

- The DHCP request contains standard IP Deskphone IP DHCP option requests from the point when the IP Deskphone does not receive the VLAN information. These options include the Vendor Specific and all Site Specific options.
- 2. The DHCP server receives the request. If the server is configured, the DHCP server returns a DHCP Offer message with a special text string in the Vendor Specific option or one of the Site Specific options.

The following is the format of the text in the option:

VLAN-A:XXX+YYY+ZZZ+...

where VLAN-A is a substring followed with VLAN information. XXX, YYY, ZZZ are the numbers of the supported VLANs. There can be from 1 to 10 different VLANs. Each VLAN is separated with a symbol +.

- 3. After receiving the DHCP Offer message, the IP Deskphone scans each Vendor and Site Specific option for the VLAN-A string.
- 4. If the IP Deskphone finds the VLAN-A string, it tries each VLAN and in turn XXX, YYY, ZZZ searches for a DHCP server.
- 5. The search is done by sending a DHCP Discover message looking for a DHCP Offer message as a response.
- 6. If the IP Deskphone finds a response, it discontinues its DHCP exchange on the untagged channel and continues its DHCP exchange on the "discovered" VLAN.
- 7. If there is no response, the initial untagged Discover message assumes there is no VLAN configuration information available from the DHCP server and continues using untagged packets. When the IP Deskphone sends its first DHCP Discover message, it does not know if it can find VLAN configuration information. If it does discover VLAN information, it continues the VLAN configuration as described above. If it does not find any VLAN information, it assumes there is only a Configuration Phase.

DHCP options

The DHCP protocol provides options mechanisms for the client and server to exchange information in addition to the standard Bootstrap Protocol (BOOTP) information. This section describes the client and server options supported by the IP Deskphone.

- IP Deskphone to Server options on page 103
- Server to IP Deskphone options on page 104

IP Deskphone to Server options

When a DHCP client sends DHCP Discover and Request messages, it includes a list of options as part of the request. The IP Deskphone DHCP client sends the following options:

Option	Description	
12	Specifies the Hostname. By default, the Hostname is "T"+MAC Address; for example, T001765FDBF1D. The Hostname can be manually provisioned using the keypad.	
53	Specifies the DHCP Message Type.	
55	Specifies the messages to tell the server which options the IP Deskphone is requesting. It appears in the Discover and Request. The SIP software requests the following options	
	1 - IPv4 Subnet Mask	
	• 3 - Router	
	6 - Domain Name Server	
	• 15 - Domain Name	
	28 - Broadcast Address	
	43 - Vendor Specific Information	
	• 58 - Renewal Time	
	• 59 - Rebinding Time	
	66 - TFTP Server Name. The client treats this more generically as a request for the provisioning server name and protocol.	
	• 99 - Must not be included	
	 128, 131, 144, 157, 188, 191, 205, 219, 223 - Specifies old site specific options. Recovered by IANA according to RFC 3942 and must not be used for new installations. 	
	• 224, 227, 230, 232, 235, 238, 241, 244, 247, 249, 251, 254- Specifies site specific options.	
57	Specifies maximum DHCP message size. The maximum message size is 1190 bytes.	
60	Sends "Nortel-SIP-Phone-A" as the Vendor Identifier.	
61	Specifies Client Identifier (MAC Address).	

Server to IP Deskphone options

The DHCP server can send any option to the IP Deskphone as part of the DHCP Offer message. The IP Deskphone accepts the following options:

	DHCP Option	Description
IPv4 Address		
Net mask	1	

Table continues...

	DHCP Option	Description
Router Option	3	
Domain Name Server	6	Accepts the first two DNS addresses.
Domain Name	15	
Broadcast Address	28	This is the broadcast address of the subnet. The IP Deskphone automatically calculates the broadcast address if it is not provided.
Vendor Specific Option	43	
DHCP Renewal Time	58	
DHCP Rebinding Time	59	
TFTP Server Name	66	Two forms of the server name are supported. If a dotted-decimal IP address is returned, it is assumed to point to a TFTP server. A full URL can also be provided to specify a protocol and FQDN.
Old Site Specific Options	128, 131, 144, 157, 188, 191, 205, 219, 223	Options are supported, but not recommended for new installations. These options are reclaimed according to RFC 3942.
Site Specific Options	224, 227, 230, 232, 235, 238, 241, 244, 247, 249, 251, 254	New site specific options which are recommended to be used.

The Vendor (43) or site specific options allows a vendor-encapsulated or site-specific option (or both) to transport the "Nortel-SIP-Phone-B" option string with auto-provisioning parameters to the IP Deskphone. The administrator must use one of the site-specific or vendor-encapsulated option codes; the method used depends on the DHCP server's capabilities and what options are already in use for other vendor devices.

Multiple DHCP Servers

It is possible that two or more DHCP servers can respond to the DHCP Discover message. When the IP Deskphone sends a Discover message, it waits for 1 second to collect all the responses. If there is more than one response, the IP Deskphone selects the response with the longest lease time. If the lease time is identical, the first response is selected.

Configure the DHCP server to support SIP IP Deskphone class identifier

After the DHCP server is configured to recognize the IP Deskphone with SIP Software as a unique IP Deskphone, the DHCP server can treat the IP Deskphone differently than other DHCP

Deskphones. An IP Deskphone-aware DHCP server can automatically configure IP Deskphones by sending all information that the IP Deskphone requires.

The IP Deskphone and the DHCP server communicate using a unique class identifier. After the IP Deskphone first sends the DHCP DISCOVER, it includes the Nortel-SIP-Phone-A ASCII string within the Vendor Class Identifier (Option 60). The DHCP server recognizes this special Vendor Class Identifier (Option 60) and sends back OFFER, which also includes the same Vendor Class Identifier. This makes it possible to notify the IP Deskphone with SIP Software that the server is IP Deskphone-aware, and that it is safe to accept the offer from the server.

Every IP Deskphone with SIP Software fills in the Vendor Class ID option of the DHCPDISCOVER and DHCPREQUEST messages with the null-terminated, ASCII-encoded string Nortel-SIP-Phone-A, where A identifies the version number of the information format of the IP Deskphone.

The Class Identifier Nortel-SIP-Phone-A must be unique in the DHCP server domain.

The unique DHCP configuration is required to allow the DHCP server to respond with a unique Option 66 parameter to the IP Deskphone with SIP Software.

Note:

The DHCP standard defines Option 66 as the bootp server address in a string. The meaning of the bootp server address is extended in Avaya IP Deskphone with SIP Software to include the provisioning server address. The string in the DHCP offer for Option 66 can be the numeric IP address or name of the Provisioning server or the URI (if FTP, HTTP, or HTTPS protocol is used) of the provisioning server in the form of

cprotocol>:///provisioning server URL>.

For example:

http://mydomain.com/SIP phone.

If provisioning server authentication is required, the user credential must be embedded in the URI in the form of

cprotocol>://<userid>;<password>@@cprovisioning server URL>[:port][/
path].

For example:

```
ftp://www.mydomain.com/ABC
```

or

ftp://myuserid:mypass@ftp.mydomain.com:21/ABC

Configuring the DHCP server to support the vendor class identifier is not mandatory but is one way to segregate network configuration data for the SIP phones from that for other devices. Below is an example of the Linux dhcpd DHCPv4 server configuration file modifications for the phone's vendor class id when you want to have specific handling for different phone types.

dhcpd.conf

```
# Custom options for Avaya 1100 and 1200 phones
class "11xx12xxUNIStim" {
   match if substring(option vendor-class-identifier, 0, 14) = "Nortel-i2004-A";
   option tftp-server-name "http://< IP address>/";
}
```

```
class "11xx12xxSIP" {
    match if substring(option vendor-class-identifier, 0, 18) = "Nortel-SIP-Phone-A";
    option tftp-server-name "http://< IP address>/ ";
}
...
pool {
    range 192.168.xxx.xxx 192.168.xxx.xxx;
    allow members of "11xx12xxUNIStim";
    allow members of "11xx12xxSIP";
}
...
```

The following is an example of the similar handling but for the Open DHCP Server's configuration file.

OpenDHCPServer.ini

```
[GLOBAL_OPTIONS]
SubnetMask=255.255.255.0
Router=192.168.1.101
TFTPServerName="tftp://192.168.1.169"

# Custom options for Avaya 1100 and 1200 SIP phones
[RANGE_SET]
FilterVendorClass="Nortel-SIP-Phone-A"
DHCPRange=192.168.1.210-192.168.1.220
TFTPServerName="http://192.168.1.188"

# Custom options for Avaya 1100 and 1200 UNIStim phones
[RANGE_SET]
FilterVendorClass="Nortel-i2004-A"
DHCPRange=192.168.1.230-192.168.1.240
TFTPServerName="tftp://192.168.1.188"
...
```

Refer to your DHCP server's documentation for specifically how to configure a vender class id.

Configure DHCP Server with auto-provision data

The network items found in the IP Deskphone's Device Settings menu can be auto-provisioned using DHCP. The parameters are sent to the phone in the DHCP OFFER and DHCP ACK messages by adding them in either a vendor or site specific option.

The option text begins with "Nortel-SIP-Phone-B," followed by parameter/value pairs separated by semi-colons. The option string syntax is shown below:

```
"Nortel-SIP-Phone-B, <param>=<value>; <param>=<value>; "
```

See section <u>Configuration parameters</u> on page 108 for a list of the auto-provision parameters and their syntax. Be sure any parameters being sent in the DHCP option string are set to "AUTO" mode in the Device Settings menu; if they are set as MANUAL then the manual values will override them and they will not take effect. For more details on how to setup automatic vs. manual configuration parameters, see <u>Provisioning the IP Deskphones</u> on page 130.

Below is an example of the Linux dhcpd DHCPv4 server configuration file containing an example of site-specific option 224. The example option's data configures the phone to enable the Bluetooth radio, disable the PC port, disable the USB interface and disable LLDP.

dhcpd.conf

```
# This line sets the tag Avaya-Custom-Phone to the numeric option
option Avaya-Custom-Phone code 224 = string;
...
class "Avaya11xx12xxSIP" {
    # This limits this option to the 11xx12xx SIP phones
    match if substring(option vendor-class-identifier, 0, 18) = "Nortel-SIP-Phone-A";

# This line puts the auto-provisioning parameters in the option
    option Avaya-Custom-Phone "Nortel-SIP-Phone-B,bt=y;pc=n;usb=n;lldp=n;";
    ...
}
```

The following is an example of the similar handling but for the Open DHCP Server's configuration file.

OpenDHCPServer.ini

```
# Custom options for Avaya 1100 and 1200 SIP phones
[RANGE_SET]
# This filter limits the items in this [RANGE_SET] to the 11xx12xx SIP phones
FilterVendorClass="Nortel-SIP-Phone-A"
# This line defines the auto-provisioning parameters in option 224
224="Nortel-SIP-Phone-B,bt=y;pc=n;usb=n;lldp=n;"
...
```

Refer to your DHCP server's documentation for specifically how to configure a vendor or site option and its data.

Configuration parameters

The IP Deskphones can receive the auto-provision parameters shown in the following table:

Table 9: Provisioning info block format

Parameter	Value	Description	
EAP (802.1x)	EAP (802.1x)		
eap	dis for disable	Disable or select an EAP authentication	
	md5 for EAP-MD5	method.	
	peap for EAP-PEAP		
	tls for EAP-TLS		

Table continues...

Parameter	Value	Description
	Caution: Changing this parameter can impact network connectivity and can require manual correction.	
	Important:	
	Information is transferred in clear text DHCP.	when you provision this parameter using
eapid1	Character string from 4 to 20 characters	802.1x (EAP) device ID1.
	⚠ Caution:	
	Changing this parameter can impact r correction.	network connectivity and can require manual
	Important:	
	Information is transferred in clear text DHCP.	when you provision this parameter using
eapid2	Character string from 4 to 20 characters	802.1x (EAP) device ID2.
	⚠ Caution:	
	Changing this parameter can impact network connectivity and can require manua correction.	
	Important:	
	Information is transferred in clear text when you provision this parameter using DHCP.	
eappwd	Character string from 4 to 12 characters 802.1x (EAP) password.	
	Caution: Changing this parameter can impact network connectivity and can require manual correction.	
	Important:	
	Information is transferred in clear text when you provision this parameter using DHCP.	
Other networking		
ca	Character string with a maximum of 80 characters	The URL of the Certificate Authority (CA) server
cahost	Character string with a maximum of 32 characters	The Certificate Authority (CA) host name assigned to the IP Deskphone.
cadomain	Character string with a maximum of 50 characters	The Certificate Authority (CA) domain name to which the IP Deskphone is a member of.
dns	Character string with a maximum of 50 characters	Primary DNS server URL

Parameter	Value	Description		
dns2	Character string with a maximum of 50 characters	Secondary DNS server URL		
lldp	y for yes	Enable 802.1ab LLDP.		
	n for no			
	⚠ Caution:			
	Changing this parameter can impact correction.	Changing this parameter can impact network connectivity and can require manual		
prov	Character string with a maximum of 50	Provisioning server URL.		
	characters	For an HTTP server, you must include "http://" in the URL.		
st	y for yes	Enable stickiness.		
	n for no			
cachedip	y for yes	Enable cached IP.		
	n for no			
dhcp	y for yes	Enable Dynamic Host Configuration		
	n for no	Protocol (DHCP).		
ntqos	y for yes	Enable Avaya Automatic QoS		
	n for no			
igarp	y for yes	Ignore GARP.		
	n no

	n for no			
srtpid	96 (default)	Payload type ID		
	115			
	120			
Voice VLAN				
vq	y for yes	Enable 802.1Q for voice.		
	n for no			
	⚠ Caution:			
	Changing this parameter can impact network connectivity and can require manual correction.			
vcp	Value from 0 to 8	802.1Q control p bit for voice stream.		
vmp	Value from 0 to 8	802.1Q media p bit for voice stream		
vlanf	y for yes n for no	Enable VLAN filter on voice stream.		
vvsource	n for no VLAN	Source of VLAN information.		

Parameter	Value	Description
	a for auto VLAN using DHCP	
	Iv for auto VLAN using VLAN Name TLV	
	Im for auto VLAN using Network Policy TLV	
PC Port		
nis	a for automatic negotiation	Network port speed.
	10 for 10 Mbps	
	100 for 100 Mbps	
	⚠ Caution:	
	Changing this parameter can impact no correction.	etwork connectivity and can require manual
	Important:	
	You must select automatic negotiation Avaya 1120E/1140E/1150E IP Deskph	when using Gigabit Ethernet (GigE) on none.
nid	a for automatic negotiation	Network port duplex.
	f for full duplex	
	h for half duplex	
	Caution:	
	Changing this parameter can impact network connectivity and can require manual correction.	
рс	y for yes	Enable PC port. This parameter does not
	n for no	apply to the 2001 IP Phone.
pcs	a for automatic negotiation	PC port speed.
	10 for 10 Mbps	
	100 for 100 Mbps	
pcd	a for automatic negotiation	PC port duplex.
	f for full duplex	
	•	
	h for half duplex	
Data VLAN		
Data VLAN		Enable 802.1Q for PC port.
	h for half duplex	Enable 802.1Q for PC port.
	h for half duplex y for yes	Enable VLAN for data. This parameter
dq	y for yes n for no	·

Parameter	Value	Description
dp	Value from 0 to 8	802.1Q p bit for data stream.
Diffserv Codepoint		
cdiff	Value from 0 to 255	Diffserv code points for control messages.
mdiff	Value from 0 to 255	DiffServ code point for media packets.
pcuntag	y for yes	Enable tag stripping on packets forwarded
	n for no	to PC port.
dscpovr	y for yes	DSCP Precedence Override
	n for no	
Miscellaneous		
bt (1100 only)	y for yes	Enable Bluetooth® (Avaya 1140E/1165E IP
	n for no	Deskphone only).
hd (1100 only)	w for wired	Headset type (Avaya 1120E/1140E/ 1165E
	b for Bluetooth® (1140E and 1165E only)	IP Deskphone)
	u for USB, n for none	
menulock	f for full lock	Menu lock mode.
	p for partial	
	u for unlock	
unid	Character string up to 32 characters	Unique network identification.
usb	y for yes	Enable USB port. (Avaya 1165E IP
	n for no	Deskphone only)
usbm	y for yes	Enable USB mouse device on USB port.
	n for no	(Avaya 1165E IP Deskphone only)
usbk	y for yes	Enable USB keyboard device on USB port.
	n for no	(Avaya 1165E IP Deskphone only)
usbh	y for yes	Enable USB headset device on USB port.
	n for no	(Avaya 1165E IP Deskphone only)
usbms	y for yes	Enable USB flash drive device on USB
	n for no	port. (Avaya 1165E IP Deskphone only)
Display control		
ct	Value from 0 to 15 (Avaya 1100 Series IP Deskphones)	Contrast value.
	Value from 0 to 39 (for Avaya 2007 IP Deskphone)	
br	Value from 0 to 15	Brightness value (Avaya 2007 IP Deskphone).

Parameter	Value	Description
blt	Value from 0 to 6	Backlight timer (Avaya 1100 Series IP
	0 = 5 seconds	Deskphones and Avaya 2007 IP Deskphone).
	1 = 1 minute	
	2 = 5 minutes	
	3 = 10 minutes	
	4 = 15 minutes	
	5 = 30 minutes	
	6 = 1 hour	
	7 = 2 hours	
	8 = always on	
bold	y for yes	Enable bold font on phone and Expansion
	n for no	Module (Avaya 1100 Series IP Deskphones)
dim	y for yes	Enable screen dimmer (Avaya 1100 Series
	n for no	IP Deskphones only)
Error logging		
ar	y for yes	Enable automatic recovery.
	n for no	
arl	cr for critical	Auto recovery level.
	ma for major	
	mi for minor	
II	cr for critical	Log level.
	ma for major	
	mi for minor	
	in for information	
Security		
ssh	y for yes	Enable Secure Shell (SSH).
	n for no	
sshid	4 to 12 characters	SSH ID.
	Important:	
	Information is transferred in clear text when you provision this parameter using DHCP.	
sshpwd	4 to 12 characters	SSH password.

Parameter	Value	Description
	Important:	
	Information is transferred in clear text when you provision this parameter using DHCP.	
Warning:		
The provisioni	The provisioning data is transferred by DHCP, which is an unsecured protocol.	
⚠ Warning:	Marning:	

Changing this parameter could impact the network connectivity and may require manual correction.

The following table shows the dependencies between provisioning options.

Table 10: Dependencies

Primary provisioning option	Rules
VQ	If VQ is present and configured to N, then VCP, VMP, and VLANF are ignored if they are present.
DQ	If DQ is present and configured to N, then DV and DP are ignored if they are present.
PC	If PC is present and configured to N, then PCS, PCD, and PCUNTAG are ignored if they are present.
PCS	If PCS is present and configured to A, then PCD is ignored if it is present.

Chapter 8: Install the IP Deskphone

Complete instructions to install the Avaya 1200 Series IP Deskphone, including detailed figures and applicable warnings, are given in the Avaya IP Deskphones User Guides.

The steps for installing the Avaya 1200 Series IP Deskphone are summarized in the following procedure.

Installing the IP Deskphone

- 1. Remove the stand cover. Pull upward on the center catch and remove the stand cover. The cable routing tracks are now accessible.
- 2. Connect the AC power adapter (optional). Connect the adapter to the AC adapter jack in the bottom of the IP Deskphone. Form a small bend in the cable, and then thread the adapter cord through the channels in the stand.
- 3. Install the handset. Connect the end of the handset cable with the short straight section into the handset. Connect the end of the handset cable with the long straight section to the back of the IP Deskphone, using the RJ-9 handset jack. Form a small bend in the cable, and then thread the handset cord through the channels in the stand so that it exits behind the handset on the right side, in the handset cord exit in the stand base.
- 4. Install the headset (optional). If installing a headset, plug the connector into the RJ-9 headset jack on the back of the IP Deskphone, and thread the headset cord along with the handset cord through the channels in the stand, so that the headset cord exits the channel.
- 5. Install the Ethernet cable. Connect one end of the supplied Ethernet cable to the back of the IP Deskphone using the RJ-45 connector and thread the network cable through the channel.
- 6. Install the Ethernet cable connecting the PC to the IP Deskphone (optional). If connecting PC Ethernet through the IP Deskphone, connect one end of the PC Ethernet cable to the IP Deskphone using the RJ-45 connector and thread it through the channel. Connect the other end to the LAN connector on the back of the PC.
- 7. Install additional cables. Connect the Ethernet cable to the LAN Ethernet connection. If using an AC power adapter, plug the adapter into an AC outlet.
- 8. Wall-mount the IP Deskphone (optional). The IP Deskphone can be mounted either by: (method A) using the mounting holes on the bottom of the IP Deskphone stand, or (method B) using a traditional-style wall-mount box with RJ-45 connector and 15-cm (6-inch) RJ-45 cord (not provided).
- 9. Replace the stand cover. Ensure that all cables are neatly routed and press the stand cover into place until a click is heard.
- 10. Put the IP Deskphone in the wall-mount position (optional). If the IP Deskphone is to be mounted on the wall, put it in the wall-mount position by holding the tilt lever and pressing the IP Deskphone towards the base until the IP Deskphone is parallel with the base.

Release the tilt lever and continue to push the IP Deskphone towards the base until an audible click is heard. Ensure the IP Deskphone is securely locked in position.

The following figure shows the connections on the IP Deskphone.

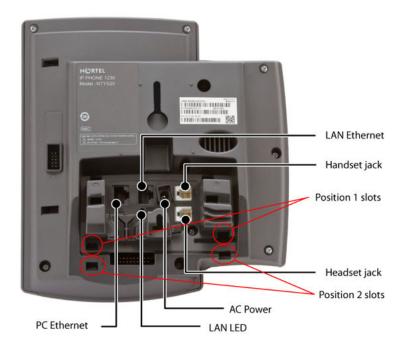

Figure 7: IP Deskphone connections

Chapter 9: Install the SIP software

This chapter provides information on installing SIP software on a new 1200 Series IP Deskphone (1220 IP Deskphone and 1230 IP Deskphone). If the IP Deskphone already has SIP software installed, see Upgrade the SIP Software on the IP Deskphone on page 122. If the IP Deskphone has UNIStim software installed, see Convert UNIStim software to SIP software on the IP Deskphone on page 127.

The 1200 Series IP Deskphones are shipped from the factory with only boot loader software.

The boot loader software is designed to work with DHCP and Option 66 to automatically obtain its IP information and the provisioning server IP address, and to read the 12xxBoot.cfg file from the provisioning server. Based on the information in the 12xxBoot.cfg file, the IP Deskphone downloads and installs a specific SIP software load.

The IP Deskphone reads and acts on the instructions in the 12xxBoot.cfg file.

You must create the 12xxBoot.cfg file as a standard text file, using the format described in <u>Boot</u> <u>loader file format</u> on page 117, and place the file on the root directory of your provisioning server.

Related Links

Boot loader file format on page 117

Downloading the 12xxBoot.cfg file on page 118

Boot loader file format

The 12xxBoot.cfg file has the following options and configurations:

Field name	Field value	Description
[FW]		Section header for software download information.
DOWNLOAD_MODE	AUTO	The software is always downloaded; this field is ignored.
VERSION	SIP12x004.04.09.00	The version of the software.
		This field is ignored.
FILENAME	SIP12x004.04.09.00.bin	Image file name.

Field name	Field value	Description
		It must match the file name of the actual software .bin file.
PROTOCOL	TFTP	Download protocol.
	FTP	Choose the appropriate protocol for your
	НТТР	server type.
SERVER_IP	XXX.XXX.XXX	IP Address of the provisioning server in dotted decimal format.

The following is an example of a 12xxBoot.cfg file for TFTP protocol.

```
[FW]

DOWNLOAD_MODE AUTO

VERSION SIP12x004.04.09.00

FILENAME SIP12x004.04.09.00.bin

PROTOCOL TFTP

SERVER IP 192.168.1.123
```

Related Links

Install the SIP software on page 117

Downloading the 12xxBoot.cfg file

There are two methods to download the 12xxBoot.cfg file to the IP Deskphone:

- Automatic TFTP/FTP/HTTP 12xxBoot.cfg download on Bootup using DHCP.
- Manual TFTP/FTP/HTTP 12xxBoot.cfg download.

Related Links

Install the SIP software on page 117

Automatic TFTP/FTP/HTTP 12xxBoot.cfg download on Bootup using DHCP on page 118

Manual TFTP 12xxBoot.cfg file download on page 119

Automatic TFTP/FTP/HTTP 12xxBoot.cfg download on Bootup using DHCP

If you have a network with DHCP that supports Option 66, then Avaya recommends using this method of downloading the 12xxBoot.cfg file to the IP Deskphone.

DHCP Option 66

The DHCP Option 66 supports TFTP, FTP and HTTP.

The DHCP option 66 URL is entered in the following format:

```
[<protocol name>://[<login>[:<password>]@]]<IP address or server
name>[:<port>][/<path>]
```

The square brackets [] indicate optional elements. The default protocol is TFTP, so if no protocol precedes the IP address, TFTP is used. If the domain name of a server is used, then the DNS IP address must also be defined.

Examples:

```
http://some_login@one_more.server.ca:80/config_folder
http://192.168.33.50
tftp://192.168.33.50
tftp://some.server.com
ftp://my_login:my_psw@test.server.org
```

12xxBoot.cfg file download

Assemble the components of the new IP Deskphone, as described in <u>Install the IP Deskphone</u> on page 115 or in the user guide of the appropriate IP Deskphone model. Plug in the IP Deskphone.

The IP Deskphone retrieves its IP address and provisioning information from DHCP. The IP Deskphone reboots and then attempts to read the 12xxBoot.cfg from the provisioning server whose IP address was supplied by DHCP. After reading the 12xxBoot.cfg file information, the IP Deskphone downloads and installs the specified SIP software using the specified protocol and provisioning server IP address. This can be the same provisioning server as the one where the 12xxBoot.cfg file is located.

Once the software image is installed, the IP Deskphone reboots again and looks for the standard SIP config files listed in the following table. The IP Deskphone then follows the 12xxSIP.cfg file instructions.

Model	Config file name
1220 IP Deskphone	1220SIP.cfg
1230 IP Deskphone	1230SIP.cfg

Downloading the 12xxBoot.cfg file on page 118

Manual TFTP 12xxBoot.cfg file download

Use the following procedure to perform a manual download of the 12xxBoot.cfg file to the IP Deskphone.

Note:

Only a TFTP server can be used for a manual download.

- 1. Assemble the components of the new IP Deskphone, as described in <u>Install the</u> IP Deskphone on page 115 or in the user guide of the appropriate IP Deskphone model.
- 2. Plug in the IP Deskphone.

The IP Deskphone Message Waiting LED is lit and the message

```
...Loading BootC...
```

is displayed.

In a few seconds, the following simple non-graphic text menu on white background is displayed.

3. Press the soft keys (1,2,3,4) in sequence from left to right.

BootC goes to manual configuration and the following menu is displayed on the IP Deskphone screen.

Note:

If you miss this screen and the IP Deskphone begins to look for DHCP, unplug the IP Deskphone, and repeat Step 2.

4. Press the Auto soft key.

The following menu is displayed.

5. Use the down arrow in the Navigation keys to scroll down and select **02 LLDP Enable**.

- 6. Press the **Man** soft key to manually configure LLDP.
- 7. Press the Cfg soft key.
- 8. Configure the following:
 - DHCP = 0
 - IP = <IP Deskphone IP address>

Press * to enter a "." (period) for the dotted decimal format.

- NETMSK: = <IP Deskphone network mask>
- DEF GW := < IP Deskphone default gateway>, and then press the OK soft key.
- 9. Use the down arrow in the Navigation keys to scroll down and select **12. Provisioning Server**.

```
12 Provisioning Server

Man Cfg AllMan Cancel
```

- 10. Press the **Man** soft key to indicate a manual entry for the TFTP provisioning server, then press the **Cfg** soft key.
- 11. Press the **OK** soft key until Prov: 0.0.0.0 is displayed.
- 12. Enter the IP address of the TFTP provisioning server where the 12xxBoot.cfg file is located.
- 13. Press the **OK** soft key until the following menu is displayed.

14. Press the **Apply** soft key.

The IP Deskphone reboots and searches for the 12xxBoot.cfg file at the IP address of the TFTP provisioning server that you entered manually.

After reading the 12xxBoot.cfg file information, the IP Deskphone downloads and installs the specified SIP software using the specified protocol and provisioning server IP address. This can be the same provisioning server as the one where the 12xxBoot.cfg file is located.

Once the software image is installed, the IP Deskphone reboots again and looks for the standard SIP configuration files listed in the following table. The IP Deskphone then follows the 12xxSIP.cfg file instructions.

Model	Config file name
1220 IP Deskphone	1220SIP.cfg
1230 IP Deskphone	1230SIP.cfg

<u>Downloading the 12xxBoot.cfg file</u> on page 118

Chapter 10: Upgrade and convert the IP Deskphone software

Introduction

This chapter describes how to upgrade an Avaya 1200 Series IP Deskphone with UNIStim software to SIP Software.

In order to upgrade an IP Deskphone with UNIStim software, first determine if you have the minimum UNIStim software release on the IP Deskphone (062AC5L). If your IP Deskphone is installed with the minimum version of UNIStim software, proceed to the section Convert UNIStim software on page 127. If your IP Deskphone is not installed with the minimum version of UNIStim Software, proceed to the section UNIStim Software on page 124.

To convert the firmware on the IP Deskphone from SIP to UNIStim, see the section <u>Maintenance</u> on page 328.

Upgrade the SIP Software on the IP Deskphone

Use the following procedures to upgrade existing SIP Software to new SIP Software on the IP Deskphone.

Download the SIP software to the provisioning server

To download the SIP software, perform the following procedure.

Downloading SIP Software for the IP Deskphone

- 1. Go to http://www.avaya.com/support.
 - The Avaya Support page appears.
- 2. Click **Downloads & Documents** in the menu at the top of the page.
- 3. Enter the IP Deskphone type in the **Enter Your Product Here** box.
- 4. From the **Choose Release** drop down list, select the desired release of SIP software.
- 5. In the **Select a content type** pane, click the **Downloads** radio button and click **Enter**.

6. From the search results, select the desired release of the SIP Software for the IP Deskphone.

A new window opens.

7. Scroll down the page and click the desired version of software; for example, SIP12x004.03.12.00.bin.

The File Download window opens.

8. Click Save.

The Save As window opens.

- 9. Select the location to save the file and click Save.
- After the file has downloaded, place the file in the correct directory on the provisioning server.

Modify the SIP provisioning file

Use the following procedure to modify the SIP provisioning file, which exists on the provisioning server.

Modifying the SIP provisioning file

- 1. Under the firmware [FW] section of the SIP Provisioning file, increase the VERSION number (for example 06A5C39d26).
- 2. Under the firmware [FW] section of the SIP Provisioning file, modify the FILENAME of the new file you want to upload to the IP Deskphone.

Important:

The VERSION number must be the same as the FILENAME (do not include the .bin extension).

For example, if the FILENAME is SIP12xx03.00.33.04.bin, then the VERSION must be SIP12xx03.00.33.04

3. Invoke the upgrade mechanism.

Use one of the next three methods to invoke a software upgrade on the IP Deskphone with SIP Software.

- a. Power off and power on the IP Deskphone.
- b. Select **Services > Check For Updates** on the IP Deskphone.
- c. Allow for an automatic check for updates to occur. (See AUTO_UPDATE under <u>Feature configuration commands</u> on page 65).

Any of these actions causes the IP Deskphone to contact the provisioning server and attempt to read the Provisioning file. A Soft Reset (**Srvcs > System >**, **Reset Phone**) does not cause the IP Deskphone to retrieve the Provisioning file and therefore does not cause a software upgrade.

Upgrade to the minimum UNIStim Software

. You can convert the software on a 1200 Series IP Deskphone from UNIStim to SIP. To successfully convert the software from UNIStim to SIP, the UNIStim software version on your IP Deskphone must be 062AC5L or higher.

Identify the current version of UNIStim software

Use the following procedure to determine the version number of UNIStim software on an IP Deskphone.

Checking the UNIStim software version on an IP Deskphone

1. Press the Globe/Services key on the IP Deskphone twice quickly.

If the admin password prompt appears, enter the password 26567*738.

The Local Tools menu appears:

Table 11: Local Tools menu

- 1. Preferences
- 2. Local Diagnostics
- 3. Network Configuration
- 4. Lock Menu

To make a selection, press the number associated with the menu item, or use the **Navigation key cluster**

to scroll through the menu items. Press the **Select** key to select the highlighted menu item.

Table 12: Using the Navigation key cluster to navigate in the Local Tools menu

Key	Action
Down	Moves highlight down
Up	Moves highlight up
Right	Selected current menu item
Left	Closes menu
Select key (center of cluster)	Selects current menu item

To close this menu, use the Quit key.

2. Select **2. Local Diagnostics** in the Local Tools menu by pressing the **Select** key in the Navigation key cluster or by pressing the number **2**.

- 3. Select **IP Set and DHCP Information** by pressing the **Select** key in the Navigation key cluster or by pressing the number **2**.
- 4. Use the down arrow in the Navigation key cluster to scroll down the menu to **Software Version**.
- 5. Note the UNIStim software version number and write it down.

Compare the version number to the minimum-required UNIStim software version (062AC5L).

UNIStim software version names contain numbers and letters. Use the last three characters in a version to compare the version of UNIStim on an IP Deskphone with the minimum required version for the upgrade.

If the version number is equal to or higher than 062AC5L, go to the section Convert UNIStim software to SIP software on the IP Deskphone on page 127.

If the number is lower than 062AC5L, see <u>Upgrade UNIStim software to the minimum required UNIStim software</u> on page 125 and follow the instructions to upgrade an IP Deskphone to the minimum-required version of UNIStim software before you convert to SIP Software.

Upgrade UNIStim software to the minimum required UNIStim software

Use either of the following two methods to upgrade UNIStim software.

- UFTP download initiated by the server if the server supports this method of upgrading UNIStim software. Refer to the appropriate documentation for your Call Server for instructions on using this method.
- 2. TFTP download on bootup.

If necessary, use the following procedure to configure the TFTP server.

Configuring the TFTP server

- The Avaya 1200 Series IP Deskphone always executes the TFTP download at bootup if a TFTP IP address is configured on the IP Deskphone after being initiated by the telephony Call Server.
- 2. Go to the TFTP server and create the 12xx.cfg provisioning file. The 12xx.cfg provisioning file is a clear text file. Create the provisioning file as shown in the next table.

Table 13: Sample 12xx.cfg provisioning file

[FW]
DOWNLOAD_MODE FORCED
VERSION 0625C23
FILENAME 0625C23.bin

This configuration file forces the software download of 0625C23.bin.

3. Download and copy the software to the TFTP server directory.

To download the UNIStim software for the IP Deskphone from the Avaya Web site:

a. Go to http://www.avaya.com/support.

The Avaya Support page appears.

- b. Click **Downloads & Documents** in the menu at the top of the page.
- c. Enter the IP Deskphone type in the **Enter Your Product Here** box.
- d. From the **Choose Release** drop down list, select the desired release of UNIStim software.
- e. In the **Select a content type** pane, click the **Downloads** radio button and click **Enter**.
- f. From the search results, select the desired release of the UNIStim software for the IP Deskphone.

A new window opens.

g. Scroll down the page and click the desired version of software; for example, Avaya 1165E IP Deskphone Release 0625C23.

The File Download window opens.

h. Click Save.

The **Save As** window opens.

- i. Select the location to save the file and click Save.
- j. After the file has downloaded, place the file in the correct directory on the provisioning server.
- 4. In the IP Deskphone **Network Configuration** menu, change the **TFTP server address**, and enter the correct TFTP server address.

This can be the provisioning server as defined in the chapter <u>Creating the provisioning files</u> on page 45.

5. Select the **Apply&Reset** context-sensitive soft key to save the configurations and reset the IP Deskphone.

The IP Deskphone downloads the software file. The display shows **[FW] reading...**.

If the download is successful, the display shows **[FW] writing...**

After the software image is downloaded to the IP Deskphone, the display shows **[FW] finished...** and the IP Deskphone resets.

The IP Deskphone registers to the TPS with the new software version.

If the upgrade is unsuccessful, see the chapter <u>Diagnostics and troubleshooting</u> on page 331 in the section **Download failures**.

Follow the next procedure to download the minimum required version of UNIStim software automatically through TFTP on bootup.

Downloading UNIStim software automatically through TFTP on bootup

Press the Globe/Services key on the IP Deskphone twice quickly.

If the admin password prompt appears, enter the password 26567*738.

The **Local Tools** menu appears:

Table 14: Local Tools menu

- 1. Preferences
- 2. Local Diagnostics
- 3. Device Settings
- 4. Lock Menu
- 2. Select 3. Device Settings from the Local Tools menu.

The **Device Settings** screen appears.

3. If you are using DHCP, select **Yes**.

If you are manually configuring the IP address, netmask, and gateway address, select **No**.

- 4. If the DHCP option is configured, the IP address is automatically obtained.
- 5. Configure the TFTP IP address within the IP Deskphone Device Settings menu.

This can be the provisioning server as defined in the chapter <u>Creating the provisioning files</u> on page 45.

6. Select the **Apply&Reset** context-sensitive soft key to save the settings and reset the IP Deskphone.

The IP Deskphone downloads the software file. The display shows **[FW] reading...**

If the download is successful, the display shows **[FW] writing...**.

After the software image is downloaded to the IP Deskphone, the display shows **[FW] finished...** and the IP Deskphone resets.

If the upgrade is unsuccessful, see the chapter <u>Maintenance</u> on page 328 in the section **Download failures**.

Convert UNIStim software to SIP software on the IP Deskphone

If an IP Deskphone has UNIStim software installed, it runs with SIP software only if the software is converted from UNIStim to SIP. If the procedure to determine the UNIStim version number is completed, and, if necessary, the procedure to upgrade the UNIStim software is completed, an IP Deskphone can be converted from UNIStim software to SIP software.

Compare the version number to the minimum required UNIStim software version (062AC5L). If the version number is not the minimum required version, see Upgrade to the minimum UNIStim Software on page 124.

The conversion to SIP software must be performed using TFTP.

Marning:

The TFTP download and upgrade of the Flash memory on the IP Deskphone can take a significant amount of time (possibly up to 10 minutes). Do not unplug or reboot the IP Deskphone during the process.

The following procedure explains how to download the SIP Software from the Avaya Web site.

Downloading SIP Software for the IP Deskphone from the Avaya Web site

1. Go to http://www.avaya.com/support.

The Avaya Support page appears.

- 2. Click **Downloads & Documents** in the menu at the top of the page.
- 3. Enter the IP Deskphone type in the **Enter Your Product Here** box.
- 4. From the **Choose Release** drop down list, select the desired release of SIP software.
- 5. In the **Select a content type** pane, click the **Downloads** radio button and click **Enter**.
- 6. From the search results, select the desired release of the SIP Software for the IP Deskphone.

A new window opens.

7. Scroll down the page and click the desired version of software; for example, SIP1165e04.03.12.00.bin.

The File Download window opens.

8. Click Save.

The Save As window opens.

- 9. Select the location to save the file and click **Save**.
- 10. After the file has downloaded, place the file in the correct directory on the provisioning server.

Perform the following procedure to convert the UNIStim software to SIP Software on the IP Deskphone.

Converting UNIStim software to SIP software using TFTP

- 1. Run the TFTP server (for example Tftpd32.exe).
- 2. Place software and configuration files in the folder of the TFTP server (for example 12xx.img F/W file and 12xx.cfg file) that contains the following lines:

Table 15: Sample 12xx.cfg configuration file

[FW]

DOWNLOAD_MODE AUTO

VERSION SIP12x004.01.03.00.bin

FILENAME 12xx.img

3. Configure the IP Deskphone Device Settings TFTP IP address to the IP address where your TFTP server is running.

After you are finished the configuration, the IP Deskphone reboots and sends a request to the TFTP server.

4. Select the **Apply&Reset** context-sensitive soft key to save the settings and reset the IP Deskphone.

The following messages display on the IP Deskphone as the IP Deskphone cycles through the conversion process, one after the other:

- a. [FW] Reading...
- b. [FW] Writing...
- c. [FW] Finished...

The IP Deskphone then boots up with SIP Software.

If the conversion is unsuccessful, see the chapter Maintenance on page 328.

- 1. TFTP file transfer takes approximately 15 seconds.
- 2. File writing takes 2.5 minutes. The IP Deskphone displays the message [FW] writing....
- 3. After the new SIP software writing is finished, the IP Deskphone displays **[FW] Finished....** and then reboots.
- 4. The first time the SIP software boots, the SIP software performs a Flash File System conversion that takes 2.5 minutes.

Chapter 11: Provisioning the IP Deskphone Device Settings

For provisioning the Device Settings parameters, the IP Deskphones support the following provisioning modes:

- · Manual provisioning
- Automatic provisioning

The IP Deskphone obtains configuration parameters that are defined as AUTO in the Auto Provisioning page from an 802.1ab switch (LLDP) or DHCP server. For more information, see <u>Parameter source precedence rules</u> on page 140.

Manual provisioning

The manual provisioning of IP Deskphone parameters overrides the configuration of parameters by any other provisioning source. Technicians can use manual provisioning to override system wide parameters for troubleshooting purposes or to provide special needs configurations for a small group of users.

Automatic provisioning

The Automatic provisioning feature creates a flexible provisioning method, which

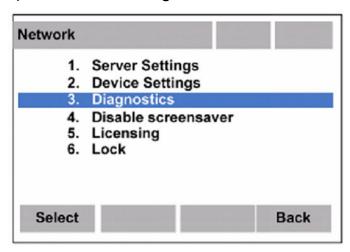

- covers the existing provisioning parameters
- supports the extension of the provisioning parameters
- supports provisioning parameters in automatic provisioning modes, when possible
- creates a common provisioning information format that supports DHCP provisioning

You can store common provisioning parameters in a managed central server, such as a DHCP server. You can configure the IP Deskphone to automatically or manually obtain the provisioning parameters from the various provisioning sources. By default, the IP Deskphone automatically provisions most parameters.

For automatic provisioning, the IP Deskphone receives the parameters from the provisioning server. You can switch between automatic provisioning to manual provisioning on the **Auto Provisioning** page. You enter parameter information on the **Configuration** page.

Provisioning IP Deskphone parameters

By default, the IP Deskphone can automatically provision most parameters. However, you can manually provision parameters. The Auto Provisioning page provides the selection to manually override the parameter. Use the **Device Settings** menu item to configure IP Deskphone parameters. Double-press the **Globe** key to open the Network menu and press **2** on the dial pad to open the **Device Settings** menu.

The **Configuration** page appears when you select the **Device Settings** menu item. Any automatic provisioned parameters appear dimmed.

The Device Settings menu shows the configuration parameters that are configured as Manual on the Auto Provisioning page. Use the Up and Down navigation keys to scroll through the main configuration options and the Right or Left navigation keys to scroll through the sub configuration options.

For all supported IP Deskphones, you can press the **Auto** soft key to switch to the **Auto Provisioning** page to define parameters that you can obtain automatically or manually. Then from the Auto Provisioning page, you can press the **Cfg** soft key to switch to the **Device Settings** option.

Configuring parameters manually for the IP Deskphone

- 1. Press **Auto** on the Configuration page to switch to the Auto Provisioning page.
- 2. Perform one of the following actions:
 - Press the AllMan soft key to change all parameters to be manually provisioned.
 - Use the dial pad to enter the number associated with the parameter, or use the navigation keys to scroll and highlight the specific parameter (up/down navigation takes you from

- group to group, while left/right navigation takes you from item to item). Press the **Enter** key to uncheck the parameter, making it "Manual" provisioned.
- 3. To exit and save, press the **Config** key to return to the Device Settings page, then press **Apply**.

Configuring parameters automatically for the IP Deskphone

About this task

Perform the following procedures to configure all parameters or specific parameters using automatic provisioning.

Procedure

- 1. Press **Auto** on the Configuration page to switch to the Auto Provisioning page.
- 2. Perform one of the following actions:
 - Press the **AllMan** soft key to change all parameters to be auto-provisioned.
 - Use the dial pad to enter the number associated with the parameter, or use the navigation keys to scroll and highlight the specific parameter (up/down navigation takes you from group to group, while left/right navigation takes you from item to item). Press the **Enter** key to check the parameter, making it "Auto" provisioned.
- 3. To exit and save, press the **Config** key to return to the Device Settings page, then press **Apply**.

Auto Provisioning parameters

Use the keys in the following table to provision the parameters for the IP Deskphones.

Table 16: Keys and descriptions

Key	Description
	Check box, select or clear: Auto-checked, Manual-unchecked.
Dial pad	Enter number of index to jump to option
Up	Move up a group index
Down	Move down a group index
Right	Go to next item.

Key	Description
Left	Go to previous item.
Enter	Select or clear the check box for item or group.
Config	Return to manual configuration page.
AllMan / AllAut	Context-sensitive. Set all items to manual (clear checkboxes) or auto (check all boxes).
Cancel	Exit Device Settings.

The **Auto** page provides control over the auto-provisioning of the **Device Settings** parameters. The page's items in order of appearance:

```
01. EAP Settings
02. LLDP Enable
        DHCP Enable
03. Primary DNS IP
       Secondary DNS IP
04. Certificate Server
        Domain Name
        Hostname
05. Ntwk Port Speed
       Ntwk Port Duplex
06. Voice 802.1Q
        Voice VLAN Source
        Voice VLAN Filter
        Voice Control pBits
       Voice Media pBits
       Avaya Auto QoS
       Voice Ctrl DSCP
       Voice Media DSCP
07. PC Port Enable
       PC Port Speed
        PC Port Duplex
       PC Port UntagAll
08. Data 802.1Q
        Data VLAN
        Data Priority Bits
09. Provision Server

Connection Keep Alive

21. Register Retry Time
Register Retry Max Time
22. Login Notify
Login Notify
Login Notify With Time

23. IPv6 Enable

24. FIPS Enable
```

Manual provisioning parameters

Use the Device Settings menu to manually provision the IP Deskphones. Double-press the Services key. You can press the number associated with the menu item or you can use the navigation keys to scroll through the list of items.

Use the keys in the following table to provision the parameters for the IP Deskphones.

Table 17: Keys and descriptions

Key	Description
Up	Main dialog: Scroll dialog up (highlight does not move) In list: move highlight up an item.
Down	Main dialog: Scroll dialog down (highlight does not move) In list: move highlight down an item
Right	Move highlight down an item In list: close list
Left	Move highlight up an item
Enter	Highlight on list item: open list In list: select highlighted item and close list Highlight on editable item: start edit mode Highlight on checkbox item: toggle checkbox state
Apply	Save changes and reboot IP Deskphone.
Auto	Go to Auto provision page.
Config	Return to manual configuration page.
AllMan / AllAut	Context-sensitive. Set all items to manual (clear checkboxes) or auto (check all boxes).
Cancel	Exit Device Settings without saving changes.
In edit	mode
Up	Scroll dialog up (highlight does not move).
DownScroll dialog down (highlight does not move)	Exits Edit mode, moves highlight up an item.
Left	Moves edit cursor to the left.
Right	Moves edit cursor to the right.

Key	Description
Enter	Exit edit mode.
ОК	Exit edit mode.
BkSpc	Backspace: delete highlighted characters or character to the left
Clear	Clear input field.
Cancel	Exit edit mode without saving changes.

Table 18: Provisioning parameters legend

Configuration menu item	List each configuration parameter in the order it appears in the menu.
Options or input	Lists every choice available for the parameter and the minimum and maximum number of characters or digits allowed.
Dependency	Show any dependency that controls when that option is enabled or can be used. If the prompt has a dependency, the dependency appears on the same line as the prompt, and input options start on the next line of the table. If an option has a dependency, the dependency appears on same line as the option and applies only to that option. If both the prompt and the option have dependencies, they are cumulative between the prompt and the option and is used to show multiple dependencies.

The parameters list in order of appearance.

Config option	Options or input	Description
Enable 802.1x (EAP)	MD5	MD5 encryption.
	PEAP	PEAP encryption.
	TLS	TLS encryption.
ID 1	4 to 8 characters	EAP ID.
ID 2	4 to 8 characters	EAP ID.
Password	4 to 12 characters	EAP password.
Enable 802.1ab (LLDP)	Checked	LLDP enabled.
	Unchecked	LLDP disabled.
Enable IPv6	Checked	IPv4 and IPv6 enabled (dual-mode).
	Unchecked	IPv6 disabled.
DHCP	Yes	DHCP used.
	No	Static IP and config used.

Config option	Options or input	Description
Phone IP	IP address	IPv4 and IPv6 IP address.
		Note:
		Maximum of 2 Phone IP addresses can be configured (1 IPv4 and 1 IPv6).
Net Mask	Subnet mask	IP Deskphone subnet mask.
		× Note:
		IPv6 does not support Net Mask, however Net Mask is required for the IPv4 address in a dual mode.
Gateway	IP address	IP Deskphone gateway IPv4 and IPv6 IP address.
DNS IP1	IP address	DNS server 1 IPv4 and IPv6 IP address.
		★ Note:
		Maximum of 2 DNS IP addresses can be configured.
DNS IP2	IP address	DNS server 2 IPv4 and IPv6 IP address.
SIP Server IP	IP address	SIP proxy server IPv4 and IPv6 IP address.
		★ Note:
		Maximum of 2 SIP proxy IP addresses per domain can be configured.
CA Server	IP address	Certificate Server IP address.
Domain Name	4 to 12 characters	IP Deskphone domain name.
Hostname	4 to 12 characters	IP Deskphone host name.
Ntwk Port Speed	Auto	Auto sense.
	10BT	Forced 10BT.
	100BT	Forced 100BT.
Ntwk Port Duplex	Auto	Auto negotiate.
	Force Full	Forced full duplex.
	Force Half	Forced half duplex.
Enable Voice 802.1Q	Checked	802.1Q header and features used.
	Unchecked	802.1Q not used.

Config option	Options or input	Description
Voice VLAN	No VLAN	VLAN not used.
	Auto	All telephony traffic transmitted on the telephony port is forwarded untagged.
		Includes:
		DHCP—VLAN ID from DHCP Auto VLAN
		LLDP VLAN Name—VLAN ID from LLDP VLAN Name TLV
		LLDP MED—VLAN ID from Network Policy Discovery TLV.
	Manual	VLAN ID entered 1 to 4094.
VLAN Filter	checked	Filter frames without Voice VLAN tag.
	Unchecked	Process all frames.
Voice Control pBits	Auto	Use value from received LLDP Network Policy TLV, SIP, or default value of 1.
	0 to 7	Force signalling related priority bits to chosen value.
Voice Media pBits	Auto	Use value from received LLDP Network Policy TLV, SIP, or default value of 1.
	0 to 7	Force media related priority bits to chosen value.
DSCP	0 to 63	: DSCP marking to be applied to IP packets for QoS classification.
Avaya Auto QoS	Checked	Enable automatic QoS provisioning by Avaya applications.
	Unchecked	Disable automatic QOS provisioning by Avaya applications.
Enable PC Port	Checked	PC port active.
	Unchecked	PC port disabled.
PC Port Speed	Auto	Auto sense.
	10BT	Forced 10 BT.
	100BT	Forced 100 BT.
PC Port Duplex	Auto	Auto negotiate.
	Force Full	Forced full duplex.

Config option	Options or input	Description
	Force Half	Forced half duplex.
Enable Data 802.1Q	Checked	802.1Q header and features used.
	Unchecked	802.1Q not used.
Data VLAN	No VLAN	Data VLAN not used.
	Enter VLAN ID	VLAN ID entered 1 to 4094.
Data Priority bits	Auto	Use value from the info block or default of 7.
	0 to 7	Force all priority bits to chosen value.
PC-Port Untag all	Checked	Removes the 802.1Q header from a packet before it forwards to the IP Deskphone PC port.
	Unchecked	Leave 802.1Q header on packets destined to the PC port.
Cached IP	Checked	Last IP Deskphone IP address info received is used if DHCP server not reached.
	Unchecked	Must receive response to assign IP Deskphone IP address.
Ignore GARP	Checked	IP Deskphone ignores Gratuitous ARP requests.
	Unchecked	IP Deskphone responds to Gratuitous ARP requests.
Provisioning	Server URL	Provisioning server IPv4 or IPv6 IP address.
		★ Note:
		Maximum of 1 Provisioning Server IP address can be configured.
	Protocol:	Provisioning protocols.
	• TFTP	* Note:
	• FTP	If IPv6 is enabled, only FTP
	• HTTP	protocol can be used.
	• HTTPS	
	Device ID	ID used by provisioning server to authenticate the IP Deskphone. Enter the User ID as the Device ID. TFTP does not require Device ID.

Config option	Options or input	Description
	Password	Password used by provisioning server to authenticate the IP Deskphone. Maximum number of characters is 99.
PVQMon IP	IP address	PVQM server IPv4 or IPv6 IP address.
		Note:
		Maximum of 1 PVQM server can be configured.
NAT Traversal	NAT Signal	NAT method for SIP signaling.
	• None	Note:
	• STUN	IPv4 mode only (IPv6 disabled).
	NAT Media	NAT method for media signaling.
	• None	
	• STUN	
	NAT TTL (sec)	Value from 0 to 65535.
STUN S1 IP	IP address	IP address of STUN S1 device.
STUN S2 IP	IP address	IP address of STUN S2 device.
Media Security	Enable SRTP	SRTP enabled.
	SRTP Mode	SRTP configuration values.
	BE-Cap Neg	
	BE-2M Lines	
	SecureOnly	
	Cipher1	Preferred order for SRTP cipher
	• AES_128_SHA1_80	offers.
	• AES_128_SHA1 32	
SIP UDP Port	Integer	Value from 1024 to 65535.
SIP TCP Port	Integer	Value from 1024 to 65535.
SIP TLS Port	Integer	Value from 1024 to 65535.
Connection Timers	OS keep-alive	
Keep-Alive	Integer	Value from 5 to 1800.
Register Retry	Integer	Value from 30 to 1800.
Register Max Retry	Integer	Value from 600 to 1800.
Login Notify	Off	Configuration values for login
	Success	banner notification.

Config option	Options or input	Description
	Failure	
	Both	
Login Notify With Time	Checked	Configuration values for login
	Unchecked	banner with time notification.
Enable Bluetooth (1120E/	Checked	Bluetooth is enabled.
1140/1165E only)	Unchecked	Bluetooth is disabled.
SSH-SFTP	Checked	SSH-SFTP is enabled.
	Unchecked	SSH-SFTP is disabled.
Enable SSH	Checked	SSH is enabled.
	Unchecked	SSH is disabled.
UserID	Maximum of 11 characters	
Password	Maximum of 11 characters	
Enable SFTP	Checked	SFTP is enabled.
	Unchecked	SFTP is disabled.
Enable FIPS	Checked	FIPS is enabled.
	Unchecked	FIPS is disabled.

Parameter source precedence rules

The 1100-series SIP IP Deskphones can obtain provisioning information from many sources at various times. A precedence rule can resolve the possible conflict when different values are specified in various sources for one parameter. The IP Deskphone considers the obtained parameters in the following priority, from highest to lowest:

- Manual provisioning
- Automatic provisioning using 802.1ab switch (LLDP)
- Automatic provisioning using DHCP, including Provisioning Info Block data from the Nortel-SIP-Phone-B or Nortel-SIP-Phone-A DHCP options
- Automatic provisioning using TFTP/HTTP/HTTPS downloaded configuration files
- · Last auto received value
- Factory default

Provisioning information from a provisioning source with high priority can overwrite the provisioning information from a provisioning source with low priority. The manual provisioning has highest priority. The other provisioning sources are auto-provisioning sources. Automatic provisioning defines provisioning control for each parameter. You can either manually or automatically provision each parameter. Each provisioning parameter provides an attribute that specifies if the parameter was previously provisioned manually or automatically.

The default value of the stickiness attribute is AUTO. If the provisioning parameter is AUTO, the IP Deskphone can receive the value from automatic provisioning sources based on the precedence rule. If you manually change the parameter, the attribute value is MANUAL. If the attribute is MANUAL, the provisioning information from automatic provisioning sources is ignored, except for the standard DHCP parameters. The AllAut softkey in the Device Setting's Auto dialog will return all parameters to AUTO. The Set to Factory Default function returns all parameters to AUTO as well as resetting their value to the factory default value.

If you enable DHCP, then the IP address, the subnet mask, and the default gateway, which the IP Deskphone obtains from the DHCP server, overwrites the manually configured value. The value for EAP device ID and password can also overwrite the manually configured value. If you configure stickiness and the current provisioning source does not provide the provisioning information for the particular parameter, the last received provisioning value is used.

Chapter 12: Voice Quality Monitoring

Feature overview

Proactive Voice Quality Monitoring (PVQMon or VQMon) allows an Avaya 1200 Series IP Deskphone with SIP Software to report voice quality statistics to a server in the network. The IP Deskphone with SIP Software collects various voice quality statistics, for example, packet loss, and sends the voice quality statistics to the server at regular intervals during a call. A subset of these statistics is also available for the user to view on the IP Deskphone by selecting the **Audio** soft key and then the **Monitor Audio Quality** menu item.

VQMon set-up

Configure the following parameters on the IP Deskphone with SIP Software to connect to the server and send the PVQMon statistics.

- 1. Enable the feature. To enable the feature, configure the VQMON_PUBLISH parameter in the device configuration file (see VQMon configuration commands on page 92).
- 2. Configure the IP address of the PVQMon server. Configure the IP address of the PVQMon server in either of the following settings:
 - a. Configure VQMON_PUBLISH_IP through the device configuration file (see <u>VQMon</u> configuration commands on page 92).
 - b. Configure PVQMon IP in Device Settings (see <u>Table 52: PVQMon IP configuration</u> on page 167)
- Configure the remainder of the VQMon parameters in the device configuration file (see <u>VQMon configuration commands</u> on page 92). These parameters provide threshold information to the IP Deskphone with SIP Software. A report is sent to the server when these thresholds are exceeded.

Server set-up

The IP Deskphone with SIP Software works with Telchemy server software. The name of the software is SQmediator and is available through Telchemy (http://www.telchemy.com). The minimum version required is release 1.0.

How VQMon works

The IP Deskphone with SIP Software gathers statistics about the current call when VQMon is enabled. Statistics are also gathered regarding the quality metrics of the current call. The call-related statistics contain condensed information about the SIP Session Description Protocol (SDP), the Call ID, the local and remote address, voice quality-related statistics, Zulu times for start-time and the time the report was sent.

The voice quality-related statistics include jitter, packet loss, delay, burst gap loss, listening R-factor, R-LQ, R-CQ, MOS-LQ and MOS-CQ. See <u>Table 19: Glossary of RTCP XR metrics</u> on page 143. More information on each of these metrics is provided in RFC3611 "RTP Control Protocol Extended Reports (RTCP XR)".

When the IP Deskphone detects that a particular voice quality metric has exceeded a threshold (defined in the Device Configuration file), the IP Deskphone sends a message to the server indicating that there is an issue. If the issue persists, then the IP Deskphone sends another message indicating that there is an exceeded value at regular intervals. This happens continuously until the voice quality metric falls below the threshold value. As well, the IP Deskphone can send regular reports of the voice quality at time intervals defined in the Device Configuration file.

Table 19: Glossary of RTCP XR metrics

Metric	Description
Burst	A period of high packet losses and / or discards. A burst is calculated in milliseconds.
Conversational R-factor	Voice quality metric based on burst packet loss and vocoder selection.
Delay	One way delay which includes end-to-end delay, jitter buffer delay and packetization delay. Delay is calculated in milliseconds.
Inter-arrival jitter	The variation in packet arrival times due to transmission (routing, queuing delay) through the network. Jitter is calculated in milliseconds.
Listening R-factor	Voice quality metric based on burst packet loss, transmission delay and burst loss.
MIU	Media Information Unit. MIU is a concept from VQMon. An MIU can be any size down to a 10 millisecond (8 sample) block. An MIU means a frame in the i200x implementation.
MOS	Mean Opinion Score. A subjective measurement of the voice quality of a voice call.
MOS_CQ	The VQMon conversational quality MOS score calculated for a call channel.
MOS_LQ	The VQMon listening quality MOS score calculated for a call channel.

Metric	Description
Packet loss rate	The percentage of total packets loss versus packets received.
R-factor	A measurement of voice quality based on network impairments including burst packet loss, delay and encoding/decoding algorithm selection.

End of call report

The IP Deskphone sends a report using VQMON Publish message to the proxy. The proxy redirects the publish ID described within the report. An end-of-call report is always generated if VQMON is enabled. The IP Deskphone does not negotiate or exchange messages with the device defined using PUBLISH_IP options.

Session interval report

The IP Deskphone can send voice quality reports at time intervals defined in the Device Configuration file. The minimum and default time interval is 60 seconds. If the IP Deskphone sends session interval reports more frequently, then a threshold violation has occurred.

Alert interval report

When the IP Deskphone detects that a voice quality metric has exceeded a threshold, the IP Deskphone initiates a timer which sends a message to the server every 5 seconds. When all voice quality metrics fall below the threshold values, the IP Deskphone stops sending VQMON Publish messages with the report. The alert interval report does not differ from the session interval reports or end-of-call reports.

Chapter 13: Device Settings on the IP Deskphone with SIP Software

Important:

An Avaya 1200 Series IP Deskphone with SIP Software displays different menus than an IP Deskphone with UNIStim software.

Introduction

This chapter describes how to configure the Device Settings parameters on the IP Deskphone with SIP Software. This includes items such as the IP address, the subnet mask, and the gateway IP address of the IP Deskphone.

The Device Settings parameters are listed below in the order they appear on the Device Settings menu of the IP Deskphone with SIP Software. Read the section at the end of this chapter that explains how to provision the Device Settings parameters. If you are familiar with the Device Settings parameters, skip the last section in the chapter and proceed to the provisioning instructions.

- Enable 802.1x (EAP)
- Device ID
- Password
- Enable 802.1ab (LLDP)
- · DHCP: Yes, No
- SET IP
- Net Mask
- Gateway
- DNS IP1
- DNS IP2
- Ntwk Port Speed: Auto, 10BT, 100BT
- Ntwk Port Duplex: Auto, Force Full, Force Half
- Disable Voice 802.1Q

- Voice VLAN: No VLAN, Manual
- VLAN Filter
- Ctrl Priority bits: Auto, 0–7
- Media Priority bits: Auto, 0-7
- · Disable PC Port
- PC Port Speed: Auto, 10BT, 100BT
- · PC Port Duplex: Auto, Force Full, Force Half
- Disable Data 802.1Q
- Data VLAN: No VLAN, Manual (value from 1 to 4094)
- Data Priority bits: Auto, 0-7
- · PC-Port Untag al
- · Cached IP
- Ignore GARP
- Provisioning: Server URL, Protocol (TFTP/FTP/HTTP), Device ID, Password
- PVQMon IP
- NAT Traversal: NAT Signal (None/ SIP Ping/ STUN), NAT Media (None/ STUN), NAT TTL, STUN S1 IP, STUN S2 IP
- SSH: Yes, NoSFTP: Yes, No

802.1x (EAP) Port-based network access control

Extensible Authentication Protocol (EAP) supports multiple authentication methods and represents a technology framework that facilitates the adoption of Authentication, Authorization, and Accounting (AAA) schemes, such as Remote Authentication Dial In User Service (RADIUS). RADIUS is defined in RFC2865. The IP Deskphone with SIP Software supports only the MD5 authentication method.

802.1x defines the following three roles:

- Supplicant—an IP Deskphone that requires access to the network to use network services.
- 2. Authenticator—the network entry point to which the supplicant physically connects (typically a Layer 2/3 switch). The authenticator acts as the proxy between the supplicant and the authentication server. The authenticator controls access to the network based on the authentication status of the supplicant.
- 3. Authentication server—performs authentication of the supplicant.

Enable and disable Network-level authentication through the EAP configuration menu.

The RADIUS server is the authentication server and performs the actual authentication of the supplicant. The following EAP methods are supported:

• EAP-MDS on page 268

- EAP-TLS on page 268
- EAP-PEAP on page 268

The following options are available for the administrator:

- · When EAP-MD5 is selected, the administrator is prompted to enter ID1 and Password
- When EAP-PEAP is selected, the administrator is prompted to enter ID1, ID2, and Password. If the administrator enters only ID1, then ID2 contains same value of ID1.
- When EAP-TLS is selected, the administrator is prompted to enter ID1. If SCEP is used to
 install the device certificate, the administrator is required to enter CA Server (URL of the SCEP
 service), the Domain Name which the IP Deskphone belongs to and optionally the Hostname.
- When Disabled mode is selected, the existing IDs and Passwords are erased.

Authorization

If 802.1x is configured and the IP Deskphone is physically connected to the network, the IP Deskphone (supplicant) initiates 802.1x authentication by contacting the Layer 2/3 switch (authenticator). The IP Deskphone also initiates 802.1x authentication after the Ethernet connection (network interface only) is restored following a network link failure.

However, if the IP Deskphone resets, it assumes the Layer 2 link has remained in service and is authenticated.

The IP Deskphone fails to authorize if the DeviceID and the IP Deskphone passwords do not match the DeviceID and IP Deskphone passwords provisioned on the RADIUS Server. The Layer 2 switch (authenticator) locks out the IP Deskphone and network access is denied. If this happens during reauthorization, all phone services are lost. The connected PC operates as normal.

Device ID

The Device ID is for use with the 802.1x (EAP) protocol. If the 802.1x (EAP) is not used, then there is no prompt to enter the Device ID.

Password

The Password is for use with the 802.1x (EAP) protocol. If the 802.1x (EAP) is not used, there is no prompt to enter the Password.

802.1ab Link Layer Discovery Protocol

802.1ab Link Layer Discovery Protocol (LLDP) is a standard for discovering the physical topology between neighboring devices. 802.1ab LLDP defines a standard method for Ethernet network devices, such as switches, routers, and IP Deskphones to advertise information about themselves to other nodes on the network and to store the information they discover in a Management Information Base (MIB).

802.1ab (LLDP) takes advantage of the VLAN Name and Network Policy TLVs, and provides an automatic configuration of the IP Deskphone network policy parameters. Key parameters, such as VLAN ID, L2 priority, and DSCP values are received from the switch and are automatically configured in the IP Deskphone.

802.1ab Link Layer Discovery Protocol (LLDP) provides the following functionality

- Periodic transmission of advertisements containing device information, device capabilities and media specific configuration information to neighbors attached to the same network.
- Reception of LLDP advertisements from its neighbors.
- Implementation of behavioral requirements specified by Link Layer Discovery Protocol Media Endpoint Discovery (LLDP-MED).
- Storage of received data in local data structures, for example, in MIB modules.

TLVs

The information fields in each MIB are contained in a Link Layer Discovery Protocol Data Unit (LLDPDU) as a sequence of short, variable-length, information elements known as TLVs that each include type, length, and value fields. Each LLDPDU includes several mandatory TLVs plus optional TLVs. Optional TLVs may be inserted in any order.

The IP Deskphone supports both the transmit and receive LLDP mode.

Transmit direction:

An LLDPDU transmitted by the IP Deskphone supports the following TLVs:

- 1. Chassis ID
- 2. Port ID
- 3. Time To Live
- End of LLDPPDU
- 5. Port Description
- 6. System Description
- 7. System Capabilities
- 8. Port VLAN ID
- 9. Port And Protocol VLAN ID

- 10. VLAN Name
- 11. Protocol Identity
- 12. MAC/PHY Configuration Status
- 13. Power Via MDI
- 14. Link Aggregation
- 15. Maximum Frame Size
- 16. LLDP-MED Capabilities
- 17. Network Policy
- 18. Extended Power-via MDI
- 19. Inventory Software Revision
- 20. Inventory Manufacturer Name
- 21. Inventory Model Name

Receive direction:

The IP Deskphone expects to receive the following TLVs:

- 1. Chassis ID
- 2. Port ID
- 3. Time To Live
- 4. End of LLDPPDU
- 5. System Capabilities
- 6. VLAN Name
- 7. MAC/PHY Configuration Status
- 8. LLDP-MED Capabilities
- 9. Network Policy
- 10. Location Identification

Table 20: TLV formats

TLV	Fields
Chassis ID	Length = 6
	Chassis Subtype = 5 [IP Address]
	Chassis ID = IP Deskphone IP Address
Port ID	Length = 7
	Port Subtype = 3 [MAC Address]

TLV	Fields	
	Port ID = IP Deskphone MAC address	
Time To Live	Length = 2	
	TTL= 180 [seconds]	
End Of LLDPDU	Length = 0	
Port Description	Length = 15	
	Port Description = " IP Deskphone"	
System Description	Length = the length of the system description string	
	System Description = "IP Deskphone, xxx, Software: 0604D97"	
	where: xxx = 1220, 1230	
	Software = software version. "0604D97" is an example only.	
System Capabilities	Length = 4	
	System capabilities = 0x24	
	[Deskphone + Bridge] Enabled capabilities = 0x24	
	If you disable the PC Ethernet port, the advertised enabled capabilities configured to IP Deskphone only.	
Port VLAN ID	PVID = 0	
	The IP Deskphone does not support port-based VLAN operation.	
Port And Protocol VLAN ID	PPVID = 0	
	Port and Protocol VLAN is not supported and not enabled.	
VLAN Name	VLAN name field is configured to "data" and "voice".	
Protocol Identity	 STP: Protocol identity = the first 8 bytes of an STP PDU starting with the Ethertype field. 	
	Length = 8	
	Protocol Identity = 0x00 0x26 (type/length field of Ethernet packet, size=38)	
	0x42 0x42 0x03 (LLC header indicating STP)	
	0x00 0x00 (Protocol Identity field from STP BPDU)	
	0x00	
	2. 802.1x: Length = 3	
	Protocol identity = 0x888E—(802.1x Ethertype)	
	0x01—(Version field from 802.1x frame)	
	3. LLDP: Length = 2	
	Protocol identity = 0x88CC—(LLDP Ethertype)	
	, (

TLV	Fields
	Bit 0 = 1 [Auto-negotiation supported]
	Bit 1 = 1 or 0, depending on the current auto-negotiation status, for example, either enabled or disabled.
	PMD auto-negotiation advertised capability =
	0x4000 - 10BASE-T half duplex mode
	0x2000 - 10BASE-T full duplex mode
	0x0800 - 100BASE-TX half duplex mode
	0x0400 - 100BASE-TX full duplex mode
	Operational MAU Type =
	10 – UTP MAU, 10BT, half duplex mode
	11 – UTP MAU, 10BT, full duplex mode
	15 - 2-pair Category 5 (CAT5) UTP, 100BT, half duplex mode
	16 - 2-pair CAT5 UTP, 100BT, full duplex mode
Power Via MDI	MDI power support = 0:
	Bit 0 = 0 – Powered Device
	Bit 1 = 0 – PSE MDI power not supported
	Bit 2 = 0 – PSE MDI power state disabled
	Bit 3 = 0 – PSE pair selection can not be controlled
	PSE power pair = 1
	Power Class = 2 for 1220/1230 IP Deskphones
Link Aggregation	Aggregation status = 0; the link is not capable of being aggregated, and currently is not in aggregation.
	Aggregated Port ID = 0
Maximum frame size	The MAC/PHY supports an extension of the basic MAC frame format for Tagged MAC frames. The maximum frame size is configured to 1522.
LLDP-MED System Capabilities	Bit 0 = 1—LLDP-MED Capabilities–supported
	Bit 1 = 1—Network Policy–supported
	Bit 2 = 1—Location Identification–supported
	Bit 3 = 0—Extended Power using MDI-PSE–not supported
	Bit 4 = 1—Extended Power using MDI-PD-supported
	Bit 5 = 1—Inventory–supported
	The Class Type field can be configured to 3 -Telephone
Network Policy Discovery	Application Type-1—voice

TLV	Fields
	Unknown Policy Flag (U)—1 only if the policy is unknown
	Tagged Flag (T)—configure accordingly Reserved (X)-0
	VLAN ID—configure accordingly
	L2 Priority—configure accordingly
	DSCP Value—configure accordingly
Location Identification Discovery	Coordinate-based LCI–16 bytes
	Civic Address LCI I–variable length
	This format can have more than one address element and one address element can range from a minimum of 7 to 256 bytes.
	ECS ELIN I–variable between 10 and 25 bytes
	Although location is received, it is not available to end user in this release of the SIP Software.
Extended Power-via MDI Discovery	Power Type = 01–PD Device
	Power Source = 00–Unknown
	There is no hardware support for determining the power source.
	Power Priority = 0010–High
	Power Value = Maximum power required as shown below:
	1220 =
	1230 =
Software Revision	Configure to the software version being used; for example, 0604D97.
Manufacturer Name	"avaya-xy",
	where: xy is a 2-digit manufacturer code as shown below:
	1220: Code 04
	1230: Code 04
Model Name	Contains a string, which specifies the IP Deskphone model, for example, "IP Deskphone xxx", where, xxx is one of the following values: 1220, 1230.

DHCP

There are two methods of provisioning DHCP.

1. No DHCP (Manual configuration): All the Device Settings parameters are configured manually on the IP Deskphone with SIP Software.

2. Yes: The IP Deskphone with SIP Software is configured to get a standard set of Device Settings parameters from the DHCP server.

NO DHCP mode

No DHCP mode is also known as Manual Device Settings. In this mode, the IP Deskphone does not need a DHCP server because no DHCP requests are sent during startup. All necessary parameters must be configured manually or through the device configuration file.

The minimum following parameters must be configured to achieve normal operation:

- SET IP
- Net Mask
- Gateway
- DNS IP
- Provisioning server IP, protocol, and, if user authentication is required to access the provisioning server, the user credentials

Note: TFTP protocol does not require user authentication. Device ID and password are ignored. FTP protocol requires user authentication and the default Device ID is anonymous with no password.

HTTP protocol can operate with or without user authentication. If no authentication is required, make sure to clear the Device ID and password fields in the configuration dialogue.

SET IP

Select SET IP in the Device Settings menu to configure the IP address.

Net Mask

Enter a subnet mask In the Net Mask field.

Gateway

Enter an IP address of the local gateway in the Gateway field.

DNS IP1 and DNS IP2

Configure the Domain Name Servers (DNS) IP addresses DNS IP1 and DNS IP2.

Ntwk Port Speed

There are three options to provision the network port speed.

- Auto Link speed is auto negotiated with the network device and attached PC.
- 10BT Link speed is available for up to 10 Megabit Full Duplex on the network and the PC port.
- 100BT Link speed is available for up to 100 Megabit Full Duplex on the network and the PC port.

Ntwk Port Duplex

There are three options available to provision the Network Port Duplex for Network Port Speed of 10BT or 100BT.

- Auto duplex is autonegotiated. Avaya recommends that Auto Negotiate mode is used on the network and the IP Deskphone.
- Force Full duplex is forced to FULL. Use Force Full mode only when the network is forced Full Duplex. Otherwise a duplex mismatch results.
- Force Half duplex is forced to HALF. Use Force Half mode only when the network is forced Half Duplex. Otherwise a duplex mismatch results.

Disable Voice 802.1Q

If 802.1Q is disabled, standard Ethernet frames are transmitted. If 802.1Q is enabled, all frames transmitted by the Ethernet driver have the 802.1Q tag bytes inserted between the source MAC address and the protocol type field.

Voice VLAN

Configure the Voice VLAN.

Table 21: Telephony Port (incoming)

Voice VLAN Setting	Result
No VLAN (default setting)	All telephony traffic that is transmitted on the telephony port is forwarded untagged.
Manual (value from 1 to 4094)	All telephony traffic that is transmitted on the telephony port has an 802.1q header appended and its Voice VLAN ID is set to the value manually configured here. Enter a value from 1 to 4094.

VLAN Filter

Configure the VLAN Filter (not available if Voice VLAN is configured as No).

Table 22: VLAN Filter

VLAN Filter Setting	Result
Enabled (box is checked)	Traffic is forwarded to the IP Deskphone port, based on a review of the MAC address of the packet as well as the 802.1q tag value. Traffic is forwarded through the IP Deskphone port, (to the network stack of the IP Deskphone), only if the packet matches the MAC address of the IP Deskphone and contains the Voice VLAN tag. If the Automatic VLAN Discovery feature is used, the filter is adjusted dynamically as the IP Deskphone validates the VLAN suggested by DHCP.
Disabled	The VLAN filter is disabled by default. If the VLAN filter is disabled, traffic is forwarded to the IP Deskphone port based only on a review of the MAC address of the packet. The IP Deskphone accepts traffic addressed to the MAC address of the IP Deskphone as well as any broadcast or multicast packets from any VLAN.

Ctrl Priority bits

802.1Q priority bits for the control or signaling stream. There is not a control priority bit prompt if 802.1Q is not enabled.

Media Priority bits

802.1Q priority bits for the media (audio) stream There is not a media priority bit prompt if 802.1Q is not enabled.

Disable PC Port

With a disabled PC Port, the IP Deskphone with SIP Software does not receive or send packets to or from the PC port. No device can use the PC port to connect to the network.

Data VLAN

Configure the Data VLAN (the VLAN applicable to the PC port). The behavior of the PC port is summarized in the following table.

Table 23: PC Port (incoming traffic from PC)

Data VLAN	Result
No VLAN	All traffic received on the PC port is forwarded based on the MAC address. The packets are not modified in any way.
Manual (value from 1 to 4094)	All untagged packets received from the PC have an 802.1q header appended and the VLAN ID is configured to the value that is manually provisioned in this field. Any packet arriving on the PC port that is already tagged with matching VLAN ID is forwarded as is. Packets tagged with different VLAN IDs are dropped.
	Enter a value from 1 to 4094.

Table 24: PC Port (outgoing)

Data VLAN	Result
No	All traffic received on the network port and telephony port is forwarded to the PC port based on MAC address only. The packets are not modified in any way.
4095 (Note that the value 4095 is not a valid VLAN ID. This is intentional to ensure a proper VLAN ID is entered.)	Traffic is forwarded to the PC port based on a review of the MAC address of the packet, as well as the value configured in the Data VLAN field. Traffic is

Data VLAN	Result
	forwarded out the PC port (to the PC) only if the
	packets contain the Data VLAN tag. Untagged traffic
	and traffic with a VLAN tag other than the Data
	VLAN are dropped.

Data Priority bits

There is not a prompt for data priority bits if 802.1Q is not enabled.

PC-Port Untag all

Configure PC-Port Untag-All, which configures PC-Port VLAN Tag Stripping.

When enabled, all outgoing traffic to the PC has the VLAN tag removed. When disabled, packets are sent to the PC as is if Data VLAN is configured as No or if Data VLAN is enabled and the VLAN tag matched. Packets with different VLAN ID are discarded.

Cached IP

Leave unchecked to conform to the DHCP standard and to obtain an IP address from the DHCP server. Only check Cached IP to force the IP Deskphone to start with a cached IP address in the event that the IP Deskphone cannot connect to the DHCP server and obtain an IP address.

Port Speed and Duplex

In the Network menu, Auto Negotiation mode is the default setting for initial startup. Typically, the IP Deskphone is connected to a network that supports Auto Negotiation, and the IP Deskphone selects the best speed and duplex mode available. There is no intervention required under normal operation.

Important:

Avaya recommends that Auto Negotiation mode is used on the network and the IP Deskphone. Use Full Duplex mode only when the entire network is running in Full Duplex mode. Otherwise, a duplex mismatch results.

If the IP Deskphone is connected to a network configured for Full Duplex mode only, the IP Deskphone cannot automatically negotiate the proper configuration. Therefore, in this instance, to allow the IP Deskphone to work at the optimum speed and duplex mode, Full Duplex mode must be enabled.

Ignore GARP

Gratuitous Address Resolution Protocol (GARP) Protection prevents the IP Deskphone with SIP Software from GARP spoof attacks on the network.

The IP Deskphone with SIP Software provides the ability to ignore GARP messages.

Provisioning

The next four menu items apply to configuring the provisioning parameters.

Server URL

Enter the numeric IP address, name, or URL of the provisioning server in the Server URL box.

Protocol

Select the protocol used to access the provisioning server, either TFTP, FTP, or HTTP.

Device ID

Enter the Device ID (User ID) used by the provisioning server for authentication of the IP Deskphone with SIP Software.

Password

Enter the password used by the provisioning server for authentication of the IP Deskphone with SIP Software.

PVQMon IP

If the Proactive Voice Quality Monitor (PVQMon) server is available on the network, enter the PVQMon IP address.

NAT Traversal

The next five menu items apply to configuring the NAT Traversal Method if the IP Deskphone with SIP Software is connected to the network through a Network Address Translation device or a firewall.

NAT Signal

The IP Deskphone with SIP Software supports two methods of NAT traversal of signaling path: SIP_PING and STUN.

The default NAT traversal method is None.

SIP_PING is a legacy Avaya Proprietary protocol for NAT Traversal for SIP signaling only. STUN is an Internet standard for NAT traversal.

If the value for NAT traversal is not configured as None, this parameter overrides the value of the parameter SIP PING specified by the device configuration file for NAT SIGNALLING.

If the value for NAT traversal is set to None, the value of SIP_PING, if specified by the device configuration file for NAT_SIGNALLING, is used instead.

NAT_SIGNALLING is required for networks that use STUN or SIP_PING for NAT traversal.

NAT Media

The IP Deskphone with SIP Software supports STUN for media path the NAT traversal. The NAT Media feature can be disabled by setting the NAT_Media field in Device Settings menu to NONE.

STUN protocol cannot coexist with Application Layer Gateway (ALG), Media Portals, or RTP Proxy servers. If STUN is selected, ensure none of these devices are configured in the SIP Proxy server.

NAT TTL

Enter the Time to Live (TTL) in seconds for the NATport if STUN is enabled. The IP Deskphone with SIP Software pings the open ports on an interval less than the TTL to prevent the NAT from tearing down the ports.

STUN S1 IP

Enter an IP address for the STUN S1 IP device. The STUN server must reside in the public Internet for STUN protocol to be effective.

STUN S2 IP

Enter an IP address for the STUN S2 IP device. The STUN server must reside in the public Internet for STUN protocol to be effective.

Configure the device settings

This section describes how to provision the **Device Settings** parameters regardless of DHCP mode (Yes or No DHCP). Parameters that are not needed in Yes DHCP mode are grayed out on the IP Deskphone screen and cannot be modified.

Perform the following procedure to provision the **Device Settings** parameters on the IP Deskphone with SIP Software.

Provisioning the Device Settings parameters

1. Press the **Globe/Services** key on the IP Deskphone quickly twice. The Network menu appears:

Table 25: Network menu

- 1. Server Settings
 2. Device Settings
 3. Diagnostics
 4. Lock
- 2. To navigate in the Network menu, use the Navigation key cluster:

Table 26: Using the Navigation key cluster to navigate in the Network menu

Key	Action
Down	Moves highlight down
Up	Moves highlight up
Right	Selected current menu item
Left	Closes menu
Select key (center of cluster)	Selects current menu item

Menu items can also be accessed through the IP Deskphone keypad. Press the number (1 to 4) corresponding to a menu item to highlight that menu item. Press the **Select** key to select the highlighted menu item.

To close this menu, use the Quit key.

- 3. In the Network, choose **2. Device Settings**.
- 4. Enter the admin password. Press the **OK** context-sensitive soft key.
- 5. Use the Navigation key cluster to edit an item:

Table 27: Using the Navigation key cluster to navigate in the Device Settings menu

Key	Action
Down	Opens list or moves highlight down list.

Key	Action
Up	Moves highlight up list.
Right	Selects the next item or moves the cursor right in an edit item.
Left	Selects the previous item or deletes a character in the edit field.
Select key (center of cluster)	Selects the highlighted item in the combo box or ends edit mode.

In Edit mode, the first field of the item is highlighted.

Press the **Apply&Reset** context-sensitive soft key to save settings in the Device Settings menu after all the necessary changes are made. This action resets the IP Deskphone.

Press the **Return** context-sensitive soft key to exit the Device Settings menu without saving any changes.

6. Navigate to the first item in the Device Settings menu to configure **EAP**.

Table 28: EAP configuration

Enable 802.1x (EAP): □	
Device ID:	
Password:	

A check mark appears in the check box if the item is active.

- 7. If the Enable 802.1x (EAP) check box is checked, fill in the Device ID and the Password.
- 8. Configure 802.1ab Link Layer Discovery Protocol Data (LLDP) in the Enable 802.1ab (LLDP) menu.

Use the right arrow in the Navigation key cluster to highlight the Enable 802.1ab (LLDP) box. A check mark appears in the check box if the item is active.

Table 29: 802.1ab configuration

```
Enable 802.1ab (LLDP): □
```

9. Configure DHCP in the Device Settings menu.

Use the right arrow in the Navigation key cluster to highlight the DHCP box. Press the **Select** key to access a list of DHCP mode choices:

- Yes
- No

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select No.

Table 30: DHCP configuration

DHCP:	No	▼	
	No		
	Yes		

10. If DHCP is disabled, select SET IP in the Device Settings menu to configure the IP address.

Table 31: SET IP configuration

SET IP: 0.0.0.0

11. If DHCP is disabled, configure Net Mask and Gateway. Enter a subnet mask in the Net Mask field and enter the IP address of the local gateway in the Gateway field.

Table 32: Net Mask and Gateway configuration

Net Mask : 0.0.0.0 Gateway : 0.0.0.0

12. If DHCP is not Full DHCP, to configure the DNS enter the IP address of the local DNS servers DNS IP1 and DNS IP2.

Table 33: DNS configuration

DNS IP1 : 0.0.0.0 DNS IP2 : 0.0.0.0

13. Configure Ntwk Port Speed in the Device Settings menu.

Use the right arrow in the Navigation key cluster to highlight the Ntwk Port Speed box. Press the **Select** key to access a list of Ntwk Port Speed choices:

- Auto
- 10BT
- 100BT

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select a Ntwk Port Speed.

Table 34: Ntwk Port Speed configuration

Ntwk Port Speed :	Auto	▼	
	Auto		
	10BT		
	100BT		

14. Configure Ntwk Port Duplex in the Device Settings menu.

Use the right arrow in the Navigation key cluster to highlight the Ntwk Port Duplex box. Press the **Select** key to access a list of Ntwk Port Duplex choices:

- Auto
- Force Full
- Force Half

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select Ntwk Port Duplex.

Table 35: Ntwk Port Duplex configuration

Ntwk Port Duplex :	Auto	▼	
	Auto		
	Force Full		
	Force Half		

Disable Voice 802.1Q. Press the Select key to disable Voice 802.1Q.

A check mark in the Disable Voice 802.1Q box indicates that Voice 802.1Q is disabled.

Table 36: Voice 802.1Q configuration

Disable Voice 802.1Q: □

16. Configure Voice VLAN.

Use the right arrow in the Navigation key cluster to highlight the Voice VLAN box. Press the **Select** key to access a list of Voice VLAN mode choices.

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select the parameter.

Voice VLAN:	No VLAN	▼		1
-------------	---------	---	--	---

17. Enable or disable the VLAN Filter. Press the **Select** key to enable the VLAN Filter.

A check mark in the VLAN Filter box indicates that the VLAN Filter is enabled.

Table 37: VLAN Filter configuration

VLAN Filter : □

18. If 802.1Q is enabled, configure Ctrl Priority bits.

Use the right arrow in the Navigation key cluster to highlight the **Ctrl Priority bits** box. Press the **Select** key to access a list of Ctrl Priority bits choices.

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select the parameter.

Table 38: Ctrl Priority bits configuration

Ctrl Priority bits :	Auto	▼	
	Auto		
	Value from 0 to 7		

19. If 802.1Q is enabled, configure Media Priority bits.

Use the right arrow in the Navigation key cluster to highlight the **Media Priority** bits box. Press the **Select** key to access a list of Media Priority bits choices.

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select the parameter.

Table 39: Media Priority bits configuration

Media Priority bits :	Auto	▼	
	Auto		
	Value from 0 to 7		

20. Disable PC Port configuration. Press the **Select** key to turn off the PC port on the IP Deskphone.

A check mark in the Disable PC Port box indicates the PC port is disabled.

Disable PC Port can be used in an environment where administrators do not want users accessing the data network through the built-in PC port.

Table 40: Disable PC Port configuration

Disable PC Port : □

21. If the PC port is not disabled, configure PC Port Speed in the Device Settings menu.

Use the right arrow in the Navigation key cluster to highlight the **PC Port Speed** box. Press the **Select** key to access a list of PC Port Speed choices:

- Auto
- 10BT
- 100BT

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select a PC Port Speed.

Table 41: PC Port Speed configuration

PC Port Speed :	Auto	▼	
	Auto		
	10BT		
	100BT		

22. If the PC port is not disabled, configure PC Port Duplex in the Device Settings menu.

Use the right arrow in the Navigation key cluster to highlight the **PC Port Duplex** box. Press the **Select** key to access a list of PC Port Duplex choices:

- Auto
- Force Full
- Force Half

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select PC Port Duplex.

Table 42: PC Port Duplex configuration

PC Port Duplex :	Auto	▼	
	Auto		
	Force Full		
	Force Half		

23. Disable Data 802.1Q. Press the **Select** key to disable Data 802.1Q.

A check mark in the Disable Data 802.1Q box indicates that Data 802.1Q is disabled.

Table 43: Data 802.1Q configuration

Disable Data 802.1Q: □

24. Configure the Data VLAN.

It is possible to Enable or disable separate VLAN for anything other than voice and signaling.

Use the right arrow in the Navigation key cluster to highlight the **Data VLAN** box. Press the **Select** key to access a list of Data VLAN mode choices:

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select the parameter.

Table 44: Data VLAN Configuration in Device Settings menu

Data VLAN :	LLDP VLAN NAME	▼	
	No VLAN		
	LLDP VLAN NAME		
	Value from 1 to 4094		

If 802.1ab (LLDP) is disabled, Data VLAN cannot be automatically configured. LLDP VLAN NAME does not appear in the in the list of Data VLAN mode choices.

25. If 802.1Q is enabled, configure Data Priority bits.

Use the right arrow in the Navigation key cluster to highlight the **Data Priority bits** box. Press the **Select** key to access a list of Data Priority bits choices:

Scroll through the list with the Up/Down arrows and select the appropriate parameter. Press the **Select** key to select the parameter.

Table 45: Data Priority bits configuration

Data Priority bits :	Auto	▼	
	Auto		
	Value from 0 to 7		

26. Configure PC-Port Untag-All, which configures PC-Port VLAN Tag Stripping. Check the check box by pressing the **Select** key in the Navigation key cluster to enable this item.

If the check box is not checked, tag stripping is disabled and the packet is sent to the PC port unmodified. If the check box is checked, tag stripping is enabled and the 802.1q header is removed (assuming one exists) from the packet before it is forwarded through the PC port.

If Data VLAN is enabled in step 15, PC-Port Untag All is enabled and the check box is checked by default. In this case, the outgoing tag is stripped. Override the default by pressing the **Select** key to remove the checkmark.

If Data VLAN is disabled, PC-Port Untag All is disabled and the check box is not checked by default. In this case, the ingress tag is not stripped. The default can be overridden by pressing the **Select** key, which places a checkmark in the box.

Table 46: PC-Port Untag-All Configuration in Device Settings menu

PC-Port Untag all : □

27. Configure Cached IP.

Leave unchecked to conform to the DHCP standard and to obtain an IP address from the DHCP server. Only check Cached IP to force the IP Deskphone to start with a cached IP address in the event that the IP Deskphone cannot connect to the DHCP server and obtain an IP address.

To force the IP Deskphone to start with a cached IP address, press the **Select** key.

A check mark in the Cached IP box indicates that the IP Deskphone is forced to start with a cached IP address.

Table 47: Cached IP configuration

Cached IP: □

- 28. Configure the Ethernet port mode.
 - Ignore GARP: GARP requests handling. The default can be overridden by pressing the **Select** key, which places a check mark in the box.

Table 48: Ethernet port mode configuration

Ignore GARP: □

29. Enter Provisioning Parameters: Server URL, Protocol, Device ID, and Password.

The next four tables show menu items in the Device Settings menu that apply to configuring the Provisioning parameters.

 Server URL: Enter the URL of the provisioning server in the Provisioning Server URL box. Provisioning Server URL: 0.0.0.0

• Protocol: Select either TFTP, FTP, or HTTP used for provisioning in the **Protocol** box.

Table 49: Protocol configuration

Protocol:	TFTP
	TFTP
	FTP
	HTTP

 Device ID: Enter the **Device ID** used by the provisioning server for authentication of the IP Deskphone.

Note:

TFTP does not require a Device ID. If FTP or HTTP are used, enter the information for a Device ID

Note:

Enter your User ID as the Device ID.

Table 50: Device ID configuration

 Password: Enter the password used by the provisioning server for authentication of the IP Deskphone.

🐯 Note:

TFTP does not require a password. FTP and HTTP do require a password.

Table 51: Password configuration

d: XXXXXXXX

30. Configure the PVQMon IP address.

If this server is available on the network, enter the PVQMon IP address.

Table 52: PVQMon IP configuration

PVQMon IP:	0. 0. 0. 0

31. Configure the NAT Traversal Method. Use one of the following methods to traverse Network Address Translation (NAT) devices for the IP Deskphone with SIP Software.

The next five tables show menu items in the Device Settings menu that apply to configuring the NAT Traversal Method.

NAT Signal

Select either None, SIP_PING, or STUN to define the NAT traversal mode for SIP signaling.

Table 53: NAT Signal configuration

NAT Media

Select either None or STUN to define NAT traversal mode for signaling.

Table 54: NAT media configuration

NAT Media :	STUN	
	None	
	STUN	

NAT TTL:

Enter the Time to Live (TTL) in seconds for the NAT traversal.

Table 55: NAT TTL configuration

• STUN S1 IP:

Enter an IP address for the STUN S1 IP device.

Table 56: STUN S1 IP configuration

|--|

STUN S2 IP:

Enter an IP address for the STUN S2 IP device.

Table 57: STUN S2 IP configuration

JN S2 IP :	00. 00. 00. 00

Chapter 14: Multiple Appearance Directory Number

The Multiple Appearance Directory Number (MADN) feature operates differently depending on the type of Communication Server. For instance, the MADN feature operates differently on the Communication Server 2000 than the Communication Server 1000. For more information about the MADN feature and how it operates on the communication servers, see the following sections:

- Communication Server 1000 on page 169
- Communication Server 2000 and Communication Server 2100 on page 171

Communication Server 1000

CS 1000 Multiple Appearance Directory Numbers (MADN) provides the following features:

- Several devices (TNs) share a common Directory Number (DN).
- When the DN receives a call, all devices ring.
- You can configure two call arrangements; Single Call Arrangement (SCA) and Multiple Call Arrangement (MCA).

Single Call Arrangement

Single Call Arrangement (SCA) MADN allows only a single active call on the DN, regardless of the number of DN appearances:

- A call on a DN appearance makes all other appearances busy (they cannot receive or make calls).
- Activity on one DN appearance reflects on other appearances; this is achieved by using the Event Dialog SIP feature. For more information, refer to RFC 4235.
- SCA MADN provides Automatic Privacy for telephones that share a DN. When a call is in progress on the DN, no other telephone on which the DN appears can bridge into the call, unless the call is put on hold
- Telephones with a Privacy Override Allowed (POA) Class of Service can bridge into an established call on an SCA MADN. However, you cannot bridge into a call until the call establishes.
- Any user with the MADN SCA feature can put a call on hold. Any other user in the group can
 pick up the held call by accessing the line key with SCA provisioned.

 The state of the user's group is reflected in the line key icon. Three states are available; idle, active, and held. For more information about line key icons, see the applicable IP Deskphone User Guide.

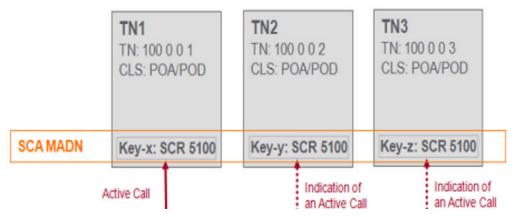

Figure 8: SCA MADN

Multiple Call Arrangement

Multiple Call Arrangement (MCA) MADN allows as in-progress calls as there are appearances of the DN:

- A call on a DN appearance does not make other appearances busy (they can receive or make calls).
- Activity on one DN appearance does not reflect on other appearances.
- There is no simple method for a DN appearance to bridge into or pick up a call on another DN appearance.

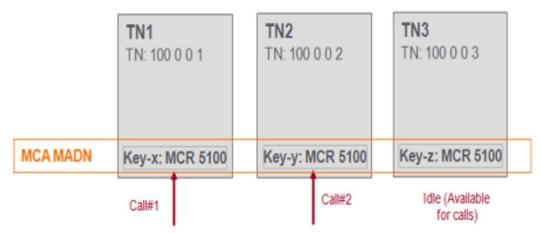

Figure 9: MCA MADN

The MADN SCA feature for CS 1000 requires you to configure **PROMPT_AUTHNAME_ENABLE** to **YES** in the device configuration file. This prompts the end user to enter an Authentication ID that is different from the Login ID.

The following example shows a TN configured for SCA MADN:

TN 100 0 0 1 UEXT/SIPL

```
With:
SIPU user1
SCPW xxxx
KEY 0 SCR 8000
KEY 1 HOT U xxxx
```

The following example shows a TN configured for MCA MADN:

```
TN 100 0 0 2
UEXT/SIPL

With:
SIPU user2
SCPW xxxx
KEY 0 MCR 8001
KEY 1 HOT U xxxx
```

Note:

You must enter 8000/8001 as the Login ID and user1/user2 as the Authentication ID when you register to a corresponding user on an IP Deskphone.

Communication Server 2000 and Communication Server 2100

The MADN feature allows a Directory Number (DN) to appear on more than one IP Deskphone with SIP Software. The MADN with Single Call Arrangement (SCA) feature allows multiple IP Deskphones to appear as a single line to a caller. Any one of the IP Deskphone phones in a group with MADN can initiate or answer a call, but only one call can be active at any given time. Any other user in the group can join the active call by picking up the handset of the IP Deskphone with SIP Software.

With the MADN SCA feature configured on multiple phones of different registered SIP users, the phones share one single DN. An incoming call to this DN causes all the phones in the group to ring.

Any user of an IP Deskphone with the MADN SCA feature can put a call on hold or can prevent others from joining in the active call.

If a user's group is active (as seen by line icon being off-hook) and the user picks up the handset, the user is automatically joined to an ongoing MADN call (unless the server restricts this feature for privacy or other factors).

Vertical services

Vertical services are CS 2000 and CS 2100 features that can be activated or deactivated by dialing a defined code; for example, Privacy. Even though no more than one active session can be established for the MADN SCA group, members of the group can still enter certain vertical services.

Currently, the available vertical service is Privacy.

Privacy

A user can activate the privacy service by putting the current session on hold and dialing the privacy code. The CS 2000 connects the IP Deskphone to the Avaya Media Server (MS) to hear a confirmation for its request and terminates the session. The user takes the original session off hold.

Privacy access codes

The privacy access codes are: PRV, PRLA, PRLC. For example: PRV = 191 PRLA = 192 PRLC = 193 If the initial state of the MADN group is nonprivate, the PRV access code is used to toggle between privacy on and privacy off. If the initial state of the MADN group is private, the PRLA access code allows bridging and PRLC closes it.

Feature dependencies and restrictions

The minimum release to support MADN SCA feature is 1.1. Multi-User login is not supported.

Chapter 15: Multiuser

The Multiuser feature allows multiple SIP user accounts to be in use on the IP Deskphone at the same time. Multiple users, each with their own account, can share a single IP Deskphone allowing each user to receive calls without logging off other users. One user can have multiple user accounts (for example, a work account and a personal account) active at the same time on the same IP Deskphone. You can register each account to a different server, and for each account, the IP Deskphone exposes the functionality available to that account.

One account is considered a primary account and is used by default for most IP Deskphone operations. Each account is associated to a line key; the primary account is always on the bottom right line key of the IP Deskphone, and an arbitrary key (including a key on an Expansion Module) can be selected for additional accounts.

You can use the line key to do the following:

- · start dialing
- · place a call using the corresponding user account
- to answer an incoming call targeted to that account

Initiating a call without pressing a line key (for example, by dialing digits at the idle screen and lifting the handset) uses the primary account.

A running IP Deskphone is associated to a single profile that represents one configuration of the IP Deskphone with all relevant persistent data such as preferences and call logs. A different profile is associated to each account used as a primary account. The IP Deskphone can store up to five different profiles; the IP Deskphone takes data from the profile associated to the current primary account. A number of configurations are independent of profiles and tied directly to an account making them available to that account regardless of the primary account you use (for example, voice mail ID).

The IP Deskphone receives and answers calls targeted at any of the registered accounts; the incoming call screen indicates who the call is for. You can place an outgoing call using any of the accounts; the account that you use is displayed on the dialing screen. When a call is active, information from both local and remote parties appear on the screen.

Regardless of which account receives the call, incoming call logs, outgoing call logs, and instant messages appear in a single list. The IP Deskphone indicates the local user in the detailed view of the entry.

Some features are only available to the primary account, such as instant messaging, retrieving parked calls by token, and establishing ad-hoc conference calls.

If you log off of the primary account, the IP Deskphone unregisters all other accounts at the same time. These accounts are registered automatically after you log on the primary account (it is possible to use a different primary account to log on) again. When the IP Deskphone restarts, all accounts

that were logged in before the IP Deskphone restarted, are automatically logged back on. The provisioning server can also configure the users who are allowed to log on to the IP Deskphone.

Configuration

Depending on server policy, the Multiuser feature can require you to configure the **PROMPT_AUTHNAME_ENABLE** value to **YES** in the device configuration file. This enables a prompt that requires you to enter an Authentication ID that is different from the Login ID. For example, CS 1000 requires an Authentication ID to find a corresponding TN and a Login ID to find a key; enabling **PROMPT AUTHNAME ENABLE** creates a prompt for the authentication ID.

When you configure Multiuser, consider the following parameters:

- MAX_LOGINS represents the number of user accounts that can log on at the same time. Configure MAX_LOGINS to any value greater than one; the default is 24.
- Configure DOD_ENABLE to NO; a secondary user cannot log on if DOD_ENABLE is enabled. The default value is NO.
- The **SELECT_LAST_INCOMING** parameter determines call selection when multiple calls are in the **Ringing** state. If you configure **SELECT_LAST_INCOMING** to **NO**, the first selected call remains the selected call as new calls are added to or drop from the list of ringing calls. If you configure this value to **YES**, the selected call becomes the ringing call last added to the list. The default value is **NO**.

Initial logon

To logon for the first time, you must enter a user name and password, and specify if the logon is permanent or not. On the logon screen, you can choose which domain you want to access, and change the language you want to use. You can use the Domain key only to select a domain from the configured list; you cannot modify domains.

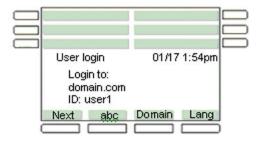

Figure 10: Primary logon screen

After you log on, the idle screen appears on the IP Deskphone. If there is no profile for the primary account, the IP Deskphone automatically creates a profile. You can create up to five profiles. If you exceed the limit of five profiles, the IP Deskphone automatically deletes the least recently-used profile.

Similarly, configurations for each user of the primary account are loaded after a user logs on to the IP Deskphone. The configurations are independent of the profile; if the account you use is registered as the secondary account (not the primary account), the IP Deskphone uses the configurations of

the primary account. The IP Deskphone keeps up to 24 sets of configurations (one set for each user). If you exceed the limit of 24 sets of configurations, the IP Deskphone automatically deletes the least recently-used set, and a new account is registered.

Additional logons

The Login command in the System menu allows you to register additional accounts. If you log on as a secondary user, you cannot change the language selection.

The following figure shows the secondary logon screens.

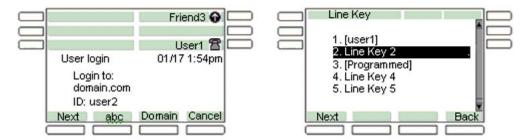

Figure 11: Example of secondary logon screens

You can specify a Line Key for a new account. By default, the IP Deskphone selects the first unused key. If the IP Deskphone reaches the configured limit on concurrent logons and you select the Login command, an error message appears.

During the logon operation, a login user message appears on the IP Deskphone screen. The IP Deskphone can receive calls for user accounts that are registered; however, other features are not available until the logon process is complete. The IP Deskphone does not display a profile selection prompt and does not create a profile for the secondary account.

Automatic logon

Use the following configuration options to determine the behavior of the automatic logon feature:

- AUTOLOGIN_ENABLE NO (or 0): This configuration requires you to enter the Login ID, Authentication ID, and password for each user every time there is a restart of the IP Deskphone.
- AUTOLOGIN_ENABLE YES (or 1): If the IP Deskphone is switched off, you are automatically logged back on when you restart the IP Deskphone. If multiple users are logged on when the IP Deskphone is switched off, the IP Deskphone automatically logs all users back on when you restart the IP Deskphone.

• AUTOLOGIN_ENABLE USE_AUTOLOGIN_ID (or 2): You do not enter user credentials; the system administrator pre-configures the IP Deskophone using an IP Deskphone-specific file. The following example shows a SIP provisioning file:

[USER_CONFIG] DOWNLOAD_MODE FORCED VERSION 000001 PROMPT NO	IP Deskphone-specific configuration file
AUTOLOGIN_ID_KEY01 8010@avaya.com AUTOLOGIN_AUTHID_KEY01 user1 AUTOLOGIN_PASSWD_KEY01 1234	The IP Deskphone uploads a phone-specific file in the format SIP{MAC ld}.cfg
AUTOLOGIN_ID_KEY02 8050@avaya.com AUTOLOGIN_AUTHID_KEY02 user1 AUTOLOGIN_PASSWD_KEY02 1234	

Logging off

The Logout command in the System submenu, prompts you to select an account, asks for confirmation, and then proceeds to log off the account. Logging off an account frees the corresponding Line key and does not require a password.

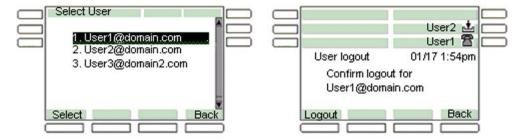

Figure 12: Example of log off screens

Consider the following when logging out of an IP Deskphone:

- Unless the parameter LOGOUT_WITHOUT_PASSWORD is set to YES (default is NO), the
 phone prompts you for the User Password before logging off an account. When there are
 multiple accounts logged in and the "All accounts" option is chosen, the administrative
 password must be entered.
- The administrative password can be entered instead of the user password to log off an individual login account.

Primary account logout

Logging off the primary account causes all other accounts to log off automatically and the IP Deskphone to display the logon screen. The IP Deskphone logs back in the secondary accounts automatically after you register a new primary account or the same primary account.

If you restart the IP Deskphone after you logged off the primary account, the logon screen appears on the IP Deskphone. Logging on a new primary account leads to automatic logon of the secondary accounts.

The list of programmed feature keys is part of the IP Deskphone profile. Logging off one primary account and logging on a different account can change the set of feature keys. If a secondary account is assigned to a key that is also in the new set of feature keys, the secondary account takes precedence; the secondary account is logged on and the feature key acts as a Line key. If the account is logged off manually, the programmed feature key becomes available.

Secondary account logout

If you log off a secondary account by selecting the secondary account in the Logout Select User screen, the IP Deskphone removes the secondary account from the autologon list. After you restart the IP Deskphone, the IP Deskphone does not log on the secondary account.

Server failover

If the connection to your account proxy is lost, the IP Deskphone notifies your account and periodically attempts to reconnect. Some features, such as incoming calls, remain accessible for other accounts, but other features are not available until connection is reestablished or you cancel the reconnection. Cancelling the connection to your account is the same as logging off. If you are using the primary account, the IP Deskphone returns you to the initial logon screen. If you are using a secondary account, that secondary account is removed from the list of secondary accounts that are logged on automatically.

If more than one account loses connection, the IP Deskphone attempts to reconnect to each account in sequence. The IP Deskphone tries to reconnect the first account to lose connection until that account reregisters or you cancel the attempt. Then the IP Deskphone attempts to reconnect the next account that lost connection. Cancelling the reconnection of the primary account immediately abandons reconnection of all other accounts, logs off secondary accounts that are still connected, and returns the IP Deskphone to the logon screen.

The IP Deskphone uses a single logon queue for automatic logons and failover. This means that if automatic logons are still pending when an account cannot connect, a reconnection attempt for that account can only begin after all automatic logons are complete or cancelled.

Cable unplugged

If the IP Deskphone detects that the network cable is unplugged while accounts are logged on, the IP Deskphone assumes that all accounts have lost their connection to the server. When the cable is

reconnected, the IP Deskphone proceeds to reregister all accounts, starting with the primary account.

Line keys

Each registered user is associated to a separate line key. Each line key displays the name of the registered account and some basic state information for the account.

The primary account is associated to the first bottom-right line key of the IP Deskphone. If you are using a secondary account, the order of the next available line key is from bottom to top and right to left on the IP Deskphone, followed by the keys on the Expansion Module from bottom to top and right to left. You can select a different available line key for secondary accounts during the logon process.

The following figure is an example of the IP Deskphone with and Expansion Module and multiple accounts.

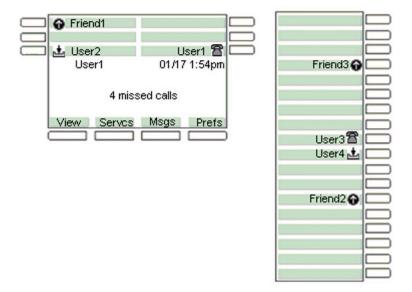

Figure 13: IP Deskphone with Expansion Module and multiple accounts

Pressing a line key brings up a dialing prompt, initiates a call to a preselected target, or answers an incoming call. See Making a call on page 180.

At select account prompts, such as the Logout screen or User Settings screen, pressing a line key highlights the corresponding account. See <u>Account selection</u> on page 188.

The icon for each line key reflects the state of the account associated with that line key.

- If there is a call for the account, a IP Deskphone icon displays the state of the call, such as when the call is on hold or is ringing.
- If there is more than one call, the state of the most active call is displayed.

- Missed incoming calls and new voice mail messages for the account are indicated with an icon. The icon supplements the NN missed calls message on the idle screen and the red LED which cannot provide per-account information.
- The MADN, do-not-disturb, and call forwarding features also affect the appropriate line key icon of the account.

Making a call

You can place a call using any of the registered user accounts. The account that you select determines:

- · the proxy used
- the domain name used for the call target (if none was specified)
- · the caller the target sees is calling
- the service-package-dependent features that are available

Receiving a call

When you receive an incoming call, the account that the call is intended for is displayed on the IP Deskphone. The line key of that account displays the icon for an incoming call. You cannot use a different account to answer the call.

If you are receiving multiple calls at the same time, a list of all active and incoming calls appears. If you select a specific call in the list, you can choose to answer or process that specific call. The IP Deskphone sorts the list by the most recent incoming call first. If there are numerous calls to process, you can configure the selected call to automatically select the last incoming call to make it easier to answer, or to leave the selected call static. The selected call does not jump as new calls come in, but remains on the same call, as new calls are added, to make it easier for the user to process that call.

If the calls are for different accounts, the line keys associates with the accounts receiving the incoming calls display an incoming-call icon.

Being in a call

When a single call is active, the screen displays the local account in use and the remote user. If multiple calls are active, each call appears on a single line. The local account for the active call appears on the context line. Each line key reflects the most active call state of the account the line key is associated with.

The active call is affected by operations such as transfer or call parking. One exception is the New Call action which uses the primary account by default, but can be overridden by pressing another line key to initiate a call.

You can use your account to transfer or park an active call that is received on that account. The exception is the New Call action because it uses the primary account by default. You can override the New Call action by pressing another line key to initiate a call.

Joining calls into an ad-hoc conference always uses the conference server of the primary account. Calls that are on accounts that cannot access the server cannot be joined. After you create an adhoc conference, you can join additional calls into the same conference. You cannot create more than one ad-hoc conference at a time.

You can join any two calls with the 3-way call feature, regardless of the account. The service package of the account to which a call is associated determines which operations, such as Call Park, are available on that call. After you establish a 3-way call, the join functionality becomes unavailable until the 3-way call is terminated.

The following figure is an example of the IP Deskphone with one call.

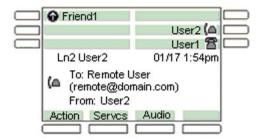

Figure 14: Example of the IP Deskphone with one call

The following figure is an example of the IP Deskphone with multiple calls.

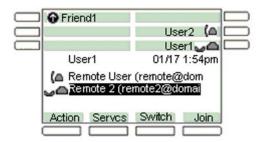

Figure 15: Example of the IP Deskphone with multiple calls

Instant messages

You can only receive or send instant messages from the primary account. Incoming messages for secondary accounts are rejected, are not displayed on the screen, and are not added to the instant message logs.

Menu features

The menus displayed on the IP Deskphone are customized to match the service package of the active account that is accessing the menu. Menus are accessed from the Idle screen when the primary account is active. For example, you can only use the Retroe Context-sensitive soft key to retrieve a parked call if call parking is allowed by the service package of the primary user.

Similarly, accessing the Address Book through the Directory hard key displays the Address Book of the primary account. However, accessing the address book in select mode (for example, while dialing or selecting an item for a speed dial key) accesses the address book of the user account that is in use on the address-input screen.

Modifying settings

Preferences, such as Voice Mail and IM settings, are available for each account. The main **Preferences** menu includes a **User Settings** entry. If you select **User Settings**, you are prompted to select a registered account. After you select a registered account, a menu appears that lets you modify the settings of the account you selected.

Per-account call notification options

The **Call Settings** entry in the **User Settings** menu provides you with a number of configuration options relating to how incoming calls for a particular account are treated.

The configuration options are:

- what kind of audio alert you want to use (ring tone, beep, or nothing)
- whether you want the red LED to blink
- whether you want the call to be added to the Incoming Call logs

IM settings

IM Settings is located in the **User Settings** menu. Any change in settings on the primary account takes effect immediately. You can also modify settings for a secondary account, but the modifications do not take effect until you register the secondary account as the primary account.

Voice Mail settings

Voice Mail Settings is located in the **User Settings** menu. You can program different voice mail addresses and IDs for each account. To access the voice mail of a secondary account, press the line key of the secondary account to obtain a dial prompt, and then press the **VMail** soft key.

Waiting messages are reported in the following two ways:

- The red LED lights up if any account has a waiting message.
- A shaded envelope icon appears on the line key of each account that has a waiting message (unless the account is in a call).

Remembering settings after logout

The IP Deskphone remembers up to 24 sets of configurations for each profile. If you configure settings for an account and you log off the account, the settings are restored after you log back onto the account (as either a primary account or a secondary account).

If you log on an account that you did not save the settings in a profile for, the IP Deskphone creates a new set of default settings for that account. If there are already 24 sets of configurations in the profile, the IP Deskphone discards one set that is not currently registered with the account, and replaces the discarded set with the new set that is saved in the account profile.

Programmable keys

You cannot use a line key associated with a registered account for programmable features. The Program Key screen lists all the line keys associated to an account. If you select a line key associated to an account, an error message appears.

The Do Not Disturb, Call Forward, and Presence keys are associated to a specific user account that you create, and determine which account status to affect. See <u>User status</u> on page 185..

By default, pressing a Speed Dial programmed key initiates a call using the primary account. If you press a line key to obtain a dialing prompt, and then press a speed dial key, the IP Deskphone uses the account associated with that line key. When accounts are registered on different domains, you can program and use speed dial keys with targets that are only reachable on the domain of a secondary account.

Important:

The Speed Dial keys always use the primary account to determine the presence state of the target.

The Instant Message keys always use the primary account, because IM support is disabled for secondary accounts.

Inbox, outbox, and instant message log

Each profile has a single inbox, a single outbox and a single instant message log. The detailed view of the call log entry indicates the local account associated to each entry; that is, the source of outgoing calls and the target of received call.

The following figure is an example of the Inbox call details view.

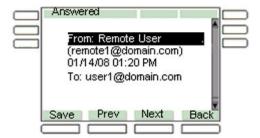

Figure 16: Example of the Inbox call details

Call logs and IM logs provide many ways of initiating a call to the address identified by the selected entry, such as lifting the handset. In most cases, the primary account is used. However, if you press a line key to initiate the call, the call uses the account associated with the line key.

If call logs and IM logs are invoked in the selection mode, you cannot initiate a call directly because the Select Context-sensitive soft key populates a dial prompt or other input field with the selected target. The operation already in progress determines which account you can use.

For example:

If you press the line key to obtain a dial prompt, press the Inbox key to select a target, press Select, and then press Send; the line key that you originally pressed determines the account you can use.

Address Books

Each registered account can have a network-based address book. Each profile contains a local address book that is independent from all network address books.

Accessing the Address Books, by pressing the Directory hard key from the Idle screen, displays the address book of the primary account. If the primary account does not have a network address book, the local address book is accessed.

Accessing the Address Book in Selection mode always accesses the address book of the current account. For example, after obtaining a dial prompt by pressing Line Key 2, you can press the Directory key to access the address book of the account associated to Line Key 2. You can access the network-based directory of the appropriate account if it is available; otherwise, the IP Deskphone accesses the local address book.

You can only access the network-based address book of secondary users in selection mode. You cannot modify the address book of a secondary account on the IP Deskphone. However,

modifications that you make to the address book remotely, such as using a different client of the Personal Agent, are reflected on the IP Deskphone.

The local address book is shared by all accounts that do not have a network-based address book. You can modify the local address book if the primary account does not have a network-based address book. Changes to the network-based address book of the primary account are not reflected in the local address book.

If you use the Friends view, you can always access and modify the address book of the primary account (local or network-based). There is no selection mode for the Friends view. You can only monitor and view the presence information of Friends of the primary account in the Friends view.

User status

The features associates with the User status include the following:

- · Do Not Disturb
- · Call Forwarding
- Presence

Do Not Disturb

Selecting the Do Not Disturb (DND) command from the Services menu prompts you to specify which account you want to place in the DND mode. The option all allows you to place all accounts in the DND mode (the all option is highlighted by default). By selecting an option, the IP Deskphone prompts you to confirm the operation before proceeding.

Activating DND for a specific account automatically causes calls to that account to be rejected with a busy signal. However, the IP Deskphone can still receive calls to other accounts. After DND mode is active for an account, the label of the account line key periodically displays a DND indicator.

The following scenarios apply to DND.

- If you select a single account that is in DND mode, the IP Deskphone displays a prompt that asks if you want to deactivate the DND mode.
- If you select a single account that has Call Forwarding active, an error message appears to indicate that DND cannot be activated.
- If you select the option all, and at least one account is not in DND mode, DND mode is activated for all accounts. If an account is in Call Forward mode, Call Forward is disabled.
- If you select all and all accounts are in DND mode, DND mode is deactivated for all accounts.

If you use a programmed DND feature key, the account that is affected by the DND feature key is determined when the feature key is configured. After you press the DND feature key, the IP Deskphone behaves as described in the preceding scenarios, except that there is no confirmation

prompt displayed. The IP Deskphone performs the operation immediately, and a message appears to indicate what was done.

The DND mode for each account is persistent. If you restart the IP Deskphone, or log off the account and log the account back on, the account maintains the original state.

Call Forwarding

After you select the Call Forward command from the Services menu, the IP Deskphone prompts you to specify the account that you want to place in Call Forward mode. The option forward all places all accounts in Call Forward mode in one operation, and the option forward none deactivates Call Forward for all accounts at the same time.

The following scenarios apply to Call Forward:

- If you activate call forwarding for a specific account, the IP Deskphone automatically redirects all calls to the selected account to the address that you specify. The target address must be reachable from the domain of the account. Other accounts can still receive calls. The line key label periodically indicates that Call Forward mode is active.
- If you select a single account that does not have Call Forward or DND active on it, the IP
 Deskphone prompts you to specify a forwarding target, and the mode you select is then
 enabled. If DND is already active, a message appears indicating that Call Forward cannot be
 activated. If Call Forward is already active, a message appears asking you if you want to
 deactivate Call Forward.
- If you select the forward all option, all accounts are in Call Forward mode using the provided target, and DND is deactivated for all accounts. If accounts are already in Call Forward mode for a different target, the accounts are updated to use the new target.
- If you select the forward none option, the Call Forward feature is deactivated for all accounts for which the Call Forward feature is currently active.

After you press a single account Call Forward programmed key:

- If the account is already forwarding calls to the programmed target, call forwarding is deactivated.
- If the account is not forwarding calls to the programmed target, the account is set to forward
 calls to the given target, disabling DND if necessary, and overriding any other call forward
 target that is active for the account.

After you press a forward all programmed key:

- If all accounts are already set to forward calls to the key target, call forward is disabled for all accounts (behaves like the forward none option).
- If all accounts are not configured to forward calls to the key target, call forwarding is activated for all accounts using the key target (behaves like the forward all option).

If you do not perform any Call forwarding or DND operations, you can press the single and all keys to switch one or all accounts between forwarding to key's target and not forwarding states.

The Call Forward mode and target is persistent for each account. If you restart the IP Deskphone, or log off the account and log the account back on, the account maintains the original state.

Presence

After you select the Presence command from the Services menu, you are prompted to specify which presence state of the account you want to modify. The option all lets you set all accounts to the same presence in one operation.

If you select a single account, the current state of the account is displayed. You can change the current state of the account by entering the new presence state and note. After you confirm the operation, the new presence state is applied.

If the all option is selected, no current state is displayed, and you are immediately prompted to select the new state. The new state is applied to all registered accounts.

If you use a programmed Presence feature key, the account that is impacted by the Presence feature key is determined after the feature key is configured.

After you press a single account Presence programmed key:

- If the account is already set to the programmed presence state, the account is set back to the Connected presence state.
- If the account is not already set to the programmed presence state, the account is set to the programmed presence state.

After you press the all accounts Presence programmed key:

- If all accounts are already set to the programmed presence state, all accounts are set to the Connected presence state.
- If all accounts are not already set to the programmed presence state, all accounts are set to the programmed presence state.

As like the Call Forwarding keys, if you do not perform any Presence operation, you can use the single and all keys as toggles. However, the presence states are not entirely under your control. Some states are applied automatically (for example, On The IP Phone), and all states are applied by sending a message to the SIP proxy which can choose to not accept the change. As a result, it is possible for a set all presence operation to not configure all accounts to the programmed presence; if you press the Presence key again, another attempt is made to apply the programmed presence to all accounts. It is more effective to program a separate Presence key to set all accounts to the Connected state.

Events that update presence states automatically occur for each account. For example, the On The Phone state is applied to any account that has at least one call active.

Account presence is not retained after logging off or restarting the IP Deskphone.

Notifications

The IP Deskphone can spontaneously display messages on the screen to report events that you did not initiate. This includes events such as failure to retrieve a service package and availability of a new location list.

These spontaneous notifications do not indicate which account is affected by the event. A message appears to indicate the affected account.

The following figure is an example of an account notification.

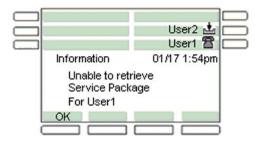

Figure 17: Example of an account notification

It is possible for the same event to occur for multiple accounts at the same time, or in quick succession. In the preceding figure, the accounts are displayed one after the other.

Account selection

There are a number of scenarios where you are prompted to select an account (for example, logoff, per-account settings, programming keys).

The scenarios fall into the following two categories:

- Prompts where you must select exactly one account. If only one account is logged on, the
 prompt does not appear. The IP Deskphone selects the single account automatically, and
 immediately displays the next screen. Otherwise, the primary account is always at the top of
 the list, and is highlighted when the prompt first appears.
- Prompts where an all or none option is available.

Pressing an account line key highlights the corresponding item in the account list. If no selection is made in a certain amount of time, the prompt acts as if you pressed the Back Context-sensitive soft key, canceling whichever operation required selection of an account.

Feature dependencies and restrictions

The number of line keys on the IP Deskphone limits the number of accounts that you can register simultaneously. The IP Deskphone is limited to six accounts. Connecting an Expansion Module to the IP Deskphone increases the limit by 18, allowing for 24 registered accounts. Additional Expansion Modules do not increase the limit further.

These are hard limits. Further restrictions may be imposed by the administrative policy. See Configuration on page 175

Performance characteristics

Because the multiuser feature can allow the IP Deskphone to have multiple users logged on to the IP Deskphone at the same time, the chances of numerous multiple calls increase. The IP Deskphone can handle five simultaneous incoming calls at a time without any noticeable impact. But as the number of simultaneous incoming calls increase, there is a noticeable delay in ringing and updating the display to present all the calls to the user. It may take up to five seconds for 10 simultaneous incoming calls, and this time increases as the IP Deskphone receives more simultaneous incoming calls.

CS 1000: Several keys with the same DN on a TN

CS 1000 allows you to simultaneously make or receive a maximum of 2 calls. To overcome this limitation you can configure several Multiple Call Ringing (MCR) keys with the same DN on one TN and register from the IP Deskphone to each configured key. This applies to systems using Meridian Communications Adapter (MCA) – Multiple Appearance DN (MADN).

Each registration must have the same Login ID and Authentication ID. The first registration maps to the lowest numbered DN key. Subsequent registrations are assigned DN keys in ascending order of the key numbers.

The following example shows several MCR keys configured on the same DN, on one TN:

```
TN 100 0 0 1
UEXT/SIPL

With:
SIPU user1
SCPW xxxx
KEY 0 MCR 5000
KEY 1 HOT U xxxx
KEY 2 MCR 5000
KEY 3 MCR 5000
KEY 3 MCR 5000
```

Chapter 16: Features

Customizable banner for login

SIP Software allows the IP Deskphone to display a customizable banner when you log on to the IP Deskphone. When the login banner is provided with login banner text and is configured as "enable", the IP Deskphone displays the banner text on the screen when the user logs on.

The banner text is only displayed in the language that is provisioned (changing the IP Deskphone configured language does not change the banner text language). The banner appears only for the primary user of the IP Deskphone. In a multiuser configuration, a secondary user logon does not cause the banner to appear, even if the login banner is configured as enable.

If the login banner is configured a enabled, the banner screen on the IP Deskphone is displayed after the final step of the logon process.

The following image is an example of the Login Banner screen which displays the provisioned banner text.

Figure 18: Login Banner

The following table describes the function of the context-sensitive soft key for the Login Banner screen.

Table 58: Context-sensitive soft key for the Login Banner screen

Context-sensitive soft key	Action
Ok	Completes the login process and dismisses the login screen.

The following table describes the function of the Navigation keys for the Login Banner screen.

Table 59: Navigation

Key	Action
Up and down arrows	Allows you to scroll up and down the banner text.
Left and right arrows	No action (the text is word-wrapped automatically).
Enter	No action.

The following table describes the outside actions on content for the Login Banner screen.

Table 60: Outside actions on content

Key or action	Result	
Inbox	No action.	
Outbox	No action.	
Directory (Address book)	No action.	
Goodbye	No action.	
Expand (IM Box)	No action.	
Сору	No action.	
Services	Press once, no action. Press twice invokes the Network menu.	
Quit	No action.	
Headset	Brings up the dial prompt (in case the user wants to place an emergency call).	
Hold	No action.	
Dialpad	No action.	
Handsfree	Brings up the dial prompt (in case the user wants to place an emergency call).	
Off Hook	Brings up the dial prompt (in case the user wants to place an emergency call).	
Mute	No action.	
Volume up and volume down	No action.	
User-defined feature keys	No action.	
Incoming call	Incoming calls get a Do Not Disturb (DND) response while the banner is displayed.	

The user must explicitly dismiss the banner screen (like a location list), and the IP Deskphone goes in DND mode until the banner is dismissed. The IP Deskphone cannot make or receive any calls, other than an emergency call, until the banner is dismissed.

If any other pop up messages or prompts, such as a location prompt, occur while the banner is displayed, the pop up messages or prompts appear below the banner screen, and are viewed by the user only after the user dismisses the login banner.

The following configuration flag is used for enabling or disabling the customized login banner.

LOGIN_BANNER_ENABLE Y/N (Default: N)

The banner text is defined in a separate text file that is linked from the original configuration file.

The banner text file is a separate file downloaded by provisioning. The banner text file is specified much like the current dialing plan is specified (file name listed in 12xxSIP.cfg, under section [LOGIN_BANNER]), and is downloaded when enabled or disabled.

To be accepted, the file must contain at least one byte and must be no larger than 2048 bytes. The encoding of the file must be UTF-8, or compatible with UTF-8, to ensure that all the characters are displayed properly.

Speed Dial List

When configured by provisioning, a feature key can be used as a "Speed Dial List". The feature key and the contents of the Speed Dial List must be specified by the provisioning mechanism. The user cannot modify or delete the feature key used by the Speed Dial List and cannot modify the content of the Speed Dial List.

Invocation of the Speed Dial List is similar to any other feature key invocation. The Speed Dial List key causes a full screen list to appear on the IP Deskphone and the user can automatically dial one of the offered choices. The Speed Dial List supports up to 30 entries.

The contents of the Speed Dial List can vary (context-sensitive) based on the current call state of the IP Deskphone and the type of Speed Dial List entry configured. Only entries in the Speed Dial List can be context-sensitive; not all speed dial keys or individual features keys are context-sensitive.

A Speed Dial key, or one included in a Speed Dial List, can cause any call that it placed on hold (when invoked) to be unheld automatically when the call completes, based on a new value that must be configured when a Speed Dial key is created or configured.

Administration and use of the Speed Dial List feature

Provisioning the device configuration provides the IP Deskphone with the following features:

• Index of key to use as Speed Dial List. You can use the following flag to disable the Speed Dial List feature by configuring the key index to less than two (2).

SPEEDLIST_KEY_INDEX <key index>

Label to use for the Speed Dial List key.

SPEEDLIST LABEL <text>

The IP Deskphone retrieves the device configuration through provisioning, and if the SPEEDLIST KEY INDEX flag is configured to a valid programmable key that can be used for the

feature (greater than one (1) and less than or equal to the available number of programmable keys), the following events occur:

- 1. The IP Deskphone checks for a previously loaded "Speed Dial List" file (a file containing the contents of the speed dial list), which must be properly configured and uploaded to the IP Deskphone through provisioning.
- 2. The IP Deskphone parses the file, and configures the feature key specified by SPEEDLIST_KEY_INDEX to hold the Speed Dial List.
- 3. If the key defined for use by the Speed Dial List is already in use, the defined key is overwritten and is assigned Speed Dial List functionality.
- 4. The Speed Dial List feature key uses the label that is provided in SPEEDLIST_LABEL, and cannot be modified by the end user.

The following screen describes the feature key used by the Speed Dial List in the feature key programming interface.

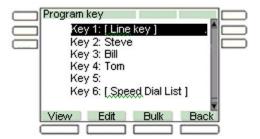

Figure 19: Main feature key programming screen showing Speed Dial List provisioned on key 6

A feature key provisioned for use as a Speed Dial List has a similar appearance to all other programmed feature keys on the idle screen (or in-call screen). The label used for that key is provided through provisioning.

When the user presses the feature key provisioned as a Speed Dial List, the list of speed dials configured appears on the screen, and the user can select an item from the list to invoke Speed Dial.

If the Speed Dial List is empty, or ends up empty due to context-sensitive hiding of contents, the error message, "Not available", is displayed on the screen with a "Dial List" context line.

Speed Dial List screen

The Speed Dial List screen for the IP Deskphone is where the user can select or invoke one of the provisioned Speed Dial List entries.

The following image is an example of the screen that appears after the user presses the feature key that is provisioned as the Speed Dial List for the IP Deskphone.

Figure 20: Example of a Speed Dial List

The Speed Dial List screen displays all the Speed Dial List entries provisioned for the user. The listed items displayed are based on the provisioned list as well as the current Idle or Mid-call state of the IP Deskphone. When the Speed Dial List is invoked while the IP Deskphone is idle, only Speed Dial List entries that are configured as IDLE are displayed. Similarly, only items marked as MID CALL are displayed if the Speed Dial List is invoked while the IP Deskphone is in a call.

The following table describes the function of the context-sensitive soft keys for the Speed Dial List screen.

Table 61: Context-sensitive soft keys for the Speed Dial List screen

Context-sensitive soft key	Action
Dial	Invokes the selected speed dial.
Exit	The screen is dismissed without invoking a Speed Dial List entry.

Auto Retrieve flag

Because the Auto Retrieve behavior is added to the regular speed dial keys (programmed keys) instead of just speed dial list entries, the Auto Retrieve flag is configured for programmed speed dial keys.

The following screen appears as the last step, after the "Enter Subject" prompt, in the creation or modification of a Speed Dial key to allow the user to configure the Auto Retrieve behavior for the Speed Dial function.

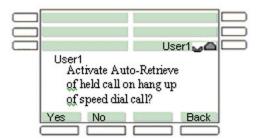

Figure 21: Speed Dial Key creation — last step

The following table describes the function of the context-sensitive soft keys for the **Auto Retrieve** screen.

Table 62: Context-sensitive soft keys for the Auto Retrieve screen

Context-sensitive soft key	Action
Yes	Enables the Speed Dial Auto Retrieve behavior.
No	Disables the Speed Dial Auto Retrieve behavior.
Back	Dismisses the screen and returns you to the previous key programming screen.

If the Auto Retrieve behavior is enabled on a Speed Dial key (programmed keys) or Speed Dial List entry that is invoked, and a call is placed on hold to invoke the current key or entry, the IP Deskphone attempts to remove the call on hold after the key or entry call is complete.

The following is a description of how the Auto Retrieve function operates.

- 1. A is talking to B when A invokes the Speed Dial List and selects an entry.
- 2. The call between A and B is placed on hold, and A places another outgoing call to C (a URI specified in the Speed Dial List entry).
- 3. When the call between A and C is complete, if the Auto Retrieve flag is enabled for the Speed Dial, then the IP Deskphone attempts to take the call between A and B off hold.

If another call comes in during the call between A and C, or if the state of the call between A and B changes when the call between A and C is active, the re-connection of the call between A and B may not always happen.

The following is an example of a Speed Dial List file that must be loaded through provisioning.

[key]
label=S1
target=s1@avaya.com
retrieve=YES
mode=MidCallOnly
type=spdial
[key]
label=S2
retrieve=NO
mode=IdleOnly
subject=subject2

type=spdial
[key]
label=S3
retrieve=NO
target=s3@avaya.com
type=spdial

Busy Lamp Field

The Busy Lamp Field (BLF) is an alternate presence-monitoring mechanism for the IP Deskphone that allows presence functionality on proxies that support BLF.

BLF is an icon state for a corresponding Speed Dial key on an IP phone; the icon state tells you if another extension connected to the same SIP server is busy. If configured, the IP Deskphone subscribes to a resource list available on the server and receives information about other extensions. BLF works through the SIP protocol by making use of SUBSCRIBE and NOTIFY messages; the IP Deskphone is the subscriber and the SIP server is the notifier.

How it works

If you configure an IP Deskphone to monitor a list of zero or more extensions, it sends a **SUBSCRIBE SIP** message to the server. A **NOTIFY SIP** message, which includes XML in the message body, is sent to the subscriber to advise the subscriber of the current state of the extension being monitored. Once the status of the monitored extension changes, the subscriber receives a **NOTIFY SIP** message from the server. The subscriber must acknowledge the **NOTIFY SIP** message by responding with a 200 OK SIP message.

BLF is based on an Event Dialog package. Dialog refers to the SIP relationship that two SIP peers establish. Dialogs can be created by many methods, although RFC 3261 defines only one: the **INVITE** method. In other words, as soon as two SIP peers establish a new call/dialog, modify a call/dialog, or cancel a call/dialog, the monitoring party receives notification about that event. For more information, refer to RFC 4235.

Note:

Dialog Package (BLF) differs from Presence package. Refer to RFC3856 for more information on Presence.

Use the command <code>BLF_ENABLE</code> to enable the BLF feature on an IP Deskphone. In order to use BLF it must be activated, properly provisioned, and connected to the server that supports this feature.. It is used whenever a speed dial key is provisioned on the IP Deskphone; an icon assigned to the speed dial key reflects the new status of the monitored peer, which is extracted from a <code>NOTIFY</code> message. You can configure speed dial keys for as many parties as you want to monitor; the parties must exist on the configured Resource List Uniform Resource Identifier (URI). Figure 22: Call states and corresponding Presence icons on page 197 shows the various call states and corresponding icons.

State	Meaning	Icon
Unknown	The presence of the monitored IP Phone is unknown	0
Terminated	The monitored IP Phone is not involved in a call and is available	•
Ringing	The monitored IP Phone is ringing	G Flashing
On the phone	The monitored IP Phone is busy on a call	ø

Figure 22: Call states and corresponding Presence icons

Resource List URI

The SIP-specific event notification mechanism allows the subscriber to request to be notified of changes in the state of a particular resource. Users often subscribe to multiple resources; without an aggregating mechanism, the user would have to generate a **SUBSCRIBE** request for each resource they monitor.

A resource list is identified by a URI, and it represents a list of zero or more URIs (SIP endpoints). Each URI is an identifier for an individual resource to which the user can subscriber. The configuration of URI is done on the server and an IP Deskphone requires only to be configured with the desired Resource List URI; the URI can even be configured automatically if the server supports auto-generation. For more information, refer to RFC 4662.

If **BLF_ENABLE = YES**, then use **BLF_RESOURCE_LIST_URI** to configure the Resource List URI. You must use the URI provided by the proxy when you configure the user for BLF.

If **BLF ENABLE** = **SCS** | **SIPX**, the Resource List URI auto generates in the following format:

~~rl~C~<username>@<domain></domain></username>

BLF call pickup

The Call Pickup feature allows a user to pick up a call by pressing the corresponding speed dial key when the indicator for a monitored line flashes. The IP Deskphone must send an **INVITE** with the Replaces header. Target uri, call-id, to-tag and from tag in the Replaces header are taken from the **NOTIFY** message. The Replaces header is specified in RFC 3891.

Use the MAX_BLFCALLS parameter to configure this feature. This parameter specifies the maximum number of available BLF(picked up) calls on an IP Deskphone. The actual value of MAX_BLFCALLS correlates with the value of MAX_APPEARANCE, which specifies the maximum number of available calls of any type. MAX_BLFCALLS must always be less than or equal to MAX_APPEARANCE. If initial value of the MAX_BLFCALLS parameter is greater than the value of MAX_APPEARANCE, the value of the MAX_BLFCALLS parameter is forcibly reduced.

BLF Call Pickup is only supported for IP Office. Therefore, **IP_OFFICE_ENABLE** must equal **YES** for Call Pickup to work.

Configuration flags for Busy Lamp Field

The provisioning must provide a configuration flag, containing relevant URI, to the IP Deskphone in order to use the Busy Lamp Field (BLF).

The following table describes the configuration flags used to configure the BLF.

Table 63: BLF configuration commands

Configuration command	Description
BLF_ENABLE Y/N/SCS/SIPX (default: N)	Enables or disables the BLF.
	When BLF_ENABLE has the SCS or SIPX value, the BLF_RESOURCE_LIST_URI parameter is ignored and the IP Deskphone autogenerates an URI of the following format: ~~r1~C~ <username>@<domain></domain></username>
BLF_RESOURCE_LIST_URI <blf uri=""></blf>	Configures the BLF resource list URI for the BLF feature. <blf uri=""> is the server-provided URI used to subscribe to BLF notifications (for example, blf-resource-list@as.avaya.com).</blf>

Roaming profiles

Roaming profiles enable the user to obtain the same settings when they are logged on to multiple IP Deskphones for features such as Address Book, Programmable keys, and Speed Dial List.

The updatable data is split into 3 text files for these features:

- · address book
- custom keys
- · speed dial list

The user configuration file is used to specify the specific names of the feature files to be downloaded. The IP Deskphone requests a user configuration file using the name <username@domain>.cfg, where <username@domain> is the address of the primary user; for example lpg@macadamian.com.cfg.

The USER_FILE_ENABLE device configuration file parameter is used to determine whether to download the user.cfg file on user login and to check for updates.

Filemames to be downloaded are specified in a [files] section. An example of the syntax is provided below:

```
[files]

addressbook=abook.txt
customkeys=keys.txt
speeddiallist=sdl.txt
```

For more information about the Device Configuration file, see <u>Create the device configuration file on the provisioning server</u> on page 55.

Address book file

The Address book file represents each contact [contact] and each group [group] (name only). A contact provides attributes to specify nickname, SIP address, group and whether it is a friend. An example of the syntax is provided below.

and the second of the second o
[version]
id=12345
[contact]
nickname=lpg
address=lpg@macadamian.com
group=macadamian
buddy=1
[group]
name=macadamian

Custom keys file

The Custom keys file enables programmable keys to be provisioned for the IP Deskphone. This file consists of multiple sections:

- index index of the physical key on which the feature is made available. This uses the same numbering as on the IP Deskphone user interface (right hand keys, then left hand keys, then Expansion Module keys).
- label the text which appears next to the key on the IP Deskphone screen.
- type the feature programmed on the key.
- audiocodecs priority-order list of codecs
- autoanswer allowed addresses for acceptance of auto-answer requests
- key configuration for programmable keys
- prefs main profile preferences
- reasons list of reject reasons
- subjects list of call subjects
- · versions

The sections in the custom keys file can be in any order. Each section contains parameters and values. All parameters should contain values, except for the following:

- banner
- hotlineURL

If a parameter has no value, its previous value is restored. For parameters which are allowed blank values, if the parameter is blank then the value is cleared.

The custom keys file supports sections which contain user preferences. This file has the same format as the prefs.txt file which is stored on the flash of the IP Deskphone. After downloading the custom keys file, this information is merged with information from the user profile (file prefs.txt). If the parameter has a new value in the custom keys file, then the old value is replaced. If any parameter is not provisioned through the custom keys file, the old parameter with its corresponding value is used. After the merge, the new data is written on the flash to the prefs.txt file. This information is then used by the profile manager.

Note:

The label for a programmable key can be modified by the IP Deskphone end-user through the phone UI in the **Feature Options > Feature Keys** menu. If the end-user enters a blank label for a key that has a default label defined in the custom keys file, then that default label overrides the blank label and is applied to the key

The following table describes the sections and keys, and provides examples.

Section name	Key	Value example	Description
[audiocodecs]			The priority-ordered list of codecs
	str-0	PCMU	The key consists of prefix "str-" and
	str-1	G729	the sequence number 0,1
			The value can be any supported codec.
[autoanswer]			
	str-0	3007@mycompany.co m	The list of allowed addresses from whom auto-answer requests should be accepted.
[key]			Contains special section(s) for describing configuration for the programmable keys.
	icon	5	Icon number; codes are defined in the "Tab. 1. Icon definition"
	index	3	Key number; sequential, starting with the IP Deskphone, then the Expansion Module(s)
	label	CallForward	Text to be displayed for the key
	target	*4	Information number to be sent to IP Office

Table continues...

Section name	Key	Value example	Description
	type	feature	Key type
[prefs]			Contains the main profile preferences.
	alertPattern	4	Default ringtone pattern, 0-7
	alertVolume	6	Volume of ringtones, 0-7
	handsetVolume	8	In-call volume of handset, 0-19
	handsfreeVolume	10	In-call volume of handsfree speaker, 0-19
	headsetVolume	8	In-call volume of headset, 0-19
	pagingVolume	3	Volume of beeps, 0-7
	alphaDialing	0	Defines if dial prompt should start up in Alpha mode (0 – digits mode, 1 – alpha mode)
	autoAnswerMode	0	Determines when to accept auto- answer requests in calls.
			0 = autoAnswerWhiteList only
	autoClearMissedCalls	0	Determines if entering the inbox (without selecting each missed call) clears the "xx new calls" message
	backlightTimeout	60	Time to wait before dimming screen, in minutes
	banner	Avaya	Text to show on idle screen (can be blank)
	dateFmt	2	Display format for dates
			2 -m/d/y, 3 - d/m/y
	timeFmt	0	Display format for time
			0 – 12hrs (5:45pm), 1 – 24hrs (17:45), 2 – 24hrs French (5h45)
	globallgnore	0	Designates whether the Ignore key terminate all forks of a call.
			Value = 0 or 1
	hotlineURL	2600@mycountry.gov	Target url for a hotline call.
	language	English	User interface language.
			Value = language filename without extension
	menuAutoBackout	30	Delay before the menus timeout
			Valid values: 0,15,30,60,120,200,600 seconds

Table continues...

Section name	Key	Value example	Description
	notifyCallForward	0	Specifies whether server-forwarded calls make the IP Deskphone beep
			Value = 0 or 1
	octEndsDialing	1	Specifies if # causees dial prompts to place call
			Value = 0 or 1
	outgoingPrivacy	0	Anonymization setting to use for outgoing messages
			0 = none
	incomingPrivacy	0	Anonymization setting for remote user information
			0 = none
	publicScaHold	0	Specifies whether others can retrieve calls a user pus on hold
			Value = 0 or 1
	searchMethod	0	Search mode for searchable menus
			Values: 0 = UKNOWN_SEARCH
			1 = INDEX_SEARCH
			2 = FIRST_CHARCTER_SEARCH
			3 = NAME_SEARCH
[reasons]			This section contains the list of reject reasons
	str-1	Out of office	The key consists of prefix "str-"and the sequence number 0, 1
			The value can be any string.
	str-2	Busy	
[subjects]			
	str-0	Hello!!	The key consists of prefix "str-"and the sequence number 0, 1
			The value can be any string.
	str-1	Hi!	

The following rules apply to the [key] section:

- 1. In non-IP Office mode, any keys defined as "feature" have no effect and are ignored.
- 2. If the "type" field is omitted, the key is considered as the "spdial" key by default.
- 3. If the [type] field has the incorrect paramete,r the [key] section is considered to be incorrect and is ignored (appropriate ECR record is registered in the ECR file).

Feature key types

The following attributes depend on the type of key being programmed:

- spdial Speed Dial key
- cfwd Call Forward key
- dnd Do Not Disturb key
- im Send an Instant Message key
- presence Change-my-presence key

The following attributes are type-specific attributes:

- target for cfwd, spdial, im keys. The SIP address to target when the key is pressed. This is a
 mandatory attribute for spdial and im. Omitting this attribute from a cfwd key creates a "disable
 call forward" key.
- user for cfwd, dnd, presence keys. The SIP address of the logged-in user whose state should be modified. Omitting this attribute creates "apply to all users" key.
- subject for spdial. Optional. This is for the call subject to send on the call.
- retrieve for spdial key. Optional. If this key is configured to Yes, the autoretrieve mode is enabled.
- state for presence keys. Mandatory. The state to apply when the key is pressed;
 CONNECTED or UNAVAILABLE.
- note for presence keys. Optional. The note to configure when the presence is changed; arbitrary text.

An example of the syntax is provided below:

```
[key]
index=2
label=label1
target=lpgp@macmcs.madadamian.com
type=spdial
subject=my first call subject

[key]
index=4
label=label22
note=on vacation
state=UNAVAILABLE
type=presence
```

Speed Dial List file

The Speed Dial List file is used to populate the menu which appears when a Speed Dial List custom key is pressed.

The SDL key itself is provisioned using the device configuration file, not the custom keys file.

The Speed Dial List file format is similar to Custom keys file format, except for the following:

• Only keys of type spdial are supported; the "type=" attribute can be omitted.

- The index attribute is ignored.
- Mode attributed is supported to specifies in which context the SDL entry should be visible. The value options are IdleOnly, MidCall, and Always (default).

An example of the syntax is as follows:

```
[key]
label=label11
target=lpgp@macmcs.madadamian.com
retrieve=YES
subject=my second call subject
mode=MidCall
```

Roaming profile limitations

Roaming profiles have the following limitations:

- Changes made on the IP Deskphone cannot be uploaded to the Call Server.
- The user cannot edit the downloaded Speed Dial List.
- Profiles are downloaded for the primary user only.
- If a file is downloaded that places a custom key on a key that is already in use as a user's login Line key, the Line key takes precedence. The custom key is restored if the user logs off.
- If a file is downloaded that places a custom key on a non-existent key for example, Key 10 and the IP Deskphone does not have an Expansion Module attached, then the key is not shown. The key appears only when an Expansion Module is attached.

Roaming profiles and service packages

If the IP Deskphone supports roaming profiles that have a service package and that service package has the network address book enabled, then when the service package arrives, the service package-enabled network address book replaces the Address Book. The roaming profile and the network address book are mutually exclusive. To prevent this from happening, disable the network address book in the user's service package.

Default names

Default names can also be provisioned in the Device Configuration file if per-user files are not required. Default names are overridden by names specified in the user.cfg file.

- DEFAULT ADDRESSBOOK FILE
- DEFAULT SPEEDDIALLIST FILE
- DEFAULT CUSTOMKEYS FILE

For more information about the Device Configuration file, see <u>Feature configuration commands</u> on page 65.

SIP Domain DNS Lookup feature

The DNS Lookup feature enables the IP Deskphone to discover IP addresses for a specified SIP domain using DNS.

There are two ways the DNS Lookup feature can provide SIP domain IP addresses to the IP Deskphone:

- 1. using DNS SRV records (refer to RFC2782)
- 2. using DNS A/AAAA records (IPv4/IPv6 address records)

How DNS lookup works

One or two IP addresses can be configured for a particular SIP domain - primary and secondary IP addresses:

- SERVER_IP[x]_1
- SERVER_IP[x]_2

where x = the domain number from 1 to 5.

If the IP Deskphone attempts to log on using these configured addresses and fails to do so, the IP Deskphone then tries to discover the IP addresses using DNS. If there is no primary or secondary SIP domain IP address configured, then the IP Deskphone uses DNS to determine the IP address. If only SERVER_IP[x]_2 is configured (SERVER_IP[x]_1 is 0.0.0.0), then DNS Lookup is used first; if DNS Lookup fails, only then is the secondary IP address tried.

The DNS Lookup feature tries to obtain SIP domain IP addresses through DNS SRV records, using the domain name as a parameter for UDP, TCP, and TLS. Multiple SRV records can be configured for each domain and for each transport protocol (UDP, TCP and TLS). The hostname is returned instead of the IP address. The hostname must point to an address record (A or AAAA record).

SRV record example:

```
_sip._tcp.example.com. 86400 IN SRV 0 5 5060 sipserver.example.com where:
```

- sip = the desired service
- tcp = the transport protocol
- example.com = the configured domain name
- 5060 = the port to be used
- sipserver.example.com = the SIP proxy to be used (hostname is replaced by the IP address using A/AAAA records)

The DNS Lookup feature then tries to find the IP address of the SIP domain in A/AAAA records on the DNS Server. Only the IP address is returned; therefore, default ports are used — 5060 for UDP/TCP and 5061 for TLS.

Important:

If the Fail Back to Primary feature is enabled, then DNS lookup is not used. In this case, you must configure both primary and secondary IP addresses for a domain.

Caution:

If DNS servers are not properly configured or do not respond, DNS Lookup can take a long time until all necessary requests are sent and corresponding timers expire.

Server Profiles

A System Configuration file allows the administrator to specify a list of domains to which the IP Deskphone can connect. The administrator can specify up to five different SIP domains. Each SIP domain supports 2 SIP servers: the Primary (S1) and the Secondary (S2). The System Configuration file contains the SIP server-specific configuration parameters that are applied to any SIP server specified in the list of SIP domains.

The Server Profiles option supports two different sets of configuration parameters: one specific to the Primary SIP server and one specific to the Secondary SIP server. Each server can be configured separately by updating configuration parameters contained in the System Configuration file with values taken from the Server Profile configuration file. Server Profile parameters are always applied on top of the System Configuration file.

The Server Profile file format is similar to the System Configuration file format, excluding the following configuration parameters:

Table 64: Parameters not included in Server Profile configuration file

SERVER_IP5_1 SERVER_TLS_PORT4_2 ADHOC_ENABLED5	SERVER_IP4_2	SERVER_TCP_PORT4_2	CONFERENCE_URI5
	SERVER_IP5_1	SERVER_TLS_PORT4_2	ADHOC_ENABLED5

Table continues...

SERVER_IP5_2	SERVER_PORT5_1	MAX_ADHOC_PORTS5
SERVER_PORT1_1	SERVER_TCP_PORT5_1	DNS_DOMAIN
SERVER_TCP_PORT1_1	SERVER_TLS_PORT5_1	DHCP_ENABLE
SERVER_TLS_PORT1_1	SERVER_PORT5_2	ENABLE_USB_PORT
SERVER_PORT1_2	SERVER_TCP_PORT5_2	USB_HEADSET
SERVER_TCP_PORT1_2	SERVER_TLS_PORT5_2	ENABLE_BT
SERVER_TLS_PORT1_2	AUTOLOGIN_ID_KEYxx	PCPORT_ENABLE
SERVER_PORT2_1	AUTOLOGIN_AUTHID_KEYxx	EAP
SERVER_TCP_PORT2_1	AUTOLOGIN_PASSWD_KEYxx	EAPID1
SERVER_TLS_PORT2_1	AUTOLOGIN_ENABLE	EAPID2
SERVER_PORT2_2	LLDP_ENABLE	EAPPWD

All Server Profile files are uploaded to the IP Deskphone through the standard upgrade mechanism. When switching from one server to another server, the IP Deskphone applies the configuration parameters for the appropriate server.

The Server Profile option is implemented using the following command parameters:

- PRIMARY_SERVER_PROFILE <filename>
- SECONDARY_SERVER_PROFILE <filename>

The commands are processed as follows:

- 1. If the x_SERVER_PROFILE command is specified and contains the x Server Profile <filename>, the Server Profile file is downloaded to the IP Deskphone during the standard upgrade mechanism after downloading the System Configuration file.
 - If the Server Profile file is specified but cannot be downloaded, the IP Deskphone uses the old Server Profile file, if it exists in the Flash File System (FFS). If there is no old Server Profile file, the IP Deskphone applies the parameters from the System Configuration file by default.
 - For example: **PRIMARY_SERVER_PROFILE profile01.dat** applies values from the **profile01.dat** file for the Primary server
- 2. If the x_SERVER_PROFILE command is specified, but the parameter is absent, the IP Deskphone applies the parameters from the System Configuration file by default for this server. The old Server Profile file is removed from the FFS.
- 3. If the "x_SERVER_PROFILE' command is not specified or is skipped, the IP Deskphone applies the configuration values obtained from the old Server Profile file, if it exists. Otherwise, the configuration values are taken from the System Configuration file by default.

Note:

If the IP Deskphone is reset to factory default, all profiles are removed.

The Primary and Secondary Server Profile file names are displayed in the Server Settings menu of the IP Deskphone.

Limitations:

Only one server profile can be active at time; this means that in Multi-User mode, the logic is applied for only the Primary User.

IP Deskphone soft reboot

When a different server profile is applied, changes to certain parameters can cause the IP Deskphone to perform a soft reboot.

Changes to the following parameters initiate a soft reboot.

FIPS_MODE	ENABLE_UPDATE	ENABLE_USB_PORT
SFTP_WRITE_PATTERNS	SESSION_TIMER_ENABLE	USB_HEADSET
SFTP_READ_PATTERNS	SESSION_TIMER_DEFAULT_SE	ENABLE_BT
MLPP_NETWORK_DOMAIN	SESSION_TIMER_MIN_SE	PCPORT_ENABLE
MLPP_PRECEDENCE_DOMAIN	SET_REQ_REFRESHER	LLDP_ENABLE
SNTP_ENABLE	SET_RESP_REFRESHER	EAP
IPV6_ENABLE	DOD_ENABLE	EAPID1
IPV6_STATELESS	SLOW_START_200OK	EAPID2
SIP_TCP_PORT	MAX_APPEARANCE	EAPPWD
SIP_TLS_PORT	USE_PUBLISH_FOR_PRESENC E	

Managing Server Profile files

To download a new Server Profile file, the Server Profile parameters must first be configured in the System Configuration file and provisioned in the Device Configuration file. The IP Deskphone downloads the new Server Profile file on startup, or the download can be initiated through pressing the Services key on the IP Deskphone, and selecting Check for Updates > Upgrade [DEVICE_CONFIG] from the menu

Information about profiles is presented in the IP Deskphone File Manager. If a Server Profile file is downloaded on the IP Deskphone, the file name (profile1.dat or profile2.dat) is displayed in the System folder of the File Manager.

To delete a Server Profile on the IP Deskphone, press the **Delete** soft key; the profile is completely removed from flash and main memory. When a server profile is deleted, if parameters in the server profile have corresponding parameters in the System Configuration file, then those System Configuration file parameters are implemented after the server profile parameters are deleted.

The content of each file can be viewd by using the **prtcfg** command in the PDT shell or by using the **printProfConfig <n>** command in the vxshell where <n> is one of the following values:

- 0 root System Configuration file
- 1 first profile

- 2 second profile
- 3 all profiles
- any other value all profiles

Auto Login parameters in server profiles

In SIP 4.4 and later, a user can now have a different auto-login for each server.

If the IP Deskphone configuration parameter AUTOLOGIN_ENABLE is configured as 2 or USE_AUTOLOGIN_ID, then the UserID, AuthID, and Passwd values are extracted from the AUTOLOGIN[_ID_KEY]_AUTHID_KEY]_PASSWD_KEY] configuration parameters.

Server profiles support all configurations of the AUTOLOGIN_ENABLE parameter.

If the AUTOLOGIN_ENABLE parameter in a profile is configured as 0 (or NO) or 1 (or YES), then the configuration file behaves as if there was no profile.

If the AUTOLOGIN_ENABLE parameter in the profile is configured as 2 (or USE_AUTOLOGIN_ID), the IP Deskphone performs a soft reset. After the soft reset, users specified by the AUTOLOGIN[_ID_KEY|_AUTHID_KEY|_PASSWD_KEY] configuration parameters are logged in.

If the profile does not contain the AUTOLOGIN_ENABLE parameter, the parameter from the System Configuration file is used.

Auto login user names and passwords are not printed using the prtcfg command as they are not stored in the system configuration file and are secure parameters which should not be displayed.

Example of Auto-Login parameters in config file

The following example shows the AUTOLOGIN parameters as they might be used in phone's config file. In this example, the PROMPT_AUTHNAME_ENABLE is YES, so the AUTOLOGIN_AUTHID_KEYnn parameter is included for each login.

AUTOLOGIN_ENABLE USE_AUTOLOGIN_ID
PROMPT_AUTHNAME_ENABLE YES
DN Key 1
AUTOLOGIN_ID_KEY01 7903@mydomain.com
AUTOLOGIN_AUTHID_KEY01 steven
AUTOLOGIN_PASSWD_KEY01 7654
DN Key 2
AUTOLOGIN_ID_KEY02 7904@mydomain.com
AUTOLOGIN_AUTHID_KEY02 steven
AUTOLOGIN_PASSWD_KEY02 7654

Address Book

Overview

The IP Deskphone with SIP software supports two modes of the Address Book:

- NETWORK In this mode, the IP Deskphone downloads the user's Address Book from the network. New Address Book entries are uploaded to the network
- LOCAL In this mode, the Address Book is created and stored locally on the IP
 Deskphone. A part of the Address Book can be downloaded from the network and added to
 the content of the local Address Book

The size of the Address Book is specified by the MAX_ADDR_BOOK_ENTRIES parameter. The MAX_ADDR_BOOK_ENTRIES parameter limits the total number of entries in the Address Book (including both downloaded records and records added manually). The default value of this parameter is 1000 (permitted values are 0 to 1000).

Note:

The MAX_ADDR_BOOK_ENTRIES parameter only applies to LOCAL Address Book mode. In NETWORK Address Book mode, the size of the Address Book is controlled through a service package.

The MAX_DOWNLOAD_ADDR_BOOK_ENTRIES parameter specifies the maximum number of Address Book entries that can be downloaded from the network in LOCAL Address Book mode. The default value of this parameter is 1000 (permitted values are 0 to 1000).

In LOCAL Address Book mode, if MAX_DOWNLOAD_ADDR_BOOK_ENTRIES is larger than MAX_ADDR_BOOK_ENTRIES then only MAX_ADDR_BOOK_ENTRIES are downloaded from the network.

Address Book operation in LOCAL mode

The local Address Book is stored in the IP Deskphone flash memory in the file named *directory.txt*. At phone startup, the content of this file is loaded into the IP Deskphone memory and forms a working copy of the local Address Book.

There are two ways of downloading the Address Book from the network in LOCAL mode:

- 1. Downloading the Address Book from the Provisioning Server
 - The Address Book to be downloaded is specified in the device configuration file (or in the user.cfg file when roaming profiles are used). The IP Deskphone downloads the specified Address Book file, extracts Address Book entries up to the value of the MAX_DOWNLOAD_ADDR_BOOK_ENTRIES (or MAX_ADDR_BOOK_ENTRIES if it is less than MAX_DOWNLOAD_ADDR_BOOK_ENTRIES) parameter and saves them to the local Address Book file. The existing content of the *directory.txt* file is replaced by the entries downloaded from the Provisioning Server. The maximum number of entries in the *directory.txt* file is limited by the MAX_ADDR_BOOK_ENTRIES parameter
- 2. Downloading the Address Book from IP Office (requires the IP Deskphone to be configured to register on IP Office)

The download of the Address Book file(s) is initiated by IP Office. The IP Deskphone downloads the Address Book file(s) from IP Office, extracts Address Book entries up to the value of the MAX_DOWNLOAD_ADDR_BOOK_ENTRIES (or MAX_ADDR_BOOK_ENTRIES if it is less than

MAX_DOWNLOAD_ADDR_BOOK_ENTRIES) parameter and saves them to the extdirectory.txt file in the IP Deskphone flash memory. The existing content of the extdirectory.txt file is replaced by new entries downloaded from IP Office. Then the content of the extdirectory.txt file is merged to the local Address Book in memory according to the following rules:

- a. If an entry does not exist in the Address Book in the IP Deskphone memory, it is added
- b. If an entry already exists in the Address Book in memory, the existing entry is retained

The maximum number of entries in the local Address Book in memory is limited by the MAX_ADDR_BOOK_ENTRIES parameter.

IP Deskphone users can add manual entries to the local Address Book as long as the number of entries in the Address Book does not exceed MAX_ADDR_BOOK_ENTRIES. The number of entries that can be added manually is the difference between MAX_ADDR_BOOK_ENTRIES and MAX_DOWNLOAD_ADDR_BOOK_ENTRIES. Manually-added entries are saved to the *directory.txt* file.

Example

The following is an example of the Address Book section of the device configuration file.

#----Address book

USER_FILE_ENABLE Y

ADDR_BOOK_MODE LOCAL

MAX ADDR BOOK ENTRIES 1000

MAX_DOWNLOADED_ADDR_BOOK_ENTRIES 1000

DEFAULT_ADDRESSBOOK_FILE /Addressbook/addressbook.txt

Chapter 17: Hotline service

The Hotline service allows you to provision a SIP IP Deskphone to a Hotline Phone. From a Hotline Phone, you can automatically make a call to a designated number.

A Hotline Phone is a dedicated IP Deskphone that has only one target. You cannot make a call to any other destinations; even emergency calls, such as E911 are not permitted. A Hotline Phone does not know the Hotline target and relies on the server to replace the To field of all INVITE messages sent from the Hotline Phone with the Hotline target to complete the call.

Important:

You cannot place calls if the server is unavailable during an upgrade.

Making a Hotline call

A call to a Hotline target is automatically placed when an off-hook condition occurs, or when you press digits during idle on-hook, and then lift the handset.

Hotline Service allows only one hotline user to login to the Hotline Phone. The Multi-user Login feature is restricted to one user only.

Hotline service restrictions

Because the Hotline Phone is a dedicated IP Deskphone used only for Hotline service, certain features are restricted on the Hotline Phone.

The following is a list of features, on the IP Deskphone, that are restricted on the Hotline Phone.

- Call Transfer
- · Call Forward
- · Voice Mail
- Call Park
- Instant Messaging
- MLPP
- E911 call

The display of each feature that is restricted on the Hotline Phone is blocked.

Provisioning

Hotline Service configuration is obtained from the Hotline Service Enable parameter from the service package or the device configuration file. The service package takes precedence over the device configuration file.

Service Package

You can turn Hotline Service, on or off, through the Service Package or the device configuration file. If the Hotline Service Enable parameter from the service package is configured as true, the Hotline Service is enabled (available) from the service package.

Device configuration file

The IP Deskphone uses the configuration parameters for the Hotline Service to indicate if Hotline Service is available and if a hotline call is in progress.

The following table describes the two configuration parameters in the device configuration file for Hotline Service.

Table 65: Hotline Service configuration parameters

Parameter name	Description	Default
HOTLINE_ENABLE	Indicates if Hotline Service is enabled or disabled.	No (indicates that Hotline Service is disabled)
HOTLINE_URL	Used as To field of INVITE message by the SIP IP Deskphone to notify the Proxy Server that this is a call from a Hotline Phone. The HOTLINE_URL is not a real URL of the Hotline target. The IP Deskphone has no idea about the Hotline target. The Proxy server replaces the To field of INVITE request message with a real Hotline target when it receives an INVITE request from the Hotline Phone.	Hotline

Chapter 18: Session Timer Service

The Session Timer for the Session Initiation Protocol (SIP) feature (RFC4028) allows the Avaya 1200 Series IP Deskphone to support a keep-alive mechanism for SIP sessions. SIP sessions are periodically refreshed by UPDATE requests (or re-INVITES for the IP Deskphones that do not support UPDATE). The UPDATE requests are sent during an active call to allow endpoints or proxies to determine the status of a SIP session.

The Session Timer Service contains the following elements:

- Session-Expires header
- · Min-SE header
- response message (422—Session interval too small)
- tag (timer) for existing headers

The SIP IP Deskphone generates, processes and handles the SIP messages that include the preceding elements.

Session-Expires header

The SIP Session-Expires header delivers the Session-Expires interval and provides information about the entity performing the refreshes. A value of "uac" indicates that the originating endpoint performs the refresh; a value of "uas" indicates that the terminating endpoint performs the refresh. The session interval is the maximum amount of time that occurs between session refresh requests in a dialog box before the session times-out. The minimum for this field is 90 seconds; the recommended value is 1800 seconds (30 minutes).

Min-SE header

The Min-SE header indicates the minimum value for the session expiration in units of delta-seconds. When a call is made, the presence of the Min-SE header informs the terminating endpoint, and proxies, of the minimum value that the originating endpoints accept for the session timer duration in units of delta seconds. When present in a 422 response, the Min-SE header indicates the minimum session value the terminating endpoint accepts.

When present in a request or response, the value of the Min-SE header is 90 seconds or more. If the Min-SE header is not present, the default value is 90 seconds. It is a configurable parameter.

Provisioning

The IP Deskphone uses the configuration parameters for the Session Timer Service to indicate if the Session Timer Service is available, and to configure the duration of the session timer.

The following table describes the five configuration parameters in the device configuration file for Session Timer Service.

Table 66: Session Timer Service configuration parameters

Parameter name	Description	Default value
SESSION_TIMER_ENABLE	Indicates if the session timer service is enabled or disabled. If configured as Yes, the Session Timer Service for the IP Deskphone is enabled, and the behavior of the IP Deskphone complies with RFC4028. If configured as No, the Session Timer Service is disabled.	Yes
SESSION_TIMER_DEFAULT_SE	Indicates the default session expiration in seconds. The Session-Expires header, in a request, informs the terminating endpoint and proxies of the Session-Expires interval value that the originating endpoint requires for the session timer duration, in unites of delta seconds.	1800
SESSION_TIMER_MIN_SE	Indicates the minimum session expiration in seconds.	1800
SET_REQ_REFRESHER	Indicates what refresher value is configured in the initial session request. Value 0 indicates that the refresher is omitted; value 1 indicates that the refresher is configured to UAC; value 2 indicates that the refresher is configured to UAS.	0
SET_RESP_REFRESHER	Indicates what refresher value is configured in the 200 OK response. Value 0 indicates that the refresher is omitted (only valid when SET_REQ_REFRESHER is not equal to 0); value 1 indicates that the refresher is configured to UAS; value 2 indicates that the refresher is configured to UAC.	2

Chapter 19: Emergency Services

Overview

You can use the Avaya 1200 Series IP Deskphone to make an emergency call to the Public Safety Answering Point (PSAP), from any screen, without a user logon. When you connect to the PSAP, the IP Deskphone conveys the caller's location information to the PSAP. If you are not logged on to the IP Deskphone and you pick up the handset or press the handsfree or headset button, the message "Emergency calls only" appears on the screen of the IP Deskphone.

If you hang up before the connection is established, the IP Deskphone goes back to the initial state. After the connection is established, in most cases the call can only be ended by the Public Safety Answering Point (PSAP). If you hang up, the IP Deskphone switches to loudspeaker. If the IP Deskphone is already on the loudspeaker mode, and you press the hang up button, nothing happens. The call is still connected and can only be disconnected by the emergency operator.

Note:

If E911_TERMINATE_ENABLE is provisioned for the IP Deskphone, then the caller can terminate the call to emergency services even after the call is established.

Emergency calls originate on the IP Deskphone and are completed by the Call Server. The Call Server communicates with the emergency network or emergency systems for routing, call control, and location information. Although the IP Deskphone allows the user to enter location information, this location information is not used by all Call Servers. Some Call Servers derive the location information based on the number and location databases. Characteristics of emergency calls and limitations of emergency calls using the IP Deskphone are as follows:

- Making calls without logging on is only allowed for emergency calls (according to the defined dialing plan).
- Transmission of the location information depends on M5T SIP Stack version 4.1 (because it
 must be able to transmit multiple MIME types).

Location information

Effective Emergency services also rely on accurate location information. The IP Deskphone supports the inclusion of the x-nt-location header in SIP messages that provide location information to a Avaya Call Server. The location information is selected by the user during registration, and must be correctly provisioned at the Call Server level (see appropriate NTP specific to your Call Server).

Dialing plan configuration

To allow operator control of disconnect during an emergency call, the IP Deskphone must identify an emergency call as soon as an emergency call is initiated. The IP Deskphone uses an emergency flag in the dialing plan to identify an emergency call. When the dialing plan detects that an emergency number is dialed, it automatically switches to operator controlled disconnect mode when the call is answered. The dialing plan can have multiple emergency numbers.

The following outline describes the format for the dialing plan rules.

- 1. The first part contains one or more patterns. The patterns are used to match against the dialed number. Multiple patterns are separated by the | character.
- 2. The second part contains the resulting string used in the dial step.
- 3. The third part defines the parameters used by the UA to trigger specific dialing actions. The following parameters are defined in the third part and are separated by the | character if both are used.
 - t=xxxx: timer to stop collecting digits or perform automatic dialing out after the user enters the first digit. The xxx is a decimal number for the timer value in msec. The default timer is used if the timer is not specified in the digit map.
 - emergency: if specified, special call features are enabled to handle the call as an emergency call.

The following is an example of an emergency flag in the dialing plan:

911|911# && sip:user@911.com && t=1000|emergency

This feature requires configuring the values for additional variables in the IP Deskphone config file.

The following table describes the configuration values for the emergency dialing plan.

Table 67: E911 Configuration in the IP Deskphone Config file

E911_USERNAME	The emergency user name used for making an emergency call that does not require a logon. You must configure the proxy with the same emergency user name, otherwise, the emergency call fails.
E911_PROXY	Default emergency proxy. This variable must contain the value that matches the value defined by one of the following variables specified in the same config file:
	• SIP_DOMAIN1
	SIP_DOMAIN2
	• SIP_DOMAIN3
	SIP_DOMAIN4
	SIP_DOMAIN5

	If E911_PROXY does not match the value defined by these five variables, or the variable E911_PROXY is not defined, the value of SIP_DOMAIN1 is used as the emergency proxy.
E911_PASSWORD	The password for emergency username that is used for making an emergency call that does not require login. The proxy must be configured with the same password, otherwise the emergency call fails.
E911_TXLOC	The variable that describes location information that must be sent with the REGISTER SIP message, or with the INVITE SIP message.

Important:

You must add a set of numbers (regular expressions) marked as "emergency" to the IP Deskphone dialing plan. Only these numbers are allowed for emergency calls that do not require logon.

Feature impact on configuration tasks

- 1. Configuring the SIP Proxy
 - The IP Deskphone must have an emergency user in order to make an emergency call without a user logon.
 - The IP Deskphone must have the necessary configurations values for automatic REGISTER of the emergency user (if you choose this implementation method).
 - You must add the emergency user to the proxy.
- 2. Adding the emergency user to the IP Deskphone config file
 - The IP Deskphone must have E911_USERNAME, E911_PROXY, and E911_PASSWORD configured for making emergency calls.
 - The IP Deskphone must have a specified proxy that contains a user record with the specified user name and password.
 - The IP Deskphone must have these values for automatic REGISTER of the emergency user (if you choose this way of implementation).
 - You must add specified variables to the IP Deskphone config file.
- 3. Adding an emergency number
 - You must specify an emergency number for emergency calls to:
 - define the numbers that you can use for an emergency call that does not require logging on.
 - trigger emergency functionalities, such as the inability of an emergency call originator to hold or hang up the call after the call is established.

- You can only dial these numbers if there is no user log on (or the IP Deskphone is blocked).
- You must add the emergency number to the dialing plan. The emergency flag is mandatory. For more information on the format for dialing plan rules, see <u>Dialing plan</u> configuration on page 218.
- 4. Configuring Layer 2 switch of the DHCP server to provide the IP Deskphone with location information
 - You must configure the Layer 2 switch or DHCP server to provide the IP Deskphone with location information.
 - You must provide the IP Deskphone with location information because the IP Deskphone sends it to the PSAP when making an emergency call.
 - You must configure the Layer 2 switch or DHCP server.

Network Element

Configure the domain list and proxy set up

- You must properly configure the domain list, and the active proxy must be correct, valid, and support current features.
- You must properly configure the proxy to support current features.
- The proxy must be able to transmit mixed MIME-types (for successful transferring of the location information).

Setup and configure Layer 2 switch or DHCP server to provide the IP Deskphone with location informationSetup and configure Layer 2 switch or DHCP server to provide the IP Deskphone with location information

- You must properly configure the Layer 2 switch or DHCP server to provide the SIP IP Deskphone with location information through LLDP-MED or DNCP protocols respectively.
- You must properly configure the Layer 2 switch or DHCP server to provide the IP Deskphone with location information.

Configure the proxy with emergency user name and password

- You must have configuration access to the proxy to arrange for an emergency user (if this manner of implementation is chosen).
- The emergency user and password at the proxy side must be identical to the emergency user and password that every IP Deskphone is configured with. Otherwise, you cannot make an emergency call without logging on.

Characteristics of emergency calls

The user does not have to log on to make an emergency call.

During an emergency call, the user:

- cannot make outgoing calls.
- is not notified of incoming calls and cannot accept incoming calls. Incoming calls receive a call waiting tone.
- cannot transfer, join, or conference the emergency call, place the emergency call on hold, or park the emergency call.
- cannot receive an incoming call.
- cannot auto-retrieve a parked call and auto-retrieval of parked calls is not displayed.
- cannot disconnect the emergency call in most cases. Only an emergency center or operator can disconnect the emergency call. If the user attempts to disconnect after the call has been made, the IP Deskphone switches to loudspeaker. If the loudspeaker mode is already on, the connection remains.

Note:

If E911 TERMINATE ENABLE is provisioned, then the caller can terminate the call to emergency services even after the connection has been made.

- · cannot change Audio Quality.
- can reply to IM pop-ups, which are operational during an emergency call.

During an emergency call, the keys function as follows:

- the Services, Inbox, Outbox, and Address Book keys are all disabled.
- · a right click of the mouse does not show the services menu.
- the conspicuous keys are disabled.
- the mute key and hold key are disabled.
- the increase and decrease volume keys remain functional.
- the feature keys are visible and all except the speed-dial keys are functional.

Shut down and restart

If the IP Deskphone turns on or off, the IP Deskphone restarts in the usual way, reads the config file, and receives the location information through LLDP-MED or DHCP protocols (from the Layer 2 switch or DHCP server, which must be available and properly configured). Otherwise, the IP Deskphone is not provided with valid location information and cannot transmit that information when making an emergency call.

Chapter 20: IP Deskphone restrictions

Service package restrictions

Individual features and feature restrictions are sent to the IP Deskphone as a part of the service package every time a particular user logs on to the IP Deskphone. If the Call Server does not support service packages, or if the Call Server restricts some of the features in the service package, functionality of some features is restricted.

If functionality is restricted, the associated buttons and Context-sensitive soft keys are not accessible or do not respond.

Distinctive Ringing feature

The IP Deskphone does not support the CS 2000 and CS 2100 Distinctive Ringing feature.

Chapter 21: NAT firewall traversal

The objective of putting devices behind a Network Address Translator (NAT) is to protect the devices from external interruption and to extend the public IP address space. However, the shield to stop unsolicited incoming traffic also has the drawback of breaking a number of IP applications, including SIP.

If a device is behind a NAT, transport addresses obtained are not publicly routable, and therefore, not useful in a number of multimedia applications. The limited lifetime of the NAT port mapping can also cause the SIP signaling to fail. If a port mapping is idle, it can be released by the NAT and reassigned to other applications.

The STUN protocol lets an IP Deskphone discover the presence and type of NATs between the IP Deskphone and the public Internet. In addition, an IP Deskphone can discover the mapping between the private IP address and port number and the public IP address and port number. Typically, a service provider operates a STUN server in the public Internet, with STUN-enabled IP Deskphones embedded in end-devices, which are possibly behind a NAT.

A STUN server can be located using DNS SRV records using the domain of the service provider as the lookup. STUN typically uses the well-known port number 3478. STUN is a binary encoded protocol with a 20-octet header field and possibly additional attributes. The STUN protocol learns the public IP addresses, and therefore, some security is necessary.

To initiate a STUN lookup, the IP Deskphone sends one or more Binding Request packets using UDP to the STUN server. These packets must be sent from the same IP address that the IP Deskphone uses for the other protocol, because this is the address translation information that the IP Deskphone tries to discover.

The server returns Binding Response packets, which tell the IP Deskphone the public IP address and port number from which it received the Binding Request. The IP Deskphone knows the private IP address and port number it used to send the Binding Request, and therefore, it learns the mapping between the private and public address space being performed by the NAT. If the Binding Response packets indicate the same address and port number as the request, the IP Deskphone knows no NATs are present.

The IP Deskphone supports two methods for NAT traversal of the signaling path:

- SIP_PING
- STUN

The NAT traversal method can be selected manually through the Device Settings menu or configured through the device configuration file. The default NAT traversal method is NONE.

The IP Deskphone can conduct SIP dialogs through a Symmetric NAT using UDP. This allows the IP Deskphone to work from behind and/or in front of a symmetrical NAT with servers and/or clients that support RFC3581. For this feature to work properly, the receiving end device must support

RFC3581. This feature is enabled or disabled through the USE_RPORT parameter in the device configuration file.

RFC3581 does not address NAT traversal for media or voice.

Chapter 22: Three-port switch and VLAN functionality

System overview

The Full VLAN support feature can create an IP Deskphone Voice VLAN and PC Data VLAN on the three-port switch manually or automatically (see <u>Figure 23: Voice-VLAN and Data VLAN</u> on page 226).

If both Data and Voice VLANs are enabled on a three-port switch, only the frames with Data and Voice VLAN tagged go to the networks. The IP Deskphone receives only the frames with Voice VLAN tagged and sends the frames with Voice VLAN tagged, while PC or Local Networks receive all kinds of frames.

When only voice VLAN is enabled on the three-port switch, all kinds of frames go to the Network, the IP Deskphone receives only the frames with Voice VLAN tagged and sends all frames with Voice VLAN tagged. PC or Local Networks receive all kinds of frames.

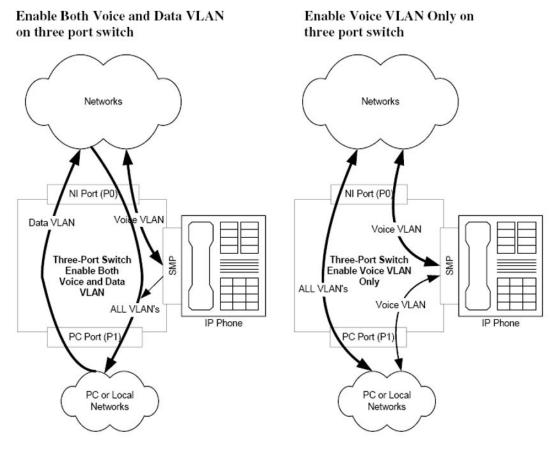

Figure 23: Voice-VLAN and Data VLAN

Table 68: Port functions on the three-port switch when VLAN is enabled

Ports	Voice VLAN enabled	Data VLAN enabled	Both Voice and Data VLAN enabled
Network Port	N/A	N/A	N/A
(Port 0)			
IP Deskphone Port	Receiving the frames with Voice VLAN tagged	N/A	Receiving the frames with Voice VLAN tagged only.
(SMP)	only.		Sending the frames with Voice
	Sending the frames with Voice VLAN tagged.		VLAN tagged.
PC Port	N/A	Tagging the incoming frame	Tagging the incoming frame
(Port 1)		untagged and forwarding it to the network port.	untagged and forwarding it to the network port.
		Replacing the incoming frame tagged with VLAN	Replacing the incoming frame tagged with VLAN other than

Ports	Voice VLAN enabled	Data VLAN enabled	Both Voice and Data VLAN enabled
		other than Data-VLAN and	Data-VLAN and forwarding it to
		forwarding it to the network	the network port.
		port.	Sending all kinds of frames.
		Sending all kinds of frames.	_

VLAN configuration can be done either manually or through DHCP. Refer to <u>Device Settings on the IP Deskphone with SIP Software</u> on page 145 for more detail on configuring VLANs.

Chapter 23: SIP messages supported by the IP Deskphone

SIP methods

The table below provides a list of SIP messages supported by the Avaya 1200 Series IP Deskphone.

Table 69: SIP methods

Method	Supported?	Comments
INVITE	Yes	Mid-call re-invites for media changes also supported.
ACK	Yes	
BYE	Yes	
CANCEL	Yes	
OPTIONS	Response only	
INFO	Yes	Optionally used for in-session DTMF signaling, and Avaya Call Server specific NAT detection
PING	Yes	Proxy detection, monitoring and Avaya Call Server specific firewall traversal
REGISTER	Yes	For user registration
REFER	Yes	For transfer
NOTIFY	Yes	
SUBSCRIBE	Yes	
PUBLISH	Yes	For VQMon Publish
PRACK	Yes	No support for PRACK-specific early-media negotiation scenarios
MESSAGE	Yes	
UPDATE	Yes	UPDATE messages received in an early dialog state require reliable provisional responses. If PRACK is disabled, or not used by a local or remote party, some UPDATE operations fail as described in RFC3311. The support of UPDATE messages is not a configurable feature.

SIP responses

The following SIP responses are also supported:

- 1xx Response—Information Responses
- 2xx Responses—Successful Responses
- 3xx Response—Request Failure Responses
- 4xx Response—Server Failure Responses
- 6xx Response—Global Responses

1xx Response—Information Responses

1xx Response	Send	Receive	Comments
100 Trying	Yes	Yes	The IP Deskphone can generate this response for an incoming INVITE if it has taken too long to generate a 180 response. Upon receiving this response, the IP Deskphone waits for a 180 Ringing, 183 Session Progress, or 200 OK responses.
180 Ringing	Yes	Yes	The IP Deskphone begins local ringing through the active transducer.
181 Call is being forwarded	No	Yes	See 183.
182 Queued	No	Yes	See 183.
183 Session progress	No	Yes	The IP Deskphone accepts a 183 response with SDP to allow for earlymedia negotiation.

2xx Response—Successful responses

2xx Response	Send	Receive	Comments
200 OK	Yes	Yes	
202 Accepted	Yes	Yes	

3xx Response—Redirection responses

3xx Response	Send	Receive	Comments
300 Multiple Choices	No	Yes	When receiving this response, the IP Deskphone redirects the original request to next contact specified.
301 Moved permanently	No	Yes	When receiving this response, the IP Deskphone redirects the original request to the new contact specified. However, the IP Deskphone takes no additional special consideration of the "permanent" status of this change.
302 Moved temporarily	Yes	Yes	This response is sent to an incoming invite if the IP Deskphone has local call-forwarding enabled. When receiving this response, the IP Deskphone redirects the original request to the new contact specified.
305 Use Proxy	Yes	Yes	The IP Deskphone generates these responses when receiving requests that did not come through the configured SIP proxy. When receiving this request, the IP Deskphone contacts the new address in the Contact header field.
380 Alternate service	No	Yes	When receiving this request the IP Deskphone contacts the new address in the Contact header field.

4xx Response—Request failure responses

4xx Response	Send	Receive	Comments
400 Bad request	Yes	Yes	The IP Deskphone generates a 400 Bad Request response for various failure conditions generally when a request is invalid, and a more specific error response does not apply.
401 Unauthorized	No	Yes	Receiving a 401 response results in the IP Deskphone re-issuing the request using HTTP digest authentication.
402 Payment required	No	Yes	See <u>Default error handling</u> on page 233.
403 Forbidden	No	Yes	SeeDefault error handling on page 233.

4xx Response	Send	Receive	Comments
404 Not found	Yes	Yes	The IP Deskphone generates this response for requests to unknown users. Receiving this response falls through to the default handling.
405 Method not allowed	Yes	Yes	The IP Deskphone ends this response to a known method if it is received at a time when the IP Deskphone is not prepared to handle or the request is missing necessary information. Receiving this response falls through to the default handling.
406 Not acceptable	Yes	Yes	The IP Deskphone can send this response when receiving a REFER request which has an unsupported URI. Receiving this response falls through to the default handling.
407 Proxy authentication required	No	Yes	See 401.
408 Request timeout	No	Yes	See default handling.
410 Gone	No	Yes	See <u>Default error handling</u> on page 233.
413 Request entity too large	No	Yes	See <u>Default error handling</u> on page 233. The IP Deskphone does not automatically retry if a retry-after header is present.
414 RequestURL too long	No	Yes	See <u>Default error handling</u> on page 233.
415 Unsupported Media	Yes	Yes	The IP Deskphone can send this response when an incorrect content-type is detected for a request. Receiving this response falls through to the default handling. See <u>Default error handling</u> on page 233.
420 Bad Extension	Yes	Yes	The IP Deskphone can respond with a 420 when checking required extensions of incoming requests. When receiving a 420, see default handling. The IP Deskphone does not retry the request.
480 Temporarily unavailable	No	Yes	See Default error handling on page 233.
481 Call leg/ transaction does not exist	Yes	Yes	Incoming requests are matched against existing dialogs. If a request appears to be in-dialog, but does not have an existing dialog, the IP Deskphone responds with a 481. For incoming 481

4xx Response	Send	Receive	Comments
			responses, the default handling is used. See <u>Default error handling</u> on page 233.
482 Loop detected	Yes	Yes	Default handling is used when this response is received. See <u>Default error handling</u> on page 233.
483 Too Many Hops	No	Yes	See <u>Default error handling</u> on page 233.
484 Address Incomplete	No	Yes	See <u>Default error handling</u> on page 233.
485 Ambiguous	No	Yes	See <u>Default error handling</u> on page 233. The IP Deskphone does not attempt to retry the request.
486 Busy Here	Yes	Yes	The IP Deskphone can respond with this if the user is on the IP Deskphone, and the IP Deskphone has reached its maximum number of allowed calls and cannot present the incoming call to the user. When this message is received by the IP Deskphone an error is displayed and a busy tone is played.
487 Request Canceled	Yes	Yes	See default handling.
488 Not Acceptable	Yes	Yes	The response is used by the IP Deskphone when a failed media negotiation occurs.
491 Request Pending	Yes	Yes	The IP Deskphone sends and receive this message in GLARE conditions.

5xx Response—Server failure responses

5xx Response	Send	Receive	Comments
500 Internal Server Error	Yes	Yes	The IP Deskphone can send this response when a request is received but the IP Deskphone software is not in a correct state to handle it. When receiving this message, the IP Deskphone displays an error for the user.
501 Not Implemented	No	Yes	See <u>Default error handling</u> on page 233.
502 Bad Gateway	No	Yes	See <u>Default error handling</u> on page 233.
503 Service Unavailable	Yes	Yes	
504 Gateway timeout	No	Yes	See Default error handling on page 233.
505 Version Not Supported	Yes	Yes	

6xx Response—Global responses

6xx Response	Send	Receive	Comments	
600 Busy Everywhere	Yes	Yes	The IP Deskphone can send this response when the IGNORE setting is configured to NETWORK, and the user chooses to ignore an incoming call. When received, this response falls through the default handling. See Default error handling on page 233.	
603 Decline	Yes	Yes	The IP Deskphone can send this response when the user declines an incoming call. An optional reason can be supplied.	
604 Does Not Exist Anywhere	No	Yes	SeeDefault error handling on page 233.	
606 Not Acceptable	No	Yes	See Default error handling on page 233.	

Default error handling

All 4xx/5xx/6xx responses (with the exception of 401/407) received by the IP Deskphone, when attempting to initiate a call, result in the display of an error on the screen, and typically results in fast or regular busy tone.

If a media negotiation fails during dialog setup, the IP Deskphone terminates the dialog.

If an in-dialog failure occurs during media (re)negotiation, the IP Deskphone falls back to previouslynegotiated media settings. When a failure occurs that makes this impossible, the IP Deskphone attempts to clear the call by terminating the dialog.

SIP header fields

The following table contains the supported SIP headers.

Header field	Supported?
Accept	Yes
Accept-Encoding	Yes
Accept-Language	Yes
Alert-Info	Yes
Allow	Yes

Header field	Supported?
Allow-Events	Yes
Authentication-Info	Yes
Authorization	Yes
Call-Id	Yes
Call-Info	Yes
Contact	Yes
Content-Disposition	Yes
Content-Encoding	Yes
Content-Length	Yes
Content-Type	Yes
Cseq	Yes
Date	Yes
Expires	Yes
Error-Info	Yes
Max-Forwards	Yes
Mime-Version	Yes
Organization	Yes
P-Access-Network-Info	Yes
P-Asserted-Identity	Yes
P-Associated-URI	Yes
P-Called-Party-ID	Yes
P-Charging-Function-Addresses	Yes
P-Charging-Vector	Yes
P-Media-Authorization	Yes
P-Preferred-Identity	Yes
P-Visited-Network-ID	Yes
Path	Yes
Priority	Yes
Privacy	Yes
Proxy-Authenticate	Yes
Proxy-Require	Yes
RAck	Yes
Reason	Yes
Record-Route	Yes
Refer-To	Yes

Header field	Supported?
Referred-By	Yes
Remote-Party-ID	Yes
Replaces	Yes
Reply-To	Yes
Require	Yes
Resource-Priority	Yes
Retry-After	Yes
Route	Yes
RSeq	Yes
Server	Yes
Service-Route	Yes
Subject	Yes
Supported	Yes
Timestamp	Yes
То	Yes
Unsupported	Yes
User-Agent	Yes
Via	Yes
Warning	Yes
WWW-Authenticate	Yes

Session description protocol usage

SDP Headers	Supported?	
vProtocol version	Yes	
oOwner or creator and session identifier	Yes	
sSession name	Yes	
tTime description	Yes	
cConnection information	Yes	
mMedia name and transport address	Yes	
aMedia attribute lines	Yes	

SDP and Call Hold

The IP Deskphone can support sending and receiving of hold using the method specified by RFC2543 and RFC3261/3264.

Transport layer protocols

Protocol	Supported?
Unicast UDP	Yes
Multicast UDP	No
TCP	No

SIP security authentication

Authentication	Supported?	Comments
Digest Authentication	Yes	
Proxy-to-User Authentication	Yes	
User-to-User Authentication	No	The IP Deskphone responds to a 401, but never challenges incoming requests with a 401 response.
S/MIME	No	
AKA	No	

SIP DTMF Digit transport

Transport type	Supported?
RFC2833	Yes
In-band tones	Yes
Out-of-band tones	Yes (vnd.avaya.digits)

Supported subscriptions

Subscription type	Supported	Avaya Call Server specific
address-book	Yes	Yes
call-park	Yes	Yes
dialog	Yes	Yes
presence	Yes	Yes
message-summary	Yes	No
ua-profile	Partial	Yes
service-package	Yes	Yes
network-redirection-reminder	Yes	Yes

Supported instant messaging

Message type	Supported?
plain text	Yes
Avaya unencrypted	Yes
Avaya encrypted	Yes

Chapter 24: Audio codecs

Overview

The optional audio codecs feature allows you to select the audio compression or decompression algorithm (codec) used on the Avaya IP Deskphone. You provision codecs using the Device Configuration file, and then the user can select from the provisioned codecs using the Audio menu on the Avaya 1200 Series IP Deskphone.

When the user selects an audio codec, that codec is used for both incoming and outgoing calls.

The following table lists the audio codecs supported by IP Deskphone.

Table 70: Audio codecs supported by IP Deskphone

Codecs	Description
G.723.1	This codec is a compressed, nonwideband audio codec. It provides high-quality audio with less network connection requirements. This codec is ideal for bandwidth-conscious environments that do not support higher quality encoding. Expanded support of the existing G.729a codec with Annex allows for two byte Silence Insertion Descriptor (SID) frame for CNG.
G.711 a-law	PCMA
G.711 mu-law	PCMA
G.729	

In the case of an upgrade from a UNIStim IP Deskphone or an earlier version of the SIP firmware, Avaya recommends that you specify the preferred codec in the Device Configuration file; otherwise the default value is used.

The G.711 codec (PCMU and PCMA) is always used to place the codec list for emergency 911 calls. The G.711 codec is always used to receive incoming calls from the emergency operator. If the administrator disables this codec, the SIP IP Deskphone can make outgoing non emergency calls.

You can configure a maximum of 15 codecs. You can enable or disable the use of specific codecs for incoming and outgoing calls, though incoming and outgoing calls are not specifically independent.

VQMON Codec configuration

You can enable the VQMON feature through the Device Configuration file to send an SIP Publish message with the VQMON report as text content, and use this report for QoS monitoring.

Network layer for the SDP negotiations

The following table contains static payload types and other parameters for the supported codecs, including the default ptime value for each codec. The phone may use a different value, ranging from the default to 50 msec, if the caller (a third party caller) requests it by adding the corresponding ptime attribute to the SDP. The 1200 SIP IP Deskphone does not include ptime in its SDP message. Note that 10 msec ptime is not supported.

Table 71: Static payload types and other parameters for the supported codecs for the IP Deskphone

Codec	Payload type	SDP encoding name	Clock rate (HZ)	Bit rate (kbps)	Default ptime (msec)	Channels
G.711 a-law	8	PCMA	8000		20	1
G.711 u-law	0	PCMU	8000		20	1
G.729A + 40ms ptime	18	G729	8000		20	1
G.729B	18		8000	8	20	1
G.723.1	4	G723	8000	5.3	30	1
				6.3		
G.723.1A	4		8000	5.3	30	1
				6.3		

The annexes selection for G.729 and G.723.1 are not available to the user and the administrator is responsible for enabling or disabling annexes using the Device Configuration parameters.

Codec preference through Device Configuration

Use the Device Configuration file to specify a list of codecs, and the preferred order in which they are used for incoming and outgoing calls. You can also use the Device Configuration file to enable or disable AnnexB support by G.729 and AnnexA support by G.723.1. You can add a text descriptor to the technical name of the audio codec; these descriptors appear on the user interface of the IP Deskphone.

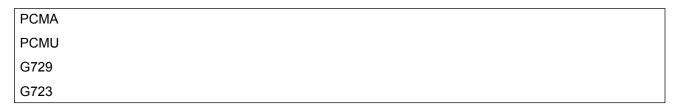

You can specify, by name, the exact codecs to offer in the Device Configuration file. This grants the administrator full control over the audio settings used for inbound and outbound calls. The following table is a sample of Device Configuration file entries for audio codec configuration.

Table 72: Sample Device Configuration file codec entries

```
AUDIO_CODEC1 PCMA standard a-law
AUDIO_CODEC2 PCMU standard u-law
AUDIO_CODEC3 G729 729 codec
AUDIO_CODEC7 G723 high-compression codec
```

The following table lists the codec identifiers for the Device Configuration file.

Table 73: Codec identifiers for the Device Configuration file

The IP Deskphone displays the codecs listed in the exact order that they are listed in the Device Configuration file.

The list of codecs specified in the Device Configuration file determines the list of codecs that are available for selection on the IP Deskphone.

Two fields in the device configuration file, G729_ENABLE_ANNEXB and G723_ENABLE_ANNEXA are used to enable or disable AnnexB and AnnexA support by G729 and G723 codecx, respectively. These flags can have the following values: YES, NO (No is the default value).

Important:

If codecs are not specified, the default list used by the current version of the IP Deskphone is PCMU, PCMA, G.729.

To stop the IP Deskphone from using a specific codec, you must change the its entry in the Device Configuration file to a different codec, and then clear the value, which disables the codec entry. If you remove all codecs from the allowed list, the IP Deskphone resets to the default list of codecs.

Important:

To reset the phone to the default list of codecs, it is necessary to remove the values against each AUDIO_CODECx item in the Device Configuration file.

For example:

```
AUDIO_CODEC1 PCMA standard a-law

AUDIO_CODEC2 PCMU standard u-law

AUDIO_CODEC3 G729 729 codec

AUDIO_CODEC4 G722 wideband codec

AUDIO_CODEC5 G723 high-compression codec
```

would become

AUDIO_CODEC1			
AUDIO_CODEC2			
AUDIO_CODEC3			
AUDIO_CODEC4			
AUDIO_CODEC5			

If the ordered list of codecs is small and no matching codec is found during negotiations, the call drops, as the audio stream cannot be established. For backward compatibility with SIP Firmware Release 1.X, the Device Configuration file supports the DEF_AUDIO_QUALITY parameter as long as no codec is allowed using the parameter AUDIO_CODECN, in which case the DEF_AUDIO_QUALITY parameter is ignored and has no effect.

Specifying the **DEF_AUDIO_QUALITY** as High or Medium has the same effect as omitting the parameter altogether and without specifying codec through the parameters.

If set to Low, then the list of default codecs is reversed before being sent in the SDP negotiations. When you do not provide a text description in the Device Configuration file, the application uses the default text description from the language file.

The AUDIO_CODECN parameters specifies the order of preference for audio codecs. If there are no valid entries provided, then the parameter uses the default list of codecs. If you enter a codec that is not recognized by the IP Deskphone then the parameter considers the codec as a blank entry. To remove a codec from the list, you must first blank the entry, or change it to an invalid codec name in the Device Configuration file.

Codec preference selection on the IP Deskphone

The Audio Quality Settings screen on the IP Deskphone allows the user to select an exact codec by name. This grants the user full control over the audio settings used for inbound and outbound calls.

The list of codecs is populated with the names of the codecs provided during Device Configuration. If a text descriptor is provided for a codec in the Device Configuration file, it appears after the codec name. The Audio Codec Ordering screen allows the user to modify the order of preference of the codecs. To change the list of available codecs, you must perform an update through Device Configuration. The IP Deskphone creates the ordered list from the list of codecs in the Device Configuration file. The user can reorder the list using the Preferences menu on the IP Deskphone. On subsequent Device Configuration updates, at start time, or during other updates, the ordered codec list of the user is synchronized with the list in the Device Configuration file. This synchronization makes both lists equal. If the user creates an order that is different from the one in the Device Configuration file, the IP Deskphone appends it to the end of the list.

Codecs preferences on the IP Deskphone

The user cannot modify the text descriptors through the IP Deskphone; the text descriptors can only be read by the user. After the system loads the Device Configuration file, the user preference selections are synchronized with the system codecs specified in the Device Configuration file. This ensures that the codecs available to the user are always set according to user preferences.

If the user modifies the order through the IP Deskphone, then the user-defined order is saved for the codecs that are defined as system codecs in the Device Configuration file. Codecs are appended at the end of the list in their relative order from the Device Configuration file. Until the user modifies the order of the codecs, the list of ordered codecs reflects the order specified in the Device Configuration file.

The following table shows examples of the list of codecs provided by Device Configuration, user configuration, and resulting list of codecs that the system uses for presentation and codec negotiation purposes.

Table 74: Examples of the ordered lists of Codecs

Codecs Supported by the IP Deskphone	Ordered list of codecs provided by Device Configuration	Ordered list of codecs provided by user configuration	Ordered list of codecs used by the IP Deskphone
	A, B, C, D, E	N/A	A, B, C, D, E
	A, B, C, D, E	E, D, C, B, A	E, D, C, B, A
A, B, C, D, E, F, G	A, B, C, D, E	A, D, E	A, D, E, B, C
	A, C, D, E	A, B, C, D, E	A, C, D, E
	A, C, D, E	A, B, C, E	A, C, E, D

Note:

The user-defined order of the codecs can be specified/changed by means of the Custom keys file through the section [audiocodecs]. See Custom keys file on page 200. When the IP Deskphone downloads the Custom keys file, the IP Deskphone performs the following actions:

- The IP Deskphone parses the section [audiocodecs] from the Custom keys file. If the codec specified within the file exists in the list of codecs in the Device Configuration file. then the codec is added to the list of the supported codecs. Otherwise, the codec is rejected.
- The IP Deskphone adds the last codecs, presented in the Device Configuration file, to the list of supported codecs.

Chapter 25: Certificate-based authentication

Certificate-based authentication overview

Certificate-based authentication allows the administrator to ensure that the IP Deskphone is authorized to access the enterprise LAN environment. Certificate-based authentication supports three types of Extensible Authentication Protocols (EAP):

- EAP-MD5—User ID/password-based authentication
- EAP-PEAP—certificate-based authentication
- · EAP-TLS—certificate-based authentication

Trusted root certificates and device certificates must be installed before using EAP-TLS, EAP-PEAP or HTTPS.

Certificate-based authentication supports two types of device certificates: one is used by EAP-TLA, and the other is used by SIP-TLS, but the administrator can also have a third device certificate for HTTPS. The user must connect to a Certificate Authority (CA) to retrieve or sign certificates. A CA is a trusted third party; components of a system agree to trust the CA to verify the necessary information.

When the CA validates the user information, it issues the user a certificate that contains a variety of data, including:

- the identity of the issuing CA
- how much the CA trusts the user
- · an expiry date for the certificate

Other components of the system can read the user's certificate to determine if the certificate, and the identity it represents, are valid.

The administrator can install and manage the certificates on the IP Deskphone. The certificates authenticate the IP Deskphone to an authentication server before the IP Deskphone can access the enterprise network.

Certificate-based authentication includes the following features:

EAP Authentication

The supplicant can be authenticated to an authentication server using one of these EAP methods:

- EAP-MD5
- EAP-PEAP
- EAP-TLS

Device certificate management

The administrator can install a device certificate on the IP Deskphone by using SCEP or PKCS#12 import file. The IP Deskphone can verify the imported device certificate by checking the availability of the IP Deskphone against the Certificate Trust List (CTL) stored in the IP Deskphone. CTL is a predefined list of trusted certificates including CAs, intermediate CAs, and server certificates which the IP Deskphone views as trust anchors. The administrator can also view and delete a certificate on the IP Deskphone.

Provisioning configuration file

The provisioning configuration file, such as 12xxSIP.cfg and all other configuration files referred by 12xxSIP.cfg, specifies software and resource files that are downloaded to the IP Deskphone from a provisioning server by using the secure provision method HTTPS.

Security and error logs

The administrator can view security and error logs that occurred during the operation of the IP Deskphone. This feature is accessed through the Diagnostics screen.

Security policy file updates

The security policy file defines a set of rules to determine the required actions taken by the IP Deskphone.

Certificates overview

Certificates bind an identity to a pair of electronic keys that are used to encrypt and sign digital information, and make it possible to verify someone's claim that they have the right to use a given key. Certificates provide a complete security solution, assuring the identity of all parties involved in a transaction. Certificates are issued by a Certification Authority (CA) and are signed with the CA's private key.

A certificate contains the following information:

- Owner's public key
- · Owner's name
- Expiration date of the public key
- Name of the issuer (the CA that issued the certificate)
- Serial number of the certificate
- · Digital signature of the issuer

Root certificate installation

The customer root certificate is a self-signed certificate (a self-issued certificate where the subject and issue fields contain identical DNs, and are not empty). The customer root certificate must be installed on the IP Deskphone and stored in the IP Deskphone trusted store for the following reasons:

- to verify the identity of the various servers that the IP Deskphone may attempt to establish secure connections with (such as TLS and HTTPS)
- to authenticate the signatures on software and configuration files that you download onto the IP Deskphone.

You can install a customer root certificate by using Simple Certificate Enrollment Protocol (SCEP) or by using the configuration file (for example 12xxSIP.cfg.).

If you use SCEP, you must first configure the URL of the CA SCEP server and the domain name, and then you can connect to the CA and download a CA root certificate to the IP Deskphone.

- The IP Deskphone sends the GetCACert request to the SCEP-enabled interface for a CA server.
- The IP Deskphone waits for a response. If an error is received (such as timeout or server unreachable), the registration process ends.
- The IP Deskphone accepts the reply which contains the CA root certificate. The reply may also
 include one or two Registration Authority (RA) certificates which are stored temporarily for use
 during the request for a device certificate.
- If the CA root certificate is not already on the IP Deskphone, the fingerprint is computed and displayed. The computed fingerprint is the thumbprint of the certificate (the SHA1 hash of the public key of the certificate).
- You must Accept or Reject the fingerprint.
- If the CA root certificate is rejected, the registration process ends.
- If the CA root certificate is already in the trusted store, no prompt appears.
- If the fingerprint is accepted, the CA root certificate is added to the trusted store on the IP Deskphone.

If you use the configuration file (for example, 11xxe.cfg), you can download one or more CA root certificates to the IP Deskphone.

- The [USER_KEYS] section is added to the configuration file (for example 12xxSIP.cfg), where
 the FILENAME attribute points to the file name of a customer root certificate in Privacy
 Enhanced Mail (PEM) format. The PROTOCOL attribute of the [USER_KEYS] section can be
 assigned to one of the IP Deskphone supported protocols, such as HTTP, TFTP, HTTPS and
 FTP.
- After the configuration file is downloaded and parsed by the IP Deskphone, the [USER_KEYS] section is processed and the root certificate is downloaded to the IP Deskphone.
- After the certificate file is downloaded, you must authenticate the contents of the certificate file before installing it on the IP Deskphone. There are two possible situations.
 - If there are no existing customer root certificates on the IP Deskphone, a fingerprint for the file is computed. Depending on the value that is configured in the Security Policy parameter,

- CUST_CERT_ACCEPT, the user can either be prompted to accept this fingerprint, or prompted to enter the fingerprint for verification.
- If there is one or more customer root certificate on the IP Deskphone, the certificate file must be digitally signed with a signing certificate. In this case, there is no interaction with the user. The signature is internally verified and the signing certificate is verified to be issued by a customer root certificate that is already installed on the IP Deskphone.
- If the authentication of the file is successful, the customer root certificate is installed on the IP Deskphone in the trusted certificate store.

Important:

Although the certificate file usually contains a single customer root certificate, it is possible that the certificate file may contain more than one certificate and CRL. This occurs where the PEM encoding for each certificate or CRL is appended in the file with a blank line between each file. If the authenticity of the file is successfully verified, all entities in the file are installed on the IP Deskphone.

When the IP Deskphone tries to establish a secure connection (for example, HTTPS, SIP TLS) with a server, the server provides its certificate which then must be verified by the IP Deskphone.

The following are the possible configurations (depending on the server configuration):

- 1. Server can provide only its Server certificate.
- 2. Server can provide the entire certificate chain (up to the Root CA certificate).

In the first scenario, the IP Deskphone only needs the CA certificate which was used to sign the Server certificate. The certificate file must be PEM encoded.

In the second scenario, every certificate in the chain must be verified. Root and Intermediate CA certificates of the chain must be installed in the IP Deskphone Trusted Certificates store. Certificates must be PEM encoded and combined into one file.

Signing a resource file

The following is the command to sign a resource file using openss1.

```
openssl smime -sign -in unsigned_file -signer sign_cert_file -outform PEM -binary -inkey sign cert pk file -out tmp signature file
```

The first customer root certificate must either be signed by a Avaya Trusted Certificate or Fingerprint accepted. To control further signing of a customer root certificate, and prevent security risks, the following Security Policy parameter must be configured.

```
CUST CERT ACCEPT - VAL NO CHECK
```

Device certificate installation

A device certificate is a certificate used to prove the identity of the IP Deskphone to a server while establishing various secure connections, such as TLS and HTTPS, between the IP Deskphone and a server. Each device certificate is associated with a specific usage purpose. It is possible for one or two device certificates to be installed on the IP Deskphone (for example, one for all TLS connections and one for VPN). A Device Certificate Profile (DCP) allows for various combinations of sharing device certificates among different applications. Within the DCP, you can identify one of more uses (or purposes) for the device certificate associated with each profile, to provide a flexible model for the sharing of device certificates among IP Deskphone applications.

The following sections describe the process used to install a device certificate on the IP Deskphone. This process starts with defining a DCP for each device certificate that must be installed on the IP Deskphone. See <u>Device certificate profiles</u> on page 247.

The two methods used to install a device certificate on the IP Deskphone are:

- SCEP
- PKCS#12 download

SCEP is a protocol that allows the IP Deskphone to send a device certificate request to a CA server based on a locally generated private key to provide more security for the private key (because the private key is never transmitted, even in an encrypted form). See SCEP on page 252

PKCS#12 is an industry standard for exchanging certificate and private keys. A device certificate downloaded to the IP Deskphone in a PKCS#12 file contains the complete certificate including the private key of the device certificate which is generated offline by a Certificate Authority (CA). The PKCS#12 file is encrypted using password at the time of generation to protect the private key. See PKCS 12 download on page 254.

For more information on defining a device certificate profile, see <u>Device certificate profiles</u> on page 247.

Device certificate profiles

You can determine the method used to install a device certificate on the IP Deskphone. Each device certificate installed on the IP Deskphone is attached to a Device Certificate Profile (DCP). The configuration of the profiles allows you to determine the method used to install a device certificate and provides you with some control over the device certificate attributes.

You can do the following:

- Specify the method used to obtain a device certificate for the IP Deskphone (SCEP or PKCS#12).
- Specify the purpose of a device certificate; whether the certificate is used for EAP-TLS, or HTTPS (for example, allow sharing of device certificates).
- Renew a device certificate obtained by SCEP.
- Customize attributes requested from a SCEP server such as the Distinguished Name (DN).

The following table defines the profile attributes and the allowed values for a device certificate profile.

Table 75: Device Certificate Profile Attribute

Name	Туре	Value(s)	Default	PKCS#12 Required	Description
Index	Int	>0	Pre-defined [1- MAX_PROFILES]	V	Device Certificate Profile index.
Version	String		IIII	V	String containing version of last installed PKCS12 file.
Source	Int	0 = SCEP	Index 1 = 0	✓	SCEP is default for
		1 = PKCS12	Index 2+ = 1		the first profile. PKCS12 is default for the other profiles.
Active	Int	0 = Inactive	Index 1 = 0	V	Specifies if the
		1 = Device	Index 2+ = 1		profile is active and if the profile is used for
		2 = User (future)			device or user authentication. The value 0 indicates that the device certificate with this index is not used (regardless of the Source value).
Purpose	Int	Bit flags	-1 (ALL)	•	Covers all feature usages plus special cases for All(=–1).
Delete	Int	0 = No 1 = Yes	0	~	Used to force a device certificate to be deleted. Automatically resets to 0 after a certificate is deleted.
CAServerName	String		AdminCA1	×	AdminCA1 is a default for backward compatibility with previous UNIStim versions.
HostnameOverrid e	String		""	×	Override hostname for this certificate only (only for SCEP). The default is empty because the default is not used.

Name	Туре	Value(s)	Default	PKCS#12 Required	Description
Renew	Int	-1 = Never 0 = Immediate >0 = # Days	30	×	Number of days remaining to request a new device certificate.
AutoCN	Boo1	0 = Manual 1 = Auto	1	×	Auto means that the common name (CN) is automatically populated with the UPN as in UNIStim 3 (for example: hostname@domainn ame). This is provided for backward compatibility.
CN	String		""	×	Common Name
0	String		""	×	Organization

Name	Туре	Value(s)	Default	PKCS#12 Required	Description
					domain name configurations.
IPAddress	Boo1		0	×	Include in SCEP request if configured. Content from current hostname and domain name configurations.

With the exception of the version, all the DCP configurations described in the preceding table apply to SCEP-requested device certificates. The PKCS#12 column identifies the limited set of parameter that apply to a DCP configured for PKCS#12. Many of the parameters apply only to the configuration of a certificate request, which is why the parameters apply only to SCEP.

The following describes the key profile attributes:

Index

The Index is the index of the device certificate profile. For each type of IP Deskphone, there is a fixed number of profiles available in the range of 1 to MAX_PROFILES. The index also identifies a priority. When a device certificate is requested for a specific purpose, such as EAP-TLS, the IP Deskphone searches through the device certificates to find the first one that is defined, active and can be used for the requested purpose.

Source

The Source identifies if the IP Deskphone requests the device certificate using SCEP or if the device certificate is downloaded using PKCS#12. If PKCS#12 is specified, direct action is not taken. This allows a downloaded device certificate to be installed in this profile.

Active

If the Active attribute is not active, the IP Deskphone assumes that there is no device certificate associated with the profile and takes no action to request one (even if SCEP is specified as the source).

CAServerName

CAServerName is the name of a CA server that is sent in the initial SCEP request to get the CA root certificate. Although some SCEP servers ignore the CAServerName, the CAServerName is important for EJBCA, and to differentiate between multiple CAs on a single server.

Important:

CAServerName must not be confused with the URL specified for the CA server which is used to make the SCEP connection.

AutoCN

The AutoCN parameter indicates if the CN in an SCEP certificate request should be automatically populated based on the Hostname and Domain Name configuration parameters.

The Hostname and Domain Name parameters are part of the overall IP Deskphone configuration and are not configurable within each DCP.

- If AutoCN is configured as 1 (True), then the CN is constructed as Hostname@Domainname.
- If AutoCN is configured as 0 (False), then the CN is configured as the value of the CN parameter in the DCP.
- Purpose The Purpose attribute uses bit masks to identify what features a particular device certificate is used for. Two bytes allows for any combination of up to 16 uses. For example, a certificate that is used for EAP-TLS, DTLS and SCR have the purpose value of 97 (1+32+64).

The following table defines the values of the device certificate profile purposes.

Table 76: Device certificate profile purpose definitions

Application purpose of usage	Value (hexidecimal)	Value
EAP-TLS	0x0001	1
SIP-TLS	0x0002	2
HTTPS	0x0004	4
LICENSING	0x0080	128
ALL	0xffff	-1

The default configurations for DCP #1 allow DCP #1 to be active and to use SCEP to retrieve a device certificate that can be shared among all applications (purpose is ALL). All remaining profiles are configured for PKCS#12 and to be inactive by default. The default configurations are compatible with UNIStim 4 software. SIP 3.0 supports two profiles; SCEP and PKCS12.

To configure applications on the IP Deskphone, you must know which certificates are required and what methods of device certificate installation are available. You can use this knowledge to determine which profiles must be configured and how the certificates are shared among the different applications. You must als

To configure applications on the IP Deskphone, you must know the following information:

- · the required certificates
- · the methods of device certificate installation
- · the profiles that must be configured
- the method of sharing certificates among different applications
- the certificate attribute requirements (such as, subject, subjAltName, and key usage) for each
 use

The profile index is part of the provisioning parameter name. For example, the parameter to assign the source (SCEP or PKCS#12) for DCP #2 is the following: dcpsource2

The following is an example of the provisioning file, system.prv, that shows some of the device certificate profile attributes that are provisioned when SCEP is used to install a device certificate.

```
dcp_source1=scep;
dcp_active1=y;
dcp_purpose1=eds; # EAP-TLS, DTLS, SCR
    dcp_renew1=60; # 60 days before expiry
    dcp_autocn1=n;
dcp_attrcn1="My Name";
```

Figure 24: Example of the provisioning file, system.prv

SCEP

Simple Certificate Enrollment Protocol (SCEP) is a process used to obtain a certificate. This process occurs between the IP Deskphone that requires a certificate and a trusted CA that is responsible for providing certificates.

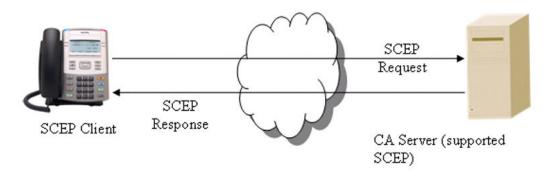

Figure 25: SCEP Client-Server interaction

The IP Deskphone can require several device certificates. You can request an individual device certificate for each application, or you can request a device certificate to be shared among applications.

The following describes the enrollment process for the IP Deskphone for which a device certificate profile is properly configured for SCEP. The following process is executed by the IP Deskphone for every active Device Certificate Profile (DCP) on the IP Deskphone that is configured for SCEP.

- 1. After the IP Deskphone starts up, the IP Deskphone automatically generates a private-public key pair for each Device Certificate Profile configured on the IP Deskphone for SCEP.
- The IP Deskphone uses the SCEP GetCACert command to retrieve a customer root certificate from the CA server and prompts the administrator to validate the certificate fingerprint before the IP Deskphone stores the root certificate permanently on the IP Deskphone.

- 3. The IP Deskphone prompts the user to enter a password to be included in the certificate request the IP Deskphone is about to generate. A password may or may not be required depending on the configuration of the SCEP/CA server.
- 4. The IP Deskphone generates a device certificate request which is forwarded to the certificate authority using the SCEP command PKCSReq.
- 5. After the device certificate request is approved, the CA signs the device certificate request with the CA private key and returns the completed certificate to the IP Deskphone.
- 6. The IP Deskphone stores the device certificate and the IP Deskphone private key into the IP Deskphone memory with the matching private key.
- 7. The IP Deskphone can now verify the identity of the device certificate when requested by a server.

During the enrollment process, and before the IP Deskphone sends the device certificate request to the CA server, the IP Deskphone prompts the administrator to enter a challenge password. The use of a password is optional depending on the configuration of the SCEP server. If the SCEP server is configured to not require a password, the administrator does not enter a value and presses the OK Context-sensitive soft key.

The name included in the device certificate request is constructed using the hostname and domain name shown in the Network Configuration screen immediately under the CA server. If there is no hostname entered, a hostname is created using the IP Deskphone MAC address according to the form NTIPP012345, where NTIPP is an acronym for IP Deskphone and 012345 are the last six hex digits of the MAC address. By default, the certificate request includes a Subject Common Name in the form of hostname@domainname. The SCEP configuration fields in each DCP provide more flexibility in the form and location of this name.

Device Certificate Authentication Considerations for SCEP

An important aspect of the device certificate request is the format and location of the name that is requested for the device certificate. The server presented with a device certificate by the IP Deskphone always confirms the authenticity of the certificate by verifying that the issuer of the device certificate is trusted by the server and that the signature on the device certificate is authentic by performing certificate chain validation. A server also performs verification based on the name contained in the device certificate must be appropriate to the type of authentication that the server uses. The Subject Common Name (CN), the full Subject Distinguised Name (DN), or the Subject Alternate Name (SAN) is used to determine if the entity has the necessary permissions.

For example, if Microsoft IAS is used as the RADIUS server for EAP-TLS authentication, the CN in the certificate must be the User Principle Name (UPN) of a valid user registered in the Active Directory configured for remote access. Other RADIUS or TLS servers can impose different conditions on the certificate name.

Important:

Before deploying any solution, you must identify what certificate validation criteria is enforced so that the correct certificate name is requested by the IP Deskphone.

Important:

Some SCEP servers reject all SCEP certificate signing requests that include a Subject Alternate Name (SAN). The Microsoft Windows 2003 Server version of SCEP is an example where a certificate request which includes a SAN is always rejected.

During the enrollment process and before the IP Deskphone sends the device certificate request to the CA server, the IP Deskphone prompts you to enter a challenge password. If the password feature is disabled in the SCEP server, you do not require a password.

A certificate requested by SCEP is stored in Profile 0 and uses some hard-coded attributes for requested certificates.

The following table lists additional provisioning file parameters for SCEP support in addition to UI parameters in the Device settings window.

Table 77: SCEP provisioning parameters

Parameter	Purpose	Default	Allowed
CA	SCEP server	Empty	String
			Example:
			http://47.11.15.206/certsrv/mscep/mscep-err.dll
CA_DOMAIN	Domain	Empty	String
	information used in SCEP request		Example:
	m cozi roquoti		IpClients.com
HOST_NAME	Host name	Empty	String
1	information used in SCEP request		Example:
	332. Toquot		1234

PKCS 12 download

PKCS#12 is an industry standard for importing and exporting keys and their related certificates. On the IP Deskphone, this method is only used to import the IP Deskphone device certificate and private key.

The IP Deskphone can download a PKCS#12 file from the provisioning server. The provisioning configuration file (for example, 11xxe.cfg), contains the [DEV_CERT] section where the FILENAME attribute points to the PKCS#12 file name. The file name must include the * symbol which is

substituted with the IP Deskphone MAC address to allow the definition of unique filenames for the PKCS#12 files containing the device certificates for each IP Deskphone.

The following is an example of the [DEV_CERT] section:

```
[DEV_CERT]
FILENAME "*.p12" #
VERSION <n>
PROFILE <n> # profile index
PURPOSE <bit> # bitflag with all purposes it can be used for # (default is -1 = ALL)
```

Figure 26: Example of the [DEV_CERT] section

The administrator is responsible for creating the PKCS#12 file with the required device certificate associated with the private key of the device certificate. The PKCS#12 file must be in Distinguished Encoding Rules (DER) or BER format. If you are creating the certificate for the first time, you must mark the private key of the certificate as exportable. If you export a certificate to a PKCS#12 file, you must enter a password.

Important:

The PKCS#12 password cannot exceed 12 characters in length and must include only characters that you can enter on the IP Deskphone. These characters include all numbers, upper and lower case letters, and the following special characters: _ - . ! @ \$ % & + : ^

Installing a device certificate using PKCS 12

The high level sequence of procedures for installing a device certificate using a PKCS#12 file is as follows:

- 1. The PROFILE Index can range from 1 to the maximum number of supported Device Certificate Profiles (DCP) for the IP Deskphone type.
 - Configure the DCP for the specified index for a PKCS#12 downloaded certificate, otherwise the file is rejected. By default, profile 1 is configured for SCEP and all other profiles are configured for PKCS#12.
- 2. The IP Deskphone checks the version in the [DEV_CERT] section against the version stored in the specified PROFILE. If the version in the specified profile is missing or is older, the device certificate file is downloaded. The profile index is 1.
- 3. Download the file.
- 4. Enter the PKCS#12 protected password.
- 5. Validate the device certificate to ensure that you entered the correct password.
- 6. Extract the private key and device certificate.
- 7. Validate the device certificate to ensure the following:
 - the correct password is entered

- Key size is >= to the value specified in the Security Policy File
- · Key Algorithm is DSA
- · the certificate is not revoked
- the certificate is not expired
- 8. If the IP Deskphone has correctly validated the device certificate, the IP Deskphone stores the device certificate and private key in the device certificate profile specified in the [DEV_CERT] section of the IP Deskphone memory (SFS).
 - The version specified in the [DEV_CERT] section is stored in the profile for future reference when determining if a new device certificate is available for download.

The PKCS#12 imported certificate is stored in Profile 1.

Certificate Trust Line (certificate verification)

There are two methods to validate a certificate before the IP Deskphone can use it:

- Certificate Revocation List (CRL) The Certificate Revocation List method has a limitation in the number of CRL entries used due to the limitation of the IP Deskphone memory. It supports up to 100 CRL entries.
- Certificate Trust List (CTL) The Certificate Trust Line is a collection of certificates bundled
 together into a file and downloaded into the IP Deskphone. The file is signed and all of the
 certificates in the bundle are inherently trusted by the IP Deskphone (id the file signature is
 verified). You can use the CTL in place of a CRL because in the IP Deskphone, the CTL is
 much smaller than the CRL.

The IP Deskphone uses CTL to verify the various network elements such as proxy servers and provisioning servers. For the IP Deskphone to trust any network element, the certificate of the IP Deskphone must be added to the CTL.

The use of CTL is optional. If CTL is not installed on the IP Deskphone, the authentication of the network element reverts back to the default which is to authenticate the certificate chain to a root certificate trusted by the IP Deskphone.

A file is signed by appending a digital signature which is created using a Signing Certificate. The Signing Certificate must either be directly issued by a CA root certificate installed on the IP Deskphone, or there must be a certificate chain that can be followed which ends with a CA root certificate installed on the IP Deskphone. In either case, the IP Deskphone must have a trust anchor which can verify the authenticity of the Signing Certificate.

The file Signing Certificate requires the following minimum attributes:

- Version—3
- · Key usage—Digital Signature
- Extended key usage—Code signing and secure email
- Key—1024 or 2048 bits

In addition, the Signing Certificate cannot be a self-signed root certificate and must have a valid Subject Key Identifier and an Authority Key Identifier (which uniquely identifies the issuing certificates).

Validating a certificate using the Certificate Trust List

The high level sequence of procedures for validating a certificate using the Certificat Trust List is as follows:

- Create the CTL file including start date, expire date and a list of certificates concatenated together in PEM format so that the entire file can be signed by a trusted entity. A signed CTL file consists of the following:
 - Validity fields
 - NOT_VALID_BEFORE: 23/11/2007 11:12:13
 - NOT VALID AFTER: 25/10/2011: 22:23:24
 - · Original unsigned file content
 - · Digital signature

The parts are appended together with the Validity periods first, followed by the certificates, and then by the digital signature. The signature must be in the form of a PKCS7 detached signature of the file in PEM format. A detached signature is a signature that does not embed the content that is signed.

The IP Deskphone does not accept unsigned CTL files. After a CTL file is accepted, the included certificates are added to the trusted certificate store of the IP Deskphone.

Important:

Do not insert additional characters between the Certificate and the Digital Signature. Otherwise, the validation fails. Do not change any information from the original file content that was used to create the signature. Otherwise the signature becomes invalid and you must create a new signature.

- 2. The CTL is provisioned to the IP Deskphone in a secure way. Avaya recommends that you use HTTPS as the secure method to download the CTL file to the IP Deskphone.
- 3. The IP Deskphone checks the validity periods as follows:
 - Not Valid Before—Not used
 - Not Valid After—The IP Deskphone checks this when
 - The CTL file is downloaded.
 - Every 24 hours.
 - When a remote certificate is presented to the IP Deskphone.
 - The CTL is expired; the CTL is deleted and an event is logged in the security log.

4. After the IP Deskphone starts a TLS channel with a server (EAP or TLS) and receives a server certificate, the IP Deskphone validates the certificate by checking the availability of the certificate in the CTL and to decide whether to trust the certificate or not. If the server certificate is not in the CTL, the server certificate is rejected and a TLS channel is not established.

The administrator has to ensure that the CTL is up-to-date. If a new CTL is downloaded to the IP Deskphone, the old CTL file is overwritten by the new one.

The IP Deskphone can trust up to ten server certificates in the CTL file.

The following is an example of a CTL file.

```
NOT_VALID_BEFORE: 23/11/2007 11:12:13
NOT_VALID_AFTER: 25/10/2011 22:23:24
----BEGIN CERTIFICATE----
// the content of the certificate goes here
----END CERTIFICATE----
----BEGIN PKCS7-----
// the content of the digital signature goes here

Figure 27: Example of a CTL file

Certificate Administration

The administrator can view and delete certificates. Because a certificate can be deleted, it is critical that the administrator password to access this function is protected and limited only to those individuals who absolutely require it.

Certificate administration is accessed through the Diagnostics menu.

To view Certificate Administration option in Diagnostics menu, configure the following parameter in Security Policy:

CERT ADMIN UI ENABLE YES

The default value is NO.

After the Security Policy file is enabled, to access the Certificate Administration screen, from the Network screen, choose, Device Settings, Diagnostics, and then Certificate Administration.

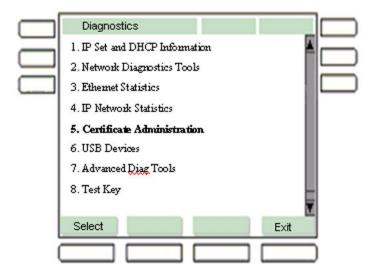

Figure 28: Diagnostics main menu

The following table describes the function of the Navigation keys for the Diagnostics menu.

Table 78: Navigation

Key	Action
Up and down arrows	Use the up and down arrows to change the selected item in the list.
Enter	Invokes the Select Context-sensitive soft key.
Digital keys (number associated with option)	Invokes an appropriate option.
*	Selects the first option Server Settings, but does not activate it.
#	Selects the last option Lock, but does not activate it.

Certificates Administration main menu

The certificates administration screen displays the following options:

- · Trusted Certificates
- · Device Certificates
- CRL

• CTL

To access the Certificates Administration screen, from the Diagnostics menu, select Certificates Administration.

Figure 29: Certificates administration main menu

The following table describes the function of the Context-sensitive soft keys for the Certificates Administration screen.

Table 79: Context-sensitive soft keys for the Certificates Administration screen

Context-sensitive soft key	Action
Select	Selects the required option.
Back	Returns you to the Diagnostics menu.

Trusted Certificates screen

The Trusted Certificates screen displays a list of subject Common Name (CN) of the trusted certificates as shown in the following figure:

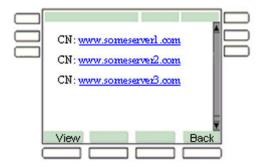

Figure 30: Trusted Certificates screen

The following table describes the function of the Context-sensitive soft keys for the Trusted Certificates screen.

Table 80: Context-sensitive soft keys for the Trusted Certificates screen

Context-sensitive soft key	Action
View	Displays the information of the selected Trusted Certificate which includes the following:
	Common Name (CN)
	Serial Number (SN#)
	Expiry Date
	Certificate Status (such as OK or Expired)
Back	Returns you to the previous screen.

Figure 31: Trusted Certificates details

The administrator can delete the certificate in the "Detailed Mode" by using the Delete Contextsensitive soft key. Deletion does not happen automatically; the IP Deskphone displays a warning confirmation screen.

The following table describes the function of the context-sensitive soft keys for the Trusted Certificates Details screen.

Table 81: Context-sensitive soft keys for the Trusted Certificates Details screen

Context-sensitive soft key	Action
Delete	Displays a warning confirmation. Deletes the selected certificate.
Back	Returns you to the previous screen.

Device Certificates screen

The Device Certificates screen displays a list of subject Common Name (CN) of device certificates as shown in the following figure:

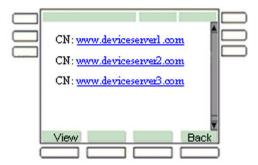

Figure 32: Device Certificates screen

The following table describes the function of the Context-sensitive soft keys for the Device Certificates screen.

Table 82: Context-sensitive soft keys for the Device Certificates screen

Context-sensitive soft key	Action
View	Displays the information of the selected Device Certificate which includes the following:
	Common Name (CN)
	Serial Number (SN#)
	• Usage
	Expiry Date
	certificate profile index
	Status (such as, OK or Expired)
Back	Returns you to the previous screen.

Figure 33: Device Certificate details

The administrator can delete the certificate in the "Detailed Mode" by using the Delete Contextsensitive soft key. Deletion does not happen automatically; the IP Deskphone displays a warning confirmation screen.

CRL screen

The CRL screen displays a list of CA issued CRLs stored in the IP Deskphone, as shown in the following figure:

Figure 34: CRL screen

The following table describes the function of the Context-sensitive soft keys for the CRL screen.

Table 83: Context-sensitive soft keys for the CRL screen

Context-sensitive soft key	Action
View	Displays the information on the selected CRL Issuer which includes the following:
	CRL Issuer
	Issued date
	 List of serial numbers that belong to the CRL associated with the revocation date.
Back	Returns you to the previous screen.

The following figure is an example of the CRL Details screen for the CRL Issuer www.ca1.com.

Figure 35: CRL details

If you delete a Trusted Anchor Certificate, the CRL issued by the anchor is also deleted.

CTL screen

The CTL screen displays a list of subject Common Name (CN) of the CTL certificates as shown in the following figure:

Figure 36: CTL certificate screen

The following table describes the function of the Context-sensitive soft keys for the CTL screen.

Table 84: Context-sensitive soft keys for the CTL screen

Context-sensitive soft key	Action
View	Displays information on the selected certificate which includes the following:
	Common Name CN)
	Serial Number (SN#)
	Expiry Date
	Certificate Status (such as, OK or Expired)
	•
Delete	Displays a warning confirmation. Deletes the CTL.
Back	Returns you to the previous screen.

After you press the View Context-sensitive soft key on the required certificate, information about the certificate you selected appears on the screen.

The following figure is an example of the CTL Certificate Details screen for the certificate www.ctlserver1.com.

Figure 37: CTL Certificate details screen

You can use the PDT shell command to view an installed CTL.

The following is an example command with the output of the command.

```

```

Figure 38: Example of command output

Important:

The CTL file size must not exceed 20 Kbytes.

EAP Authentication

EAP-enabled networks allow the administrator to ensure that individual devices or users are authorized to access the enterprise's LAN environment.

The following diagram shows the network architecture for 802.1x and EAP.

Figure 39: 802.1x and EAP network architecture

IEEE 802.1x defines three roles:

- a supplicant—an entity that requires access to the network for use of its services.
- an authenticator—the network entry point to which the supplicant physically connects, typically
 a Layer 2 switch. The authenticator acts as a proxy between the supplicant and the
 authentication server and controls the access to the network based on the authentication
 status of the supplicant.
- an authentication server—typically a RADIUS server; performs the actual authentication of the supplicant.

There are three supported EAP methods:

- EAP-MD5
- EAP-TLS
- EAP-PEAP/MD5

The administrator selects the EAP method from the EAP configuration menu, as shown in the following figure:

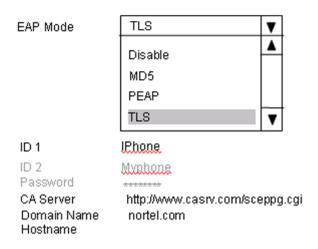

Figure 40: EAP configuration menu

The administrator can do the following:

- When EAP-MD5 is selected, the administrator is prompted to enter ID1 and Password.
- When EAP-PEAP is selected, the administrator is prompted to enter ID1, ID2 and Password. If the administrator enters only ID1, then ID2 has the same value of ID1.
- When EAP-TLS is selected, the administrator is prompted to enter ID1. If SCEP is used to
 install the device certificate, the administrator is required to enter the CA Server (URL of the
 SCEP service), the Domain Name which the IP Deskphone belongs to, and the Hostname
 (optional).
- When Disable is selected, the existing IDs and passwords are erased.

The following is a list of additional provisioning file parameters for EAP support in addition to the UI parameters on the Device Settings screen

Table 85: EAP Provisioning Parameters

Parameter	Purpose	Default	Allowed
EAP	EAP mode	DISABLED	DISABLED/MD5/PEAP
EAPID1	Device ID1	Empty	String (4 to 20 characters)
EAPID2	Device ID2	Empty	String (4 to 20 characters)
EAPPWD	Password	Empty	String (4 to 12 characters)

EAP Authentication failures are logged using event 1033.

The following is an example of a TLS authentication failure

1033 [Minor] [FRI MAY 15 13:48:06 2009] [10223] [n:/fw/build/../bsp/vxWorks/common/dot1x/Supplicant/moceap_tls.c:147] - EAP-TLS Failed to Authenticate

The following sections describe the behavior of each method:

EAP Disabled

EAP disabled is the factory default setting. The IP Deskphone does not send a message to the authenticator upon startup, and normal network access is attempted. If the IP Deskphone receives a Request-Identity message from the Layer 2 switch, the Request-Identity is ignored. If the Layer 2 switch requires 802.1x authentication, the IP Deskphone is blocked from the network, and the administrator must enable the EAP feature on the IP Deskphone and configure a DeviceID and Password (if required) to access the network after the IP Deskphone is successfully authenticated. Or, the administrator can plug the IP Deskphone to an EAP disabled port on the Layer 2 switch.

EAP-MDS

EAP-MD5 allows the IP Deskphone to authenticate to the RADIUS server before the IP Deskphone can access the network. This procedure requires a user ID and password. If the IP Deskphone fails to authenticate to the RADIUS server, the IP Deskphone displays a "EAP Authenticate-Fail" message, and the IP Deskphone cannot access the network.

EAP-TLS

EAP-TLS allows the IP Deskphone to authenticate to the RADIUS server before the IP Deskphone can access the network. This procedure requires a user ID, root certificate, and device certificate. The root and device certificates must be installed on the IP Deskphone before using this feature. The customer root certificate can be installed using SCEP or SIP configuration file. For more information, see Root certificate installation on page 245 and Table 77: SCEP provisioning parameters on page 254.

The device certificate can be installed using one of two methods:

- SCEP on page 252
- PKCS 12 download on page 254

If the IP Deskphone fails to authenticate to the RADIUS server or to install the required certificates, the IP Deskphone displays a "EAP Authenticate-Fail" message, and the IP Deskphone cannot access the network.

EAP-PEAP

EAP-PEAP allows the IP Deskphone to authenticate to the RADIUS server before the IP Deskphone can access the network. This procedure requires a user ID1, root certificate, user ID2, and password. EAP-PEAP is the outer authentication protocol that requires a user ID1 and root certificate to establish a TLS channel. EAP-MD5 is the inner authentication protocol that requires a user ID2 and password to pass through this channel in a secure mode. The customer root certificate can be installed using SCEP or SIP configuration file. For more information, see Root certificate installation on page 245.

If the IP Deskphone fails to authenticate to the RADIUS server or to install the required certificates, the IP Deskphone displays a "EAP Authenticate-Fail" message, and the IP Deskphone cannot access the network.

EAP Re-authentication

The re-authentication process proceeds in the background without disturbing the ongoing operation of the IP Deskphone. If the re-authentication fails or times out, the IP Deskphone becomes

inoperable. Re-authentication interval is controlled by the Layer 2 switch re-authentication interval parameter. The minimum supported re-authentication interval when EAP-MD5 and EAP-PEAP are configured is 10 seconds; for EAP-TLS, the minimum interval is 20 seconds.

Provisioning configuration file download

Securely download provisioning configuration files through HTTPS.

Provisioning configuration files download through HTTPS

The IP Deskphone can contact a provisioning server and download an 12xxSIP.cfg file to identify additional files and protocols used. When a file is identified, and the protocol specified in the "protocol" parameter is HTTPS, the IP Deskphone contacts the target server and negotiates a TLS connection. Then, the IP Deskphone downloads the specified file and terminates the connection.

HTTP connection over TLS is established by using single or mutual authentication.

HTTPS support in BootC mode

When a firmware upgrade is performed and there is not enough memory to allocate a buffer for new firmware, the IP Deskphone automatically reboots and BootC is loaded. HTTPS is supported for downloading provisioning files (for example, 1220SIP.cfg) and firmware images from the Provisioning Server. It uses the embedded and customer certificates that are installed on the IP Deskphone.

BootC downloads the provisioning file (for example, 1220SIP.cfg). Only the [FW] section of this file is processed. BootC uses the same settings (for example, Provisioning Server URL, protocol) that are used in normal mode. BootC performs the firmware upgrade, and the IP Deskphone automatically reboots again. The IP Deskphone starts up with new firmware in Normal mode.

Note:

Regardless of whether the firmware upgrade was successful or not, the [FW] section does not offer to update during the IP Deskphone reboot

Both mutual authentication and server-only authentication methods are supported. The TLS connection cipher is set according to the security policy configured on the IP Deskphone (the security policy must be configured in Normal mode). The default cipher is TLS_RSA_WITH_AES_256_CBC_SHA.

Important:

Customer certificates must be installed in Normal mode.

Single Authentication

A server certificate, user name, and password are required to establish TLS connection between the IP Deskphone and the provisioning server. The server certificate must be signed by a certificate authority. The IP Deskphone uses the server certificate to validate the identity of the provisioning server that the IP Deskphone is connected to; the provisioning server uses the user name and password to authenticate the IP Deskphone. The IP Deskphone must be preloaded with the root certificate used in signing the server certificate. The root certificate is downloaded to the IP Deskphone by connecting to a provisioning server through EAP-MD5, and using one of the insecure protocols supported by the IP Deskphone, such as HTTP, TFTP or FTP. EAP-MD5 ensures that the connection between the IP Deskphone and the provisioning server is secure. The user name and password are required to authenticate the IP Deskphone to the provisioning server and must be loaded in a secure manner before the IP Deskphone establishes the HTTPS connection with the provisioning server. There is no mechanism for getting a user name and password on the IP Deskphone in a secure "no-touch" manner; the IP Deskphone must be deployed to a secure network where the TFTP download of insecure files is not transmitted over an insecure network.

Mutual Authentication

A device certificate and server certificate are required to establish TLS connection between the IP Deskphone and the provisioning server. The server certificate must be signed by a certificate authority. The IP Deskphone uses the server certificate to validate the identity of the provisioning server that the IP Deskphone is connected to; the provisioning server uses the device certificate to validate the identify of the IP Deskphone. The IP Deskphone must be preloaded with the root certificate used in signing the server certificate. The root certificate is downloaded to the IP Deskphone by connecting to a provisioning server through EAP-MD5, and using one of the insecure protocols supported by the IP Deskphone, such as HTTP, TFTP or FTP. EAP-MD5 ensures that the connection between the IP Deskphone and the provisioning server is secure. The administrator can use the existing device certificates, such as EAP-TLS or SIP-TLS device certificate, instead of having a special device certificate for HTTPS, to establish mutual authentication. For details about device certificate installation and certificate profiles, see Device certificate installation on page 247.

Security and error logs

You can access the Security Log and the Error Log to view errors and failures that may have occurred during the operation of the IP Deskphone.

Before you can access the Security and Error Logs, you must configure the Security Policy file with the following parameter:

SECURITY LOG UI ENABLE YES

If configured as yes, you can access the Security and Error Logs from the **Network** screen, by choosing CTL download error: **Device Settings > Diagnostics > Security and Error Logs**.

The Security and Error Logs are stored in the Logs folder. To access the Security and Error Logs, select **File Manager > Logs folder**, and then press the **Services** key.

The Logs main menu lets you choose one of the following options:

- 1. Security Log
- 2. Error Log

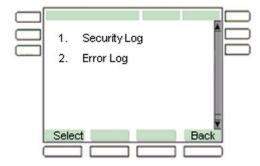

Figure 41: Logs main menu

When the user selects a log file, the screen displays each log item on a full screen, as shown in the following figure:

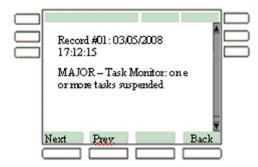

Figure 42: Log item screen

The following table describes the function of the Context-sensitive soft keys for the log item screen.

Table 86: Context-sensitive soft keys for the log item screen

Context-sensitive soft key	Action
Next	Navigates to the next log entry.
Prev	Navigates to the previous log entry.
Back	Returns you to the Logs main menu.

Security policy file updates

The security policy file contains a set of rules for certificate-based authentication on the IP Deskphone. The rules include the following:

- CERT_ADMIN_UI_ENABLE Determines if the Certificate Administration user interface is enabled on the IP Deskphone. The acceptable values are YES and NO; the default value is NO.
- SECURITY_LOG_UI_ENABLE Determines if the Security Log user interface is enabled on the IP Deskphone. The acceptable values are YES and NO; the default value is NO.
- KEY_SIZE The default size used when generating keys on the IP Deskphone. Acts as the minimum allowed key size that should be enforced when loading certificates from the IP Deskphone. The acceptable values are:
 - KEY SIZE 1024
 - KEY_SIZE_1536
 - KEY_SIZE_2048

The default value is KEY_SIZE_1024.

- KEY_ALGORITHM The preferred key generation algorithm. The acceptable value is:
 - KEY ALG RSA
- DWNLD_CFG_SIGNING defines if configuration files are forced to be signed when a customer certificate is installed.
 - NO automatically accept the downloaded file without authentication
 - YES file must be signed and fully authenticated

The default is NO.

 CUST_CERT_ACCEPT_VAL_NO_CHECK is added to the existing values (VAL_NO_MANUAL, VAL_MANUAL_A, VAL_MANUAL_B.

The default value is VAL_MANUAL_A).

 SEC_POLICY_ACCEPT is for Security Policy File acceptance (VAL_MANUAL_A, VAL_MANUAL_B.

The default value is VAL MANUAL A)

- SIGN_SIP_CONFIG_FILES Overrides the file signing of a file, such as the device configuration file and the dial plan file. You cannot override the file signing of the Security Policy and Customer Certificates. The acceptable values are:
 - YES—Signing is required.
 - NO—No authentication check is performed.

The default value is NO.

- FP_PRESENTED If the resource file is not signed and if there are no customer certificates, then you are prompted with a Finger Print display with the option to accept or reject
- FP_ENTERED If the resource file is not signed and if there are no customer certificates, then you must manually enter the Finger Print value and then select Accept.

- SUBJ_ALT_NAME_CHECK_ENABLE Checks the Subject Alternative Attribute in the presented certificate. The acceptable values are YES and NO. The default value is NO.
- CERT_EXPIRE is for certification expiration policy. The acceptable values are:
 - DELETE CERT
 - LOG_EXPIRE
 - NO EXPIRE LOG
- DWNLD_CFG_ACCEPT defines how TFTP configuration authenticates when there are no customer certificates on the phone. The default value is VAL_ACCEPT The acceptable values are:
 - VAL_ACCEPT
 - VAL_MANUAL_A
 - VAL_MANUAL_B
- DWNLD_CFG_SIGNING defines if configuration files are forced to be signed when a customer certificate is installed. The default is NO. The acceptable values are:
 - NO automatically accept the downloaded file without authentication
 - YES file must be signed and fully authenticated

Changes made to the security policy file have an entry in the security log file.

SECURITY_POLICY_PARAM_CHANGE

0x1055

The security log file stores only the non-sensitive information. For example, if the password is changed, the security log file indicates this change without storing the password value.

You can use the PDT shell command to view the output of the security policy command.

The following is the output of the securitypolicy command from the PDT shell.

-> securitypolicy

CUST CERT ACCEPT = VAL MANUAL A

SEC POLICY ACCEPT = VAL MANUAL A

SIGN SIP CONFIG FILES = NO

CERT EXPIRE = DELETE CERT

SEC POLICY TEXT = YES

AUTO PRV ACCEPT = VAL ACCEPT

DWNLD_CFG_ACCEPT = VAL_ACCEPT

AUTO PRV SIGNING = NO

DWNLD_CFG_SIGNING = NO

CERT ADMIN UI ENABLE = YES

SECURITY_LOG_UI_ENABLE = YES

KEY SIZE = KEY SIZE 1024

KEY_ALGORITHM = KEY_ALG_RSA

TLS_CIPHER = RSA_WITH_AES_256_CBC_SHA

SUBJ_ALT_NAME_CHECK_ENABLE = NO

FTP_PASSWORD = ****

Certificate Admin option in the user interface

The following procedure provides the steps to view the **Certificate Admin** option in the user interface.

Viewing the Certificate Admin option in the user interface

- 1. Create a text file; for example, SecurityPolicy.txt.
- 2. Add CERT_ADMIN_UI_ENABLE YES in the text file.
- 3. Sign the file using a signing certificate. For example, SecurityPolicy.txt.sig file is created.
- 4. Download the file using the [SEC_POLICY] section in the 12xxSIP.cfg file. An example of the SEC_POLICY section is as follows:

[SEC_POLICY]
DOWNLOAD_MODE FORCED
PROTCOL HTTP

Installation

This section describes the following:

- Device certificate installation using PKCS#12
- · CTL download

Device Certificate Installation

SCEP and PKCS#12 are two methods used to install device certificates. If SCEP is used to install device certificates, see SCEP on page 252 for more information.

The following describes the process of using PKCS#12 to install device certificates.

 The administrator adds a [DEV_CERT] section to 12xxSIP.cfg to let the IP Deskphone import a PKCS#12 file. The following is an example of the format of the [DEV_CERT] section:

Figure 43: Example of [DEV_CERT] section

- The "*" pointed by the FILENAME attribute is substituted with the IP Deskphone MAC address before the IP Deskphone requests the PKCS#12 file. If the IP Deskphone has multiple PKCS#12 files, the administrator must add another ID beside "*". This ID can be the profile index.
- The VERSION attribute determines if the file should be downloaded by comparing this VERSION with the VERSION stored in the corresponding device certificate profile.
- The PROFILE attribute points to the device certificate profile index. The certificate profile index identifies the file name where the profile is stored in the IP Deskphone memory (SFS), and identifies the device certificate profile.
- The PURPOSE attribute identifies device certificate usage. The purpose attribute is a bit
 mask that lets a device certificate be used for multiple purposes; for example, sharing of
 device certificates. These purposes can be:
 - EAP-TLS
 - SIP-TLS
 - HTTPS (optional)
- 2. After 12xxSIP.cfg is downloaded to the IP Deskphone from the provisioning server, the IP Deskphone executes the [DEV_CERT] section and downloads the PKCS#12 file.
- 3. After the PKCS#12 file is downloaded, the IP Deskphone prompts the administrator to enter the PKCS#12 protected password as shown in the following figure.

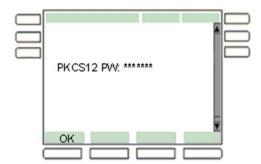

Figure 44: PKCS12 password prompt

Important:

The password can be empty, but the use of an empty password is not recommended except under very controlled conditions.

- 4. After the password is validated, the IP Deskphone extracts the private key and device certificate from the PKCS#12 file.
- The IP Deskphone validates the device certificate to ensure that the device certificate is signed by a trusted CA, is not revoked, and that the key size meets the minimum requirement.
- 6. If the device certificate is validated correctly, the IP Deskphone stores the device certificate and the private key in the IP Deskphone memory (SFS) in the device certificate profile specified in the [DEV_CERT] section.

CTL download

This section describes the process of downloading a CTL file on the IP Deskphone.

1. The administrator adds the [CTL] section to 12xxSIP.cfg to allow the IP Deskphone to download a CTL file. The following is an example of the format for the [CTL] section:

```
[CTL]

DOWNLOAD_MODE AUTO

PROTOCOL HTTPS

FILENAME ctl.pem
```

- 2. After 12xxSIP.cfg is downloaded to the IP Deskphone from the provisioning server, the IP Deskphone executes the [CTL] section and downloads the CTL file.
- 3. After the CTL file is downloaded, the IP Deskphone validates the CTL file to ensure that the CTL file is signed by a trusted entity. If the CTL file is validated correctly, the CTL file is stored in the IP Deskphone memory (SFS).

Upgrade and rollback tasks

The IP Deskphone loaded with secure software cannot downgrade to a previous insecure framework.

SIP configuration file (12xxSIP.cfg)

PKCS12 Import

The [DEV_CERT] section is added to 12xxSIP.cfg to let the IP Deskphone import a PKCS#12 file. The following is an example of the format of the [DEV_CERT] section:

Figure 45: Example of [DEV_CERT] section

- The "*" pointed by the FILENAME attribute is substituted with the IP Deskphone MAC address before the IP Deskphone requests the PKCS#12 file. If the IP Deskphone has multiple PKCS#12 files, the administrator must add another ID beside "*". This ID can be the profile index.
- The VERSION attribute determines if the file should be downloaded by comparing this VERSION with the VERSION stored in the corresponding device certificate profile.
- The PROFILE attribute points to the device certificate profile index. The certificate profile index identifies the file name where the profile is stored in the IP Deskphone memory (SFS), and identifies the device certificate profile.
- The PURPOSE attribute identifies device certificate usage. The purpose attribute is a bit mask
 that lets a device certificate be used for multiple purposes; for example, sharing of device
 certificates. These purposes can be:
 - EAP-TLS
 - SIP-TLS
 - HTTPS (optional)

CTL download

The [CTL] section is added to 12xxSIP.cfg to allow the IP Deskphone to download a CTL file from a provisioning server. The following is an example of the format for the [CTL] section:

```
[CTL]

DOWNLOAD_MODE AUTO

PROTOCOL HTTPS

FILENAME ctl.pem
```

Customer root certificate download

The [USER_KEYS] section is added to 12xxSIP.cfg to allow the IP Deskphone to download a customer root certificate from a provisioning server. The following is an example of the format for the [USER_KEYS] section:

```
[USER_KEYS]

DOWNLOAD_MODE AUTO

PROTOCOL HTTPS

FILENAME custroot.pem
```

Security policy file

The security policy file defines a set of rules to determine the required actions taken by the IP Deskphone. The following is an example of security policy file rules and default actions:

```
CERT_ADMIN_UI_ENABLE NO SECURITY_LOG_UI_ENABLE NO KEY_SIZE 1024 KEY_ALGORITHM KEY_ALG_RSA TLS_CIPHER RSA_WITH _AES_256_CBC_SHA
```

The format of the security policy file, as shown in the preceding example, is parameter-value paired. The parameter name and value are separated by a space.

Diagnostic logs

All EAP failures are logged in the security log which include the following EAP error messages:

EAP_MD5_AUTH_FAILURE	0x1030
EAP_INVALID_DEVICE_CERTIFICATE	0x1031
EAP_INVALID_ROOT_CERTIFICATE	0x1032
EAP_TLS_AUTH_FAILURE	0x1033
EAP PEAP AUTH FAILURE	0x1034

The following is a list of certificate-related events and failures logged in the Security Log.

SLC_AVAYA_CERTIFICATE_IMPORTED	0x0006
SLC_SERVICE_PROVIDER_CERTIFICATE_IMPORTED	0x0007
SLC_AVAYA_CERTIFICATE_REVOKED	0x0008
SLC_SERVICE_PROVIDER_CERTIFICATE_REVOKED	0x0009
SLC_AVAYA_CERTIFICATE_EXPIRED	0x000A
SLC_SERVICE_PROVIDER_CERTIFICATE_EXPIRED	0x000B

Table continues...

.

SLC_CERTIFICATE_DELETED	0x000C

SLC_DEVICE_CERTIFICATE_EXPIRED	0x0019
SLC_CTL_EXPIRED	0x0020
SLC_CTL_DOWNLOAD_ERROR	0x0021

The following is a list of minor errors that are logged in the Security Log.

SLC_AVAYA_CERTIFICATE_EXPIRED_AUTH	0x1002
SLC_SERVICE_PROVIDER_CERTIFICATE_EXPIRED_AUTH	0x1003
SLC_PROVIDER_CERTIFICATE_IN_AVAYA_KEYS_FILE	0x1004
SLC_PKI_MGMT_INIT_FAILURE	0x1005

The following is the Security Policy parameter change event.

Any changes made to the security policy file has an entry in the security log file. For more information, see<u>Security policy file updates</u> on page 272.

Fault management behavior

Authentication failures are indicated by a failure message on the IP Deskphone screen and are reported to the error log files. The administrator can view the security logger by using the PDT or the security log viewer. For more information, see <u>Security and error logs</u> on page 270.

The following is a list of authentication failure messages that appear on the IP Deskphone screen when a failure occurs during the operation of the IP Deskphone:

- EAP Authenticate-Fail—happens when the IP Deskphone fails to authenticate to an authentication server; the message applies for the three EAP methods: EAP-MD5, EAP-PEAP, and EAP-TLS.
- EAP Authenticate-Timeout—happens after the third time the IP Deskphone fails to authenticate to an authentication server and the IP Deskphone is connected to an EAP disabled port on the Layer 2 switch.

For EAP failures logged in the security log, see Diagnostic logs on page 278.

Chapter 26: Security

This section specifies the behavior of the following security features:

- SIP over TLS
- Connection persistence
- SRTP
- SFTP
- SSH

SIP over TLS

To avoid security problems such as message integrity attacks, SIP over TLS uses Transport Layer Security (TLS) to provide secure communication between the IP Deskphone and the SIP proxy.

Transport Layer Security (TLS) protects SIP signaling traffic. It sits on top of the Transmission Control Protocol (TCP), the preferred default protocol for SIP traffic. You can use TLS with a user name and password to provide a means of server-only authentication. IP Deskphone-specific Public Key certificates can provide even stronger mutual authentication of both the server and the IP Deskphone.

Using SIP over TLS protects SIP messages on a hop-by-hop basis. To achieve complete end-toend security through the use of TLS, each element involved in the system must also be capable of securing SIP traffic using TLS.

Connection persistence

Connection persistence allows the IP Deskphone to establish a connection and monitor the connection for failure by using "keep-alive requests.

The IP Deskphone establishes connection with the proxy using the commonly accepted ports. Periodically, based on a configured timer value, the IP Deskphone issues a request to the server to verify that the connection with the server at the TCP level is still active. When the IP Deskphone discovers that the keep-alive packet has not been answered, it attempts to reestablish a connection with the proxy. If this is successful, the IP Deskphone reregisters with the proxy (and sends a new subscription requests where appropriate). If it is not possible to reestablish the connection, the IP

Deskphone falls back into a state where connection attempts are tried periodically based on random, but increasing time periods, in order to give the server adequate time to recover.

SSH and secure file transfer

The Secure Shell Handler (SSH) is a widely-used protocol for providing secure logon access to run commands remotely. To establish a connection, you must access the SSH-capable client, and know the user name and password that is configured on the IP Deskphone through the use of the provisioning system.

Secure File Transfer Protocol (SFTP) lets the administrator securely log on to the IP Deskphone (using the common user name and password shared with SSH/PDT). After you logon, the IP Deskphone displays a list of files on the flash file that you can transfer.

SSH and SFTP configuration parameters

The following table provides a list of SSH and SFTP configuration parameters.

Parameter	Description	Default value	Boundaries
Enable SSH	Enables the SSH server on the IP Deskphone for secure shell access.	Not checked (off)	Not checked (off) Checked (on)
Enable SFTP	Enables the SFTP server on the IP Deskphone for secure FTP access. SSH must be enabled for SFTP to be enabled	Not checked (off) (appears dimmed until SSH is enabled)	Not checked (off) Checked (on)
User ID	The User ID that must be entered when connecting to the IP Deskphone SSH or SFTP.	None	Non-null string Maximum: 11 characters
Password	The password that must be entered when connecting to the IP Deskphone through SSH, SFTP.	None	Non-null string Maximum: 11 characters

UI Properties for Device Settings SSH and SFTP parameters are as follows:

- The User ID field is empty and the Password field displays "****" when both SSH and SFTP are disabled and applied.
- The user can enable SSH or SFTP.
- The user must provide a valid user ID and password when the User ID field is empty, and an application (SSH or SFTP) is selected. If a valid user ID and valid password are not provided,

and the user presses the **Apply** context-sensitive soft key, one of the following error message appears:

- Error: User ID size: 4-12 appears if a valid user ID is not provided.
- Error: Password size: Enter [4..11] chars appears if a valid password is not provided.
- Error: User ID size: 4-12 Error: Password size: Enter [4..11] chars appear if both a valid user ID and a valid password are not provided.

TCP/TLS operation overview

TCP is the alternative protocol the IP Deskphone uses when sending and receiving SIP requests. Avaya recommends TCP for Avaya SIP-enabled entities.

When a server initiates a TCP or TLS connection to the IP Deskphone, the connection only lasts as long as the server chooses to keep the connection open; a persistent connection is not maintained by the IP Deskphone.

How the IP Deskphone uses TCP

TCP is a connection-based protocol, which means the IP Deskphone must first establish a connection with a target. This is done using a three-way handshake. After the handshake process is complete and a connection is made, the IP Deskphone can send data over the TCP connection. The data, which makes up a SIP request, can now be sent and received by either side of the communication.

How the IP Deskphone uses TLS

Transport Level Security (TLS) is a protocol for establishing a secure connection between two endpoints. After a connection is established using TCP, TLS negotiates the cryptographic parameters used to secure the traffic that is sent over that connection. TLS, Public Key Cryptography, and X. 509 certificates provide either mutual or server authentication.

- Mutual authentication occurs when both the client and the server have public key certificates
 assigned, that are used during the TLS handshake, to validate the identity of both
 communicating parties. Both the server and the end point device certificates are "signed" by
 well-known trusted certificate authorities.
- Server authentication occurs when a server has a certificate signed by a certificate authority.
 The certificate is only used for the client to validate the identity of the server it is connected to.
 After the TLS connection is established, the server can identify the IP Deskphone through a user name and password.

How TLS impacts SIP

TLS impacts SIP in the following ways:

• URIs – contain transport parameters used to indicate the preferred method of contact. For example.

Contact: Bob<sip:bob@company.com;transport=tls>

Important:

A transport parameter of TLS indicates that the server or client prefers TLS to be used for communication.

SIP Software Release 3.2 and later adds transport=tls to the contact header when using TCP or TLS.

• VIA header – contains the transport protocol used to send a request. For example, Via: SIP4.1/TLSbob.company.com;; alias

The IP Deskphone attempts to downgrade the allowed protocols if connection attempts are made and fail. In order to avoid the IP Deskphone using an unsecure protocol, only TLS is enabled.

The order of preference for protocols is always: TLS, TCP, and UDP.

You must enable the SIP TLS Listening port for incoming TLS connections to be made.

Certificate requirements

For the IP Deskphone to validate that the server certificate provided by the TLS-enabled proxy matches the connected address, the certificate must contain the IP Addresses of the IP Deskphone.

The server certificate has a Subject Alternative Name field, which contains the IPv4 and IPv6 IP addresses that correspond with the proxy. For example:

```
subjectAltName=IP:192.168.100.100subjectAltName=IP:
2001:0db8:0000:0000:0000:0000:1428:5 7ab
```

Important:

The IP Deskphone must have a device certificate loaded. If the device certificate is not loaded, the IP Deskphone fails to establish a TLS connection with the system.

IP Deskphone security configuration

The following table lists the various security parameters for the IP Deskphone.

Table 87: Provisioning parameters summary

Parameter	Purpose	Default	Allowed
SERVER_TCP_PORT1_	Configures the TCP and	TCP: 5060	Integer
1 SERVER_TCP_PORT1_2	TLS ports used when connecting to the SIP	TLS: 5061	
SERVER_TCP_PORT2_1	domain.		
SERVER_TCP_PORT2_2			
SERVER_TCP_PORT3_1			
SERVER_TCP_PORT3_2			
SERVER_TCP_PORT4_1			
SERVER_TCP_PORT4_2			
SERVER_TCP_PORT5_1			
SERVER_TCP_PORT5_2			
SERVER_TLS_PORT1_1			
SERVER_TLS_PORT1_2			
SERVER_TLS_PORT2_1			
SERVER_TLS_PORT2_2			
SERVER_TLS_PORT3_1			
SERVER_TLS_PORT3_2			
SERVER_TLS_PORT4_1			
SERVER_TLS_PORT4_2			
SERVER_TLS_PORT5_1			
SERVER_TLS_PORT5_2			
SIP_UDP_PORT	Configures the local SIP	UDP: 5060	Integer
SIP_TCP_PORT	listening ports. After you change the listening ports	TCP: 5060	
SIP_TLS_PORT	parameters through the Check For Updates functionality, you must restart the IP Deskphone to apply the modified values.	TLS: 5061	
CONN_KEEP_ALIVE	Configuration values that affect connection persistent.	30	Min: 15 Max: 1800
REGISTER_RETRY_TIME		30	Min: 30 Max: 1800
REGISTER_RETRY_MAX TIME		1800	Min: 600 Max: 1800
KEEPALIVE_RETRIES		3	Min: 0 Max: 10

Table continues...

Parameter	Purpose	Default	Allowed
			See Managing connection persistence on page 292.
SRTP_ENABLED SRTP_MODE	SRTP configuration values.	No	BE-2MLines
		BE-2MLines	BE-Cap Neg
			SecureOnly
SRTP_CIPHER_1 SRTP_CIPHER_2	Allows configuration of the preferred order for SRTP	AES_CM_128_H MAC_SHA1_80,	AES_CM_128_HMAC _SHA1_32
o.t., _o.,	cipher offers.	AES_CM_128_H MAC_SHA1_32	AES_CM_128_HM AC_SHA1_80
			None
LOGIN_NOTIFY	Configures whether or not	Off	Off
	the login banner appears after a successful logon.		Success
			Failure
			Both
LOGIN_NOTIFY_TIME	Configures whether or not	Not checked	Not checked (off)
	the time at which the login success or failure occurred appears.		Checked (on)
SSH	Configuration of the SSH	NO	YES
	server on the IP Deskphone. The parameter must remain consistent with the current UNIStim design.		NO
SFTP	Configuration of the SFTP	NO	YES
	server on the IP Deskphone. The parameter must be added, but can remain consistent with SSH.		NO
SFTP_READ_PATTERNS	File extensions allowed to read (get) from the IP Deskphone.	.cfg,.dat	"," separated values. See Note 1. After a change is detected in this parameter, the system resets.
SFTP_WRITE_PATTERNS	File extensions allowed to write (put) from IP Deskphone.	.cfg,.dat	"," separated values. See Note 1 and Note 2. After a change is detected in this

Table continues...

Parameter	Purpose	Default	Allowed
			parameter, the system resets.
SSHID	Configuration of the SSH and SFTP user ID.	None	See Note 3.
SSHPWD	Configuration of the SSH and SFTP password.	None	See Note 3.
HASHED_ADMIN_PASSW ORD	Indicate whether the Admin Password is hashed or not.	NO	YES NO
ENALBE_LOCAL_ADMIN_ UI	Configure the availability of the local administration UI on the IP Deskphone.	YES	YES NO
HASH_ALGORITHM	Hash algorithm.	SHA1	SHA1 MD5
ALLOW_EMERGENCY_PRIORI TY_HEADER	Indicates if a "Priority: emergency" header must be added to emergency outgoing calls or not.	NO	YES NO
CALLINFO_IMAGE_ENABLE	Specify whether to obtain image from "Call-Info" url or not.	NO	YES NO
MKI_ENABLE	Use Master Key Identifier (MKI) or not.	NO	YES NO
SECURE_UI_ENABLE	Configure the availability of other sensitive data that you want to hide from the normal end user, such as the IP address, the MAC address on the IP Deskphone information screen, and the FE IP Address and Port on the audio quality details screen.	NO	YES NO
ADMIN_PASSWORD_EXPIRY	The date that the configured ADMIN_PWD is no longer valid, and a new password must be downloaded from the provisioning server.	Empty	Timestamp

Note:

The SFTP file read and write pattern entries must be strictly followed.

The following are examples of valid and invalid formats of SRTP read and write patterns.

Example of valid formats:

SFTP_READ_PATTERNS: cfg,.rel,.re2,.re3,.dat SFTP_WRITE_PATTERNS: cfg,.txt,.wr1,.wr2

Example of an invalid format:

.cfg, .txt

For the SFTP file read and write pattern entries to be valid, there must be no space between the extensions.

Note:

SFTP writes can only be made to the sftpWr folder. You are only allowed to write a file that is 10%, or less, of the available space on the folder. If a file size greater than 10% is written, a write failure occurs, and the system logs the following event:

1042[Minor][TUE JAN 02 19:08:18 2007][353][i:/fw/build/../util/sshapp/sftpS erver.c:691] - File (./sftpWr/lf.wrl) too large to write.

Note:

If logon failures occur for SSH and SFTP applications, the system logs the following event:

1040[Minor][TUE JAN 02 20:12:14 2007][4189][i:/fw/build/../sshapp/sshServer .c:616] - SSH Authentication Failed.

Manually configure the IP Deskphone for UDP and TCP

After you enable the administration user interface, you can manually change network settings on the IP Deskphone. You can manually configure the IP Deskphone through the Server Settings menu.

Note:

To meet security requirements, the local administration user interface of the IP Deskphone can be disabled for deployed IP Deskphones. If this is the case then you must manually configure the parameters during initial IP Deskphone configuration or through the provisioning server.

Note:

Disabling the local administration user interface drastically reduces the ability to view or edit the configuration of the IP Deskphone, and almost completely removes the ability to diagnose any communication or configuration errors in the field. However, disabling the local administration user interface increases the security of the IP Deskphone because the user is not able to view the configurations or make changes.

Configuring the domain protocol

- 1. Press the **Globe** key twice.
- 2. Using the Navigation key cluster, select **Server Settings**..
- 3. Select a domain.
- 4. Enter the admin password (if the UI and password are enabled).

- 5. Use the Navigation key cluster to scroll through the Domain List screen and select the required configured SIP domain.
- 6. Press the **Edit** context-sensitive soft key.

Table 88: Listening port parameters

Parameter name	Description	Default value	Boundaries
SIP UDP Port	The listening port on the	5060	Min: 1024
	IP Deskphone for incoming UDP requests.		Max: 65535
			Disabled: 0 (must be non-zero for a TLS-only option)
SIP TCP Port	The listening port on the	5060	Min: 1024
	IP Deskphone for incoming TCP requests.		Max: 65535
			Disabled: 0 (must be non-zero for a TLS-only option)
SIP TLS Port	The listening port on the	0	Min: 1024
	IP Deskphone for incoming TLS requests.		Max: 65535
			Disabled: 0 (must be non-zero for a TLS-only option)

Note:

The configuration of the IP Deskphone for various protocols must be completed for outgoing and incoming connections. For a complete TLS-only option, the outgoing server UDP and TCP protocols must be configured as a non-zero value, and the incoming UDP and TCP listening ports must be configured as a non-zero value.

Using the TLS to connect to the SIP proxy

The IP Deskphone can establish a connection with the proxy after the appropriate configurations are made for the TLS. After the IP Deskphone registers with the SIP Proxy, the user can detect if a secure connection is established by the presence of a security icon (padlock) on the idle screen.

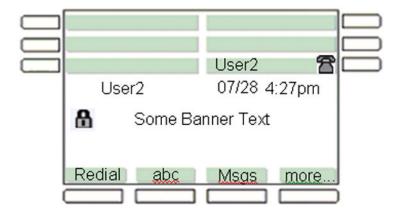

Figure 46: Security icon enabled

Connecting to the server requires that the IP Deskphone uses, at a minimum,

TLS_RSA_WITH_AES_128_CBC_SHA, and as an objective,

TLS_RSA_WITH_AES_256_CBC_SHA. Because this is a server-specific configuration, the IP Deskphone must be prepared to handle both. There is no difference in screen indication, regardless of the type of cipher used.

The following table describes the configurations that affect the presence of the security icon on the idle screen of the IP Deskphone.

Configuration	Result	Idle Screen Security Icon Display
Default: UDP + TCP	SIP is unsecured.	No
UDP only	SIP is unsecured.	No
TCP only	SIP is unsecured.	No
TLS only	Connection is only established if SIP is secure.	Yes
UDP + TLS: unsupported	Unsupported.	Unsupported
TCP + TLS	Connection is established with either TCP or TLS.	Yes – only if TLS connection is used No – if fall back to TCP occurs
UDP + TCP + TLS	Connection is established using TCP or TLS, potentially falling back to using only UDP.	Yes – only if TLS connection is established No – if fall back to TCP or UDP occurs
None : unsupported	Unsupported	Unsupported

Unsupported configurations cannot be saved. If the configurations are unsupported, the IP Deskphone displays an error message.

The following is an example of an error message for unsupported configurations: Unsupported: UDP + TLSUnsupported: No protocols enabled.

Registration behavior based on configuration settings

The following table describes the behavior of the IP Deskphone when the IP Deskphone is configured to communicate with a server using specific protocols.

Table 89: Registration results based on configuration

Configuration	Description	Expected result	Possible results
IP Deskphone: UDP + TCP Server: UDP + TCP + TLS	The IP Deskphone allows protocols enabled for communication with the server.	The IP Deskphone establishes a connection to the server using TCP.	If the server does not accept incoming requests on TCP, it takes approximately thirty seconds for the initial connection attempt to fail, and then the IP Deskphone attempts to contact the server using UDP. If this connection also fails, the IP Deskphone waits a configured period of time before attempting to reconnect.
IP Deskphone: UDP Server: UDP + TCP + TLS	The IP Deskphone only has UDP enabled for sending requests to the server.	The IP Deskphone registers using UDP as the protocol.	If the IP Deskphone is unable to contact the server, it waits a configured period of time before attempting to reconnect.
IP Deskphone: TCP only Server: UDP + TCP + TLS	The IP Deskphone only has TCP enabled for sending requests to the server.	The IP Deskphone registers using TCP as the protocol.	If the IP Deskphone is unable to contact the server, it waits a configured period of time before attempting to reconnect.
IP Deskphone: TLS only Server: UDP + TCP + TLS	The IP Deskphone only has TLS configured for sending requests to the server. The IP Deskphone must have a device certificate installed if the server is configured for mutual authentication.	The IP Deskphone registers using SIP over TLS. If a device certificate is provisioned, and the server is configured for mutual authentication, then the IP Deskphone provides a certificate during the TLS handshake. Otherwise, serveronly authentication is used.	If the IP Deskphone is unable to contact the server, it waits a configured period of time before attempting to reconnect.
UDP + TLS: unsupported	Unsupported	Unsupported	Unsupported

Table continues...

Configuration	Description	Expected result	Possible results
IP Deskphone: TCP + TLS Server: UDP + TCP + TLS	The IP Deskphone attempts to contact the server using TLS first, because TLS has higher priority than TCP.	The IP Deskphone registers the same as if it was configured for TLS only.	If the IP Deskphone is unable to connect to the server using TLS, it attempts to connect using TCP. If attempts to connect using TLS and TCP fail, the IP Deskphone waits a configured period of time before attempting to reconnect.
IP Deskphone: UDP + TCP + TLS Server: UDP + TCP + TLS	The IP Deskphone attempts to contact the server using TLS first, because TLS has higher priority than TCP and UDP.	The IP Deskphone registers the same as if it was configured for TLS only.	If the IP Deskphone is unable to connect to the server using TLS, it attempts to connect using TCP. If attempts to connect using TLS and TCP fail, the IP Deskphone attempts to connect using UDP. If attempts using TLS, TCP, and UDP fail, the IP Deskphone waits a configured period of time before attempting to reconnect.
None: unsupported	Unsupported	Unsupported	Unsupported

Note:

The server must be configured with the appropriate protocols enabled for the success condition to be realized. Failure results are possible if the server configuration is changed to disallow protocols.

Managing connection persistence

The IP Deskphone attempts to establish and maintain a persistent connection with the proxy when TCP and TLS are active protocols. After this connection is established, the IP Deskphone sends all outgoing connections over this persistent connection.

SIP IP Deskphones and servers, which use UDP to communicate, listen for incoming connections on known ports, and originate each request on a randomly selected UDP port. Even if TCP is used, new requests can potentially be sent using a new source port unless the connection between the IP Deskphone and proxy is kept active.

Connection persistence does the following:

- Keeps a connection established between a client and the outgoing proxy.
- Reuses the open connection for future incoming and outgoing requests.

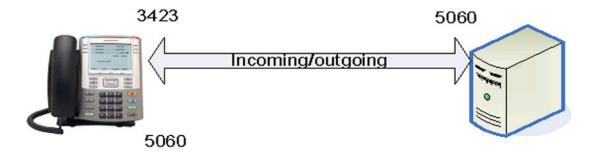

Figure 47: Incoming/Outgoing with connection reuse

When using UDP, an IP Deskphone behind a firewall must periodically send a request to the server to maintain an open pinhole in the firewall so that the server can contact the IP Deskphone when sending requests.

When using TCP/TLS and connection persistence, it is not necessary to send a SIP_PING to the server in order to keep a pinhole alive, and the keep-alive mechanism is reduced to a method which involves significantly less overhead.

The following figure demonstrates how critical it is that the server can communicate directly with the IP Deskphone through the use of the established TCP connection because it has no way of getting through the firewall in order to contact port 5060 on the IP Deskphone.

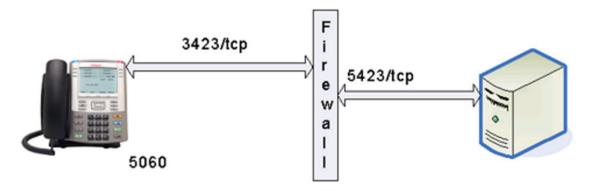

Figure 48: Connection reuse and a firewall

Table 90: Connection timers definitions and allowed values

Parameter name	Description	Default value	Boundaries
OS Keep-alive only	Selecting this value causes the OS TCP Keep-alive functions to be used instead of the CRLF ping/pong mechanism. Some system deployments may prefer the lighter weight TCP keep-alive	Not checked	Checked

Table continues...

Parameter name	Description	Default value	Boundaries
Keep-alive	This is a value, measured in seconds, that the IP Deskphone uses when a connection to the server is established using TCP or TLS. The IP Deskphone periodically sends a packet to the server, which contains a pair of CRLF, to ensure the server is responding.	30	Min: 5 Max: 1800
Register Retry	When a connection failure occurs, this value in seconds is how long the IP Deskphone waits before attempting to reregister with the proxy.	30	Min: 30 Max: 1800
Register Max Retry	After a failure to reconnect with the proxy, the IP Deskphone increases the amount of time that it waits for the next registration retry attempt. This value, measured in seconds, is the maximum value that the IP Deskphone waits in between retry attempts	1800	Min: 600 Max: 1800

SRTP

Secure Real-time Transport Protocol (SRTP) encrypts the Real-time Transport Protocol (RTP) traffic between two end-points to achieve full security for the media path.

Security Descriptions for the Session Description Protocol (SDESC) (RFC4586) defines a mechanism to transmit the necessary cryptographic parameters between two end-points. SRTP is initiated when Secure Real-time Transport Control Protocol (SRTCP) allows both sides of a conversation to agree on the keys you can use to encrypt or decrypt the messages that are transmitted.

Media security — SRTP

Secure RTP (SRTP) encrypts the media path between two end-points. After both end-points agree on the necessary parameters to encrypt and decrypt audio packets, the voice path between them is established.

SRTP is configured on the IP Deskphone to provide multiple levels of protection.

The following table highlights the two cipher suites that are used and their related parameters.

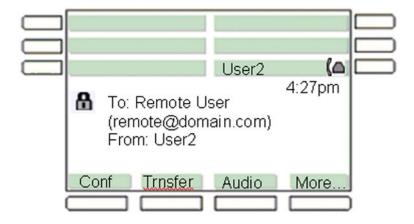

Table 91: SRTP properties

Parameter	AES_CM_128_HMAC_S HA1_80	AES_CM_128_HMAC_SHA1_32
Master key length	128 bits	128 bits
Master salt length	112 bits	112 bits
SRTP lifetime	2^48 packets	2^48 packets
SRTCP lifetime	2^31 packets	2^31 packets
Cipher	AES Counter Mode	AES Counter Mode
Encryption key	128 bits	128 bits
MAC	HMAC-SHA1	HMAC-SHA1
SRTP auth. tag	80 bits	32 bits
SRTCP auth. tag	80 bits	80 bits
SRTP auth. key len.	160 bits	160 bits
SRTCP auth. key len.	160 bits	160 bits

Call security is identified by the presence of the security icon present during an active call, as shown in the following example.

The presence of the security icon is the only visible indication that the media path is encrypted. The presence of this icon depends on whether the IP Deskphone has been configured to support SRTP or not and is visible when the IP Deskphone is not in the idle screen.

Available SRTP configurations are provided in the following table.

Table 92: Configuration effects on media security display

Configuration	Result	Media Security Icon Display (during active call)
Default: UDP + TCP, no SRTP	SIP is unsecured; media is unsecured.	No
UDP + TCP. Best-Effort SRTP	SIP is unsecured; media is encrypted, but due to transmission of crypto parameters in clear text, the media cannot be considered secure.	No
UDP + TCP, SRTP-Only	SIP is unsecured; media is encrypted, but due to transmission of crypto parameters in clear text, the media cannot be considered secure.	No
TLS, no SRTP	SIP is secured; media is unencrypted.	No
TLS, Best-effort	SIP is unsecured; media is encrypted only if both end-points agree on use of SRTP.	Yes/No, depending on negotiation
TLS, SRTP Only	SIP is secured, media is encrypted. If both end-points do not agree on the use of SRTP, the connection fails.	Yes

The security icon indicates the security status of a call, and is useful for best-effort environments where there is a possibility of an unsecured call or where TLS is not used to communicate with the proxy.

The FAST_EARLY_MEDIA_ENABLE option must be set to NO to support SRTP.

Last successful or unsuccessful logon

You can configure the IP Deskphone to provide the user with logon feedback regarding the last successful logon or the last unsuccessful logon, and provide the local time at which logon feedback was logged (assuming that the IP Deskphone has the correct time configured). The time is correct when the IP Deskphone successfully retrieves the correct time during a successful logon process, or through the use of SNTP.

The display of a logon success and failure notification is local only to the IP Deskphone being used, and displays the last time that a user successfully logged on to the IP Deskphone or failed to log on to the IP Deskphone.

The figures shown below provide examples of the IP Deskphone display screen based on the configuration of the IP Deskphone and whether Login Notify is enabled or not.

The following notification appears on the display screen when the user login ID or password is incorrect and log in fails.

Note:

The server recognizes account login failure thresholds. After a configurable number of failures, the server temporarily disallows login attempts for an account. The IP Deskphone does not display any indication of this lockout.

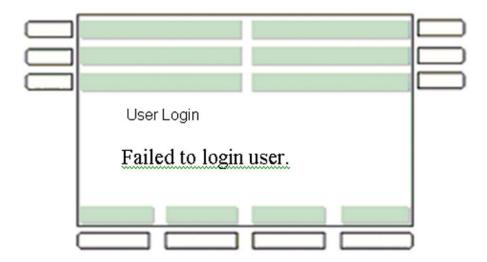

Figure 49: New login failure notification

The following notification appears on the display screen when the user successfully logs on.

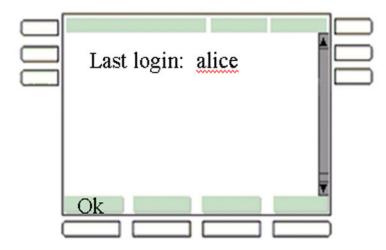

Figure 50: Basic login notification

The following notification appears on the display screen when the user successfully logs on when Login Notify with Time is enabled.

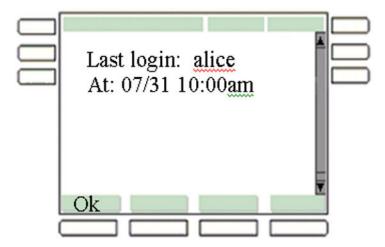

Figure 51: Basic login and time notification

The following notification appears on the display screen to notify the user of the last unsuccessful log on attempt made.

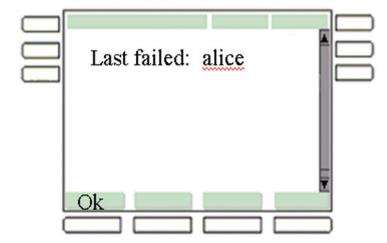

Figure 52: Login failure notification

The following notification appears on the display screen to notify the user of the date and time of the last unsuccessful log on attempt made.

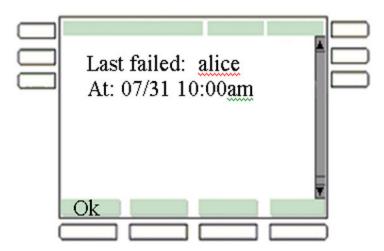

Figure 53: Login failure with time notification

The following notification appears on the display screen to notify the user the last successful and unsuccessful log on attempts made.

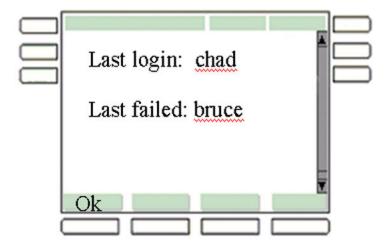

Figure 54: Login and login failure notification

The following notification appears on the display screen to notify the user of the date and time of the last successful and unsuccessful log on attempts made.

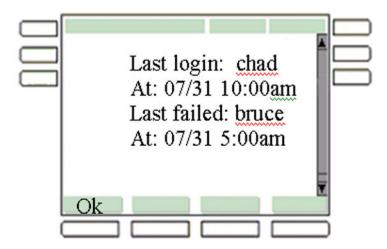

Figure 55: Login and login failure with time notification

Enhanced administrative password security

The provisioning server can provide additional security associated with the administrative password. The provisioning server provides the password to the IP Deskphone in the form of an SHA1 or MD5 hash instead of the plain text password. This removes the need to store the password on the IP Deskphone by using the existing ADMIN_PASSWORD provisioning parameter.

The provisioning server can also enforce a password expiry using the provisioning flag, ADMIN_PASSWORD_EXPIRY. This flag contains a date after which the admin password stored on the IP Deskphone is not accepted. After this time, the administrative password must be changed in the administrative server. Password expiry can only be enforced if the date and time are retrieved by the IP Deskphone through SIP, SOAP, or SNTP.

Important:

IP Deskphone licensing information is located in the *Keycode Retrieval System (KRS) User Guide*. You must register for access to KRS.

Debug port security

The debug port (Accessory Expansion Module (AEM) port) is disabled by default to prevent unauthorized access and intervention in IP Deskphone operation when a dongle is used.

Enabling the debug port requires access to the **Advanced Diag Tools** menu, which is always protected by the admin password, and enabling the **Debug port** option.

The default value of the **Debug port** option is **disabled**. Resetting the IP Deskphone to the factory defaults resets this parameter as well.

The **Debug port** option can be manually changed on a per-phone basis. The change survives an IP Deskphone reboot.

The **Debug port** option cannot be changed while the vxshell is active on the IP Deskphone (that is, vxshell is accessed through the PDT). If an attempt is made to change the option while the vxshell is active, the error message Cannot change Debug port is displayed on the phone screen. There is no way to change the **Debug port** option through provisioning or configuration files

When the **Debug port** option is disabled, and a dongle is connected to the IP Deskphone, the dongle is disabled from the initial startup of the IP Deskphone and neither input nor output debug information is available. When the **Debug port** option is enabled, the debug port of the IP Deskphone can be used for connecting a debug dongle.

If an Expansion Module is connected to the AEM port, it is recognized and is fully functional (EXP_MODULE_ENABLE parameter must be set to YES), regardless of the **Debug port** option setting.

In SIP 4.4 and later, the "magic key" sequence to switch between dongle mode and Expansion Module mode ([MUTE]-[UP]-[DOWN]-[UP]-[DOWN]-[UP]-[2] for dongle mode and [MUTE]-[UP]-[DOWN]-[UP]-[DOWN]-[UP]-[1] for Expansion Module mode) is not supported.

Chapter 27: Licensing

A license is a "right to use" granted by Avaya, that the customer purchases to enable the features on the IP Deskphone. A license contains at least one entitlement and can contain more than one entitlement. A license usually has an expiry date and is keyed for a specific license server.

An entitlement is the most basic component of a license and represents a single instance of a right to a particular feature or capability. Entitlements are feature-related information passed to the server through licenses. Entitlements are also known as tokens or keycodes.

On Avaya IP Deskphones, the licensing solution uses the Embedded Server Model. In this model, the licensing server is embedded on the IP Deskphone and executes on the phone. There is a one —to—one relationship between the license file and IP Deskphone. There are no multiple IP Deskphones per server in the embedded server model; each IP Deskphone has its own embedded server. The IP Deskphone does not have to connect to a remote server to obtain tokens; instead, it calls the license server locally on the IP Deskphone. There are two modes of operation in this model.

- Node Locked Solution
- Network Locked Solution

In the Node Locked Solution within the embedded server model, the administrator obtains a license file for each IP Deskphone, and the license file is installed onto the IP Deskphone through the provisioning infrastructure.

For the Network Locked Solution within the embedded server model, the administrator obtains a generic license file, and the license file is installed onto the IP Deskphones through the provisioning infrastructure.

The Embedded Server Model does not provide the following capabilities:

- Grace period handling
- SSL communication with the IP Deskphone as the server is local to the phone
- Crediting or transfer of entitlements
- Web-based OAM interface. There is no OAM functionality to upload the license file to an IP Deskphone.

Licensing framework supports two types of tokens.

- Time Based Tokens These tokens expire based on the expiry date associated with the key code.
- 2. Standard tokens The warranty date on these tokens is verified based on firmware build and contract dates available from the IP Deskphone.

Important IP Deskphone licensing information is located in the Keycode Retrieval System (KRS) User Guide. You must register for access to KRS.

Accessing the Keycode Retrieval System

The Keycode Retrieval System (KRS) User Guide provides important IP Deskphone licensing information. You must register for access to KRS. The ollowing section describes how to access the KRS User Guide.

Registering for access to KRS

- Go to http://support.avaya.com/krs.
 - Users must have an Avaya Access registration profile to access the KRS application.
- 2. Follow the instructions on this page to obtain an Avaya Access registration profile and to request access to KRS.
- 3. On the right side of the page, click **KRS Site** and log in when prompted.
- 4. Select **IP CLIENTS** from the list for the product whose keycodes you would like to access.

Licensing framework

The licensing framework contains the fundamental infrastructure required to deliver a token-based licensing model that consists of a node-locked based licensing server and a licensing client.

The licensing framework consists of the following components:

- License Server (node-locked)—embedded in the IP Deskphone and calls the server locally.
- License Client—resides in the IP Deskphone and makes requests to the License Server for tokens.
- KRS integration—a key or license generator provided with the CKLT solution which is integrated into the Keycode Retrieval System (KRS).

Characteristics of the licensing framework

The following list describes the characteristics of the licensing framework on the IP Deskphone.

- The embedded server relies on a real time clock to calculate when a token expires
- The embedded server (node-locked) enables the license server to execute on the IP Deskphone. The IP Deskphone obtains tokens by calling the server locally.
- The license file is installed on the IP Deskphone through the provisioning server or TFTP server.
- The IP Deskphone does not have an internal real-time clock. The time of day is obtained from the Call Server that the IP Deskphone is registered to on the network.

- The license file contains only one type of token because the IP Deskphone only uses one type at a time.
- The administrator must enter the IP Deskphone system ID directly into the Keycode Retrieval System (KRS).
- A Node Locked license file is keyed for the IP Deskphone so that the license is only valid on a specific IP Deskphone.
- A Network Locked license file can be installed on a limited number of IP Deskphones at a given site.
- The system ID is the MAC of the IP Deskphone.
- When the IP Deskphone is connected to an Avaya server, the IP Deskphone gets an additional token.

License file download

This section describes the procedure for downloading Node Locked license files and the procedure for downloading Network Locked license files.

Node Locked license file download

Use the following procedure to download Node Locked license files keyed to each phone by MAC address from the provisioning or TFTP server.

Downloading Node Locked license files:

 Configure the IP Deskphone with a provisioning IP address so it can access a provisioning server.

For more information about provisioning parameters for the IP Deskphone, see <u>Create the SIP provisioning file on the provisioning server on page 46.</u>

 The IP Deskphone config file must include a [LICENSING] section to enable the IP Deskphone to download the licence file. Add [LICENSING] section to the IP Deskphone .cfg file.

An example of an IP Deskphone cfg files is 12x0SIP.cfg.

The [LICENSING] section specifies a wild card filename which uses the IP Deskphone MAC address as the filename with the ipctoken prefix and cfg suffix.

For example:

```
[FW]
DOWNLOAD_MODE AUTO
VERSION 4.04.09.00
PROTOCOL TFTP
FILENAME SIP12x0_04.04.09.00.bin
...
```

```
[LICENSING]

DOWNLOAD_MODE AUTO

VERSION 000001

FILENAME ipctoken*.cfg
```

3. Place the IP Deskphone license file on the provisioning server.

The generated license file must be named ipctokenMAC.cfg, where MAC is the 12-character MAC address of the IP Deskphone.

For example, for an IP Deskphone with MAC address "000f1fd304f8", the license file will be named "ipctoken000f1fd304f8.cfg".

4. Start the provisioning server so the IP Deskphone can retrieve the .cfg files when the server starts.

When the new license file is downloaded to the IP Deskphone from the provisioning server, it overwrites the existing license file and reboots the IP Deskphone to activate the new license.

Network Locked license file download

If a Network Locked license file is to be used, the same license file can be installed on all IP Deskphones. In this case, the wildcard "*" is not used in the FILENAME, as the filename is fixed and does not contain the MAC address of each IP Deskphone.

Use the following procedure to download a Network Locked license file from the provisioning or TFTP server.

Downloading a Network Locked license file:

- Configure the IP Deskphone with a provisioning IP address so it can access a provisioning server. For more information about provisioning parameters for the IP Deskphone, see <u>Create the SIP provisioning file on the provisioning server</u> on page 46.
- The IP Deskphone config file must include a [LICENSING] section to enable the IP Deskphone to download the licence file. Add [LICENSING] section to the IP Deskphone .cfg file.

An example of an IP Deskphone cfg files is 12x0SIP.cfg.

For example:

```
[FW]

DOWNLOAD_MODE AUTO

VERSION 4.04.09.00

PROTOCOL TFTP

FILENAME SIP12x0_04.04.09.00.bin
...

[LICENSING]

DOWNLOAD_MODE AUTO

VERSION 000001

FILENAME ipctoken.cfg
```

- 3. Place the IP Deskphone license file on the provisioning server.
- 4. Start the provisioning server so the IP Deskphone can retrieve the .cfg files when the server starts.

When the new license file is downloaded to the IP Deskphone from the provisioning server, it overwrites the existing license file and reboots the IP Deskphone to activate the new license.

[LICENSING] section

The IP Deskphone config file must include a [LICENSING] section to enable the IP Deskphone to download the licence file. The [LICENSING] section specifies a wild card filename which uses the IP Deskphone MAC address as the filename with the cfg prefix and suffix.

The following format is an example of the [LICENSING] section that is added to the IP Deskphone config file (1xxxe.cfg):

[LICENSING] VERSION version FILENAME X*.Y

The following table describes the items in the [LICENSING] section.

Table 93: Description of items in the [LICENSING] section of the config file.

Field name	Field value	Description
[LICENSING]	_	Section header for licensing config file information.
VERSION	000001	The version of the license file.
FILENAME	X*.Y	License filename. The IP Deskphone looks for a file with the IP Deskphone MAC address included in the filename.

The 12x0.cfg file can have one, or all, of the following sections:

- [FW]
- [DEVICE CONFIG]
- [LICENSING]

Although the IP Deskphone [FW] section is not required to activate the token, the provisioning server and the IP Deskphone provisioning server IP configuration must be configured to retrieve, save, and process the license file.

The following is an example of an 12x0.cfg file that contains the [FW] section and the [LICENSING] section.

```
[FW]
DOWNLOAD_MODE AUTO
VERSION 04.04.09.00
FILENAME SIP12x004.04.09.00.bin
```

```
PROTOCOL TFTP

SERVER_IP 47.11.183.165
...

[LICENSING]

VERSION 000001

FILENAME ipctoken*.cfg
```

The following is an example of an 12x0e.cfg file with the [LICENSING] section only.

```
[LICENSING]
VERSION 000001
FILENAME ipctoken*.cfg
```

License information for the IP Deskphone

The Licensing information screen provides information on Embedded Mode, status and other licensing information.

To access the Licensing information screen, press the **Globe** key twice.

Select **Prefs > Network > Licensing** and select **1. License Info**. Enter the admin password (if prompted).

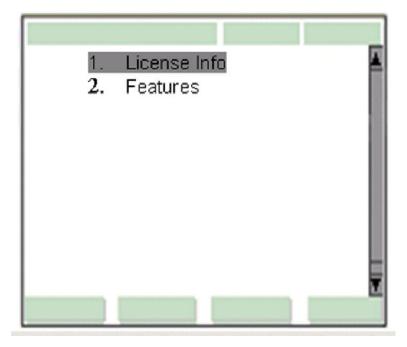

Figure 56: Licensing menu

Licensable features

Licensable features are divided into three groups.

- 1. Basic Feature Set
- 2. Enhanced Feature Set 1 token required
- 3. Advanced Feature Set 2 tokens required

The Basic Feature Set is always enabled on the IP Deskphone. Enabling the Enhanced Feature Set requires an additional token. Enabling the Advanced d Feature Set requires two tokens.

When connected to an Avaya Server, the IP Deskphone gets an additional token. This means that the Enhanced Feature Set is available when the IP Deskphone connects to an Avaya Server.

Access Licensed Features list

The **Licensed Features** screen can be accessed through the IP Deskphone by pressing the Globe key twice and then selecting **Prefs > Network > Licensing > 2. Features**.

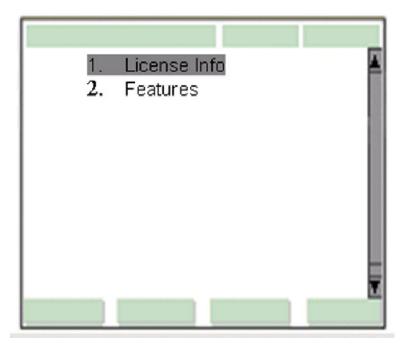

Figure 57: Licensing menu

The **Licensable Features** list displays.

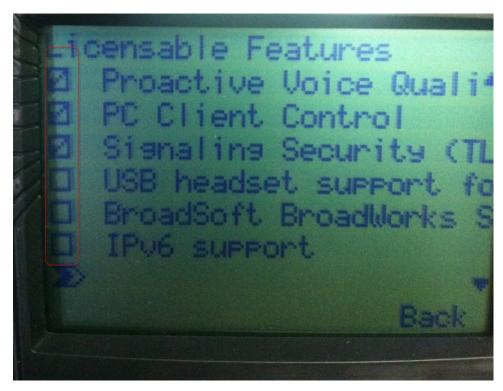

Figure 58: 12xx Licensable Features allowed by license

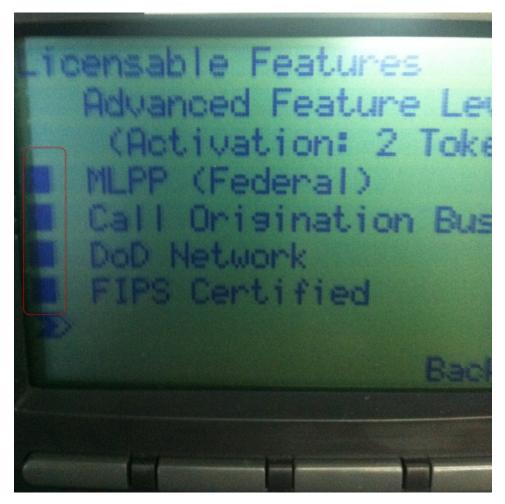

Figure 59: 12xx Licensable Features not allowed by license

Node-locked license mode

In the node-locked license mode, the IP Deskphone uses a license file to acquire the required tokens needed to activate the features. There are two types of tokens: time-based tokens, and standard tokens.

Time-based token

The following figure is an example of a node-locked time-based token. In this example, the embedded server on the IP Deskphone contains 5 tokens and the IP Deskphone is enabled for Advanced Feature Set and connected to a non-Avaya server.

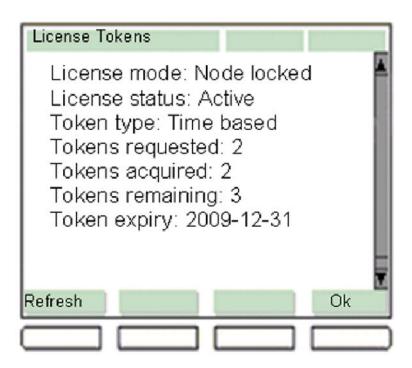

Figure 60: Node-locked license mode — License information for time-based token (connected to non-Avaya Server)

The following figure is an example of a node-locked time-based token. In this example, the embedded server on the IP Deskphone contains 5 tokens and the IP Deskphone is enabled for Advanced Feature Set and connected to an Avaya server.

Figure 61: Node-locked license mode — License information for time-based token (connected to Avaya Server)

Note the extra line Tokens Required: 1. This line is displayed only when the IP Deskphone connects to an Avaya Server.

The status of the time-based token can be one of the following:

- Active
- Inactive

A time-based token can be inactive for one of the following reasons:

- · Insufficient tokens
- · License expired

Standard token

The following figure is an example of a node-locked Standard token. In this example, the embedded server on the IP Deskphone contains five tokens. The IP Deskphone is enabled for Advanced Feature Set and is connected to a non-Avaya server.

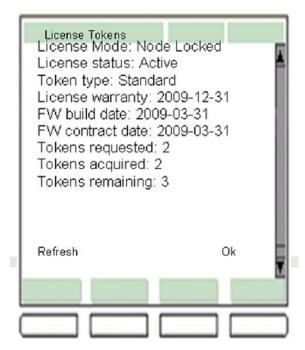

Figure 62: Node-locked license mode — license information for Standard token (connected to non—Avaya Server)

The following figure is an example of a node-locked Standard token. In this example, the embedded server on the IP Deskphone contains five tokens. The IP Deskphone is enabled for Advanced Feature Set and is connected to an Avaya server.

Note the extra line Tokens Required: 1. This line is displayed only when the IP Deskphone connects to an Avaya Server.

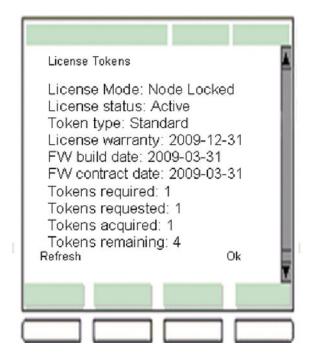

Figure 63: Node-locked license mode — license information for Standard token (connected to Avaya Server)

The status of the standard token can be one of the following:

- Active
- Inactive

A standard token can be inactive for one of the following reasons:

- · Insufficient token
- · License expired

Invalid or no license file

The following figure is an example of an invalid or no license file.

1.License Mode: Node Locked
Status: Invalid or No License File
2.Tokens Requested: 3
3.Tokens Acquired: 0
4. Licensed Features:2

Figure 64: License information — Invalid or no license file

Evaluation period

When the IP Deskphone arrives from the factory, it has a 31–day evaluation period. This period allows users to try licensed features before they actually purchase the tokens. Any time the user loads a valid license file and has tokens granted, the evaluation is terminated immediately.; Once the evaluation period expires, there is no way to reset it.

The following figure is an example of the IP Deskphone with 15 days left in the evaluation period.

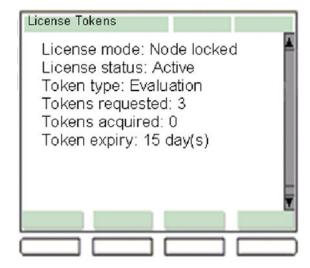

Figure 65: IP Deskphone in an evaluation period

Alarms

The license feature provides notifications on the IP Deskphone screen about the licensing status. The license feature provides notification on the IP Deskphone screen if the following conditions apply:

- · No avaliable tokens
- · Expired tokens
- · Evaluation period has ended

A notification message is displayed in a pop-up window on top of the IP Deskphone screen. The window can be dismissed by pressing the **Stop** key or by lifting the handset. After the message is dismissed, the IP Deskphone closes the warning window. The warning window re-displays every 24 hours at 1:00 am. You can configure the time frame through the IP Deskphone configuration system. If the licensed features are disabled, the IP Deskphone cannot display any type of window warning.

Support warning

A Support warning is used to direct the user to contact technical support. The actual label displayed on the screen and the contact information are specified in the device configuration file.

License not available warning

A warning window, indicating that a license is not available, appears on the IP Deskphone screen when the token request or refresh is rejected due to insufficient tokens available or an invalid license file

The following figure is an example of a warning window indicating that a license is not available.

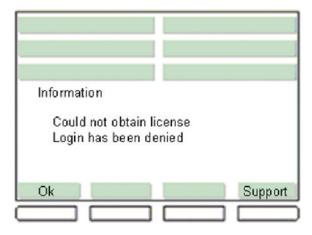

Figure 66: License not available warning

License expiry warning

A warning window, indicating that a license has expired, appears on the IP Deskphone screen when a node-locked license expires.

The following figure is an example of a warning window indicating that a license is expired.

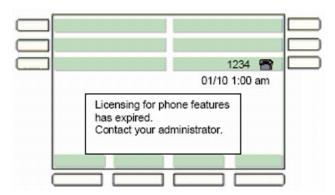

Figure 67: License expiry warning

Evaluation period expiry warning

A warning window, indicating that the evaluation period has expired, appears on the IP Deskphone screen when the evaluation period expires and if the IP Deskphone has never had a valid token grant.

The following figure is an example of a warning window indicating that the evaluation license period is expired.

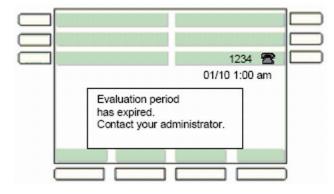

Figure 68: Evaluation period expiry warning

Evaluation threshold warning

A warning window informing you of the approaching evaluation expiration date appears on the IP Deskphone at the following predefined times:

- 15 days before expiration date
- 7 days before expiration date
- 1 day before expiration date

The following figure is an example of the evaluation threshold warning.

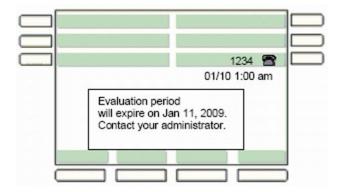

Figure 69: Evaluation threshold warning

Licensing expiry threshold warning

When the expiration date of the node-locked licence approaches,, a warning window is displayed on the IP Deskphone. The warning window indicates when the license will expire, and notifies you at the following predefined times:

- 30 days before the license expires
- 15 days before the license expires
- 7 days before the license expires
- 1 day before the license expires

The following figure is an example of the license expiry threshold warning.

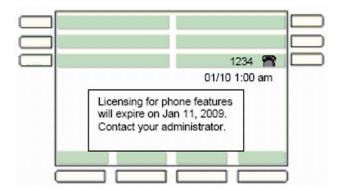

Figure 70: License expiry threshold warning

Licensed features

The following Standard features are available to all users without a token.

- SIP Core Features (RFC3261 and SIPPING 19)
- · 3-way calling and conference calling
- · Audio codecs standard and wideband
- Auto Login and Auto Logout
- Busy Lamp Field (BLF)
- Distinctive ringing
- Downloadable ringtones
- · Standard font languages
- · Multiple calls per user
- Server failover redundancy
- Session timers
- SNTP (time server)
- Speed Dial List
- Transfer to VM softkey
- · USB flash drive
- Hotline

The following extended features are available with a token or if the IP Deskphone is registered to a recognized Avaya server (Avaya, Avaya Communication Server 1000, or IP Office) then extended features are available without a token.

- · Standard features
- Authentication security
- Call Server Service Package

- · Expansion Module support
- · Instant Messaging
- Media Security (SRTP)
- · Multiuser login support
- NAT Traversal/STUN
- Proactive Voice Quality Management
- PC Client Control
- Signaling Security (TLS)
- USB headset support for audio
- IPv6 support

The following advanced features are available with two tokens or if the IP Deskphone is registered to a recognized Avaya server (Avaya, Avaya CS 1000, or IP Office) then advanced features are available with one token.

- · Standard features
- · Extended features
- MLPP (Federal)
- Call Origination Busy
- DoD Network
- · FIPS Certified

Chapter 28: PC Client Softphone interworking

The interworking feature allows the user to access the functionality of the SIP IP Deskphone using a softphone client on their PC. On an incoming call, both the IP Deskphone and the PC Client Softphone ring. When the user answers the IP Deskphone, the softphone remains available for Instant Messages, video and other multimedia features.

The IP Deskphone, PC Client softphone, and the Call Server are all necessary to support interworking and the Click-to-Answer functionality.

The interworking feature enables the IP Deskphone to automatically answer an incoming call for the purpose of Click-to-Answer. To avoid any security risk, the user must pre-grant authorization to another user, or user groups, to allow them to make requests for the IP Deskphone to automatically answer their calls.

By using Click-to-Answer, the user can answer a call on their PC Client Softphone, causing the server to send an auto-answer request to the IP Deskphone. (When a user logs in, the IP Deskphone sends a special identifier so that only that specific IP Deskphone receives the request even though the user is logged in on multiple IP Deskphones.) The call is answered without user interaction, but the microphone is muted to prevent the device from being used as a listening device by a malicious user. When a call is answered, the user hears a ring-splash notification and can unmute the microphone to allow bidirectional media.

Pre-granting authorization for the Answer-Mode

The user must specify which users or groups of users are authorized to request auto-answer. The user can grant authorization through the Feature Options menu if the interworking feature is enabled in the user's IP Deskphone device configuration.

The user can enable and disable one or more of the following groups:

- Allow Public—Authorizes anyone on the internet.
- Allow Friends List—Authorizes everyone on the user's Friends List.
- Allow Directory—Authorizes everyone in the user's Personal Directory.
- Allow Addresses—Acts as a white-list of domain names and SIP addresses that have authorized users.

Answer-Mode Settings screen

The Answer-Mode Settings screen is used to pre-grant authorization to request an automatic answer to potential callers or groups of callers.

The Answer-Mode Settings screen has the following two independent configurations:

- Allow Mode: [Current Setting]
- · Allow Addresses

For the Allow Mode option, the current setting can be one of the following choices:

- Disabled
- Friends
- Directory—includes all Friends
- Public—includes all users

For the Allow Addresses option, the user can edit a listing by adding domain names or SIP addresses up to a maximum defined in the device configuration.

To access the Answer-Mode Settings screen, from the Preference menu, choose Feature Option and Answer-Mode Settings.

The following screen appears.

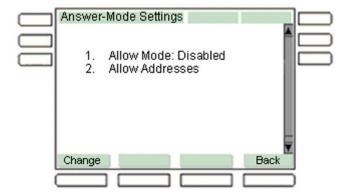

Figure 71: Answer-Mode Settings screen

The following table describes the function of the Context-sensitive soft keys for the Answer-Mode Settings screen.

Table 94: Context-sensitive soft keys for the Answer-Mode Settings screen

Context-sensitive soft key	Action
Change	Opens the screen for the selected option: Allow Mode, or Allow Addresses.
Back	Returns you to the Feature Options screen.

The following table describes the outside actions on content for the Answer-Mode Settings screen.

Table 95: Outside actions on content for the Answer-Mode Settings screen

Key or action	Result
Goodbye	Idle screen.
Quit	Idle screen.
Off Hook; call keys	Clears the screen and allows you to make a call.

Allow-Mode Settings screen

The Allow-Mode Settings screen allows you to disable the feature, and to allow automatic requests for Friends, Directory, or Public users.

To access the Allow-Mode Settings screen, on the Preference menu, choose Feature Option, Answer-Mode Settings, and then Allow Mode.

The following screen appears.

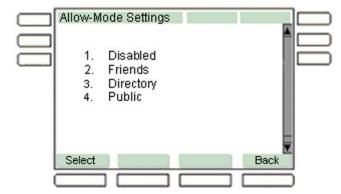

Figure 72: Allow-Mode Settings screen

The following table describes the function of the Context-sensitive soft keys for the Allow-Mode Settings screen.

Table 96: Context-sensitive soft keys for the Allow-Mode Settings screen

Context-sensitive soft key	Action
Select	Makes the current selection enabled. The selected user group is authorized for Answer-Mode.
Back	Returns you to the previous screen.

The following table describes the outside actions on content for Allow-Mode Settings screen.

Table 97: Outside action on content for the Allow-Mode Settings screen

Key or action	Result
Goodbye	Idle screen.
Quit	Idle screen.
Off Hook; call keys	Clears the screen and allows you to make a call.

Allow Addresses screen

The Allow Addresses screen is used to pre-grant authorization to request an automatic answer to a list of user-entered domains and SIP addresses.

If the user selects the Allow Addresses option in the Answer-Mode Settings screen, the user is presented with an interface for entering a list of strings. For the purpose of Click-to-Answer, only the current user is needed in the list because the requests originates from the user's PC Client Softphone.

For the Allow Addresses option, the user can edit a list of domain names or SIP addresses. The items in the list can be in any of the following formats:

· Single SIP user address

For example:

sipuser@sipdomain.com

· SIP domain

For example:

sipdomain.com (all users from sipdomain.com

IPv4 address of a SIP domain

For example:

172.25.20.20

IPv6 address of a SIP domain

For example:

2001:db8::57ab

The user can add as many entries as the device configuration allows. If the Add soft key is disabled, then the user has reached the maximum number or entries. The user can also edit and delete entries.

To access the Allow Addresses screen, on the Preference menu, choose Feature Options, Answer-Mode Settings, and then Allow Addresses.

If there are no domains in the list, the following screen appears.

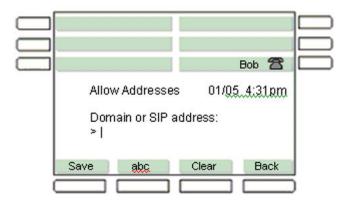

Figure 73: Allow Addresses screen — first entry

The following screen is an example of the Allow Address screen if one (or more) domain or SIP address is in the system.

Figure 74: Allow Addresses screen with domains and SIP addresses

The following table describes the function of the Context-sensitive soft keys for the Allow Addresses screen with no entries listed.

Table 98: Context-sensitive soft keys for the Allow Addresses screen - with no entries listed

Context-sensitive soft key	Action
Save	Saves the entered domain or SIP address in a list and displays the list content.
abc	Changes from alphanumeric and numeric entry (abc to 123).
Clear	Erases all entered characters.
Back	Returns you to the previous screen.

The following table describes the function of the Context-sensitive soft keys for the Allow Addresses screen with a list of entries.

Table 99: Context-sensitive soft keys for the Allow Addresses screen - with entries listed

Context-sensitive soft key	Action
Add	Displays the entry content.
Edit	Selects the current entry and displays the entry content with a populated field.
Delete	Deletes the selected domain from the list.
Back	Returns you to the Answer-Mode Settings screen.

The following table describes the outside actions on content for the Allow Addresses screens.

Table 100: Outside actions on content for the Allow Addresses screens

Key or action	Result
Goodbye	Idle screen.
Quit	Idle screen.
Off Hook; call keys	Clears the screen and allows you to make a call.

Automatically answering a call

With the interworking feature enabled, the IP Deskphone can answer automatically, manually, or reject an incoming auto-answer request. If the request is valid and the user is authorized to make the request (see Pre-granting authorization for the Answer-Mode on page 321), the call is answered automatically.

A "ring splash", or short ring tone, indicates to the user that the call was automatically answered. The subject is "Auto-Answered", and the microphone is muted (the user can deactivate the mute status by pressing the "mute" key on the IP Deskphone).

The following image is an example of a notification indicating an auto-answered call.

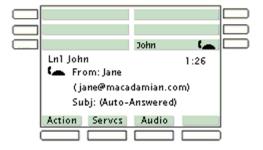

Figure 75: Example of a Notification screen indicating an Auto-Answered call

When a call is auto-answered and the handset is on the hook, the handsfree button is activated.

If there is an active call when an auto-answer request is received, the active call is placed on hold and the incoming call is answered.

If a user who is not pre-granted authorization requests a call to be automatically answered on the IP Deskphone, the call is not automatically answered and is treated as a normal call; the IP Deskphone rings and the user answers it manually.

Configuration of the PC Client Softphone

Enabling the interworking feature in the IP Deskphone device configuration file allows the user to pre-grant authorization to other users and to configure the IP Deskphone to auto-answer.

The following table describes the configuration flags used to configure the PC Client Softphone interworking feature for the IP Deskphone.

Table 101: PC Client Softphone configuration commands

Configuration commands	Description
ENABLE_INTERWORKING	The configuration values are YES and NO. The default value is NO.
	If configured as YES, the interworking feature is enabled.
	If configured as NO, the interworking feature is disabled.
	If interworking is enabled, the interface for pre- authorization is visible in the Feature Options menu. If the feature is disabled, requests to automatically answer a call are handled as a normal incoming call.
	interworking must be configured through provisioning.
MAX_ALLOWEDADDRESSES	Limits the size of the list of user and domain addresses stored for auto-answered authorization. The default value is 100.

Chapter 29: Maintenance

Convert SIP Software to UNIStim Software

The IP Deskphone can be ordered with UNIStim software installed or with SIP Software installed. If you have an IP Deskphone with UNIStim software, and you convert the software from UNIStim to SIP, the UNIStim software is overwritten. To convert an IP Deskphone from SIP Software to UNIStim software, a software reload is required.

Reloading UNIStim software

1. Determine the appropriate UNIStim version to match the hardware release number of your IP Deskphone.

There are different versions of UNIStim software available for download. Which version you choose depends on the hardware release number of your particular IP Deskphone.

If the hardware release number of your IP Deskphone is among the following hardware release numbers, download UNIStim software version release 062AC5L or higher (the hardware release number is the Product Engineering Code [PEC] followed by the release number):

- NTYS05ACE6 20
- NTYS05BCE6 20
- NTYS05BCGSE6 04

If the hardware release number of your IP Deskphone is not among the previous list, download UNIStim version release 062AC5L or higher.

- 2. Download the appropriate UNIStim software file to your TFTP server.
- 3. Create an 12xxSIP.cfg file containing the following information:

[FW]

DOWNLOAD MODE FORCED

VERSION xxx

FILENAME yyy.bin

where xxx is the UNIStim version number appropriate for the hardware release of your IP Deskphone, for example, 062AC5L, and yyy.bin is the filename containing the version number, for example, SIP12x004.01.03.00.bin.

4. Power the IP Deskphone off and on. The IP Deskphone reboots and contacts the TFTP server upon bootup and downloads the new UNIStim software.

Reset Factory Settings support

A configured IP Deskphone can be reset to factory defaults to clear all stored information and preference data. By activating this mode, the data stored on the IP Deskphone is erased, and the administrator can reconfigure it for a new user.

The IP Deskphone resets data stored in the EEPROM to factory defaults and erases files in TFFS.

There are two ways to activate **Reset to Factory Settings**:

- 1. by entering a Special Key Sequence (SKS), or
- 2. remotely using SSH-PDT.

After you activate **Reset to Factory Settings**, the action is registered in the ECR-log file.

Activating Reset to Factory Setting by SKS

- 1. At any point while the IP Deskphone is operating, press the Special Key Seguence (SKS).
- 2. Enter the following command:

```
**73639<MAC>## (or **renew<MAC>##)
```

For example, the MAC-address, A1B2C3D4E5F6, can be translated to 212223343536. Therefore, the SKS would be **73639212223343536##.

After the proper sequence is entered on the IP Deskphone, the confirmation screen appears.

3. Press the **YES** context-sensitive soft key to reset to factory setting.

Or

Press the **NO** context-sensitive soft key to close the confirmation screen and return to regular mode.

The following table describes the function of the Context-sensitive soft keys for Reset to Factory Setting.

Table 102: Context-sensitive soft keys for Reset to Factory Setting

Context-sensitive soft key	Action
Yes	Activates Reset to Factory Setting.
No	Rejects Reset to Factory Setting, closes the confirmation screen, and returns to regular mode.

Activating Reset to Factory Setting using SSH_PDT

1. Enter the PDT-command:

```
>reset2factory
```

The PDT displays the prompt:

```
>Reset to Default... Are you sure[Y/N]?
```

2. Enter Y to accept.

OR

Enter N to decline.

If you select Y, the PDT displays the prompt:

>Enter MAC-address:

3. Type in the IP Deskphone MAC-address.

><MAC><enter>

For example, if the IP Deskphone MAC-address is A1B2C3D4E5F6 , you enter:

>A1B2C3D4E5F6<enter>

4. Click Enter.

- If the MAC-address is correct, the IP Deskphone is reset and the remote telnet client is restarted.
- If the MAC-address is incorrect, the IP Deskphone displays:

>Incorrect MAC-address. Action is rejected .

Return to Step 1.

Chapter 30: Diagnostics and troubleshooting

This chapter contains the following topics:

- IP Deskphone diagnostics on page 331
- Local diagnostic tools on page 333
- How to access the Diagnostics menu on page 334
- IP Set and DHCP information on page 335
- Network Diagnostic Tools on page 338
- Ethernet Statistics on page 340
- IP Network Statistics on page 344
- Advanced Diag Tools on page 346
- Test key on page 348
- Logging Systems on page 349
- Problem Determination Tool (PDT) on page 351
- Diagnostic logs on page 358

IP Deskphone diagnostics

Network-related issues can be debugged using the Network Diagnostic Utility (NDU) built into the IP Deskphone.

Another way to diagnose a problem on an IP Deskphone is to capture a message trace using any appropriate software.

The IP Deskphone has Problem Determination Tools (PDT). These can be accessed through a SSH session using the IP address of the IP Deskphone (you can configure the login and password using provisioning or manually in the network configuration window of the phone).

Problem: Server unreachable after the IP Deskphone is powered up:

.

If the display indicates that the server is unreachable and it continuously resets, some parameters must be configured. Things to consider when setting parameters:

- Enter requested information in the menu fields by pressing the number keys on the dialpad. Press the asterisk (*) key to enter a period (.) when entering an IP address.
- To record the entry and advance the initialization to the next parameter, press **OK**.
- To abandon the manual configuration process and restart the power-up, press Cancel.
- To manually enter parameters, use the **BKSpace** or **Clear** soft keys to edit the default entry. BKSpace deletes each character as the key is pressed. Clear deletes the entire entry.
- Each parameter must have a corresponding entry.

Problem: Software download failure:

If you are having trouble downloading software, review the following.

- Are the Server URL and Protocol parameters correct in the IP Deskphone's Device Settings
 Provisioning dialog?
- Is the IP Deskphone connecting to the TFTP server log?
 Check any firewall configuration settings to allow TFTP protocol access.
- Is the syntax within the 12xxSIP.cfg correct? See <u>Creating the provisioning files</u> on page 45. Supported sections describe the syntax of the configuration file.
- Does DOWNLOAD_MODE = AUTO and is VERSION less than the current running software version? If a file does not download using the AUTO selection, it is possible the version number is not high enough. A version number exists permanently on the IP Deskphone until a higher version number is downloaded through the device configuration file or you can select Services > File Manager on the IP Deskphone.
- Check FILENAME. Does this exist on the TFTP server?
- Check to make sure your firewall settings allow for the provisioning protocol (TFTP, FTP, OR HTTP) to go through.

Problem: Software conversion failures:

There are four different boot loaders in the FLASH and application load. Various boot loaders are used to recover the IP Deskphone if a failure occurs.

- If a conversion fails before anything is written to FLASH, the IP Deskphone reboots with the previous software load.
- If the software download fails while the application is being written to FLASH, there are two possible recovery methods:
 - If an application file was not created, after power up the IP Deskphone jumps to the BootC loader and downloads a new application load using the same mechanism as the application.
 - If the application is executed and the file created is corrupted, the IP Deskphone crashes. In this case, force the IP Deskphone to use BootC by pressing the UP key and "2" during power up.

Problem: Users of the IP Deskphone complain that their banner is not updated with their custom banner:

When the banner is configured as FORCED in the device configuration file, the user's banner is overwritten by the value in the device configuration file.

Problem: Provisioning Error is displayed on the IP Deskphone display.:

The Provisioning Error is displayed on the screen when the IP Deskphone is unable to contact the TFTP, FTP, or HTTP server.

Local diagnostic tools

Local diagnostic tools provides information about the IP Deskphone, such as identification, software version, settings, and a set of testing routines for checking network condition.

You can access Diagnostics tools through the Diagnostics menu.

<u>Table 103: Diagnostics menu options</u> on page 333, describes the Diagnostics menu options.

Table 103: Diagnostics menu options

Diagnostics option	Description
IP Deskphone and DHCP information	Provides detailed information about the IP Deskphone and service configuration.
Network Diagnostics Tools	Provides access to the following testing routines:
	• ping
	tracert
Ethernet Statistics	Provides some Ethernet statistics for Network Interface and PC port.
IP Network Statistics	Provides IP Network statistics.
Certificates Administration	Supports administration of available certificates.
Advanced Diag Tools	Provides information for setting up the following configuration parameters:
	Auto Recovery (enable/disable)
	SSH (enable/disable)
	Port Mirroring (enable/disable)
	User ID and Password for SSH
Test Key	Activates key testing mode.

How to access the Diagnostics menu

To activate the **Diagnostics** menu, access the **Network** menu by selecting one of the following steps:

- Press the **Services** key twice on the IP Deskphone while the IP Deskphone is in the idle mode.
- Press the **Prefs** soft key, and then select the **Network** item in the **Preferences** menu.

The following screen appears:

Figure 76: Network menu

After you access the **Network** menu, the following options are available:

- Server Settings
- Device Settings
- Diagnostics
- Licensing
- Lock

Select **3. Diagnostics**, or press **Back** to return to the **Network** menu.

The following screen appears:

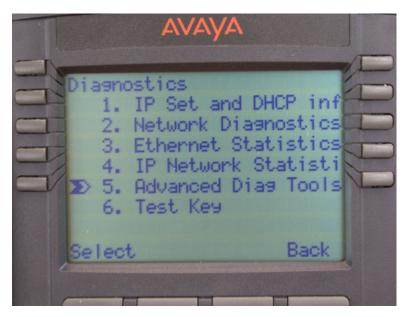

Figure 77: Diagnostics menu

The following table describes the function of the Navigation keys for the **Diagnostics** screen.

Table 104: Navigation

Key	Action
Up and down arrows	Use the up and down arrows to change the selected item in the list.
Enter	Invokes the Select soft key.
Digital keys (number associated with option)	Invokes an appropriate option.
*	Selects the first option Server Settings, but does not activate it.
#	Selects the last option Lock, but does not activate it.

IP Set and DHCP information

The **IP Set and DHCP Info** screen provides detailed information about the IP Deskphone, such as configuration, software version, IP addresses, gateway, and servers.

To access the **IP Set and DHCP Info** screen, from the **Diagnostics** menu, choose **1. IP Set and DHCP Info**.

The following screen appears:

Figure 78: IP Set and DHCP Info screen

The following is an example of the information that appears:

1. Configuration

Network Data Valid: Yes

MAC Address Stored: Yes

Perform DHCP: No

Voice VLAN Enable: No

Voice VLAN Config: No

VLAN Voice VLAN Discovered: No

2. Primary Server: S1

PC Port is: ON

3. Software Version: 3.00.09.02

Hardware ID: xxxxxx

- 4. Set IP: xxx.xxx.xxx (could be in IPv4 or IPv6 format)
- 5. Sub-Mask: xxx.xxx.xxx (could be in IPv4 or IPv6 format)
- 6. GateWay: xxx.xxx.xxx.xxx (could be in IPv4 or IPv6 format)
- 7. Voice VLAN Priority: 6
- 8. Voice VLAN ID: 6
- 9. DHCP Respond String:
- 10. Servers' Information:

S01 IP: xxx.xxx.xxx

```
Port: 4100 Act: 1 Retries: 5
S02 IP: xxx.xxx.xxx
Port: 4100 Act: 1 Retries: 5
S03: IP: xxx.xxx.xxx
Port: 4100 Act: 1 Retries: 5
S04 IP: xxx.xxx.xxx
Port: 4100 Act: 1 Retries: 5
11. Provisioning Server: xxx.xxx.xxx
```

The following table describes the function of the Navigation key for the **IP Set and DHCP Info** screen.

Table 105: Navigation

Key	Action
Up and down arrows	Use the up and down arrows to scroll the screen.

The following table describes the function of the context-sensitive soft keys for the **IP Set and DHCP Info** screen.

Table 106: Context-sensitive soft key for the IP Set and DHCP information screen

Context-sensitive soft key	Action
Return	Press the Return soft key to cancel this screen and return to the Diagnostics menu.

Duplicate IPv6 addresses from DHCPv6 server

If an IP Deskphone receives a duplicate IPv6 address from the DHCPv6 server, the IP Deskphone displays

Duplicated IPv6 Address

on the phone screen.

After a 10–second timeout, the IP Deskphone displays

Starting DHCPv6

on the phone screen and a DECLINE message is sent back to the DHCPv6 server to inform the DHCPv6 server that this address should not be assigned.

If the DHCPv6 server sends a REPLY message in answer to DECLINE, the IP Deskphone removes the duplicated IP address from the list of IPv6 addresses, resources associated with duplicate address are freed, and the DHCP process restarts.

If no REPLY message is received, the IP Deskphone makes four more attempts to contact the DHCPv6 server. If unsuccessful, the IP Deskphone removes the duplicated IP address from the list of IPv6 addresses, resources associated with duplicate address are freed, and the DHCP process restarts.

DHCP server unreachable

This section describes the IP Deskphone behavior when the DHCPv4/DHCPv6 server is unreachable.

If the DHCPv4/DHCPv6 server is unreachable due to the following scenarios:

- IP Deskphone starts and cannot get IPv4 address from DHCPv4 server (cached IP is disabled)
- IP Deskphone starts and cannot get IPv6 address from DHCPv6 server (cached IP is disabled)
- IPv4 address lease expires (cached IP is disabled)
- IPv6 address becomes deprecated and there are no active calls (cached IP is disabled)
- IPv6 address lease expires (cached IP is disabled)

then the following message is displayed on the IP Deskphone display screen:

DHCP server unreachable. Trying to contact...

If the IPv6 address becomes deprecated and there is an active call, the message is displayed on the IP Deskphone display screen after the active call is released.

When this message is displayed, the user can:

- · wait until the IP Deskphone receives the required IP address from DHCP
- open the Device Settings menu (by double-pressing the Services key) and try to re-configure the IP Deskphone

The message window closes automatically when the IP Deskphone receives a new valid IPv4/IPv6 address.

Network Diagnostic Tools

The **Network Diagnostic Tools** screen provides access to *ping* and *tracert* testing routines. To access the **Network Diagnostic Tools** screen, from the **Diagnostics** menu, choose **2. Network Diagnostics tools**.

The following screen appears:

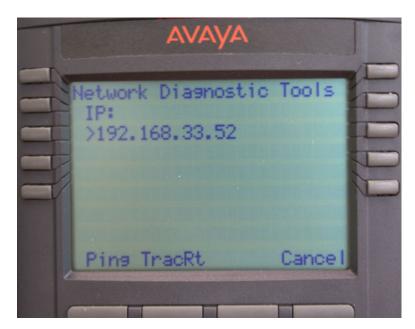

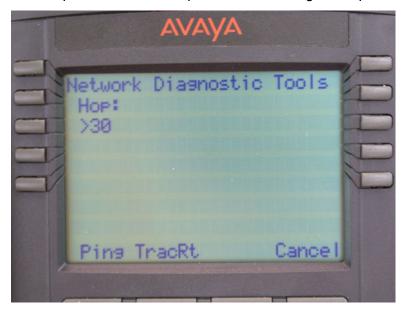

Figure 79: Network Diagnostic Tools screen

There are two configurable fields:

- IP enter an IP address.
- Hops number of hops used as a configurable parameter for tracert routine.

The following services are available:

- · activate the ping routine
- · activate the tracert routine

The following table describes the function of the context-sensitive soft keys for the **Network Diagnostics tools** screen.

Table 107: Context-sensitive soft keys for the Network Diagnostic Tools screen

Context-sensitive soft key	Action
Ping	Activates the ping routine.
Tracert	Activates the tracert routine.
Cancel	Returns you to the Diagnostics menu.

The following table describes the function of the Navigation keys for the **Network Diagnostic Tools** screen.

Table 108: Navigation

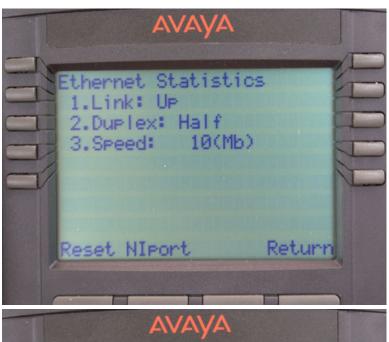

Key	Action
Up and down arrows	Use the up and down arrows to scroll through a list of testing information.
Left and right arrows	Use the left and right arrows to move through the configurable fields.
Enter	Use the Enter key to enter the editing mode for the active configurable field.

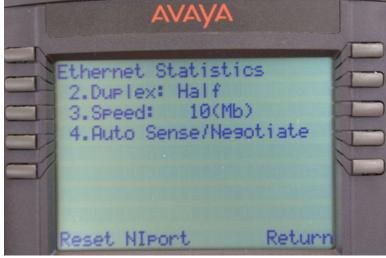

Ethernet Statistics

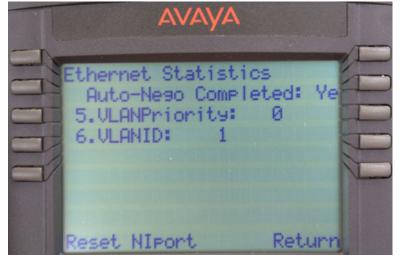

The **Ethernet Statistics** screen displays Ethernet statistics information for Network Interface (NI) or PC ports, such as the number of incoming and outgoing network packages and network settings.

To access the **Ethernet Statistics** screen, from the **Diagnostics** menu, choose **3. Ethernet Statistics**.

The **Ethernet Statistics** for the NI Port screen appears, as shown in the following screen examples. Use the up and down Navigation arrows to scroll through the complete list of Ethernet statistics.

Ethernet statistics example:

The following is an example of Ethernet statistics for the IP Deskphone:

```
1. NI Link Status: Up
2. Duplex Mode: Full
3. Network Speed: 1000Mb
4. Auto Sense/Negotiate
Auto-Negotiate Capability: Yes
Auto-Negotiate Completed: Yes
5. Port VLAN Priority: 0
6. Port VLAN ID: 0
7. Packet Collision: 0
8. CRC Errors: 1
9. Frame Errors: 1
A. Unicast Packets Tx: 1
B. Unicast Packets Rx: 1
C. Broadcast Packets Rx: 1
D. Multicast Packets Rx: 1
=== 802.1x Status ===
EAP Status: Disabled
```

The following table describes the function of the context-sensitive soft keys for the **Ethernet Statistics (NI Port** screen.

Table 109: Context-sensitive soft keys for the Ethernet Statistics (NI Port) screen

Context-sensitive soft key	Action
Reset	Resets statistics value.
NI Port	Switches to the PC Port Ethernet statistics.
Return	Returns you to the Diagnostics menu.

The following table describes the function of the Navigation keys for the **Ethernet Statistics (NI Port)** screen.

Table 110: Navigation

Key	Action
· ·	Use the up and down arrows to scroll through the list of statistics information.

Ethernet Statistics (PC Port) screen

The **Ethernet Statistics (PC Port)** screen displays Ethernet statistics for the PC Port. To view the **PC Port** Ethernet statistics, from the **Ethernet Statistics** screen, press the **NI Port** soft key.

The following screen appears:

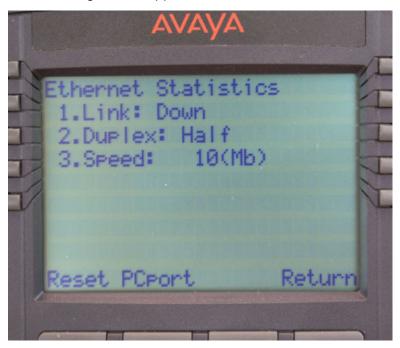

Figure 80: Ethernet Statistics (PC Port) screen

Use the up and down Navigation arrows to scroll through the list of Ethernet statistics for the PC Port.

The following is an example of Ethernet Statistics for the PC Port:

```
    PC Link Status: Up
    Duplex Mode: Full
    Network Speed: 10 Mb
    Auto Sense/Negotiate
    Auto-Negotiate Capability: Yes
    Auto-Negotiate Completed: Yes
    Port VLAN Priority: 0
    Port VLAN ID: 0
    Packet Collision: 0
    CRC Errors: 1
    Frame Errors: 1
    Unicast Packets Tx: 1
```

- B. Unicast Packets Rx: 1
- C. Broadcast Packets Rx: 1
- D. Multicast Packets Rx: 1

The following table describes the function of the context-sensitive soft keys for the **Ethernet Statistics (PC Port)** screen.

Table 111: Context-sensitive soft keys for the Ethernet Statistics (PC Port) screen

Context-sensitive soft key	Action
Reset	Resets statistics values.
PC Port	Switches to the NI Port Ethernet statistics.
Return	Returns you to the Diagnostics menu.

The following table describes the function of the Navigation keys for the **Ethernet Statistics (PC Port)** screen.

Table 112: Navigation

Key	Action
Up and down arrows	Use the up and down arrows to scroll through a list of statistics information.

IP Network Statistics

The **IP Network Statistics** screen provides information such as the number of incoming and outgoing network packets, number of error packets, and protocols. To access the **IP Network Statistics** screen, from the **Diagnostics** menu, choose **4. IP Network Statistics**.

The following screen appears:

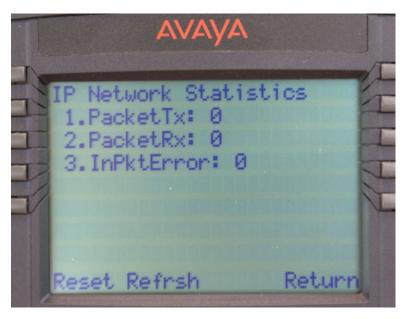

Figure 81:

Use the up and down Navigation arrows to scroll through the list of IP Network Statistics information. The following is an example of IP Network Statistics for the IP Deskphone:

- 1. Packet Sent: 0
- 2. Packet Received: 0
- 3. Incoming Packets Error: 0
- 4. Outgoing Packets Error: 0
- 5. Incoming Pkt Discarded: 0
- 6. Outgoing Pkt Discarded: 0
- 7. Unknown Protos: 0
- 8. Last ICMP Type/Code: 1

The following table describes the function of the context-sensitive soft keys for the **IP Network Statistics** screen.

Table 113: Context-sensitive soft keys for the IP Network Statistics screen

Context-sensitive soft key	Action
Reset	Resets statistics values.
Refresh	Refreshes the IP Network statistics.
Return	Returns to the Diagnostics menu.

The following table describes the function of the Navigation keys for the **IP Network Statistics** screen.

Table 114: Navigation

Key	Action
Up and down arrows	Use the up and down arrows to scroll through a list of statistics information.

Advanced Diag Tools

With the **Advanced Diag Tools** option, you can modify the following parameters:

- Auto Recovery (enable/disable)
- Port Mirroring (enable/disable)

To access the **Advanced Diag Tools** screen, from the **Diagnostics** menu, choose **5. Advanced Diag Tools**.

The following screen appears:

Figure 82: Advanced Diag Tools screen

Use the up and down Navigation arrows to scroll through the Advanced Diag parameters.

The following table describes the function of the context-sensitive soft keys for the **Advanced Diag Tools** screen.

Table 115: Context-sensitive soft keys for the Advanced Diag Tools screen

Context-sensitive soft key	Action
Apply	Invokes the selected service.
Back	Dismisses the dialog box and returns you to the Diagnostics menu.

The following table describes the function of the navigation keys for the **Advanced Diag Tools** screen.

Table 116: Navigation

Key	Action
Up and down arrows	Use the up and down arrows to scroll through a list of statistics information.
Enter	Use the Enter key to enter the editing mode for the active configurable field or change the value for check boxes.

Port Mirroring

The ability to use Port Mirroring depends on the device configuration parameter defined in the device configuration file. The following device configuration file parameter manages the PC Port Mirroring option:

PORT MIRROR ENABLE [YES/NO]

This parameter determines whether or not the Port Mirror option can be managed:

- If PORT_MIRROR_ENABLE is YES, then you can activate or deactivate the Port Mirror option on the IP Deskphone. The Port Mirroring prompt in the Network-> Diagnostics > Advanced Diag Tools menu is enabled and can be modified.
- If PORT_MIRROR_ENABLE is NO, then you cannot manage the Port Mirror option on the IP Deskphone. The Port Mirroring prompt in the Advanced Diag Tools menu is disabled (dimmed); Port Mirroring is disabled.

The default value for the PORT_MIRROR_ENABLE is NO. This means that Port Mirroring is disabled and cannot be enabled.

Gathering Network Traces from a phone

You can capture network traces from the PC port of the IP Deskphone.

1. Ensure the PC port is enabled on the IP Deskphone.

Open the **Device Settings** menu. Check to see if the **Enable PC Port** parameter checkbox is displayed and the checkbox is checked. If the **Enable PC Port** parameter checkbox is not visible, do the following:

- Press the Auto soft key and check the 07. PC Port Enable checkbox in the Auto Provisioning window.
- Press the **Config** soft key to return to the **Network Settings** window.
- Check the PC Port checkbox.
- 2. Ensure the Port Mirroring feature is enabled through provisioning.
- 3. Enable port mirroring on the IP Deskphone by pressing the **Services** key twice and opening **3. Diagnostics > 6. Advanced Diag Tools**. Select the **Port Mirroring** check box.
 - Note:

If the check box is dimmed and cannot be selected, this means that Port Mirroring was not enabled in the provisioning file.

- 4. Press the **Services** soft key and select **4. Check for Updates**. Press the **YES** soft key to update the IP Deskphone configuration.
- 5. Connect your PC to the PC port of the IP Deskphone.

Test key

The **Test key** screen lets you perform a physical key operation test. After you activate the test mode, the **"Test key: Press any key"** prompt appears on the screen. The IP Deskphone goes into the Do Not Disturb (DND) mode and cannot receive any external calls. Information about the pressed key event (except for the RIs key) appears on the IP Deskphone screen. To access the **Test key** screen, from the **Diagnostics** menu, choose **6. Test key**.

The following screen appears:

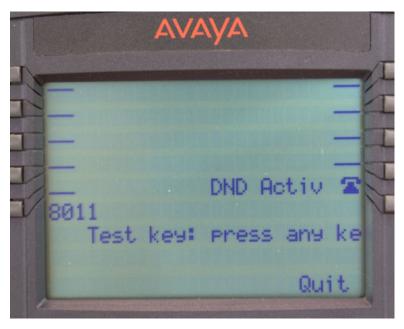

Figure 83: Test key screen

After you activate the test mode, the key event appears on the screen:

```
• Key pressing: "Test key: xx pressed"
```

• Key pressing: "Test key: xx pressed"

The following table describes the function of the context-sensitive soft keys for the **Test key** screen.

Table 117: Context-sensitive soft keys for the Test key screen

Context-sensitive soft key	Action
Quit	Dismisses the Services menu.

The following table describes the function of the Navigation key for the **Test key** screen.

Table 118: Navigation

Key	Action
Ris	Closes the test mode and restarts the IP Deskphone.

Logging Systems

Logging Systems contains a subsystem for logging incoming and outgoing SIP packages for the IP Deskphone to the log file in FFS. You can enable or disable the SIP logging subsystem by selecting **Yes** (enable) or **No** (disable).

To access the **Logging Systems** menu, press the **Services** key on the IP Deskphone, and then choose **Logging Systems** from the **Services** menu.

The following screen appears:

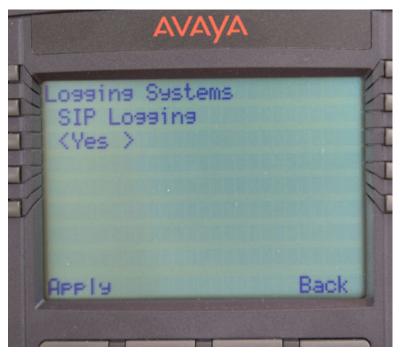

Figure 84: Logging Systems screen

The **Logging Systems** screen displays the SIP Logging subsystem. Press the **Enter** key in the Navigation key cluster to switch the value of the selected sign from Yes to No, or No to Yes. Then press the **Apply** soft key to apply the settings.

The following table describes the function of the context-sensitive soft keys for the **Logging Systems** screen.

Table 119: Context-sensitive soft keys for the Logging Systems screen

Context-sensitive soft key	Action
Apply	Applies the setting and returns to the parent screen.
Back	Dismisses the setting and returns you to the parent screen.

The following table describes the function of the Navigation keys for the **Logging Systems** screen.

Table 120: Navigation

Key	Action
Up and down arrows	Use the up and down arrows to scroll the screen.
Right and left arrows	Navigates through the signs.
Enter	Switches the value of the selected sign from ON to OFF, and OFF to ON.

You can enable or disable SIP-logging using the following command in the Device configuration file:

LOGSIP ENABLE Yes/[No]

If the parameter is Yes, the SIP-logging Manager is active and starts logging SIP incoming and outgoing packages into the log file in FFS. If the parameter is No, the SIP-logging Manager is not active and there is no logging of incoming and outgoing packages into the log file in FFS. The default parameter is No.

Problem Determination Tool (PDT)

The IP Deskphone with SIP Software contains special services that monitor the performance and various other states of the IP Deskphone. These services also automatically collect problem data, and provide symptom analysis support for the various categories of problems encountered by the software. All significant events are registered in special log files.

Error Logging framework

The Error logging framework saves error-related information in the ECR Log file and is the base object used by all the other monitoring services listed as follows:

- ECR Watchdog
- · Task Monitor
- · CPU Load Monitor
- · Stack Overflow Monitor
- · Traffic Monitor

ECR Watchdog

The ECR Watchdog tracks the IP Deskphone to ensure the IP Deskphone survives transitions (for example: soft reset). If the watchdog is active and has not detected activity in a certain period of time, the watchdog logs the appropriate error and recovers the IP Deskphone.

Task Monitor

The Task Monitor performs the following functions:

 Tracks the switch of any task to the suspended state. If the task gets to the suspended state, the Task Monitor logs the error-related information (including the suspended task information and summary information about all running tasks), and then initiates recovery of the IP Deskphone. Monitors important tasks. The Task Monitor scans these tasks, and if any task is lost without a reason, the Task Monitor logs the error and recovers the IP Deskphone.

CPU Load Monitor

The CPU Load Monitor tracks the CPU usage. If the CPU load reaches 100 percent and stays at that level for more than 1 minute, the CPU Load Monitor logs the appropriate error (including the list of most suspect tasks that could occupy the CPU), and recovers the IP Deskphone.

Stack Overflow Monitor

The Stack Overflow Monitor tracks the stack of all tasks in the real-time mode, detects the stack overflow or corruption, and logs the task trace.

Traffic Monitor

The Traffic Monitor monitors incoming and outgoing IP and SIP traffic and registers events in the ECR-log file when the traffic exceeds predefined thresholds. The Traffic Monitor also registers the content of the incoming and outgoing SIP packages.

PDT commands

The Problem Determination Tool (PDT) is a troubleshooting tool for the IP Deskphone. The PDT has powerful functions which allow you to perform special testing actions, and can display the content of any log files. The PDT helps to identify the origin of the problem under investigation, reduces the amount of time it takes to reproduce a problem with the proper RAS tracing levels set (trace levels are set automatically by the tool), and reduces the effort required to send the appropriate log information to technical support.

The PDT provides remote access to the IP Deskphone with the problem, using SSH session. Access is restricted by admin ID and password.

SSH can be enabled manually or through provisioning.

Enabling SSH manually:

Steps to enable SSH on an IP Deskphone manually:

- 1. Open the **Device Settings** dialog.
- 2. Check to see if the **Enable SSH** parameter checkbox is displayed and the checkbox is checked. If the **Enable SSH** parameter checkbox is not displayed, do the following:
 - Press the Auto soft key and uncheck the 18. SSH Enable checkbox in the Auto Provisioning window.

- Press Config soft key to return to the Network Settings window.
- Check the Enable SSH checkbox.
- Enter the UserID and Password.
- 4. Press the **Apply** soft key.
- 5. Connect to the IP Deskphone by using any SSH client program.

Enabling SSH through provisioning:

To enable SSH on an IP Deskphone through provisioning, perform this procedure:

- Open the **Device Settings** dialog.
- 2. Check to see if the **Enable SSH** parameter checkbox is displayed and the checkbox is checked. If the **Enable SSH** parameter checkbox is not displayed, do the following:
 - Press the Auto soft key and check the 18. SSH Enable checkbox in the Auto Provisioning window.
 - Press the Config soft key to return to the Network Settings window.
 - Check the Enable SSH checkbox.
- 3. Add the following parameters to the IP Deskphone device configuration file:
 - SSH YES
 - SSHID <user name>
 - SSHPWD <user password>
 - .
- 4. Press the **Services** soft key and select **4.Check for Update**. Press the **YES** soft key to update the IP Deskphone configuration.
- 5. Connect to the IP Deskphone by using any SSH client program.

The PDT supports the following set of commands:

Table 121: List of PDT commands

#	Command	Description
1	prtlog >prtlog <mngr_dest></mngr_dest>	Prints the content of the ECR-log file.
		 Outputs content of the specified log file to stdout (the screen, a stream, stdout, or a string). The input parameter specifies a type of logging manager:
		- 0 (default) — ECR-log file
		- 1 — SIP-log file
		If the input parameter is incorrect, the following notification appears:
		>prtlog: incorrect type of manager <x></x>
2	clearLogFile	Clears the content of the ECR-log file

Table continues...

#	Command	Description
3	setLogLevel <loglevel></loglevel>	Configures log level, where the loglevel is in the range 03:
		• If loglevel = 0 — logging is disabled
		If loglevel = 1 — logging only Critical errors
		If loglevel = 2 — logging Critical and Major errors
		If loglevel >=3 — logging any type of errors
4	printLogLevel	Prints log level
5	setRecoveryLevel <reclevel></reclevel>	Sets up recovery level, where the reclevel is in the range 03. If the Auto Recovery option is ON, the IP Deskphone behaves as follows:
		If reclevel = 0 — recovering is disabled
		If reclevel = 1 — recovering on only Critical errors
		If reclevel = 2 — recovering on Critical and Major errors
		• If reclevel >= 3 — recovering on any errors
6	printRecoveryLevel	Prints recovery level
7	taskMonShow	Prints a list of monitored tasks
8	";"	Prints all task information
9	ti <taskname id="" task="" =""></taskname>	Prints task information
10	memshow [level]	Shows memory information
11	checkStack <taskname id="" task="" =""></taskname>	Checks stack of some task
12	tt <taskname id="" task="" =""></taskname>	Prints Task Trace
13	info	Prints HardwareID, SoftwareID, MAC and BT address
14	prtcfg	Prints content of the IP Deskphone configuration file, SystemConfig.dat in FFS. The file contains IP Deskphone-specific configuration. The content of this file is formed from the content of several downloadable configuration files:
		Device Configuration file
		Tones file
		Language file
15	Isr	Lists directory contents (similar to unix Is) and the contents of a directory and any of its subdirectories
16	ping <host ip=""> [# of pings]</host>	Pings any host (ping)
17	tracert <host ip=""> [max hops]</host>	Traceroute to any host (tracert)
18	netinfo	Prints common network information

Table continues...

#	Command	Description				
19	routeshow	Displays host and network routing tables and stats				
20	arp	Displays entries in the system ARP table				
21	listcerts	Lists all trusted certificates				
22	printcert <index></index>	Displays certificate details				
23	sipapp <start stop="" =""></start>	Starts or stops the SIP application				
24	sendunistim <xx xx=""></xx>	Sends UNIStim message				
25	rxunistim <on off<="" td="" =""><td>Displays UNIStim messages from the Core</td></on>	Displays UNIStim messages from the Core				
26	txunistim <on off<="" td="" =""><td>Displays UNIStim messages to the Core from the SIP application</td></on>	Displays UNIStim messages to the Core from the SIP application				
27	sendevent <0xmmm <0xnnn>	Simulates an UNIStim event.				
28	Icdparam	Sets up LCD parameters for the IP Deskphone				
29	audio <hs hd="" hf="" off="" =""></hs>	Loopbacks audio to handset/headset/Handsfree				
30	display <on off="" =""></on>	Turns all LCD and LED on or off				
31	keypress <on off="" =""></on>	Turns all key presses on or off				
32	clearlog > clearlog < mngr_dest >	Clears content of the specified log file. The input parameter specifies the type of logging manager:				
		0 (default) — ECT-log file				
		• 1 — SIP-log file				
		If the input parameter is incorrect, the following notification appears:				
		>clearlog: incorrect type of manager <x></x>				
33	removelog	Removes the specified log file.				
	>removelog <mngr_dest></mngr_dest>	The input parameter specifies the type of logging manager:				
		0 (default) — ECR-log file				
		• 1 — SIP-log file				
		If the input parameter is incorrect, the following notification appears:				
		>removelog: incorrect type of manager <x></x>				
34	reset2factory >reset2factory	Resets the IP Deskphone to the default setting. See Activating Reset to Factory Setting using SSH_PDT on page 329.				

You can request the following commands to the support team if you have any issues:

- printSetInfo
- prtcfg
- prtlog 0
- prtlog 1

- netinfo
- arpShow
- memShow
- · routeshow
- i

The command (i) displays the list of tasks with TID and STATUS fields. For every task that has a SUSPEND status in the list, enter the following commands:

ti 0x. <TID>

tt 0x <TID>

checkStack 0x <TID>

To print out a list of all supported commands and a short description of each, enter the "?" command when the PDT prompt is displayed, as shown in this example:

PDT> ?.

Device configuration file

The following table describes the configuration commands in the device configuration file for alarms, logs and diagnostics.

Table 122: Alarms, logs and diagnostics configuration commands

Component	Flag	Description
PC Port Mirroring parameter which can be enabled and disabled in the Advanced Diag Tools dialog.	PORT_MIRROR_ENABLE	Determines whether the Port Mirror option can be enabled/disabled or not through the IP Deskphone Advanced Diag Tools menu.
		If PORT_MIRROR_ENABLE is configured as YES, The Port Mirroring prompt in the Advanced Diag Tools dialog is enabled, and you can activate or deactivate the Port Mirror option.
		If PORT_MIRROR_ENABLE is configured as NO, the Port Mirroring prompt in the Advanced Diag Tools dialog is disabled (dimmed); the option is deactivated by force, and you cannot access the Port Mirror option.

Table continues...

Component	Flag	Description
		The values are YES and NO. The default value is NO (disabled).
Memory Monitor.	MEMCHECK_PERIOD	Determines the time period in seconds when the Memory Monitor wakes up (after start-up or the last memory check attempt).
		The values are 1800 (0.5 hrs) to 86400 (24 hrs). The default value is 86400 (24 hrs).
SIP-traffic monitor	DOS_PACKET_RATE	Determines the maximum number of packets per second that is allowed.
SIP_traffic monitor	DOS_MAX_LIMIT	Specifies how many packets past DOS_PACKET_RATE the IP Deskphone can receive before packets are dropped.
		If packets are received at a rate of DOS_PACKET_RATE +1, then packets start getting dropped after the time specified in DOS_MAX_LIMIT (in seconds).
SIP-traffic monitor	DOS_LOCK_TIME	Specifies the amount of time (in seconds) the IP Deskphone stops processing packets after DOS_MAX_LIMIT is reached.
		If DOS_PACKET_RATE is < 1, other values are ignored and packets are not dropped.
Logging System	LOGSIP_ENABLE	Allows the administrator to enable or disable SIP-logging.
		If the parameter is YES, the SIP- logging Manager is active and starts logging SIP incoming and outgoing packets into the log files in FFS.
		The values are YES and NO. The default value is NO (the manager is not active and the IP Deskphone does not log in SIP incoming and outgoing packets.

Diagnostic logs

The IP Deskphone supports two types of log files:

- ECR-log
- SIP-log

ECR-log file

The ECR-log file registers and provides detailed information on the errors or bugs that occur during the operation of the IP Deskphone. The ECR-log also contains records indicating some events, such as restart.

Each error is logged as a record. The format of the record is the same regardless of the monitor that generates it or the level of severity of the error. There are three sections to the record.

The first section provides mandatory information for each record including:

- severity level
- · severity flag
- · time stamp
- · software version
- · source file information
- · error number
- · brief description

The following is an example of the information logged in the first section:

```
=== Record #001 === MAJOR SET Logged 01/07/2002 00:34:35 Firmware: 06A5C1Hd10 Description: Task Monitor: the Transport task is suspended
```

The second section is optional. If the task is registered in the list of stack overflow events, the following type of information may be displayed, as shown in the following example

```
ERROR*ecrStackShow: :StackOverflow: PDT tpStackBase = 0x8194ffa0, pStackLimit=0x8194bfa0, pStackEnd= 0x8194bfa0 tstack: base 0x8194ffa0 end 0x8194bfa0 size 16368 high 1492 margin 14874
```

The third section includes the supplementary information. The content depends on the flag in the calling function. The flag can be as follows:

- ECR_LOG_NO_EXTRA_INFO
 - no supplementary information
- ECR_LOG_TASK_INFO:
 - log task information (ti, tt, the stack information from SP-96 to SP+96)

- ECR_LOG_SUM_TASK_INFO:
 - log summary of each task TCB (i)
- ECR_LOG_MEM_INFO:
 - log memory usage information (memShow)

The following is an example of the supplementary information in the ECR-log file:

Figure 88: Example of the ECR-log file (continued)

SIP-log file

The SIP-log file registers incoming and outgoing SIP-packages, and each package is logged as a record. There are two sections:

- The first section requires mandatory information for each record including:
 - type of the package (incoming or outgoing)
 - time stamp
 - software version
- The second section contains the content of the package in text format.

<u>Figure 89: Example of the SIP-log file</u> on page 364 is an example of the SIP-log file that is output when the following PDT command is entered:

PDT>prtlog 1

```

Figure 90: Example of the SIP-log file (continued)

There are three ways to get SIP-logs from the IP Deskphone:

- 1. Connect to the phone through SSH
 - Online connect to the phone through SSH and enter the PDT command dbgshell. The log messages are printed out during a call to the SSH console.
 - Offline— connect to the phone through SSH and enter the PDT command prtlog 1. The active SIP-log file is printed out to the SSH console.
- 2. Log files are stored on the IP Deskphone flash device. You can access these files using the File Manager of the IP Deskphone and copy the files to an external flash drive.

Perform this procedure to copy SIP-log files using the File Manager of the IP Deskphone:

- a. Connect a USB flash drive to the USB port of the IP Deskphone.
- b. Navigate to File Manager->Phone->Logs.
- c. Select one of *.log file.
- d. Press the **Send** soft key.
- 3. You can obtain the log files through an SFTP connection to the IP Deskphone.

Perform this procedure to enable SFTP on an IP Deskphone:

Note:

Changing the SFTP_READ_PATTERNS causes the IP Deskphone reboot.

- a. Open the **Device Settings** dialog.
- b. Check to see if the **Enable SFTP** parameter checkbox is displayed and if the checkbox is checked. If the **Enable SFTP** parameter checkbox is not displayed, do the following:
 - Press the Auto soft key and check the SFTP Enable checkbox in the Auto Provisioning window.
 - Press the Config soft key to return to the Network Settings window
 - Check the Enable SSH checkbox.
- c. Add the following parameters to the device configuration file of the phone

Diagnostics and troubleshooting

```
SSH YES SSHID

SSH YES

SSHID <user name>

SSHPWD <user password>

SFTP YES

SFTP_READ_PATTERNS .txt,.zip,.log

SFTP WRITE PATTERNS .txt,.zip,.log
```

You can then connect through SFTP and obtain the most recent/logs/SIPLogFile.log and the archive:/logs/SIPLogFile.log.zip files.

HTTP server logs

To view all logs related to the http server, go to:

/usr/local/sipx/var/log/sipxbx/httpd_access_log /usr/local/sipx/var/log/sipxbx/httpd_error_log /usr/local/sipx/var/log/sipxbx/httpd_rewrite_log

Installation logs

To view the log of all the installed packages, go to:

/root/install.log

To view all system messages during startup, go to:

/var/log/messages

Configuration server logs

To view all logs related to the configuration server, go to:

/usr/local/sipx/var/log/sipxbx/sipxconfig.log /usr/local/sipx/var/log/sipxbx/sipxconfig.logins.log

PC Client Softphone interworking with the IP Deskphone

If the user does not have access to the pre-authorization configurations in the Feature Options menu, the feature is not enabled. You must verify the device configurations and enable the interworking feature so that the user can access the pre-grant authorization configuration and the IP Deskphone can auto-answer calls from authorized users or user groups. For more information, see Configuration of the PC Client Softphone on page 327.

If the call is being received, but is not being automatically answered in a Click-to-Answer scenario, the user must verify that the user making the request is an authorized user. For more information, see <u>Pre-granting authorization for the Answer-Mode</u> on page 321.

Part 2: Avaya Aura[®] support for 1200 Series IP Deskphones

The Avaya Aura[®] communications platform (solution comprised of Avaya Aura[™] Communication Manager, Avaya Aura[™] Session Manager, Avaya Modular Messaging) now supports the 1200 Series IP Deskphone with SIP 4.4 software. The 1200 Series IP Deskphones are directly registered to Session Manager and are supported by Communication Manager configured as an Evolution Server (CM-ES).

Supported platforms

The following Avaya Aura® platforms are supported:

- Avaya Aura® Communication Manager 6.2 FP2
- Avaya Aura® Session Manager 6.2 FP2
- Avaya Aura® Messaging 6.2
- Avaya Aura[®] Presence Services 6.1
- Avaya Aura® Conferencing 7.0

Telephony features

Some Communication Manager (CM) features can be invoked by dialing a Communication Manager Feature Name Extension (FNE). FNEs must be defined in Communication Manager for each of those features, subject to the existing dial plan.

Some CM features can be invoked by dialing a Communication Manager Feature Access Code (FAC). FACs must be defined in Communication Manager for each of those features, subject to the existing dial plan.

Chapter 31: Presence support for 1200 Series IP Deskphones

SIP 4.4 introduces support for the Presence feature for 1200 Series IP Deskphone users on Avaya Aura[®] with Avaya Presence Server (PS).

The Presence feature is configured in SIP 4.4 with the following new configuration parameters:

- RPID_PRESENCE_ENABLE <YES/NO>
- PRES_SERVER_IP <IP address of Presence Server>

If the RPID_PRESENCE_ENABLE parameter is set to YES, RPID-based subscription and notification messages, required for Avaya Presence Services, are sent.

PRES_SERVER_IP parameter defines the IP address of the Avaya Presence Server.

Important:

If RPID PRESENCE ENABLE is configured as YES:

- The IP Deskphone must be configured to use TLS for connection to the SIP proxy.
- USE PUBLISH FOR PRESENCE must be set to YES.
- USE_DEFAULT_DEV_CERT must be set to YES to use the default device certificate for the TLS connection to Avaya Aura to work with the contact list stored on Avaya Aura Session Manager.
- ENABLE_SERVICE_PACKAGE must be set to PPM.
- In the phone's Communication Profile, check **Presence Profile** and select the appropriate Presence Server from the drop-down list.

Presence states

Presence dialog has been expanded to include the list of activities according to RFC4480.

The following activities are available when RPID_PRESENCE_ENABLE is set to YES:

Appointment	Permanent absence
Away	Playing
Breakfast	Presentation
Busy	Shopping
Dinner	Sleeping

Table continues...

Holiday	Spectator
In transit	Steering
Looking for work	Travel
Lunch	TV
Meal	Vacation
Meeting	Working
On the phone	Worship
Performance	Unknown

To set the desired presence state and activity, the IP Deskphone user must open the Presence dialog, select the presence state (Connected or Unavailable) and then select the desired activity. Any combination of presence state and activity can be selected.

Related Links

<u>Avaya Aura® support for 1200 Series IP Deskphones</u> on page 368 <u>Presence status in Address Book</u> on page 24

Presence status in Address Book

The status dialog of the Address Book displays the presence state of contacts designated as Friends. In SIP 4.4, the IP Deskphone Address Book displays the presence state of Friends if RPID_PRESENCE_ENABLE is set to YES.

Phone state

Phone state is determined automatically, based on notifications received from Avaya Presence Server. Phone state can be one of the following:

- On hook when the phone handset is on hook; there are no active calls
- On a call the user is on a call
- Do Not Disturb when the user activated Do Not Disturb mode
- Unknown

Note:

Phone state does not depend on the presence state and activity selected by the end user.

Note:

- The 1200 Series IP Deskphones support more presence states than the Aura Presence Server (PS); activity detail appears on the 1100 Series and 1200 Series IP Deskphones but not on Avaya 96xx Series phones.
- Idle 1200 Series IP Deskphones appear as "offline" in the Avaya 96xx Series phones presence status; however, Busy, On the Phone and Away activities are displayed correctly.

Chapter 32: Personal Profile Manager support

SIP 4.4 introduces support of the Personal Profile Manage (PPM) for Avaya Aura Communication Manager/Session Manager.

The PPM) is a web service that runs as part of the Avaya Aura® Session Manager and the System Manager. PPM processes SOAP messages over HTTP/HTTPS with digest authentication.

PPM is responsible for maintaining and managing an end user's personal information in the system. This information includes (but is not limited to) contact list information, profile information, session history, access control lists, and other permissions management. In addition to communicating with other server components for managing the data within the infrastructure servers, the PPM also interfaces directly with end clients.

SIP 4.4 supports the following functionality with PPM:

- retrieving contact list from PPM
- · adding and deleting contacts
- updating contact
- · searching user
- retrieving E911 numbers
- · PPM reboot mechanism

Configuration parameter

The ENABLE_SERVICE_PACKAGE configuration parameter is expanded to include the value PPM, which switches the mode to obtain PPM data.

Related Links

Avaya Aura® support for 1200 Series IP Deskphones on page 368

Configuration on page 373

Contact lists and PPM on page 373

Emergency numbers on page 373

Global search with PPM on page 374

PPM reboot mechanism on page 374

Configuration

To enable support for PPM, configure the following parameter in the device configuration file :

ENABLE SERVICE PACKAGE PPM

Related Links

Personal Profile Manager support on page 25

Contact lists and PPM

PPM is responsible for maintaining and managing an end user's personal information in the system.

The following contact list functionality is supported with PPM:

- retrieving contact list from PPM
- adding and deleting contacts
- · updating contact information

When the IP Deskphone user adds, edits, or deletes a contact in their Address Book, a corresponding request is sent to PPM and that information is added to the user's contact list on PPM. PPM does not provide information about contact list size restrictions. This information is retrieved from the device configuration file. The parameter MAX_ADDR_BOOK_ENTRIES defines the size of the contact list and permitted number of friends.

Note:

The PPM contact list does not support a user's groups in the contact list.

Contact name, address, and designation as friend or not must be entered; otherwise, PPM rejects the entry.

Related Links

Personal Profile Manager support on page 25

Emergency numbers

The emergency number from PPM should be included in the dialing plan and possess all properties of that emergency number.

PPM data is located first, then data from a Dialing Plan file. Note that PPM data has priority over data from a Dialing Plan file. If the emergency numbers in PPM and the Dialing Plan file are identical, then the number from PPM is dialed. Emergency PPM data and Dialing Plan data from the configuration file can work together.

Note:

Calls to an emergency number are blocked from:

- Conference
- Transfer
- Join
- Hold
- Park

Related Links

Personal Profile Manager support on page 25

Global search with PPM

When PPM is enabled, and a global search is initiated from the IP Deskphone, PPM allows the IP Deskphone to search the Session Manager database for administered users. This search is based on search criteria sent in the request. IP Deskphone users can search using the following criteria:

- User Name (login name of the user; for example, 508@abc.com)
- First Name
- Last Name
- Phone Number

All users who correspond to the submitted criteria are retrieved from the database and displayed as a list. A maximum of 250 contacts are displayed.

The IP Deskphone user can search within this list using the standard local search mechanism. Pressing the **Save** soft key for a contact selected from the list saves the contact in the user's Address Book.

It is possible to call any contact in the list, save any contact from the list to the Address Book, and view the contact details.

Related Links

Personal Profile Manager support on page 25

PPM reboot mechanism

A soft reboot of the IP Deskphones can be performed on command through PPM.

The Reboot command is accessed through Session Manager. Invoking the Reboot command through PPM causes the IP Deskphone to perform a soft reboot (power cycle). This causes the IP

Deskphone to retrieve the 1xxxxSIP.cfg file from the provisioning server and perform a software upgrade if required.

Home I Elements I Session Manager I System Status I User Registrations

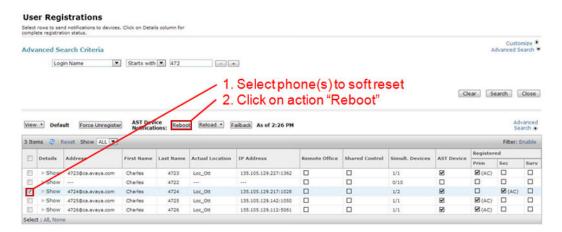

Figure 91: Reboot in Session Manager

Chapter 33: Embedded device certificate support

TLS connection with Avaya Aura® Session Manager requires mutual authentication by default. Mutual authentication requires proper Certificate Authority (CA) and device certificates to be installed on every IP Deskphone.

A default device certificate in the firmware allows easy connection to Avaya Aura® through Session Manager using TLS . The IP Deskphones already have an embedded CA certificate which is trusted by Avaya Aura®; the embedded device certificate eliminates the need for customers to generate and install device certificates manually.

If used, embedded device certificate information is displayed in the IP Deskphone and in the output of appropriate PDT commands.

Important:

The default embedded device certificates are trusted by the Avaya Aura® system. If Aura® is configured so that the default certificates are replaced by customer certificates, then the appropriate CA and device certificates must be installed on the IP Deskphones as well.

Related Links

<u>Avaya Aura® support for 1200 Series IP Deskphones</u> on page 368 Configuration on page 376

Configuration

The following parameter configures the default embedded device certificate.

USE_DEFAULT_DEV_CERT [YES/NO]

- YES Use the default device certificate if no customer device certificate is installed.
- NO Do not use the default device certificate (default).

This parameter controls the use of the default device certificate for HTTPS/TLS connections. The default value is NO. It is configured in the device configuration file.

Related Links

Embedded device certificate support on page 376

Chapter 34: SRTP support with Avaya Aura®

SRTP is supported with Avaya Aura®.

The following SRTP modes are supported:

- Secure Only
- Best Effort Capability Negotiation
- Note:

To use SRTP, you first have to be using TLS. That is, you cannot have secure media without using secure signalling.

Related Links

<u>Avaya Aura® support for 1200 Series IP Deskphones</u> on page 368 <u>Configuration</u> on page 377

Configuration

The following parameter is used to to support SRTP on Avaya Aura®:

AVAYA_AURA_MODE_ENABLE [YES | NO]

The command specifies if Avaya Aura®-specific features are active on the IP Deskphone or not. The default value is NO. It can be configured through the device configuration file and through server profiles.

- YES Avaya Aura-specific features are active.
- NO Avaya Aura-specific features are not active.
- Important:

In the device configuration file, the parameter MKI must be set to NO.

Related Links

SRTP support with Avaya Aura® on page 377

Chapter 35: Multi-user login on Avaya **Aura**®

The following multi-user scenarios are supported:

• One user can log on to a maximum of 10 IP Deskphones.

Note:

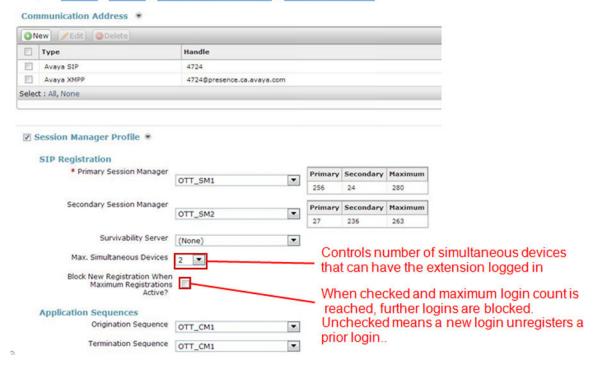

Once the call is answered at one phone, other users cannot see status of that call on the other phones.

- Multiple users (extensions) can log onto one IP Deskphone.
- When multiple users are logged onto one IP Deskphone, the IP Deskphone can be logged into more than one system.

Multi-user functionality requires Avaya Aura® FP2 (or later) with parallel forking.

The maximum number of user logins for one user extension is configured in Session Manager, as shown in the following figure.

Home I Users I User Management I Manage Users

Avaya Aura® support for 1200 Series IP Deskphones on page 368

Chapter 36: FNEs and FACs with Avaya Aura®

Some Avaya Aura® features are invoked by dialing a Communication Manager Feature Name Extension Extension (FNE) or Feature Access Code (FAC). A speed dial button on the IP Deskphone can be programmed to an FNE or FAC.

Most FNEs require first configuring the equivalent FAC.

This enables a feature to be easily accessed by pressing a speed dial key on the IP Deskphone instead of dialing an entire FNE or FAC code.

For information on configuring a speed dial key on an IP Deskphone, refer to the User Guide for the specific model of IP Deskphone.

For information on configuring FNEs and FACs in Communication Manager, see *Configuring Avaya* 1100 Series and 1200 Series IP Deskphones running Release 4.3 SIP software with Avaya Aura[®] Session Manager Release 6.1, Avaya Aura[®] Communication Manager Release 6.0.1, and Avaya Aura[®] Messaging Release 6.1 - Issue: 1.0, available at http://avaya.com/support.

FNEs and FACs with Avaya Aura® on page 380

Feature configuration details

This section provides further details on feature configuration for the IP Deskphones on Avaya Aura[®].

Feature / Functionality	Comments
Call Appearances	The endpoint template defaults to 3 call appearances.
	You can add more/remove call appearances in Endpoint Editor.
Autodial List	Configure FACs for Abbreviated Dialing List 1/2/3 and Program Group List.
	Configure abbreviated-dialing group entries.
	Configure the phone extension with abbreviated dialing group numbers.
	4. Use FACs to access lists and/or program entries.
Calling Name/Number Block	Configure the FAC and FNE for the Calling Name/
(similar to Calling Party Privacy)	Calling Number Block feature.
	Use FNEs to enable/disable the feature.
Call Forward All Calls (local)	Press the IP Deskphone's CallFwd soft key to enable Call Forward All Calls on the IP Deskphone.
	Press the CallFwd soft key again to disable the call forwarding.
Call Forward All Calls (server) Recommended over Call Forward All Calls	Configure the FAC and FNE for enabling and disabling the Call Forward All Calls feature.
(local) as Communication Manager handles call coverage better with it)	2. Use the FNE to enable/disable the feature.
Call Forward Busy/No Answer	Configure the FAC and FNE for enabling and disabling the Call Forward Busy/No Answer feature.
	2. Use the FNE to enable/disable the feature.
Call Park / Retrieve	Configure the FAC and FNE for Call Park and Answerback.
	2. Use FNEs to park a call and retrieve the call.
Call Pickup	Configure the FAC and FNE for Call Pickup.
·	Configure the pickup group for the phone extension number.
	3. Use the FNE to pickup a ringing call in the group.
Call Pickup, Directed	Configure the FAC and FNE for Directed Call Pickup.
	Configure the IP Deskphone extension COR to allow "Can use" and "Can be picked up" by directed call pickup.
	Use FNE plus the extension number to pickup the ringing call.
Mobile-X	Configure FACs for EC500 self administration and to enable/disable the self-administration feature.

Table continues...

Feature / Functionality	Comments	
	Configure FNEs to enable and disable EC500.	
	Configure the IP Deskphone extension for EC500 through off-pbx-telephone station-mapping.	
	Use the FAC to change the mobile number. User FNEs to enable/disable the feature.	
Ring Again	Configure the FAC and FNE for enabling and disabling auto callback	
	Configure the auto-callback button in the IP Deskphone's Endpoint Editor.	
	3. Use FNEs to enable and disable the feature.	
Priority Call	Configure the FAC and FNE for Priority Call.	
	Configure the IP Deskphone extension COS as "Priority Calling = Y".	
	Use the FNE to activate per-call priority calling.	
	Note:	
	An incoming priority call to Avaya Aura [®] digital phones/ 96xx phones triggers distinctive ringing, but the IP Deskphones do not provide distinctive ringing for an incoming priority call.

FNEs and FACs with Avaya Aura® on page 380

Chapter 37: Feature interactions

This chapter provides information on feature interactions for IP Deskphones with SIP Software on Avaya Aura® Communication Manager.

Conf and Join softkeys

The **Conf** and **Join** soft keys on the IP Deskphone support the IP Deskphone's local 3-way conference bridge. The **Conf** and **Join** soft keys do not work with the Communication Manager system's ad-hoc conference

Call Forward All Calls and Call Forward Busy / No Answer on Communication Manager

The Communication Manager system's **Call Forward All Calls** and **Call Forward Busy/No Answer** features are recommended over the IP Deskphone's local Call Forward feature (**CallFwd** soft key) as Communication Manager handles call coverage better with its own features.

If the local CallFwd (**CallFwd** soft key) is used, it cannot be used when the same extension is logged into multiple devices (Multiple login).

Group-Page on Communication Manager

• The Communication Manager **Group-Page** feature is not supported in SIP Release 4.4.

Local 3-way conference with MOH

When the IP Deskphone's local 3-way conference is used, and one party that has Music On Hold (MOH) enabled goes on hold, all remaining conference parties hear the MOH. Use the Communication Manager ad-hoc conference feature to avoid this.

Attended transfer

To use attended transfer, set the Communication Manager parameter "SIP Endpoint Managed Transfer?" to **NO** (found on p.19 of **system-parameter feature** configuration on the Communication Manager interface).

Remote Hold

To see **Remote Hold** displayed on a far-end phone when an 11xx/12xx IP Deskphone with SIP Software places a call on hold, the Communication Manager **Direct Hold** feature must be active so that the CM can forward the hold notification to the far end. The Communication Manager **Direct Hold** is enabled by disabling Music On Hold (MOH). To disable MOH, set **Hear System Music on Hold?** to NO in the IP Deskphone's COR (Class of Restriction).

CONFERENCE URI[n] configuration parameters

When the AVAYA_AURA_MODE_ENABLE parameter is configured as YES, the CONFERENCE URI[n] configuration parameters are not processed.

Codec support

Communication Manager offers 4 options for codec G722:

- G.722-64K
- G.722.1-24K
- G.722.1-32K
- G.722.2

! Important:

The IP Deskphones only support the G722-64K option.

Part 3: IP Deskphone migration

Part III of this document provides information on how to migrate IP Deskphones in the following scenarios:

- UNIStim IP Deskphone migration from CS 1000 to Avaya Aura on page 391
- Migrating IP Deskphones with UNIStim firmware from CS 1000 to IP Office on page 400

Related Links

<u>UNIStim IP Deskphone migration from CS 1000 to Avaya Aura</u> on page 391 Migrating IP Deskphones with UNIStim firmware from CS 1000 to IP Office on page 399

Chapter 39: UNIStim IP Deskphone migration from CS 1000 to Avaya Aura

Related Links

IP Deskphone migration on page 390

Overview on page 391

Requirements on page 392

Before you begin on page 392

Migrating IP Deskphones with UNIStim software from CS 1000 to Avaya Aura® using Aura® Utility Server on page 393

Overview

Note:

The use of Aura® Utility Server is not mandatory; any TFTP or HTTP server can be used as a provisioning server for the file download.

It is assumed that the IP Deskphones connect to Avaya Aura® through TCP or TLS and that the default embedded device certificates are used for secure connection to Aura SM and Aura Utility Services. For more information on the default certificates, see Embedded Device Certificates on page 376.

Note:

Avaya recommends that a single IP Deskphone of each type be migrated first to verify that the setup is correct.

For large installations, it is not recommended that all IP Deskphones be migrated at the same time

This chapter does not describe how to configure CS 1000, Avaya Aura®, or third-party applications such as the DHCP and TFTP servers. For this information, refer to the appropriate product documentation.

This chapter does not provide information on how to migrate the CS 1000 users and their profiles over to the Avaya Aura® system. If using this procedure to perform the migration, then the IP Deskphone users must manually input their login and password after migration in order to register with Avaya Aura® and obtain telephony services. Configuring IP Deskphone auto-registration requires knowledge of which phones belong to which users and the passwords for all users; this is out of scope of this procedure.

Related Links

UNIStim IP Deskphone migration from CS 1000 to Avaya Aura on page 391

Requirements

Ensure that the following requirements for migration have been implemented:

- The IP Deskphones are running UNIStim Release 3.3 firmware release or newer.
 - The latest firmware is recommended 062xC8Q.
- DHCP is enabled on the IP Deskphones.
 - The DHCP option should be set to YES in the **Network Configuration** menu.
- Auto Provisioning for the Provisioning Server is enabled on the IP Deskphones.
 - Check the **Provision Server** option check box in the **Network Configuration > Auto** menu.
- There is access to the Avaya Aura® Utility Services through a web interface.
- There are no network outages during migration.
 - The DHCP server, the CS 1000 system, and Avaya Aura® are available in the network.
- There are no power outages during the migration.
 - A power outage during the software upgrade can cause corruption of the IP Deskphone software. As a result, the IP Deskphone might not be able to start up and may require repair.

Related Links

UNIStim IP Deskphone migration from CS 1000 to Avaya Aura on page 391

Before you begin

- 1. Obtain the SIP software images for the IP Deskphones.
 - SIP4.4 or later software release is recommended.
- 2. Obtain a Network Locked License file.
 - For direct connection to Avaya Aura® Communication ManagerM/Session Manager, a license with no tokens is needed. For connection through Secure Router, a license with one token is needed.

3. Create a device configuration file with the configuration options required for connecting the IP Deskphones to Avaya Aura®.

Prepare all other SIP-related files to configure your IP Deskphones properly, such as licenses, images, and dial plan.

Important:

If TLS is used for secure connection to Aura® Session Manager, the following option must be added to the device configuration file:

USE DEFAULT DEV CERT YES

Related Links

UNIStim IP Deskphone migration from CS 1000 to Avaya Aura on page 391

Migrating IP Deskphones with UNIStim software from CS 1000 to Avaya Aura[®] using Aura[®] Utility Server

About this task

If you have IP Deskphones running UNIStim firmware on a CS 1000 system, and you want to migrate the IP Deskphones to Avaya Aura® with SIP software on the IP Deskphones, use the following procedure.

Procedure

1. Create configuration files for the IP Deskphones with UNIStim firmware, as shown in the following example for the 1220 IP Deskphone.

Example of configuration file for 1220 IP Deskphone:

1220SIP.cfg:

[FW]

DOWNLOAD MODE AUTO

VERSION 04.04.09.00 <— version should be taken from the SIP software file name PROTOCOL HTTP

FILENAME SIP12x004.04.09.00.bin <— specify the SIP software file name here

2. Create provisioning files for the IP Deskphones with the following content. The following example is for the 1220 IP Deskphone.

Example of provisioning file for 1220 IP Deskphone:

1220SIP.cfg:

[FW]

```
DOWNLOAD MODE AUTO
VERSION 04.03.12.00 <— version should be taken from the SIP software file name
PROTOCOL HTTP
FILENAME SIP1140e04.04.09.00.bin <— specify the SIP software file name here
```

```
[DEVICE CONFIG]
DOWNLOAD MODE FORCED
FILENAME device config.dat <-- name of the device configuration file
PROTOCOL HTTP
```

```
[Licensing]
DOWNLOAD MODE FORCED
VERSION 0002
PROTOCOL HTTP
FILENAME ipctoken.cfg <-- name of the license file
```

Additional sections can be specified in the provisioning files if there is a need to upload other files such as dialing plan and languages.

3. Add software images, provisioning files, device configuration files and other files intended for the IP Deskphones to a ZIP archive.

Warning:

Do not create any folders in the archive. These folders will not be copied to the Utility Server.

- 4. Upload the zip archive with provisioning files to the Avaya Utility Services.
 - a. Connect to the Avaya Utility Server through a Web browser.

The following page appears after logging in.

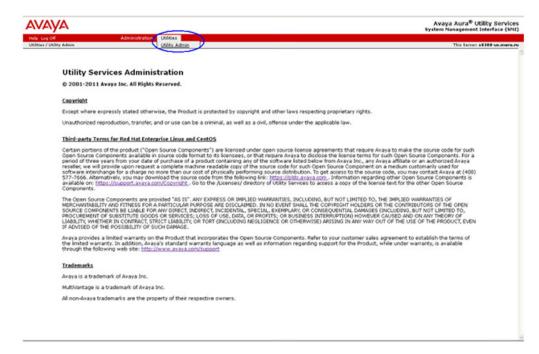

Figure 92: Utility Services main page

b. In the menu at the top of the page, click **Utilities > Utility Admin**.

The **Utility Services Administration** page opens.

Figure 93: Utility Services Administration

c. In the menu list on the left, click IP Phone Tools > IP Phone Custom File Upload.

The IP Phone Custom File Upload page opens.

Figure 94: IP Phone Custom File Upload page

- d. Click **Browse** and navigate to the created ZIP archive containing the provisioning files.
- e. Click the Upload Custom Files and Activate button.
- f. Return to the IP Phone Custom File Upload page after the files have uploaded.
- g. Click **Display Custom Directory** and make sure that all files from the zip archive are listed.
 - Note:

If some of the files already exist on the Utility Server, then they are replaced with the uploaded files.

5. Configure the DHCPv4 server.

The DHCP server must provide option 66 with the IP address of the Avaya Aura Utility Server that will be used as a provisioning server. This functionality can be achieved by providing different DHCP options based on Vendor Class ID. The IP Deskphones with UNIStim firmware report Vendor Class ID "Nortel-i2004-A" or "Nortel-i2004-B". The IP Deskphones with SIP software report Vendor Class ID "Nortel-SIP-Phone-A".

The following is an example of an appropriate configuration file for a Linux dhcpd DHCPv4 server. Please refer to the documentation of your DHCP server on how to configure the appropriate configuration file.

```
dhcpd.conf:
class "unistimA" {
    match if substring(option vendor-class-identifier, 0, 14) = "Nortel-i2004-A";
    option tftp-server-name "http://<Avaya Aura Utility Server IP address>/";
class "unistimB" {
    match if substring(option vendor-class-identifier, 0, 14) = "Nortel-i2004-B";
    option tftp-server-name "http://<Avaya Aura Utility Server IP address>/ ";
class "sigma" {
     match if substring(option vendor-class-identifier, 0, 18) = "Nortel-SIP-
Phone-A";
option tftp-server-name "http://<Avaya Aura Utility Server IP address>/ ";
pool {
range 192.168.xxx.xxx 192.168.xxx.xxx;
allow members of "unistimA";
allow members of "unistimB";
allow members of "sigma";.
```

Note:

If there is more than one DHCP server/utility server, the described process must be performed on each DHCP/Utility server, according to the migration plan.

Note:

The IP address of the Provisioning Server can also be pushed to the IP Deskphones with UNIStim firmware using the Nortel i2004-B option and the "prov=" argument of the provisioning info block. Remove the "prov=" argument from the info block on your DHCP server.

Important:

Once the DHCP configuration is put in place, there is no way to prevent random phones migrating to the Avaya Aura environment at an unexpected time due to rebooting caused by a power outage or other reason.

6. Force a reboot of the IP Deskphones by running the isetResetAll command in the Signaling Server shell.

Result

- 1. The IP Deskphone reboots.
- 2. During bootup, the IP Deskphone sends a DHCP request with Vendor Class Id "Norteli2004-A" or "Nortel-i2004-B". The DHCP server sends back a DHCP response with the IP Deskphone's IP address and the URL of the Avaya Aura Utility server (in DHCP option 66).
- 3. The IP Deskphone downloads the SIP software from the Avaya Aura Utility server and upgrades. When the upgrade is completed, the IP Deskphone automatically reboots again.

Warning:

A power outage at this stage may cause firmware corruption. If this happens, the IP Deskphone may not be able to boot up, and it may be necessary to return the IP Deskphone for repair.

- 4. The IP Deskphone starts and downloads the device configuration file, images, licenses, languages, and so on, from the Avaya Aura Utility server.
- 5. When configuration is complete, the IP Deskphone automatically reboots.
- 6. The IP Deskphone is ready to use.

Note:

If auto login is not configured in the configuration files, the IP Deskphone displays the login screen. The IP Deskphone user must enter a valid login and password in order to register on Avaya Aura.

Migrating IP Deskphones with UNIStim firmware from CS 1000 to IP Office on page 400

Overview

It is assumed that the IP Deskphones connect to IP Office through TCP.

Note:

Avaya recommends that a single IP Deskphone of each type be migrated first to verify that the setup is correct.

For large installations, it is not recommended that all IP Deskphones be migrated at the same time.

This chapter does not describe how to configure CS 1000, IP Office, or third-party applications such as the DHCP and TFTP servers. For this information, refer to the appropriate product documentation.

This chapter does not provide information on how to migrate the CS 1000 users and their profiles over to IP Office. If using this procedure to perform the migration, then the IP Deskphone users must manually input their login and password after migration in order to register on IP Office and obtain telephony services. Configuring IP Deskphone auto-registration requires knowledge of which IP Deskphones belong to which users and the passwords for all users; this is out of scope of this procedure.

Migrating IP Deskphones with UNIStim firmware from CS 1000 to IP Office on page 399

Requirements

Ensure that the following requirements for migration have been implemented:

- The IP Deskphones are running UNIStim Release 3.3 firmware release or newer.
 - The latest firmware is recommended 062xC8Q.
- DHCP is enabled on the IP Deskphones.
 - The DHCP option should be set to YES in the **Network Configuration** menu.
- Auto Provisioning for the Provisioning Server is enabled on the IP Deskphones.
 - Check the Provision Server option check box in the Network Configuration > Auto menu.
- There is access to Avaya IP Office Manager.
- There are no network outages during migration.
 - The DHCP server, the CS 1000 system, and Avaya IP Office are available in the network.
- There are no power outages during the migration.
 - A power outage during the software upgrade can cause corruption of the IP Deskphone software. As a result, the IP Deskphone might not be able to start up and may require repair.

Migrating IP Deskphones with UNIStim firmware from CS 1000 to IP Office

About this task

If you have IP Deskphones running UNIStim firmware on a CS 1000 system, and you want to migrate the IP Deskphones to Avaya IP Office, use the following procedure.

Procedure

1. Create configuration files for the 1220 and 1230 IP Deskphones with UNIStim firmware, with the following content.

Configuration file for 1220 and 1230 IP Deskphone (1220.cfg and 1230.cfg):

```
[FW]

DOWNLOAD_MODE AUTO

VERSION 04.04.09.00 <— version should be taken from the SIP software file name

PROTOCOL HTTP

FILENAME SIP12x004.04.09.00.bin <— specify the SIP software file name here
```

2. Create provisioning files for the IP Deskphones with the following content. The following example is for the 1220 IP Deskphone.

Example of provisioning file for 1220 IP Deskphone:

1220SIP.cfg:

```
DOWNLOAD_MODE AUTO

VERSION 04.04.09.00 <— version should be taken from the SIP software file name

PROTOCOL HTTP

FILENAME SIP12x004.04.09.00.bin <— specify the SIP software file name here
```

```
[DEVICE_CONFIG]

DOWNLOAD_MODE FORCED

FILENAME device_config.dat <-- name of the device configuration file

PROTOCOL HTTP
```

```
[Licensing]

DOWNLOAD_MODE FORCED

VERSION 0002

PROTOCOL HTTP

FILENAME ipctoken.cfg <-- name of the license file
```

Additional sections can be specified in the provisioning files if there is a need to upload other files such as dialing plan and languages.

3. Create a temporary folder on the hard drive of your PC. Add the software images, provisioning files, device configuration files and other files intended for the IP Deskphones to this folder.

Important:

Do not create any subfolders in the temporary folder.

- 4. Upload the folder content to the Avaya IP Office Manager.
 - Run IP Office Manager and log in.
 - In the IP Office Manager main window, click File > Advanced > Embedded File Manager....

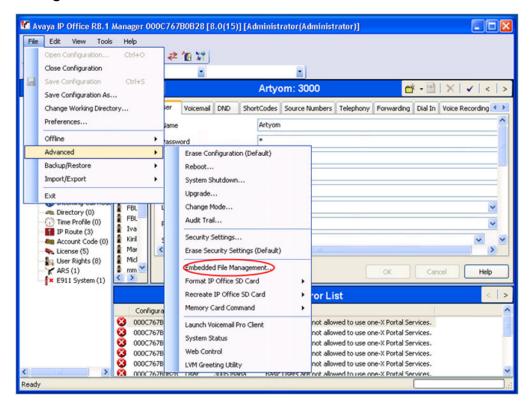

Figure 95: IP Office Manager - main window

· Select IP Office system and log in.

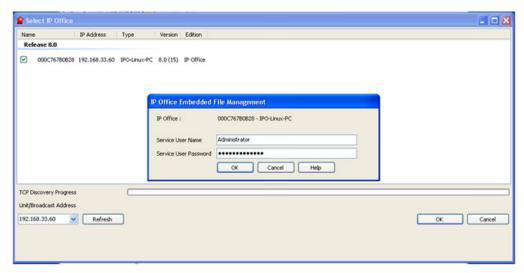

Figure 96: Select IP Office window

 Navigate to the Disk > system > primary folder in the Embedded File Management window.

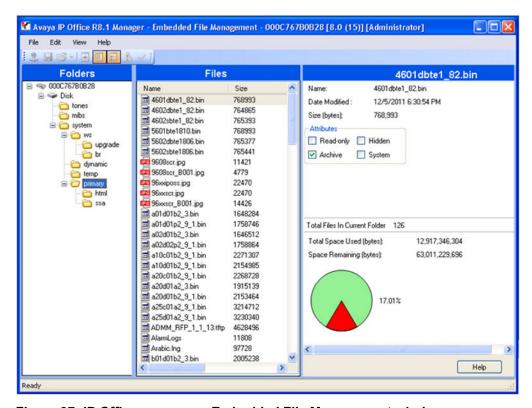

Figure 97: IP Office manager – Embedded File Management window

- In Windows Explorer, open the folder that was created in Step 3.
- Select the created configuration files in Windows Explorer and drag-and-drop them to the Disk > system > primary folder in the Embedded File Management window.
- 5. Configure the DHCPv4 server.

The DHCP server must provide option 66 with the IP address of the IP Office that will be used as a provisioning server. This functionality can be achieved by providing different DHCP options based on Vendor Class ID. The IP Deskphones with UNIStim firmware report Vendor Class ID "Nortel-i2004-A" or "Nortel-i2004-B". The IP Deskphones with SIP software report Vendor Class ID "Nortel-SIP-Phone-A".

The following is an example of an appropriate configuration file for a Linux dhcpd DHCPv4 server. Please refer to the documentation of your DHCP server on how to configure the appropriate configuration file.

```
dhcpd.conf:
class "unistimA" {
  match if substring(option vendor-class-identifier, 0, 14) = "Nortel-i2004-
    option tftp-server-name "http://<IP Office IP address>/";
class "unistimB" {
    match if substring(option vendor-class-identifier, 0, 14) = "Nortel-i2004-B";
    option tftp-server-name "http://<IP Office IP address>/ ";
class "sigma" {
     match if substring(option vendor-class-identifier, 0, 18) = "Nortel-SIP-
Phone-A";
option tftp-server-name "http://<IP Office IP address>/ ";
pool {
range 192.168.xxx.xxx 192.168.xxx.xxx;
allow members of "unistimA";
allow members of "unistimB";
allow members of "sigma";.
```

Note:

If there is more than one DHCP server/utility server, the described process must be performed on each DHCP/Utility server, according to the migration plan.

Note:

The IP address of the Provisioning Server can also be pushed to the IP Deskphones with UNIStim firmware using the Nortel i2004-B option and the "prov=" argument of the provisioning info block. Remove the "prov=" argument from the info block on your DHCP server.

Important:

Once the DHCP configuration is put in place, there is no way to prevent random phones migrating to the Avaya Aura environment at an unexpected time due to rebooting caused by a power outage or other reason.

6. Force a reboot of the IP Deskphones by running the isetResetAll command in the Signaling Server shell.

Result

- 1. The IP Deskphone reboots.
- 2. During bootup, the IP Deskphone sends a DHCP request with Vendor Class ID "Norteli2004-A" or "Nortel-i2004-B". The DHCP server sends back a DHCP response with the IP Deskphone's IP address and the URL of the IP Office server (in DHCP option 66).
- 3. The IP Deskphone downloads the SIP software from the IP Office server and upgrades. When the upgrade is completed, the IP Deskphone automatically reboots again.

Warning:

A power outage at this stage may cause firmware corruption. If this happens, the IP Deskphone may not be able to boot up, and it may be necessary to return the IP Deskphone for repair.

- 4. The IP Deskphone starts and downloads the device configuration file, images, licenses. languages, and so on, from the Avaya Aura Utility server.
- 5. When configuration is complete, the IP Deskphone automatically reboots.
- 6. The IP Deskphone is ready to use.

Note:

If auto login is not configured in the configuration files, the IP Deskphone displays the login screen. The IP Deskphone user must enter a valid login and password in order to register on IP Office.

Appendix A: User provisioning using System Manager 6.3 FP2

This appendix describes how to add an IP Deskphone user to Avaya Aura® using System Manager 6.3 FP2.

Related Links

Adding an IP Deskphone user to Avaya Aura® using System Manager 6.3 FP2 on page 406

Adding an IP Deskphone user to Avaya Aura® using System Manager 6.3 FP2

1. Open a browser and navigate to the System Manager (SMGR) login page, as shown in the following figure.

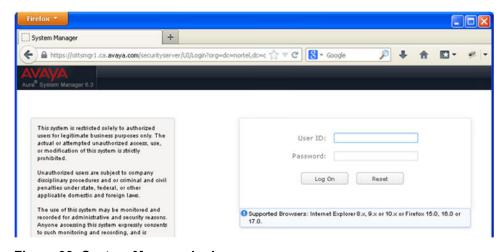

Figure 98: System Manager login page

2. Enter your User ID and password and click Log On.

The **System Manager** front page opens, as shown in the following figure.

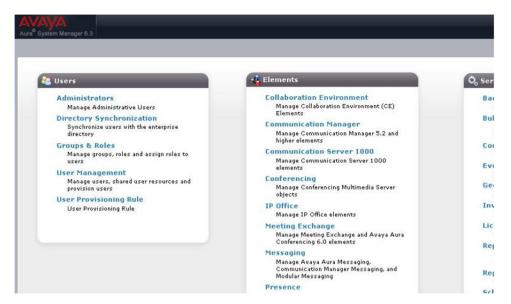

Figure 99: System Manager front page

- 3. In the Users pane on the left, click User Management.
- 4. Click **Manage Users**, and then click **New**, as shown in the following figure.

Figure 100: User Management page

5. On the **Identity** tab, shown in the following figure, enter the user information. The minimum information required is **Last Name**, **First Name**, and **Login Name**.

The **Login Name** format is extension_number@<domain>; for example, 4655@mycompany.com

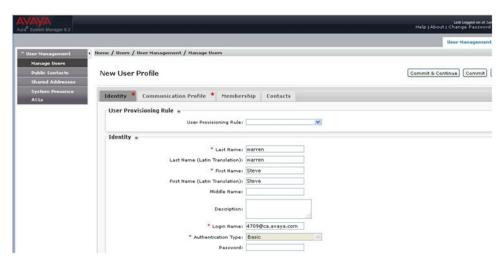

Figure 101: System Manager New User Profile page

- 6. In the upper-right corner, click **Commit & Continue**.
- 7. Click the **Communication Profile** tab.

The **Communication Profile** window opens, as shown in the following figure.

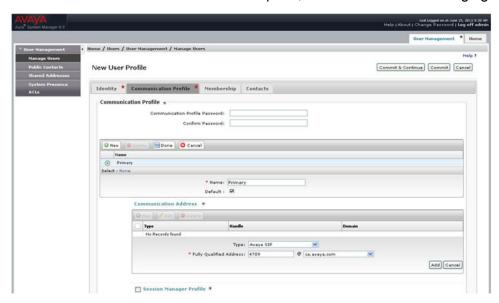

Figure 102: Communication Profile tab

- 8. In the **Communication Profile** pane, in the **Communication Profile Password** field, enter the password that the user will input to log into the IP Deskphone.
 - In the **Confirm Password** field, enter the password again.
- 9. In the **Communication Address** pane, click **New**.
- Enter the Fully Qualified Address (for example 4655@mycompany.com), and click Add.
- 11. Scroll down the **Communication Profile** page to the **Session Manager Profile** section, as shown in the following figure.

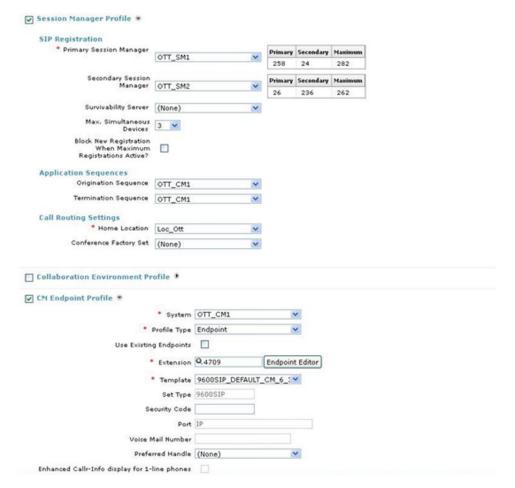

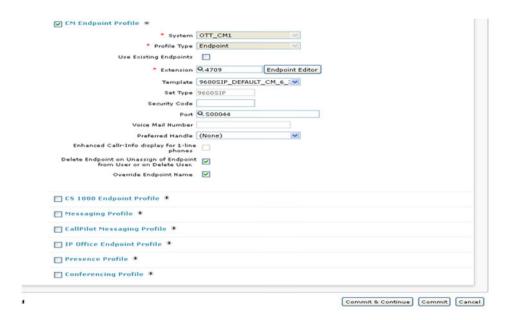

Figure 103: Communication Profile > Session Manager Profile

- 12. Check the **Session Manager Profile** check box.
- 13. In the SIP Registration section:
 - a. Select the **Primary Session Manager** from the drop-down list.
 - b. If available, select the Secondary Session Manager from the drop-down list.
- 14. In the **Application Sequences** section, select the Communication Manager for both the **Origination Sequence** and the **Termination Sequence** from the drop-down lists.
- 15. In the Call Routing Settings section, select the Home Location from the drop-down list.
- 16. In the **CM Endpoint Profile** section, in the **Extension** field, enter the same extension number that you entered for the **Login Name**.
- 17. In the Template field, select 9600SIP Default CM from the drop-down list.
- 18. At the bottom of the page, click **Commit**. See the following figure.

Appendix B: Quickstart — Add a 1200 Series IP Deskphone to Avaya Aura®

This appendix is a quickstart guide to adding one IP Deskphone to Avaya Aura®.

Related Links

Adding a new IP Deskphone to Avaya Aura® on page 411

Adding a new IP Deskphone to Avaya Aura®

1. Use System Manager (SMGR) to add the new extension.

Use the same approach/steps as configuring a 96x1 SIP phone.

Use the **9600SIP_Default_CM_** template.

You do not have to configure anything in Endpoint Editor for Quickstart use.

2. Create the phone's **12x0.cfg** configuration file; for example, 1220.cfg.

Example:

[FW]

DOWNLOAD MODE FORCED

VERSION 04.04.09.00 <-- version from the firmware file name

PROTOCOL HTTP

FILENAME SIP12x004.04.09.00.bin <-- SIP firmware file name

3. Create the phone's **12x0SIP.cfg** configuration file.

DEVICE CONFIG]

DOWNLOAD MODE FORCED

FILENAME DeviceConfig.dat <-- name of the device configuration file

PROTOCOL HTTP

4. Create the phone's **DeviceConfig.dat** device configuration file.

```
AVAYA_AURA_MODE_ENABLE YES

USE_DEFAULT_DEV_CERT YES

SIP_DOMAIN1 mycompany.com

SERVER_IP1_1 135.20.253.150

SERVER TLS PORT1 1 5061
```

5. Store all 3 config files (12x0.cfg, 12x0SIP.cfg, DeviceConfig.dat) on the Aura Utility Server using IP Phone Tools > IP Phone Custom File Upload, as shown in the following figure.

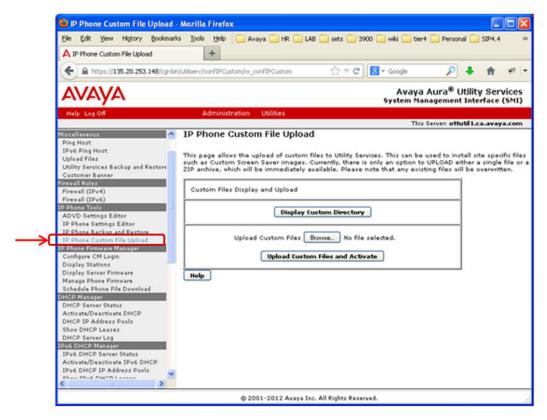

Figure 104: IP Phone Tools > IP Phone Custom File Upload screen

6. Plug in the new IP Deskphone.

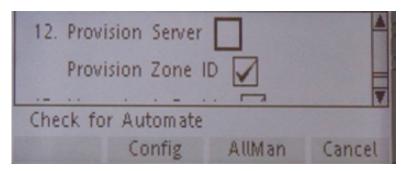

DHCP is the default and an IP address is obtained.

Note:

DHCP option 66 can be used to configure the Provisioning URL for large migrations.

- 7. Enter the Utility Server's IP address as the IP Deskphone's Provision URL.
 - Double-press the Services key quickly, and select Network Configuration from the menu.

b. Press the **Auto** soft key. Un-check the **Provision Server** check box and press the **Config** soft key.

- c. In the **Provision** field, enter the Utility Server IP address.Press the **OK** soft key and then press the **Apply** soft key.
 - Note:

Toggle the "1" key to obtain ':', 'I' and '.'.

- 8. Reboot the IP Deskphone.
 - The IP Deskphone may reboot again after obtaining the config.dat file.
- 9. Log in with the User ID (extension number) and password.

Appendix C: Configuring FACs and FNEs for the IP Deskphones on Avaya Aura®

This appendix provides information on configuring Feature Access Codes (FACs) and Feature Number Extensions (FNEs) for the IP Deskphones on Avaya Aura®.

Related Links

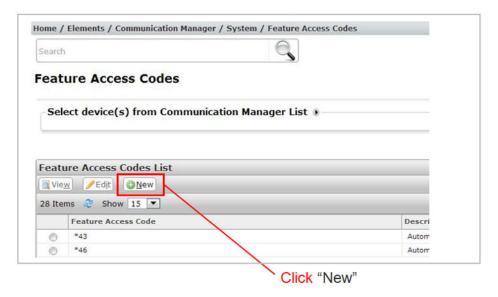

Configuring FACs for the IP Deskphones on page 414 Configuring FNEs on page 416

Configuring FACs for the IP Deskphones

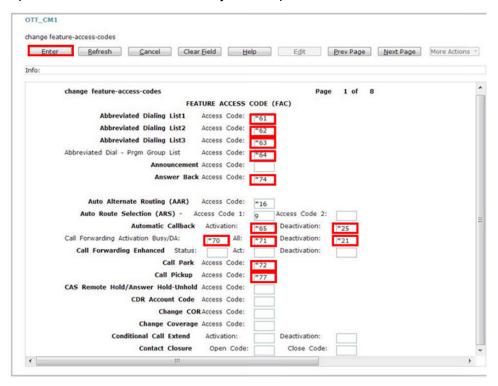

Feature Access Codes (FACs) are configured in System Manager (SMGR). in **Home > Elements > Communication Manager > System > Feature Access Codes**.

Configuring FACs

- In System Manager, go to Home > Elements > Communication Manager > System > Feature Access Codes.
- 2. Under Feature Access Codes List, click New.

3. Input FAC codes consistent with your dial plan and click **Enter** when finished.

Related Links

Configuring FACs and FNEs for the IP Deskphones on Avaya Aura® on page 414

Configuring FNEs

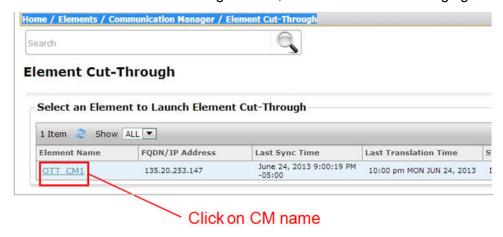

Configuring Feature Name Extensions (FNEs) is a two-part process.

- 1. Configure the FNEs in SMGR Cut Through or in Communication Manager SAT.
- 2. Add the FNEs as Implicit Users to the Session Manager (SM).

Configuring the FNEs

FNEs are configured on Communication Manager but can be accessed through System Manager using the path Home > Elements > Communication Manager > Element Cut-Through.

- 1. Go to Communication Manager Element Cut-Through page.
- 2. Click the Communication Manager name, as shown in the following figure.

The Communication Manager command page opens.

3. Enter the following in the **Command** field:

change off-pbx-telephone feature-name-extensions

4. Click Send.

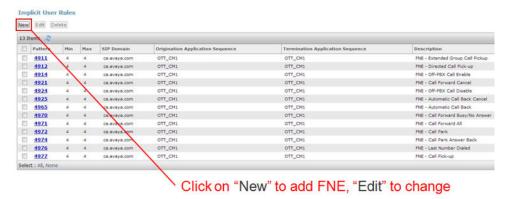

5. Input FNE numbers consistent with your dial plan and click Enter when finished.

Adding FNEs as Implicit Users

FNEs are added as Implicit Users in Session Manager after the FNEs have been configured.

- In System Manager, go to Home > Elements > Session Manager > Application Configuration > Implicit Users.
- 2. Click **New** to add an FNE, or click **Edit** to change an FNE.

- 3. Enter the data for the FNE and click Commit.
- 4. Repeat steps 2 and 3 for each FNE to be added or changed.

Appendix D: Creating a speed dial list

For ease of access to frequently-used features, you can configure a Features speed dial list. Determine the key features that are used and create a speed dial list to easily access those features.

Example:

In this example, a speed dial list has been created for the EC500 feature set. When the **Features** key is pressed, the IP Deskphone displays the EC500 feature options. The user presses 1, 2, or 3 to dial the desired EC500 FNE.

Creating the speed dial list for feature access is a two-part process.

- 1. Create the Features key on the IP Deskphone. See <u>Creating the Features key in deviceconfig.dat</u> on page 418.
- 2. Create the speed dial list file. See Creating the speed dial list file on page 419.

Related Links

<u>Creating the Features key in deviceconfig.dat</u> on page 418 <u>Creating the speed dial list file</u> on page 419

Creating the Features key in deviceconfig.dat

Create the Features key on the IP Deskphone by adding three parameters to the phone's deviceconfig.dat file

- 1. SPEEDLIST KEY INDEX [x] which key
- 2. SPEEDLIST LABEL <KEY Label> desired key label

3. DEFAULT SPEEDDIALLIST FILE <Filename — file with the feature list

Key numbering ascends from bottom to top, first on the right side, then the left side of the IP Deskphone display screen. Key 1 is reserved and cannot be used.

Key numbering example:

6	3
5	2
4	1

Deviceconfig.dat example

```
SPEEDLIST_KEY_INDEX 4
SPEEDLIST_LABEL Features
DEFAULT SPEEDDIALLIST FILE FNE Speeddiallist.txt
```

Creating a speed dial list on page 418

Creating the speed dial list file

Create the speed dial list file with speed dial data entries

Parameter	Definition
[key]	Speed dial key data delimiter.
	Required.
label= <speed dial="" name=""></speed>	Label displayed in speed dial list.
	Required.
target= <url></url>	FNE or FAC digits @ domain
	Required.
retrieve=NO	Held call retrieved when call is done.
	Optional.
subject= <display msg=""></display>	Message displayed when selected.
	Optional.
mode= <always midcall idleonly></always midcall idleonly>	When the feature is displayed in the list.
	Optional.

Example

The following is the speed dial list for the EC500 feature set.

FNE_Speeddiallist.txt

[key]

label=EC500 Enable

target=4914@mycompany.com

[key]

label=EC500 Disable

target=4924@mycompany.com

[key]

label=EC500 Self-Administration

target=15@mycompany.com

subject=Enter number
