

Using the Avaya Console for WLAN 9100 Series

Release 7.0.0
NN47252-106
Issue 01.01
June 2014

Avaya assumes no liability for any errors. Avaya reserves the right to make changes and corrections to the information in this document without the obligation to notify any person or organization of such changes.

Documentation disclaimer

Documentation" means information published by Avaya in varying mediums which may include product information, operating instructions and performance specifications that Avaya may generally make available to users of its products and Hosted Services. Documentation does not include marketing materials. Avaya shall not be responsible for any modifications, additions, or deletions to the original published version of documentation unless such modifications, additions, or deletions were performed by Avaya. End User agrees to indemnify and hold harmless Avaya, Avaya's agents, servants and employees against all claims, lawsuits, demands and judgments arising out of, or in connection with, subsequent modifications, additions or deletions to this documentation, to the extent made by End User.

Link disclaimer

Avaya is not responsible for the contents or reliability of any linked websites referenced within this site or documentation provided by Avaya. Avaya is not responsible for the accuracy of any information, statement or content provided on these sites and does not necessarily endorse the products, services, or information described or offered within them. Avaya does not guarantee that these links will work all the time and has no control over the availability of the linked pages.

Warranty

Avaya provides a limited warranty on Avaya hardware and software. Refer to your sales agreement to establish the terms of the limited warranty. In addition, Avaya's standard warranty language, as well as information regarding support for this product while under warranty is available to Avaya customers and other parties through the Avaya Support website: <http://www.avaya.com/support> or such successor site as designated by Avaya. Please note that if you acquired the product(s) from an authorized Avaya Channel Partner outside of the United States and Canada, the warranty is provided to you by said Avaya Channel Partner and not by Avaya.

Licenses

THE SOFTWARE LICENSE TERMS AVAILABLE ON THE AVAYA WEBSITE, [HTTP://SUPPORT.AVAYA.COM/LICENSEINFO/](http://SUPPORT.AVAYA.COM/LICENSEINFO/) ARE APPLICABLE TO ANYONE WHO DOWNLOADS, USES AND/OR INSTALLS AVAYA SOFTWARE, PURCHASED FROM AVAYA INC., ANY AVAYA AFFILIATE, OR AN AUTHORIZED AVAYA RESELLER (AS APPLICABLE) UNDER A COMMERCIAL AGREEMENT WITH AVAYA OR AN AUTHORIZED AVAYA RESELLER. UNLESS OTHERWISE AGREED TO BY AVAYA IN WRITING, AVAYA DOES NOT EXTEND THIS LICENSE IF THE SOFTWARE WAS OBTAINED FROM ANYONE OTHER THAN AVAYA, AN AVAYA AFFILIATE OR AN AVAYA AUTHORIZED RESELLER, AND AVAYA RESERVES THE RIGHT TO TAKE LEGAL ACTION AGAINST YOU AND ANYONE ELSE USING OR SELLING THE SOFTWARE WITHOUT A LICENSE. BY INSTALLING, DOWNLOADING OR USING THE SOFTWARE, OR AUTHORIZING OTHERS TO DO SO, YOU, ON BEHALF OF YOURSELF AND THE ENTITY FOR WHOM YOU ARE INSTALLING, DOWNLOADING OR USING THE SOFTWARE (HEREINAFTER REFERRED TO INTERCHANGEABLY AS "YOU" AND "END USER"), AGREE TO THESE TERMS AND CONDITIONS AND CREATE A BINDING CONTRACT BETWEEN YOU AND AVAYA INC. OR THE APPLICABLE AVAYA AFFILIATE ("AVAYA").

License types

Designated System(s) License (DS). End User may install and use each copy or an Instance of the Software only on a number of Designated Processors up to the number indicated in the order. Avaya may require the Designated Processor(s) to be identified in the order by type, serial number, feature

key, Instance, location or other specific designation, or to be provided by End User to Avaya through electronic means established by Avaya specifically for this purpose.

Copyright

Except where expressly stated otherwise, no use should be made of materials on this site, the Documentation, Software, Hosted Service, or hardware provided by Avaya. All content on this site, the documentation, Hosted Service, and the Product provided by Avaya including the selection, arrangement and design of the content is owned either by Avaya or its licensors and is protected by copyright and other intellectual property laws including the sui generis rights relating to the protection of databases. You may not modify, copy, reproduce, republish, upload, post, transmit or distribute in any way any content, in whole or in part, including any code and software unless expressly authorized by Avaya. Unauthorized reproduction, transmission, dissemination, storage, and or use without the express written consent of Avaya can be a criminal, as well as a civil offense under the applicable law.

Third Party Components

"Third Party Components" mean certain software programs or portions thereof included in the Software or Hosted Service may contain software (including open source software) distributed under third party agreements ("Third Party Components"), which contain terms regarding the rights to use certain portions of the Software ("Third Party Terms"). As required, information regarding distributed Linux OS source code (for those Products that have distributed Linux OS source code) and identifying the copyright holders of the Third Party Components and the Third Party Terms that apply is available in the Documentation or on Avaya's website at: <http://support.avaya.com/Copyright> or such successor site as designated by Avaya. You agree to the Third Party Terms for any such Third Party Components

Trademarks

The trademarks, logos and service marks ("Marks") displayed in this site, the Documentation, Hosted Service(s), and Product(s) provided by Avaya are the registered or unregistered Marks of Avaya, its affiliates, or other third parties. Users are not permitted to use such Marks without prior written consent from Avaya or such third party which may own the Mark. Nothing contained in this site, the Documentation, Hosted Service(s) and Product(s) should be construed as granting, by implication, estoppel, or otherwise, any license or right in and to the Marks without the express written permission of Avaya or the applicable third party.

Avaya is a registered trademark of Avaya Inc.

All non-Avaya trademarks are the property of their respective owners. Linux® is the registered trademark of Linus Torvalds in the U.S. and other countries.

Downloading Documentation

For the most current versions of Documentation, see the Avaya Support website <http://support.avaya.com> or such successor site as designated by Avaya.

Contact Avaya Support

See the Avaya Support website: <http://support.avaya.com> for Product or Hosted Service notices and articles, or to report a problem with your Avaya Product or Hosted Service. For a list of support telephone numbers and contact addresses, go to the Avaya Support website: <http://support.avaya.com> (or such successor site as designated by Avaya), scroll to the bottom of the page, and select Contact Avaya Support.

Overview

Avaya Virtual Console is a software application tool specialized for connections to Avaya 9100 Series Wireless Access Points (WAPs). Its primary purpose is for low level control or troubleshooting of WAPs that do not have a physical console connection port, or whose console port is not accessible. It offers many customized features for this purpose.

Avaya Virtual Console discovers WAPs on the local network subnet (and VLAN) by sending IP/UDP broadcast “beacon” packets. Once a WAP is discovered, Avaya Virtual Console can establish an encrypted console session to the WAP over Ethernet/UDP using broadcast and multicast. The WAP mirrors the console port using link local multicast destination address 224.0.0.120, while Avaya Virtual Console responds using a broadcast address with UDP. The default port used is 22612. This approach allows communication regardless of the IP configuration on the WAP and the Windows client.

Recommended Usage of Avaya Virtual Console

In normal circumstances, WAPs should initially be configured and managed using one of the following interfaces:

- The Wireless LAN Orchestration System (WOS) offers central management of your entire Avaya wireless network.
- The Windows Management Interface (WMI) provides a browser-based interface.
- The Command Line Interface (CLI) is used through secure Telnet (SSH).

On networks using DHCP use either the DHCP assigned IP address, or (if DNS is also in use on the network) the WAP’s host name. The factory default hostname is the WAP’s serial number. If not using DHCP, use the WAP’s 192.168.1.3 factory default IP address.

Avaya Virtual Console may be needed in special circumstances as a last resort, for troubleshooting WAP startup problems or IP connectivity issues where you cannot communicate with the WAP via WOS, SSH, or the WMI using its host name or IP address, and there is either no console port, or the console port is inaccessible, for example if the WAP is installed on a high ceiling.

How to Use this Guide

The following sections describe how to get started with Avaya Virtual Console, including the steps for recovering a WAP with an unknown login or with a bad IP configuration.

- [“Requirements” on page 3](#)
- [“Installation and Initial Setup” on page 4](#)
- [“Communicating with the WAP” on page 5](#)
- [“WAP Recovery” on page 9](#)

To modify WAP settings for enhanced security at the low levels accessed by Avaya Virtual Console, see:

- [“Recommended Avaya Virtual Console and Boot Loader Settings” on page 10](#)

For details on the other options and features of Avaya Virtual Console, see:

- [“Additional Avaya Virtual Console Features” on page 15](#)
- [“Main Menu Commands” on page 18](#)

To contact Avaya, see:

- [“Customer Support” on page 19](#)

Requirements

Installation and operation of Avaya Virtual Console requires a computer with the following:

1. Windows 7. Earlier versions of Windows are not supported. Other operating systems are not supported in this release.
2. A network adapter connected to the same VLAN or broadcast domain as the WAP's Gigabit Ethernet primary port.

WAP requirements:

1. The WAP's Boot Loader version must be Build 3069 or later. The Avaya OS version must be 7.0 or later.

Installation and Initial Setup

1. Access to Avaya Virtual Console executable is controlled by “**Customer Support**” on **page 19**. Download the executable as instructed by Customer Support.
2. Double-click on the Avaya Virtual Console executable file to install it. Follow the prompts to complete the installation.

3. The application will install an icon on your desktop. Start Avaya Virtual Console by double clicking the application icon on the desktop.

The Avaya Virtual Console main window appears. (**Figure 1**)

4. Your computer’s **Network Adapters** are listed on the lower left. Select the adapter that is connected on the same VLAN or broadcast domain as the desired WAP. By default all network adapters are selected. You may change this option by enabling or disabling the File menu option named **Check All Adapters On Start**.

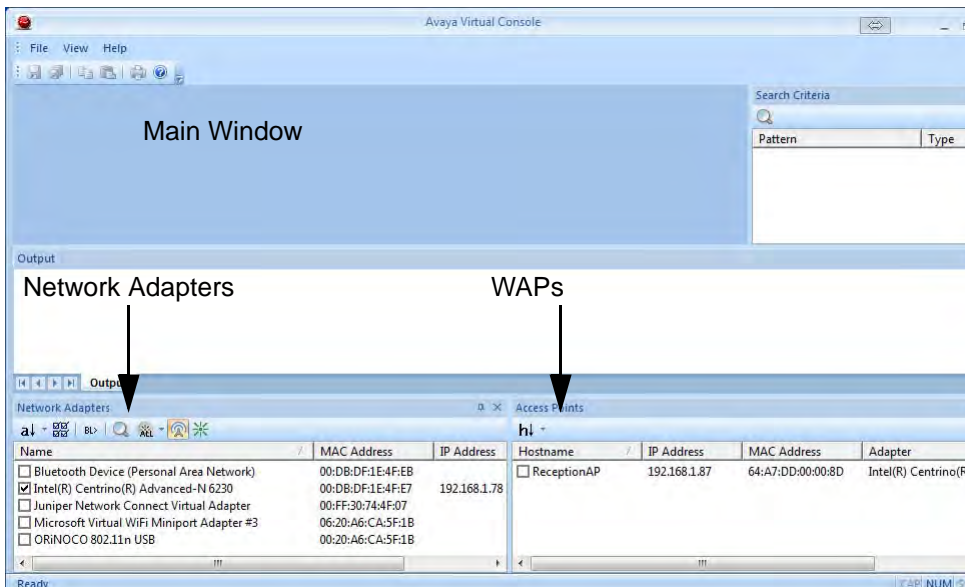

Figure 1. Initial Avaya Virtual Console Window

5. WAPs are detected on the subnets of all enabled adapters and added to the WAPs list. Some WAPs may need to be rebooted in order to be discovered, based on how each WAP has been configured to allow Avaya Virtual Console access. The WAP has options to allow Avaya Virtual Console access only to Avaya OS (i.e., CLI access) or only to Boot Loader, to both, or to neither (no access by Avaya Virtual Console at all). See **“About Avaya Virtual Console Access to the WAP” on page 10**.
 - If Avaya Virtual Console access at the Avaya OS (CLI) level is enabled on a WAP, the WAP will be detected without requiring a reboot.
 - If Avaya Virtual Console access is enabled for only the Boot Loader level on a WAP, the WAP will be detected when it reboots. The easiest way to accomplish this is to power the WAP off and then on again. See **“About Changing Settings” on page 10**.
6. Select the WAP that you wish to connect to from the WAPs list on the lower right of the Avaya Virtual Console window by clicking its checkbox (**Figure 2**). The communication session with the WAP (via Boot Loader or CLI) will be shown in the main window.

Note that once a WAP has booted, it will use its default address of 192.168.1.3 with a 255.255.255.0 mask, unless it receives a DHCP assigned address. Note that the correct WAP IP address is shown only for WAPs that have Avaya OS-level Avaya Virtual Console access enabled.

Hostname	IP Address	MAC Address	Adapter	First Seen	Last Seen
<input checked="" type="checkbox"/> ReceptionAP	192.168.1.87	64:A7:DD:00:00:8D	Intel(R) Centrino(R) Adv...	18:46:19	19:06:14

Figure 2. Discovered WAPs

Communicating with the WAP

As discussed in **“Recommended Usage of Avaya Virtual Console” on page 2**, the preferred way to connect to the WAP is via WOS, SSH (CLI), or WMI. If your network uses DHCP and DNS, you may use the WAP’s factory default hostname

to access it. The default hostname is the WAP's serial number. You may also connect using its IP address, as shown in the WAP list.

About entering Boot Loader mode

If you cannot connect to the WAP using its IP address or hostname, Avaya Virtual Console allows you to communicate with the WAP via CLI or the Avaya Boot Loader (Boot Loader—see **“About Boot Loader” on page 10** for more information). There are two ways to enter Boot Loader mode:

- **Recommended method:** set Avaya Virtual Console to automatically enter Boot Loader mode on the WAP by selecting the Boot Loader> button in the tool bar above the **Network Adapters** list. This is easier than the traditional method below, which requires you to hit space bar during a short window of time.

Figure 3. Boot Loader> button automatically enters Boot Loader mode

- **Traditional method:** when you reboot the WAP, it loads the current software image. During the load process, the WAP will prompt you with an opportunity to switch to Boot Loader mode: (Figure 4)

Press space bar to exit to boot loader: 3

You have three seconds to hit the space bar to enter Boot Loader. The prompt will count down to zero, at which point it will continue the normal load process, and you will no longer have the option of entering Boot Loader mode.

```

Avaya Boot Loader 6.3.0-6163 (Apr 24 2014 - 16:02:50)

Board      Avaya CN6120-SCP CPU Board
Clocks    CPU : 400 MHz  DDR : 800 MHz  IO : 400 MHz
I2C Bus   384 KHz, sampling at 15 MHz
Reset     Reset requested
Watchdog  Enabled (5 secs)
System DDR 1 GB, DDR3 Unbuffered non-ECC
FLASH     2 MB, CRC: OK
RTC       Tue 2014-May-06 10:36:57 GMT
CPU BIST  Pass
PCIe (0)  link up, 1 lanes, gen1 speed, first bus= 0, last bus= 0
PCIe (1)  link up, 1 lanes, gen1 speed, first bus= 1, last bus= 1
Radios    0 1
Network   eth0 [Primary], eth1
MMC       1 Storage Device Found
Environment Saving SCD settings to SCD Flash ... done, Initialized

In:  ser_xc
Out: ser_xc
Err: ser_xc

Press space bar to exit to bootloader: 0

[MMC 0] File      : 0x20000000
[MMC 0] Address   : 0x20000000
[MMC 0] Loading  : ##### done
[MMC 0] Complete: 1.8 sec, 42.9 MB/sec
[MMC 0] Bytes    : 76449520 (48e86f0 hex)
[Boot  ] Address : 0x20000000
[Image ] Name    :
[Image ] Created: 2014-04-26 2:07:19 UTC
[Image ] Type   : MIPS Linux Multi-File Image (uncompressed)
[Image ] Size   : 76449416 Bytes = 72.9 MB
[Image ] Contents: File 0: 17248659 Bytes = 16.4 MB
[Image ] Contents: File 1: 47571929 Bytes = 45.4 MB
[Image ] Contents: File 2: 11628908 Bytes = 11.1 MB
[Boot  ] Image  : Verifying image ..... OK
[Boot  ] Loading: Multi-File Image ..... OK
[Boot  ] Watchdog: Disabling ..... Ok
[Boot  ] Execute: Transferring control to OS

Initializing hardware ..... OK
    
```

Note: By default, you only have 3 seconds to hit space bar. Once the time counts down to 0 the load process continues. Then it is too late to enter Boot Loader, you'll need to reboot!

At this point the WAP OS is loaded, and you should be able to connect to the WAP using SSH or WMI.

Select Boot Loader> to have Avaya Virtual Console automatically send the space for you. See Figure 3.

Name	MAC Address	IP Address	Hostname	IP Address
<input checked="" type="checkbox"/> ASIX AX88772A USB2.0 to Fast Ethernet Adapter	9C:EB:E8:0A:52:3C	192.168.1.74	ReceptionAP	192.168.1.8
<input type="checkbox"/> Bluetooth Device (Personal Area Network)	00:DB:DF:1E:4F:EB			
<input type="checkbox"/> Intel(R) Centrino(R) Advanced-N 6230	00:0R:DE:1E:4F:F7	192.168.1.78		

Figure 4. Starting Boot Loader

Procedure to enter Boot Loader mode

1. Make sure that the desired WAP has been detected by Avaya Virtual Console and is shown in the WAPs list on the lower right. (See **Installation and Initial Setup, Step 5**).
2. Check the checkbox in front of the desired WAP's entry in the list. The Avaya Virtual Console main window will display the communication session with this WAP.

3. Set Avaya Virtual Console to automatically enter Boot Loader mode on the WAP by selecting the **Boot Loader>** button in the tool bar above the **Network Adapters** list. Avaya Virtual Console will automatically send a space character at the proper time.
4. Reboot the WAP, and you will see the boot load process in the Avaya Virtual Console main window.

Avaya Virtual Console establishes a console connection to the WAP during the reboot.

If you have trouble establishing communication with the selected WAP (nothing appears in the main window), do the following. Connect the IN port on the power injector that the WAP is using directly to an Ethernet port on your computer instead of the LAN switch.

Since Avaya Virtual Console communicates at Layer 2, you do not need to be concerned with setting the IP address of your computer to be in the same subnet as the WAP.

5. In the **Output** window, enter the Boot Loader **Username** and **Password** when prompted. The default login for Boot Loader is **admin** for both Username and Password. Note that Boot Loader has its own login Username and Password, which are separate from the Avaya OS login used for the WMI and CLI.

You should then be at the Boot Loader> prompt as shown in [Figure 5](#).

```

Avaya Boot Loader 6.3.0-6163 (Apr 24 2014 - 16:02:50)

Board      Avaya CN6120-SCP CPU Board
Clocks     CPU : 400 MHz  DDR : 800 MHz  IO : 400 MHz
I2C Bus    384 KHZ, sampling at 15 MHz
Reset      Reset requested
Watchdog    Enabled (5 secs)
System DDR  1 GB, DDR3 Unbuffered non-ECC
FLASH      2 MB, CRC: OK
RTC         Tue 2014-May-06 11:01:43 GMT
CPU BIST    Pass
PCIe (0)   link up, 1 lanes, gen1 speed, first bus= 0, last bus= 0
PCIe (1)   link up, 1 lanes, gen1 speed, first bus= 1, last bus= 1

MMC         1 Storage Device found
Environment Initialized

In:   ser_xc
Out:  ser_xc
Err:  ser_xc

Press space bar to exit to bootloader: 0

Username: admin
Password: *****
    
```

Figure 5. Connected in Boot Loader Mode

WAP Recovery

Avaya Virtual Console is very useful when you need to recover from not knowing the password for a WAP or in case of a bad IP configuration, especially when the console port is not accessible. Once at the Boot Loader> prompt you may reset the WAP to factory defaults, including resetting the username, password, and IP settings to their factory values.

1. In the **Output** window, enter:

```
env reset
```

Boot Loader commands are case sensitive and must be entered as shown, in lower case letters.

This clears the WAP configuration back to factory defaults shown below, and reloads the WAP. Once the WAP has reloaded you may gain access using the default username and password, and either the DHCP assigned address, or the default static address. DHCP is enabled on the WAP by default, so the WAP will use the assigned address if DHCP is in use on your network. If DHCP is not in use, then the default addresses below are used.

Default Username: **admin**

Default Password: **admin**

Default Static IP address: **192.168.1.3**

Default IP Subnet Mask: **255.255.255.0**

Recommended Avaya Virtual Console and Boot Loader Settings

About Boot Loader

Most management of the WAP is done via WOS, the Windows Management Interface (WMI), or CLI. The WAP also has a lower level interface: Boot Loader, which allows access to more primitive commands. You won't normally use Boot Loader unless instructed to do so by Avaya Customer Support. For proper security, you should replace the default Boot Loader login username and password with your own, as instructed below. Boot Loader has its own username and password, separate from the Avaya OS Admin User and Password (used for logging in to the WMI and CLI).

About Avaya Virtual Console Access to the WAP

Avaya Virtual Console access to the WAP may be controlled.

- You may enable or disable all Avaya Virtual Console access to the WAP as instructed in the procedure below. There are also options to allow access only to CLI (i.e., Avaya OS access) or only to Boot Loader.
- On all other WAP models (those with a console port), Avaya Virtual Console access to both Boot Loader and CLI is disabled by default. If Avaya Virtual Console is not going to be used to access a WAP, we recommend leaving Avaya Virtual Console access disabled.

About Changing Settings

Settings for Avaya Virtual Console access and for the Boot Loader passwords may be changed by a number of methods on the WAP:

- **Procedure to change Avaya Virtual Console access and Boot Loader login via CLI** changes Avaya Virtual Console access and the Boot Loader login via the CLI.

- **Procedure to change Avaya Virtual Console access only via WMI** changes Avaya Virtual Console access (but not the Boot Loader login) via the WMI.
- **Procedure to change Boot Loader login via Boot Loader** changes the Boot Loader login via Boot Loader.
- **Procedure to change Avaya Virtual Console access only via the Wireless LAN Orchestration System** changes the Avaya Virtual Console access (but not the Boot Loader login) via the WOS.

Procedure to change Avaya Virtual Console access and Boot Loader login via CLI

1. To access CLI via Avaya Virtual Console, deselect the Boot Loader> button below Avaya Virtual Console's **Network Adapters** header on the left. You may also access CLI via SSH, using terminal emulation software. Remember that Avaya Virtual Console access to Avaya OS must be enabled on the WAP, or Avaya Virtual Console will be denied access to CLI.
2. When you see the **login as** prompt, log in to CLI in the **Output** window using the username and password for Avaya OS (*not* the Boot Loader username and password).

```
login as: jsmith
jsmith@receptionap's password:

ReceptionAP#
```

3. Type **configure** to enter the CLI config mode.

```
hostname#configure
```

4. If Avaya Virtual Console access at the Boot Loader level is to be allowed, use the following three commands to change the Boot Loader username and password from the default values of **admin/admin**. In the example below, replace **newusername** and **newpassword** with your desired entries. Note that these entries are case-sensitive.

```
(config)#boot-env set username newusername
(config)#boot-env set password newpassword
(config)#save
```

- Enter the following commands if you wish to change Avaya Virtual Console access permission:

```
(config)# management
(config-mgmt)# avcon <management-status> <port> <timeout>
(config-mgmt)# save
(config-mgmt)# exit
(config)#
```

<management-status> may be one of:

- on** enables both CLI and Boot Loader access
- off** disables both CLI and Boot Loader access
- aos-only** enables only CLI (i.e. Avaya OS) access
- boot-only** enables only Boot Loader access

<port> — specify the UDP port used by Avaya Virtual Console. The default is 22612. This requires the same port be used on the Avaya Virtual Console application.

<timeout> — specify the Avaya OS login timeout for Avaya Virtual Console access. The default is 300 seconds.

Note that there is a WMI setting for changing Avaya Virtual Console access, timeout period, and the UDP port used. This may be used instead of CLI if you wish. See [Procedure to change Avaya Virtual Console access only via WMI](#).

Procedure to change Avaya Virtual Console access only via WMI

- In the WMI, select **Security** on the left, then select **Management Control**.

Management Transports		Timeout (30-100000 seconds)	Port
SSH:	<input checked="" type="radio"/> On <input type="radio"/> Off	<input type="text" value="10000"/>	<input type="text" value="22"/>
Telnet:	<input type="radio"/> On <input checked="" type="radio"/> Off	<input type="text" value="300"/>	<input type="text" value="23"/>
Avaya Virtual Console:	<input type="radio"/> On <input checked="" type="radio"/> Off <input type="radio"/> AvayaOS only <input type="radio"/> Boot only	<input type="text" value="300"/>	<input type="text" value="22612"/>
HTTPS:		<input type="text" value="10000"/>	<input type="text" value="443"/>

Figure 6. WMI Settings for Avaya Virtual Console

2. Locate the Avaya Virtual Console settings row in the **Management Transports** section.
 - a. **On/Off:** Choose **On** to enable Avaya Virtual Console access to the WAP at the Avaya OS (CLI) and Boot Loader levels, or **Off** to disable access at both levels. Avaya Virtual Console access is **Off** by default.
 - b. **Avaya OS only:** Choose this radio button to enable Avaya Virtual Console access at the Avaya OS level only (i.e., Avaya Virtual Console can access CLI only). Access to the WAP at the Boot Loader level is disabled.
 - c. **Boot only:** Choose this radio button to enable Avaya Virtual Console access at the Boot Loader level only. Avaya OS level (CLI) access to the WAP is disabled.
 - d. **Connection Timeout 30-100000 (Seconds):** Enter a value in this field to define the timeout (in seconds) before your Avaya Virtual Console connection is disconnected. The value you enter here must be between 30 seconds and 100,000 seconds.
 - e. **Port:** The default port is 22612. We recommend that you do not change this port.
3. Click **Save changes to flash** if you wish to make your changes permanent.

Procedure to change Boot Loader login via Boot Loader

1. At the Boot Loader> prompt, enter the following in the Avaya Virtual Console **Output** window to change the Boot Loader login username and password.

```
env set username newusername
env set password newpassword
```

Procedure to change Avaya Virtual Console access only via the Wireless LAN Orchestration System

1. In the WOS, select **Configure**, then Access Point.
2. A list of Access Points is displayed. Click on the name of the Access Point to modify.
3. Click on **Configuration**.
4. Select **Security** and then **Management Control**

Management Transports

Disabling SSH will cause several WOS operations to fail with this Access Point

SSH:	<input checked="" type="radio"/> On <input type="radio"/> Off	Timeout(30-100000 sec)	Port
Telnet:	<input type="radio"/> On <input checked="" type="radio"/> Off	<input type="text" value="10000"/>	<input type="text" value="22"/>
HTTPS:	<input checked="" type="radio"/> On <input type="radio"/> Off	<input type="text" value="300"/>	<input type="text" value="23"/>
Avaya Virtual Console:	<input type="radio"/> On <input checked="" type="radio"/> Off <input type="radio"/> Boot only <input type="radio"/> Access Point OS only	<input type="text" value="10000"/>	<input type="text" value="443"/>
Serial:	<input checked="" type="radio"/> On <input type="radio"/> Off	<input type="text" value="300"/>	<input type="text" value="22612"/>
		<input type="text" value="300"/>	

Figure 7. WMI Settings for Avaya Virtual Console

5. Locate the Avaya Virtual Console settings row in the **Management Transports** section.
 - a. **On/Off:** Choose **On** to enable Avaya Virtual Console access to the WAP at the Avaya OS (CLI) and Boot Loader levels, or **Off** to disable access at both levels.
 - b. **Access Point OS only:** Choose this radio button to enable Avaya Virtual Console access at the **Access Point OS only** level only (i.e., Avaya Virtual Console can access CLI only). Access to the WAP at the Boot Loader level is disabled.
 - c. **Boot only:** Choose this radio button to enable Avaya Virtual Console access at the Boot Loader level only. Avaya OS level (CLI) access to the WAP is disabled.

Additional Avaya Virtual Console Features

Avaya Virtual Console provides options that control operation, allow searching and sorting, and more.

Network Adapter Features

These features are controlled by the icons in the Network Adapters toolbar.

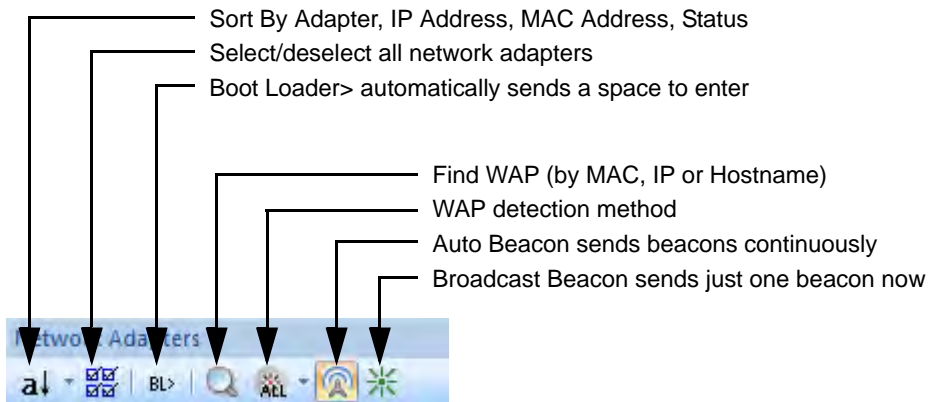

Figure 8. Network Adapters Toolbar

- **Sort By Adapter, IP Address, Mac Address, Status**—sort the list of adapters based on the selected column. Repeat the same selection to toggle the sort order between ascending and descending. You may also sort based on a column by clicking that column's header above the list.
- **Select/deselect all**—selects all network adapters. Click again to deselect all. Avaya Virtual Console will ask you to verify before deselecting an adapter for a subnet that currently has WAPs on it that are shown in the WAPs list.
- **Boot Loader>**—select this button to automatically send a space character to enter Boot Loader at the right time. This eliminates the need to hit the space bar within a three second countdown in order to enter Boot Loader. If you deselect this button and do not enter a space in time the WAP loads Avaya OS, and if Avaya Virtual Console is enabled at the Avaya OS level you will have CLI/Console access.

- **Find WAP**—performs a search to attempt to discover the specified WAP. (Figure 9) You may specify the WAP using its **MAC address** (the first three octets for a WAP are always **64:a7:DD:**, so this is entered for you), its **IP Address**, or its **Hostname**. No wild cards are allowed in the match string. Regardless of how you specify the WAP, Layer 2 techniques are used to search for it.

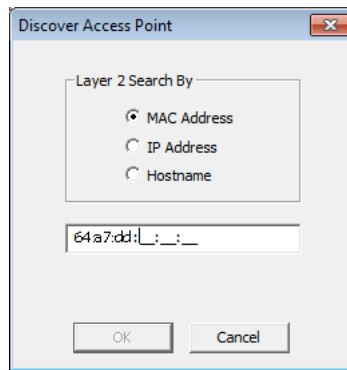

Figure 9. Discover a Specified WAP

- **WAP detection method**—selects how WAPs are detected. This button is labeled with the current detection mode: **NEXT**, **ALL**, etc. You may **Detect All WAPs** (i.e., all WAPs that boot up), **Detect Next Booting WAP** only, or **Stop WAP Detection**. Generally, changing the detection method clears the list of other currently discovered WAPs.

Another option is **Detect WAPs based on Criteria**. This search finds *all* WAPs that match *any* of the criteria shown in the **Search Criteria** list. (Figure 10)

Figure 10. Search Criteria List

The criteria in this list are only used when you have selected the **Detect WAPs Based on Criteria** option.

To add a criterion to the list, click the find button  above the list. The Discover WAP dialog appears. This is identical to the **Find WAP** dialog. (Figure 9) You may specify a WAP using its MAC address (the first three octets for a WAP are always **64:a7:DD**), its IP Address, or its Hostname. No wild cards are allowed in the match string. Click the find button again to specify additional match criteria.

Regardless of how you specify WAPs, Layer 2 techniques are used to search for them. Avaya Virtual Console will send beacons selectively to only the WAPs that match the criteria once all MAC addresses for the specified WAPs are known.

- **Auto Beacon**—this option sends beacons to look for WAPs continuously. To send just one beacon right now, turn Auto Beacon off and use the Broadcast Beacon button (below).
- **Broadcast Beacon**—this option sends just one beacon immediately. The **Auto Beacon** option must be off for this button to work.

WAP List Features

The WAPs list toolbar has just one option, which determines the WAPs list sorting order based on the selected column. Repeat the same selection to toggle the sort order between ascending and descending. You may also sort based on a column by clicking that column's header above the list.

Figure 11. Network Adapters Toolbar

Main Menu Commands

- **File**—By default, **Check All Adapters on Start** is enabled. When Avaya Virtual Console starts up, this will find the network adapters on your computer and enable all of the adapters that are connected. Avaya Virtual Console will send out beacons on these adapters to discover any WAPs on their subnets.

The **File** menu also has the usual options for saving and printing. Use the More Options button  to see all options. **Close** ends the session with the currently selected WAP in the main window. Click the checkbox in front of the WAP to reopen it. **Exit** will close the Avaya Virtual Console window.

- **Edit**—This menu contains the usual **Copy**, **Paste**, and **Select All** options for the main window.
- **View**—This menu allows the selection of which **Toolbars and Docking Windows to display**. For example, the **Search Criteria** window is shown by default, but may be removed from the layout. **Network Adapters**, **WAPs**, and **Output** windows may be removed as well. You may also

enable or disable the display of the **Standard** (quick access) toolbar below the menu and the **Status Bar** at the bottom of the Avaya Virtual Console window. Use the **Application Look** options if you wish to select the look (the skin) of Avaya Virtual Console.

- **Window**—If you have sessions open with more than one WAP, use these options to switch between windows or arrange display of multiple windows.
- **Help—About Avaya Virtual Console** shows the version number and other information.

Customer Support

See the Avaya Support website: <http://support.avaya.com> for Product or Hosted Service notices and articles, or to report a problem with your Avaya Product or Hosted Service. For a list of support telephone numbers and contact addresses, go to the Avaya Support website: <http://support.avaya.com> (or such successor site as designated by Avaya), scroll to the bottom of the page, and select Contact Avaya Support.
